Manning's stewardship of Alberta affairs for the next 25 years was marked by cautious financial conservatism and cautious social reformism. After the discovery of the giant LEDUC oil field in 1947, the government saw the promise of rich revenues to finance "good government"; successful oil policies attracted capital and maximized oil exploration and development. The industry grew rapidly, provincial revenues soared and funds were poured into planned expansion of the educational, health and transportation facilities that brought Alberta into the modern era. Manning's administration was clear of corruption and, despite huge budgetary surpluses, government growth was controlled. The combination of low taxes — Alberta has been free of a sales tax except for a few months in 1936 — and efficient services, plus Manning's unchallengeable rectitude, proved politically invincible. His unease at the "leftward" drift of federal politics, especially after the election of Lester PEARSON'S Liberals in 1963, led him to oppose several federal policies, including compulsory national medicare. He fielded his own non-compulsory, subsidized medical-care scheme, but in the end Alberta was forced to join the federal plan.

Frustrated by the major parties' unwillingness to offer the voters clear-cut philosophical choices, Manning published an appeal for a re-ordering of Canadian politics. In *Political Realignment: A Challenge to Thoughtful Canadians* (1967), he called for a regrouping of forces into a social-democratic party and a "social conservative" party, offering a free economy plus a humanitarian concern for the truly needy. None of the parties showed much interest in this proposal.

In 1968 Manning resigned as premier. He left no designated successor, and 3 years later the Social Credit government, under Premier Harry STROM, was defeated. In 1970 Manning was summoned to the Canadian Senate. He was given honorary degrees by several universities and was made a companion of the Order of Canada. In 1981 he was the first recipient of the Alberta Order of Excellence, and he received the National Humanitarian Award from B'Nai B'rith in 1982. He continued his weekly religious broadcasts on radio stations across Canada and the US.

JOHN J. BARR

**Mannix, Frederick Charles**, businessman (b at Edmonton 21 Oct 1913). As a young man he worked in the construction camps of his father's company, Fred Mannix Co. The elder Mannix sold control of the company to a US-based firm in the 1940s, but Frederick Charles regained control after his father's death in 1951 and built it into an international giant with diverse interests in oil, coal, pipelines, earth moving, and industrial plants. By 1983 Mannix owned or controlled a network of 132 companies, including Loram International, Techman Engineering, Pembina Resources and Manalta Coal (the largest coal producer in Canada), and commanded corporate assets estimated at \$1 billion. He was also director of the Royal Bank and Stelco. An intensely private man, Mannix was involved in a widely publicized court battle with the Alberta government over the expropriation of his ranch, S of Calgary, for a park.

EARLE GRAY

*Reading: Earle Gray, Wildcatters (1982).*

**Mansel Island**, 112 km long by 48 km wide, is the smallest of 3 islands lying across the entrance to HUDSON BAY. Its topography features a gently undulating limestone lowland with elevations not exceeding 100 m. The entire island was submerged under higher sea levels at the end of the last glaciation. A legacy of this marine transgression is the particularly striking relic beach deposits and elevated former shoreline features. The island itself is an outcrop of

ancient resistant marine sediments and is part of an elongated escarpment extending 725 km along the N and E margin of Hudson Bay.

DOUG FINLAYSON

**Manske, Richard Helmuth Frederick**, scientist (b at Berlin, Ger Sept 1901; d at Guelph, Ont 7 Sept 1977). In 1906 Manske immigrated with his family to Macklin, Sask. After studying at Queen's and U of Manchester and spending 5 years in the US, he returned to Canada in 1931 to the National Research Council, Ottawa. Appointed director of Dominion Rubber Co (now UniRoyal) Research Laboratories at Guelph, Ont, in 1943, he retired in 1966 and joined U of Waterloo as adjunct professor of chemistry. His studies of the plant alkaloids span some 50 years and resulted in over 150 research publications and 17 volumes of a standard reference monograph. His other interests ranged from music, astronomy, bird-watching and Greek philosophy to the culinary arts. Elected to the RSC (1935), he was president (1964) and honorary fellow (1967) of the Chemical Inst of Canada and received its medal (1959) and the Morley Medal of the American Chemical Society (1972).

RUSSELL RODRIGO

**Manuel, George**, Shuswap Indian, political organizer, author (b at Neskonlith IR, BC 17 Feb 1921). A widely respected, self-educated man and clever political strategist, Manuel was second president (1970-76) of the National Indian Brotherhood during intense local level Indian protest and numerous important court decisions affecting Indians. He helped establish the NIB and its member organizations as a force to be reckoned with in Indian affairs. A worldwide traveller in support of indigenous peoples, he emulated the principles of frugality, community development and leadership-by-example as espoused by Tanzanian Julius Nyerere. Manuel thrust Canadian Indian affairs onto the world stage at the UN and elsewhere and in 1975 became founding president of the World Council of Indigenous Peoples, from which post he promoted the concept of indigenous peoples as the "Fourth World."

J. RICK PONTING

**Manufacturing** in Canada had its beginnings early in the 18th century, but it was not until the late 19th century, with the development of electricity and a national political objective, that it achieved significant growth. Throughout the 20th century, manufacturing has contributed significantly to the economic well-being and prosperity of Canadians. Manufacturing provides equipment for exploring, developing, extracting, processing and distributing resources from LAND, OCEANS and FORESTS; for example, hydroelectric generators, fishing vessels, railway locomotives, farm machinery, mining equipment and supplies, machines for making paper, and machinery for transforming OIL AND NATURAL GAS and COAL into chemicals, TEXTILES, paints, etc. Durable goods are manufactured for HOUSING, TRANSPORTATION, COMMUNICATIONS, EDUCATION, recreation, entertainment, personal and health care — ranging from refrigerators, AUTOMOBILES, TELEPHONES, pianos, aircraft, windows and doors to tea kettles. Personal goods are manufactured for CLOTHING, FOOTWEAR, recreation, entertainment, health care; for example, dresses, shoes, suits, boots, bandages, books, video displays, TOYS AND GAMES, etc. Manufactured edible goods include beverages, butter, bread, cheese, milk, processed fruits, FISH, meats and VEGETABLES. Manufacturing also includes machinery and equipment to package, handle, distribute, store and record all other manufactured goods.

The export of manufactured goods enables Canadians to earn foreign currencies for travel and vacations and to purchase imported goods. In 1984, about one-third of the total production of Canadian factories was exported. Manu-

facturing is a major purchaser of raw materials and services; Statistics Canada data show that, for every 3 new jobs created in manufacturing, about 3 more jobs are created, ie, one each in the service sector, the RESOURCE sector and in a related manufacturing industry. To illustrate this point, steel is manufactured from IRON ORE, coal and other materials, which are mined and transported by RAILWAYS, SHIPS, trucks and conveyors (all manufactured goods). Executives, salespeople, engineers and others in the steel companies use all modes of transportation and types of accommodation and purchase many services (eg, data processing, communications, legal, accounting).

#### History

Manufacturing in Canada began with flour mills. The first gristmills were built in New France in the 17th century and, by 1840, there were 400 in UPPER CANADA and LOWER CANADA producing flour for domestic and foreign sale (see FLOUR MILLING INDUSTRY). Iron smelting began in 1730 at the FORGES ST-MAURICE near Trois-Rivières, Qué. By the mid-1740s, this foundry supplied New France's total armament requirements as well as stoves and household utensils. Canada's first steamboat, the ACCOMMODATION, was built in 1809 by the Eagle Foundry of Montréal, which made all the more than 100 parts for its engines (see SHIPBUILDING). The ROYAL WILLIAM was, in 1833, the first ship to cross the Atlantic wholly under steam power. Its engines were manufactured by St Mary's Foundry in Montréal.

Several events in the last half of the 19th century stimulated substantial growth in Canada's manufacturing industries. The first was CONFEDERATION in 1867. With political unification and self-government came geographic expansion, construction of the CANADIAN PACIFIC RAILWAY, and new settlement bringing population increases, skills and capital. In 1871 a group of businessmen founded the CANADIAN MANUFACTURERS' ASSOCIATION dedicated to promoting the growth of manufacturing. Eight years later, John A. Macdonald's NATIONAL POLICY established protective tariffs to encourage domestic processing of Canadian materials. Newly established factories, processing products for domestic consumption (eg, LUMBER, grains, animal products), survived and prospered even during the economic depression of the late 1870s and early 1880s. During this period, the discovery of electricity and the subsequent harnessing of some of Canada's vast hydro resource provided industry with an efficient, low-cost source of electrical energy (see HYDROELECTRICITY). At the same time the extent of the MINERAL wealth beneath the Canadian SHIELD began to be realized, stimulating great interest in Canada's growth potential. WWI stimulated industrial development and diversification, especially in such industries as steel, shipbuilding, nonferrous metals and PULP AND PAPER. By 1920 manufacturing directly employed 600 000 workers, about 17% of the total labour force at that time. The worldwide depression of the 1930s reduced economic activity and stifled industrial progress in Canada as in other countries, but Canadian industry expanded and diversified dramatically during WWII. There was swift growth in heavy industries (vehicles, aircraft, armaments, shipbuilding and steel) and spectacular development in ALUMINUM, electrical apparatus, communications equipment, toolmaking and CHEMICALS. By the end of the war, manufacturing directly employed over 1 million workers, more than 25% of the labour force.

#### Postwar Developments

Between 1945 and the 1980s, manufacturing has accounted for 22-24% of Canada's total real output of goods and services. Employment has roughly doubled, from 1 to 2 million, but this

represents a decline in the proportion of total employment because output per worker in manufacturing has risen about two-thirds again as fast as national productivity. Manufacturing productivity gains have, in fact, contributed about one-third of the gains in real per capita income since WWII. In this period Canada's manufacturing industry has been strongly affected by developments in ELECTRONICS, ENERGY-price escalation (especially in the mid-1970s) and trade liberalization resulting from renegotiation of parts of the General Agreement on Tariffs and Trade (GATT) and from the drastic changes in the state of international competition.

**Electronics** The first industrial computer was introduced in Canada in 1957, and since then computer TECHNOLOGY has found widespread use in manufacturing — for production and sales planning, inventory control, accounting and payroll, personnel records, market analysis, business planning, evaluating strategies, etc. In the early 1980s, the use of computer-aided design (CAD), computer-aided manufacturing (CAM) and ROBOTICS technologies has increased rapidly. Electronics spurred the explosive growth of Canada's TELECOMMUNICATIONS industry, which reached worldwide stature in this period. Canadian manufacturers participated in the AEROSPACE INDUSTRY by designing and producing communication satellites and components for spacecraft and aircraft (see SPACE TECHNOLOGY).

**Energy** The rapid rise in world oil prices had a stimulating effect on the development of Canada's rich energy resources, ie, oil, bitumen, gas, coal, hydro and URANIUM. Demand increased for machinery and equipment for exploring and developing energy resources, for producing energy in a usable form and distributing it. The increase permitted Canadian manufacturers to achieve internationally competitive scales of operation, and Canadian-manufactured machinery and equipment have been used in energy development and production throughout the world (see MEGAPROJECTS; OCEAN INDUSTRIES).

**Trade** Three developments in trade policies and practices in this period affected Canadian manufacturers substantially: the Canada-US Auto Pact; the General Agreement on Tariffs and Trade (GATT); and the world competitive environment, particularly the emergence of lesser developed countries. The 1965 Automotive Products Trade Agreement (known as the Auto Pact) between Canada and the US created a conditional, duty-free environment which has allowed the Canadian and US industries to rationalize according to appropriate economies of scale, resulting in efficient

powers has meant tougher competition across the board for Canadian manufacturers. But, as these economies have become more advanced and as costs have risen, competition has been based increasingly on product quality and technology rather than on price (see INDUSTRIAL QUALITY CONTROL). This emphasis has meant intensified competition in the domestic and international markets in such sectors as transportation equipment (including automobiles), machinery and electronic equipment. At the same time, INDUSTRIALIZATION among lesser developed countries (LDCs) has focused on sectors producing labour-intensive, low-technology, highly transportable goods. Therefore, increasing import penetration from LDCs has created significant problems in Canada in such sectors as clothing, certain textiles, the lower range of the footwear market, and consumer electrical products.

#### Canada's Manufacturing Structure

The value of goods shipped by Canada's 35 000 manufacturing establishments was almost \$230 billion in 1984. Fuel and electricity cost \$6.5 billion; materials and supplies \$135 billion; wages and salaries \$46 billion. Despite remarkable expansion in manufacturing in the western provinces, Ontario and Québec still dominate most industries, accounting for half and just over a quarter of Canada's manufacturing output, respectively. Many consumer goods industries are concentrated in these 2 provinces, which have well over half the country's population. Among these industries are food and beverages, TOBACCO, shoes and leather products, clothing, FURNITURE AND FIXTURES, transportation equipment, electrical products, and scientific and leisure goods (see sporting-goods industry). Resource-based manufacturing industries are spread more evenly across the country, eg, wood industries, newsprint, pulp and paper, steel and primary metals, non-metallic minerals, petroleum refineries and chemicals. As resource development continues in the 1980s, resource-based manufacturing will grow in the western and Atlantic provinces. The western provinces now account for a significant and growing proportion of the metal-fabricating and machinery output. East Coast offshore development will provide opportunities for increased manufacturing in the Atlantic provinces. See also FOREIGN INVESTMENT.

ROY A. PHILLIPS

**Maple** (*Acer*), genus of TREES and shrubs of the maple family (Aceraceae). Of the 125 species found worldwide, over 2/3 grow in China; 10 are native to Canada. Maples are a major constituent of eastern deciduous forests. Sugar, black, silver, red and striped maples are found in the East; mountain maple occurs eastwards from Manitoba; Manitoba maple in Saskatchewan and Manitoba; bigleaf, Douglas and vine maples in BC. The tree may be large, medium-sized or small, depending on species. The leaves are opposite, usually simple, lobed and have 3-9 veins. The paired, winged fruits are a food source for birds and small mammals; deer and moose eat young twigs and leaves. Maples grow in various soils and at varying altitudes but prefer deep, moist, fertile soils. The great commercial value of the hard, durable maple wood is overshadowed by the worldwide fame of MAPLE SUGAR and syrup. The maple leaf has long been considered an appropriate emblem for Canada. Maple leaves were used in coats of arms granted (1868) to Ontario and Québec and the new Canadian coat of arms granted in 1921. The leaf was used on regimental badges in WWI and WWII and was confirmed as an official national symbol in 1965 with the proclamation of the national flag.

ESTELLE LACOURSIERE

**Maple Ridge**, BC, District Municipality, pop 32 232 (1981c), area 26 709 ha, inc 1874, is lo-

cated on the N bank of the FRASER R between Pitt Meadows and Mission. The commercial centre, Haney, is 40 km E of downtown Vancouver. Its northern area is rugged and mountainous; the western section flat and open. Rapid growth in recent years stems from the development of large tracts of residential land. Forestry and agriculture are the leading resource sectors, along with lumber mills on the Fraser, logging in the northern area, dairying in Pitt Meadows and mixed farming in Maple Ridge. In 1981 the Maple-Meadows Industrial Park was opened. Golden Ears Provincial Park at Alouette Lk has the highest day use in the province. Whonock Lk Municipal Park is heavily used as a swimming and picnic area.

ALAN F.J. ARTIBISE

**Maple Sugar Industry** Maple syrup is a unique agricultural product. The sweet sap of the sugar MAPLE (*Acer saccharum*) was known and valued by the native peoples of eastern N America long before the arrival of European settlers. An Iroquois legend tells of the piercing of the bark of a maple and the use of the "sweet water" to cook venison, a happy accident which established the culinary tradition of maple-

cured meats. French settlers probably learned from the Indians how to tap trees to obtain sap and how to boil it to reduce it to sweet syrup or sugar slabs to be stored for later use. The Ojibwa called the "sugaring off" period the "maple moon" or "sugar month." The tradition of sugaring off became established in communities in the deciduous forests of N America and has survived to the present time.

World production of maple sugar is limited to the Maple Belt, the hardwood FOREST stretching from the midwestern US through Ontario, Québec and New England and into the Canadian Maritimes. In the fall, the sugar maple lays down concentrated sugars in the rays of the tree; these sugars mature during winter and are harvested while the frost is still in the ground. The sap flow is stimulated in spring as the days become warmer and temperatures rise above 0°C during daylight, followed by below-freezing nights. Within the tree positive pressures (as high as 165 kPa or 1.6 atmospheres) produce a natural flow of sap that is tapped by boring holes into the tree. The clear sap rushes out of these holes and into the collection system. As the pressure drops during the day, the sap flow slows down and stops. Negative pressure is then found within the tree, and it begins to absorb water through the root system. The next

Mature sugar maple tree (*Acer saccharum*), with details of leaf (artwork by Claire Tremblay).

Spring scene in the maple sugar industry, showing the smokehouse (artwork by Claire Tremblay).

day, as the tree warms up, positive pressure is restored and the pumping action yields another flow. The process continues for about 6 weeks in early spring. At the end of that time the sap takes on a cloudy appearance and the sugar content drops off dramatically. During the height of the sugaring season, sap contains about 2.5% sugar; towards the end of the season less than 1%. During the maple harvest, the tree will give up about 7% of its sap; tests confirm that this does no long-term damage to the tree. Many of the tapped trees are well over 100 years old.

There are various sap-gathering methods. Traditional bucket collection, although still used throughout the Maple Belt, is being replaced by a vacuum-tubing system that reduces labour and creates a more sanitary environment for collection. Once the maple sap is collected, it is evaporated into syrup. The dilute raw material is reduced to remove excess water; nothing is added. It takes approximately 151.4 L of maple sap to produce 3.8 L of pure maple syrup. Water can be removed from sap by using various systems, from wood-fired evaporators to reverse osmosis systems that separate water from the sugar molecules at high pressure. However, the sugarhouse remains the focal point of maple-syrup production; each sugar maker has one of his own.

There are about 20 000 maple-syrup producers in N America. Of the total world production of 16.9 million kg for the 1983 crop year, Canada produced 11.2 million kg and the US 5.7 million kg. Within Canada, Québec produced nearly 10 million kg; Ontario 780 000 kg; NB 380 000 kg; and NS 103 000 kg. During a normal crop year, some 22.7 million kg of syrup would be produced worldwide; the small 1983 crop resulted from poor spring weather conditions.

Maple syrup is a pure, natural sweetener, the only other liquid natural sweetener being honey. Maple syrup has an abundance of trace minerals that are essential to good nutrition: potassium, magnesium, phosphorus, manganese, iron, zinc, copper and tin, as well as calcium in concentrations 15 times higher than honey. It contains only one-tenth as much sodium as honey, an important consideration for those on a salt-restricted diet. Maple syrup is graded according to colour, flavour and density; standards are prescribed by law. It must be in the range of 65-67% Brix (a hydrometric scale for sugar solutions) or 32-34° on the Baumé scale (for liquids heavier than water). Anything less or more cannot be graded and sold as pure maple syrup.

The US is the major consumer. Small amounts are exported to Europe, principally to W Germany and France. The industry is developing new markets for this uniquely N American product and a strong industry is developing. In the early part of the 1970s, the traditional buyers were the large food companies. When the US Food and Drug Administration reduced the minimum volume of maple syrup that must be listed as an ingredient in products sold as "maple syrup" and "maple sugar" from 15% to 2%, sales

plunged dramatically and the industry experienced a major crisis. Efforts were made to develop a new market aimed directly at the consumer and the growth of this market has rejuvenated the industry.

Production of pure maple syrup has been encouraged by provincial and federal governments, resulting in an expansion of the crop over the last several years. As the industry continues to grow, production innovations will be needed, and research is underway in both Canada and the US to make the industry more efficient. But for the foreseeable future, the traditional sugarhouse and the family operation, so evocative of Canada's pioneer past, will remain.

LEO H. WERNER

**Maquinna**, or Mukwina, meaning "possessor of pebbles," Nootka chief (fl 1778-95?). Maquinna was the ranking leader of the Moachat group of Nootka Sound Indians on the W coast of Vancouver I during the early years of European contact. Following James Cook's 1778 visit, NOOTKA SOUND became an important fur-trading centre. Maquinna controlled the FUR TRADE and emerged as the dominant Indian leader in the Sound, operating as a middleman. Maquinna was also involved in dealings with British and Spanish representatives who visited Nootka Sound as the 2 nations asserted rival claims to the area. While Maquinna had achieved his position among the NOOTKA by traditional means, he was a leader whose role was changing because of the Europeans' impact. His power and prestige were enhanced by new wealth from the fur trade but, at the same time, he had to lead his people through new and sometimes difficult situations. His successor assumed the name of Maquinna.

ROBIN FISHER

Reading: Robin Fisher, *Contact and Conflict* (1977).

**Marani, Ferdinand Herbert**, architect (b at Vancouver 8 Aug 1893; d at Toronto 18 July 1971). Marani graduated from U of T in 1920 and shortly thereafter established a practice in Toronto. His partnerships include Marani and Morris (1947-59) and Marani, Rounthwaite and Dick (1964-71). His designs, which are noted for his contemporary translation of the Georgian tradition, include the original BANK OF CANADA building in Ottawa, the Medical Arts Building in Toronto and the Canadian Forces Headquarters in Washington, DC. Marani served in WWI and WWII and was a chairman of the Ontario Assn of Architects and of the Ontario College of Art.

ANDREA KRISTOF

**Marathon Running**, *see* LONG-DISTANCE RUNNING

**Marathon Swimming** takes place on open water for distances in excess of 1500 m. Most marathon swims are across established bodies of water such as channels, lakes or straits. The best known and most prestigious is the crossing of the English Channel, a distance of approximately 34 km. Marathon swimmers aim to win races or set records such as first crossing, fastest time, youngest or oldest swimmer, first double or triple crossing, or most crossings by the same person. Most are professionals and swim for the prize money available to winners or record breakers. Matthew Webb, the first person to swim the English Channel without the aid of a life jacket, tried to cross the rapids and whirlpool below Niagara Falls in 1883 but drowned in the attempt.

Canadian long-distance swimmers have been among the world's best. The first to draw public attention was Toronto's George Young. In Jan 1927 he won the first Catalina Swim (32 km). His feat stimulated an interest in long-distance swimming, and was responsible for the introduction of the Marathon Swim, a highlight of the CANADIAN NATIONAL EXHIBITION in Toronto. In

Aug 1927, the first "Professional Swim Championship of the World," for 21 miles (34 km), was staged at the CNE. Young did not win this event until 1931. In 1950, he was named the Canadian swimmer of the half century. The CNE world championship swims, at various distances, continued until 1937, then were cancelled owing to waning public interest. They were resumed in 1948, and by 1949 Cliff Lumsdon, of New Toronto, had emerged as an outstanding swimmer. He won the CNE men's world championship in 1949 and repeated in 1950, 1952 and 1953. In 1955, he won the Marathon Swim of 32 mi (51.5 km), and was perhaps the finest swimmer of his day in the world. Marilyn Bell, of Toronto, became a household name in 1954. In July she was the first woman to complete the 26-mile (42-km) Atlantic City, NJ, marathon race, and in Sept became the first person to complete the arduous 34-km crossing of windswept Lake Ontario. In 1955 she was the youngest to swim the English Channel, and in 1956 crossed the dangerous Straits of Juan de Fuca in record time. Bell was awarded the LOU MARSH TROPHY in 1954 as Canada's outstanding athlete. Both Lumsdon and Bell were coached by Gus Ryder, founder and coach of the Lakeshore Swim Club of New Toronto.

In the 1970s, 2 Canadian swimmers dominated long-distance swimming. Cindy Nicholas, of Scarborough, Ont, at age 16 made a record crossing of Lake Ontario in 1974, and one year later made her first of 10 English Channel crossings, setting a record for the crossing from France to England. In 1976 she was the women's world marathon-swimming champion, and in 1977 set the Channel round-trip speed record. By 1978, she had earned the title "Queen of the Channel" for the most crossings by a woman (6), and in 1979 she lowered her time for the 2-way crossing of the Channel.

Loren Passfield, of Etobicoke, Ont, was ranked the world's top woman marathon swimmer in both 1977 and 1978.

BARBARA SCHRODT

**March, Mary**, *see* DEMASDUWIT.

**Marchand, Félix-Gabriel**, lawyer, journalist, playwright, premier of Québec (b at St-Jean, LC 9 Jan 1832; d at Québec City 25 Sept 1900). Marchand, one of the last "vrai rouges" and an important transitional figure in Québec political life, assumed leadership of the shattered provincial Liberals in 1892 and led them to victory in 1897, promising, in a direct challenge to the Roman Catholic Church, to restore political control over education. The church blocked Marchand, however, and controlled education until the 1960s. Under Marchand the Liberal Party became an agent of industrial expansion, welcoming foreign capital and technology, developing Québec's vast hydroelectric-power potential and exploiting its forest resources. Although bitterly criticized, these policies were the foundation of Liberal political success for more than a generation.

BERNARD L. VIGOD

**Marchand, Jean**, union leader, politician (b at Champlain, Qué 20 Dec 1918). After completing a social-science degree in labour relations at Laval (1942), he became an organizer for the Fédération de la pulpe et du papier (Confédération des travailleurs catholiques du Canada). Secretary general of the CTCC from 1947, he was elected president 1961. During the 1950s, with other unionists, intellectuals and reform members of the Québec Liberal Party, he helped bring about the defeat of the Union Nationale government (1960). His union central, renamed the CONFEDERATION OF NATIONAL TRADE UNIONS in 1961, worked closely with the Liberal government of Jean Lesage and won some legislative reforms, such as the right of government employees to form unions and to strike. Critical of the rise of

**SEPARATISM** in Québec in the early 1960s, he was persuaded by PM Lester PEARSON to join the federal Liberal Party in 1965 to enhance the francophone presence in Cabinet and defend the cause of Québec federalism. He agreed on condition that 2 longtime friends, Pierre TRUDEAU and Gérard PELLETIER, be allowed to join him. He held several important Cabinet posts, resigning in 1976 to run in the Québec provincial election to try to prevent the PARTI QUÉBÉCOIS from coming to power. He failed in both objectives. He was appointed to the Senate in Dec 1976; selected Speaker in Mar 1980, he played a central role in the 1981 debate over reform of the Constitution. Appointed president of the Canadian Transport Commission he resigned from the Senate in Dec 1983.

M.D. BEHIELS

**Marchand, Jean-Omer**, architect (b at Montréal 28 Dec 1873; d there 11 June 1936). After training at the Ecole des beaux-arts, Paris, he started a practice in 1903 and began a series of grand public buildings in Montréal, which included the rebuilt chapel of the Collège et Grand Séminaire de Montréal (1903), the Maison-mère des Soeurs de la Congrégation de Notre-Dame (1905), the City Hall Annex (1912) and the McTavish Reservoir Pumping Station (1929). Marchand was associated with John A. PEARSON in the design of the PARLIAMENT BUILDINGS at Ottawa after the 1916 fire. Marchand was an avid collector of fine furniture, artworks and rare books on architecture, now in the architecture libraries of U de M and UQAM. ROBERT LEMIRE

**Marchand, Leonard Stephen**, politician, agronomist (b at Vernon, BC 16 Nov 1933). Len Marchand was the first Indian federal Cabinet minister and the second native member of the federal Parliament after Louis RIEL. Through early involvement with the N American Indian Brotherhood, he left a career as agricultural research scientist in 1965 to work as special assistant to 2 successive Cabinet ministers. He was elected Liberal MP for Kamloops-Cariboo in 1968, and was minister of state for small business 1976-77 and minister of state for the environment 1977-79. Defeated in 1979, he returned to BC as administrator for the 5-band Nicola Valley Indian Administration, and was appointed to the Senate in 1984. A low-profile politician considered successful in his ministerial roles, Marchand represented a liberal-individualist approach to business, environmental and Indian issues. This, and his qualified support for his party's native policies, set him apart from the mainstream both of Indian and of environmentalist activism. BENNETT MCCARDLE

**Marchildon, Philip Edward**, baseball player (b at Penetanguishene, Ont 25 Oct 1913). He was pitching in a semiprofessional Ontario league when discovered at a Barrie tryout camp. He joined the Philadelphia Athletics in 1940 and, despite a 3-year interruption for war service, won 68 major league games before retiring in 1950. In 1947, 14 of his 19 wins for the 5th-place Athletics were against first-division teams.

WILLIAM HUMBER

**Marco Polo**, sailing ship of 1625 tons launched in April 1851 from the building yard of James Smith, Courtney Bay, Saint John, NB. It was the most famous ship built in NB, cutting a week off the previous record run from England to Australia, completing the round trip in less than 6 months and earning the title "Fastest Ship in the World." She remained in the Australian trade for 15 years before being bought by Norwegian owners for the Québec timber trade. It ran ashore at Cape Cavendish, PEI, in 1883.

JAMES MARSH

**Marcotte, Gilles**, journalist, critic, professor, novelist, essayist (b at Sherbrooke, Qué 1925). Marcotte has been one of the best-known and most-respected Québec intellectuals. First a journalist at *La Tribune*, then at *Le Devoir* and *La Presse*, Marcotte worked for Radio-Canada and the NFB before becoming literature professor at Université de Montréal in 1965. He has been active in publishing, notably *Ecrits du Canada français*, since 1954 and has written a series of columns in *Actualité*. Often consulted and interviewed, the winner of many major prizes, Marcotte has been at the centre of every kind of literary activity. He has written 2 novels, *Le Poids de Dieu* (1962) and *Retour à Coolbrooke* (1965) and a spare and sombre narrative, *Un Voyage* (1973). The novelist, a master of narrative technique, sometimes lacks daring and spontaneity; he has some difficulty in seeing and being seen. The critic has no such problems. Marcotte's collection of essays, *Une littérature qui se fait* (1962), is a benchmark in the evolution of Québec critical thinking, opening new horizons on Saint-Denis GARNEAU and on such themes as solitude, exile and vertigo. *Le Roman à l'imparfait* (1976) is an original analysis of the experiences of 5 novelists struggling with characters who are themselves writers, storytellers, readers: Bessette, Ducharme, Blais, Godbout and Ferron. In *La Littérature et le reste* (1980), an exchange of letters with André Brochu, Marcotte develops and systematizes his theoretical ideas with grace and wit.

LAURENT MAILHOT

**Marcuse, Judith Rose**, née Margolick, dancer, choreographer, teacher, director (b at Montréal 13 Mar 1947). Her broad international background in ballet and modern dance has made Marcuse a versatile choreographer. Trained initially in Montréal, Marcuse attended Britain's Royal Ballet School 1962-65 and studied subsequently in Canada and the US. She danced with a number of leading companies, notably LES GRANDS BALLETS CANADIENS, 1965-68, the Bat-Dor Dance Co of Israel 1970-72, and England's Ballet Rambert 1974-76. Although Marcuse still performs, she has become increasingly occupied as a choreographer, creating works for Canadian and foreign troupes. She founded the Judith Marcuse Dance Project Soc in 1980 which emerged as a full-fledged performing ensemble in 1984. Marcuse has won both the Jean A. Chalmers Award for Choreography (1976) and the Clifford E. Lee Award for Choreography (1979).

**Maria Chapdelaine** (1916), a novel embodying the spirit of French Canada at its most lyrical, was based by author Louis HÉMON, an expatriate Frenchman, on his experiences in the Lac Saint-Jean district of Québec. Church and farm provide a physical and symbolic setting for the romance, as the seasons and feast days provide a mythic temporal framework for its action. Following the death of her mother and that of her lover François Paradis, Maria must choose between 2 suitors: Lorenzo Surprenant, who tempts her with the riches of America, and Eutrope Gagnon, the boy next door. She unselfishly accepts Gagnon, thereby ensuring the survival of family and community and affirming the traditional values of rural French Canada. Frequently reprinted both in Canada and in France, *Maria Chapdelaine* has been filmed 3 times, most recently by Gilles CARLE (1983). W.H. Blake's translation (1921), beautifully illustrated with woodcuts by Thoreau MACDONALD, remains the standard English edition.

MICHÈLE LACOMBE

The *Marco Polo*, famous NB clipper that earned the title "Fastest Ship in the World" (courtesy New Brunswick Museum).

**Marie Calumet** (1904), novel by Rodolphe Girard, narrates with Rabelaisian gusto the mock-heroic adventures of a female picaresque, inspired by a French Canadian variant of the old folk song about the bride who was given too much to eat at her wedding. Marie is the middle-aged maid hired by Father Flavel, the curate of St-Ildéphonse, to replace the comelier but less efficient Suzon. A fearsome and God-fearing gourmet cook recommended by his friend Father Lefranc, the liberal pastor of St-Apollinaire, Marie is wooed and eventually won by Narcisse, Flavel's timid but faithful hired hand. Girard's humour, gently satirizing the priest's all-too-human frailties and depicting rural life in Québec with realism and an ear for dialect, led to his denunciation by the church and dismissal from *La Presse*. His friend Albert Laberge supervised an expurgated edition (1946) translated by Irène Curie (1976); a facsimile of the 1904 text appeared in 1969, a new edition in 1973.

MICHÈLE LACOMBE

**Marie de l'Incarnation**, née Marie Guyart, founder of Ursuline order in Canada, mystic, author (b at Tours, France 28 Oct 1599; d at Québec C 30 Apr 1672). As a child, Marie Guyart, daughter of a master baker, showed unusual spirituality. Her husband, Claude Martin, died in 1619 after 2 years of marriage, leaving her with a 6-month-old son and a bankrupt business. Urged to remarry, she withdrew into secluded meditation and prayer and on 24 Mar 1620 experienced a mystical and emotional "conversion." She decided to withdraw from the world, but her sister and brother-in-law called on her to help their failing carrier business. Under Marie the business prospered but visions continued to haunt her. In 1632, though heartbroken at leaving her son Claude, she entered the Ursuline cloister at Tours. She took her vows in 1633 and taught Christian doctrine for 6 years. From her reading of the *Relations des Jésuites* and her visions she concluded that her vocation was in Canada. With 3 Ursulines and Mme de LA PETRIE she landed at Québec 1 Aug 1639 and established a convent in the lower town. In 1642 it moved to a permanent stone building in the upper town. She worked zealously at educating French and Indian girls, wrote numerous theological and spiritual treatises, an Iroquois catechism and Algonquian and Iroquois dictionaries, and kept abreast of public affairs.

CORNELIUS J. JAENEN

Reading: J. Marshall, ed, *Word from New France: The Selected Letters of Marie de l'Incarnation* (1967).

**Marie-Rose, Mother**, name in religion of Eulalie Durocher, educator (b at St-Antoine-sur-Richelieu, LC 6 Oct 1811; d at Longueuil, Canada E 6 Oct 1849). As housekeeper to a brother at the Beloeil presbytery 1831-43, she became alarmed at the lack of rural schools. When Bishop Ignace BOURGET of Montréal was unable to form a local community of the Sisters of the Holy Names of Jesus and Mary, a teaching order in Marseilles, France, Durocher accepted in 1844 to become founder and first superior of a Canadian religious community of the same name. Recognized as a woman of exceptional virtue, she brought to her work unflagging enthusiasm and unequalled ability. In the 1870s Bourget expressed the hope that she would be beatified, and on 23 May 1982 this wish was fulfilled by Pope John Paul II.

SISTER MARGUERITE JEAN S.C.I.M.

**Marie-Victorin, Frère**, brother in the Écoles chrétiennes community, botanist, teacher (b Conrad Kirouac at Kingsey-Falls, Qué 3 Apr 1885; d at St-Hyacinthe, Qué 15 July 1944). Son of a prosperous merchant, Kirouac grew up in Québec C. At 16 he joined the Frères des Écoles chrétiennes in Montréal. His postulant and early teaching years were often disrupted by illness, but long periods of convalescence allowed him to study BOTANY. As teacher at the Collège de Longueuil from 1905, Marie-Victorin stimulated student life, founded a study circle and published several literary works. However, botany took more and more of his time. Around 1908 he published his first scientific articles. He was named professor of botany at U of M in 1920. There followed 25 years of intense scientific and social activity. At the Botanical Inst, which he founded in 1922, Marie-Victorin gathered a small research team which included Jules Brunel, Ernest Rouleau, and Jacques ROUSSEAU. As his monumental *Flore laurentienne* (1935) shows, Marie-Victorin was above all a taxonomist. However, the importance he gave to phytogeography and the evolution of American flora paved the way for ecologists like Pierre DANSEREAU.

As ardent propagandist of "scientific cultivation" and of a nationalism like that of Lionel GROULX, Marie-Victorin was a major Québec intellectual and political figure in the 1930s. He took part in founding the Association canadienne-française pour l'avancement des sciences and the Société canadienne d'histoire naturelle, in organizing the Cercles des jeunes naturalistes and, most notably, in creating the Montréal Botanical Garden. He became a member of the RSC in 1924. Marie-Victorin was at the height of his power as a scholar and leader when he died in an automobile accident during a botanizing excursion.

RAYMOND DUCHESNE

**Marion, Léo Edmond**, organic chemist, administrator, educator (b at Ottawa 22 Mar 1899; d there 16 July 1979). After studying at Queen's and McGill and spending a year at University of Vienna, Marion became R.H.F. MANSKE's assistant at the National Research Council Laboratories. When Manske left NRC in 1942, Marion became chief organic chemist. His dedication to basic research, and the support of E.W.R. STEACIE and C.J. MACKENZIE, enabled him to build an internationally recognized school of alkaloid chemistry. At the NRC he directed the pure chemistry division 1952-65 and acted as VP (scientific) 1963-65. He was president of the RSC, and editor in chief of the *Canadian Journal of Research*, and contributed to the early growth of the chemistry departments of U de M and Carleton, ending his career as dean of pure and applied science at Ottawa. He received an OBE, many honorary doctorates and awards. O.E. EDWARDS

**Mariposa Folk Festival**, see FOLK FESTIVALS.

**Maritime Provinces** PRINCE EDWARD ISLAND, NOVA SCOTIA and NEW BRUNSWICK cover 134 584 km<sup>2</sup>, just a little more than 1% of Canada's land surface. The populations of Nova Scotia at 847 445, New Brunswick at 696 405 and PEI at 122 510 constituted 7% of the Canadian total of 24 343 180 (1981c). As part of a nation that has placed great stress on unlimited size and almost limitless space, and also on western development, Maritimers have often found themselves, as the 20th century has unfolded, pushed to the periphery of Canadian development.

The Maritimes constitute a cluster of peninsulas and islands which form the NE extension of the Appalachian highlands and are also significantly affected by the Atlantic Ocean. The tension between the pull of the continent and that of the Atlantic has, over the centuries, shaped the region's cultural, social, political and economic development. For much of its human period — both before and after European settlement — the Maritime region was a homeland for a distinctive group of people. Before the arrival of the first Europeans, the MICMAC, who constituted a single linguistic and cultural entity, inhabited all of present-day peninsular Nova Scotia, Cape Breton I, PEI and southern and eastern New Brunswick. Only in the upper Saint John R Valley were the MALISEET, who spoke a somewhat different Algonquian dialect but had much in common with their Micmac

neighbours. With the coming of the French, especially in the early 17th century, the Micmac-Maliseet hegemony over the region was challenged. From its beginnings in 1604 French ACADIA gradually came into existence, a territory roughly encompassing that now covered by the Maritime provinces. Though made up largely of isolated settlements, Acadia was united by a common language, culture and economy. By 1763 France was compelled to surrender its last remaining outpost in Acadia-Nova Scotia (see LOUISBOURG) to the British. Thus in 150 years, the region had passed from Micmac-Maliseet control to the French; then, after 1713, to the dual sovereignty of France and Britain; and finally after 1763 to undisputed British control.

Once Britain controlled the entire region, ethnic heterogeneity characterized its settlement. Acadians, New Englanders, foreign Protestants from present-day W and E Germany and Switzerland, English, Irish, Scots and a mixture of LOYALISTS provided Nova Scotia, New Brunswick (created in 1784 for the Loyalists) and PEI with their unique ethnic composition. This basic Anglo-Saxon and Acadian ethnic mix was virtually unaffected by the hundreds of thousands of European immigrants who, carefully bypassing the Maritimes, flooded into Canada, especially after 1900.

At CONFEDERATION in 1867, the Maritime provinces had little in common with Canada. The region's development had been radically different and, furthermore, a Maritime distinctiveness had been significantly influenced by the interplay of 3 major forces: those of the Atlantic, New England and Britain. The Atlantic was for many inhabitants of the area a frontier of space and abundance, and for them its metaphors coloured many of the cultural expressions of their region. Its powerful appeal helped to provide, for some, not only an escape from the grim and often mundane realities of everyday existence, but also a sense of acute fatalism affected by the conviction that the environment could never effectively be mastered.

The second formative force, not only at Confederation but also throughout the post-Indian period, was that of neighbouring New England. Until the AMERICAN REVOLUTION shattered the Anglo-American empire, the Maritime region was "New England's Outpost," and even in the 1980s economic, cultural, religious and social ties between the regions have been surprisingly strong.

The British connection was the third formative force. After France's direct exercise of power in N America was eliminated, Britain's influence over the Maritimes was unrivalled. The arrival of thousands of Loyalists during and after the American Revolution, and the tens of thousands of British immigrants who settled in the region during the 19th century, reinforced Britain's influence. The interaction of these forces before 1867 gave the inhabitants of Nova Scotia, New Brunswick and PEI a strong sense of provincial identity. They did not view themselves as Maritimers, and certainly not as Canadians, but rather as British Islanders, British Nova Scotians or British New Brunswickers.

It may be argued that the Maritime provinces have never fully recovered psychologically from the traumatic experience of Confederation and the sudden end in the late 19th century of the golden age of "Wooden Ships and Iron Men" (see MARITIME SHIPPING HISTORY). Before Confederation, many Maritimers believed that their region had unlimited economic potential and that theirs was the most sophisticated and best administered of all the British colonies possessing RESPONSIBLE GOVERNMENT. It was felt that the Maritimes had a special role to play in the evolution of a new British Empire. The development of this sense of destiny came to a sudden halt after

Population of the Maritime Provinces (000s)

	NS	NB	PEI
1871	388	286	94
1891	450	321	109
1911	492	352	94
1931	513	408	88
1951	643	516	98
1971	789	635	112
1981	847	696	123

Confederation when the Maritimes found themselves left out of the westward transcontinental thrust of the new Canada, bypassed by immigrants to the interior, and lacking natural and human resources for INDUSTRIALIZATION. Most Maritimers believed the identity of the villain was obvious: the federal government in Ottawa. The proof was there — before Confederation there had been widespread prosperity and the entire region had shared a feeling of optimism and pride. After Confederation there were prolonged economic recessions and a growing sense of collective inferiority and bitterness.

The anti-Confederation feeling, especially strong in Nova Scotia, provided the emotional substance to much of Maritime regional protest, particularly 1867-1930. Maritimers tended to remain quiet until those periods of extreme economic crisis when their discontent and their suspicion of "Upper Canada" and "Upper Canadians" could be channelled into regional political protest (see REPEAL MOVEMENT). The MARITIME RIGHTS Movement of the 1920s was the last significant manifestation of regional protest and anti-Confederation feeling. Because the movement had never sought political involvement outside the traditional 2-party system, it could not transform the regional grievances into a permanent political framework. Even the Conservatives, who had been champions of the movement, soon became Conservatives first and Maritime Righters second. Maritime Rights made good political rhetoric. It could help win elections, could be carefully stored until the next election, and did not demand political action or political sacrifice. It made more sense for pragmatic Maritimers to avoid the possible confrontation towards which the thrust of their regional complaints was driving them. To deviate from the 2-party system was considered political suicide. Evidently central Canadian progress and development could not be reversed by "paranoid" regional protest separated from "power politics."

The mood of the Maritime region had obviously changed by the end of the 1920s. One reason was economic resurgence after 1927, when a construction and tourism boom encouraged industries also revived, as did the traditional markets in Britain and the US. Capital development gave new importance to the pulp and paper industry. But revival was largely restricted to areas such as the Annapolis Valley, Cape Breton, Halifax County and Saint John. Elsewhere the decline continued, and consequently there was a steady exodus of young Maritimers — at least 300 000 from 1900 to 1930, of whom fully three-quarters went to the US. The social costs of such emigration are incalculable, but it seems reasonable to assume that those with ambition and initiative more often left the region than stayed. The remaining population resigned itself to a collective fate only as promising as their individual prospects of success. For most, the Maritime Rights Movement had led to "cynicism and apathy"; a feeling of dependence had replaced regional pride and the cutting edge of alienation had been worn smooth by a prevailing indifference to change.

By the late 1970s the Maritimes had undergone a remarkable transformation of collective identity. No longer were Maritimers the most vociferous critics of Confederation and Canada;

they had become, in an ironic twist of historical development, ardently Canadian. They had been able to move beyond the point of merely stressing their Maritime distinctiveness to a position where they could, at the same time, freely discuss and contemplate their powerful emotional attachment to Canada. When a person is able to admit to being an ardent Islander, New Brunswicker or Nova Scotian and an ardent Canadian at the same time, it reveals an ability to integrate 2 quite different, but not incompatible, levels of identity. According to Northrop FRYE, this dynamic tension between the imaginative sense of locality and the attachment to Canada is the essence of whatever the word "Canadian" means. Nova Scotians are Nova Scotians, Islanders are Islanders, and New Brunswickers are New Brunswickers, because as one Maritime premier put it in 1967, "we're Canadians before we're anything else." See also ATLANTIC PROVINCES.

GEORGE A. RAWLYK

Reading: E.R. Forbes, *The Maritime Rights Movement, 1919-1927* (1979); W.S. MacNutt, *The Atlantic Provinces* (1965); George A. Rawlyk, ed, *Historical Essays on the Atlantic Provinces* (1967).

**Maritime Rights**, regional protest that climaxed in the 1920s. Essentially a reform movement, it was triggered by the region's declining influence in CONFEDERATION and its inability to protect important interests in transportation, tariffs, port development and federal subsidies. Promoted by newspapers, boards of trade, Maritime clubs, Acadian "national" conventions, farm organizations and some trade unions, the agitation included frequent delegations to Ottawa, economic conferences, propaganda pamphlets and cross-country speaking tours. An amorphous movement, its leadership was legion, and included Nova Scotians H.S. Congdon, W.H. Dennis and F.B. McCurdy; New Brunswickers A.M. Belding and A.P. Patterson; and Prince Edward Islander A.E. MacLean.

Regional issues encouraged major shifts in the popular vote against unsympathetic federal governments. In 1921 Liberals swept 25 of 31 seats; in 1925, amid worsening depression, Conservatives won 23 of 29. In 1926 the Mackenzie King government appointed British lawyer Sir Andrew Duncan to investigate Maritime discontent. His recommendations of freight-rate reductions and subsidy increases were implemented, but suggestions for subsidies based on fiscal need and the use of transportation to encourage regional development were ignored. Although hopes once raised turned to cynicism in the GREAT DEPRESSION, regional resentment and vestiges of co-operation remained the movement's legacies.

ERNEST R. FORBES

Reading: Ernest R. Forbes, *The Maritime Rights Movement, 1919-1927* (1979).

**Maritime Shipping History to 1900** The shipping industry in the Maritimes began in the 18th century and reached its zenith in the last half of the 19th century. In 1878, the peak year in Canadian ownership of vessels, 7196 ships were on registry in Canadian ports, and the total gross tonnage (a rough measure of cargo-carrying capacity) of these vessels was 1.3 million registered tons. Official government figures suggest that by 1878 Canada possessed the fourth-largest merchant marine in the world, with only the UK, the US and Norway possessing larger merchant fleets. By 1878, 70% of all Canadian tonnage was owned and registered in the MARITIME PROVINCES (NS, NB and PEI), Québec had 18.6% and Ontario 10.2%. After 1878 the shipping industry in the Maritimes declined, until by 1910 it had only 29% of all Canadian tonnage on registry. Québec had 25%, Ontario 30% and BC 14%.

Small SAILING SHIPS were built in Nova Scotia in the early 1700s for local use. With the establishment and growth of settlements such as Hal-

ifax, Saint John and Shelburne in the late 18th century, many more, larger vessels were built for use in the trade with the West Indies, the American colonies and Britain. The first great shipbuilding boom occurred during the Napoleonic Wars, when shipbuilding and shipowning were closely linked to the rapid growth of the TIMBER TRADE between BNA and Britain. Steep tariff duties were imposed on timber imported to Britain from the Baltic countries, and Napoleon's Continental Blockade of Britain seriously hindered European supplies. The Maritime provinces then became the principal suppliers of timber to Britain, and the result was a growing demand for ships to carry it. Maritimers frequently sold both timber and ships in the British market: huge ships were often broken up and sold as timber to avoid duties. Demand continued after the Napoleonic Wars, partly because the preferential tariffs remained in place (see TIMBER DUTIES). By the 1860s Canadians supplied almost one-third of all new ships in Britain.

For the manufacture of ships Maritimers had plentiful supplies of softwood (particularly spruce) and a growing number of skilled shipbuilders. Although vessels built in the Maritimes may not have been as durable as British or American vessels built of oak (although many of these were hurriedly constructed from poorly seasoned timber), the price per ton of the Canadian-built vessel was much lower. This advantage was a major reason for the Canadian penetration of British shipping markets.

The rapid and frequent sale of vessels in Britain does not mean that a shipowning industry failed to develop in the Maritimes. Many merchants and timber exporters owned ships in the first half of the 19th century, either to facilitate the export of timber, fish and other products of the Maritimes, or to engage in general trade in the N Atlantic. One major merchant-exporter was Samuel CUNARD of Halifax, who created a substantial shipping business in Nova Scotia, Britain and the West Indies in the 1820s and 1830s. In 1840 Cunard began his successful transatlantic steamship line, after winning the contract to carry mail from Britain to the US. Meanwhile, other merchant-exporters were building large fleets. Saint John became the largest shipbuilding and shipowning centre in the Maritimes. Only half of all tonnage built in and around Saint John was sold in Britain before 1850, and tonnage on registry in the port grew 4% annually between 1826 and 1877. Shipowning grew because of the need for carrying capacity to transport exports from the Maritimes to Britain, Europe and the West Indies, and to transport imported goods and immigrants to BNA. The provision of a relatively cheap transportation service was critical to the growth of the export-based economy of the Maritimes.

The shipowning industry reached its peak in the 1860s and 1870s when several factors encouraged merchant-shipowners to move beyond the local Maritime trades and to engage in many world trades. First, the British market for sailing vessels began to decline, and so the opportunity to make a quick profit from selling a new vessel gradually disappeared. Canadians therefore retained their vessels and employed them in increasingly far-flung trade. Second, exports from the US to Britain and Europe continued to grow, but during and after the AMERICAN CIVIL WAR the American merchant marine declined. Enormous opportunities appeared in the shipping of American exports, and these opportunities were reflected in relatively high freight rates. Vessels from the Maritimes specialized in carrying wheat, petroleum, cotton and tobacco from American ports to Britain and northern Europe. In the 1860s and 1870s most oceangoing vessels from the Maritimes re-

mained in the N Atlantic, but appeared less often in their home ports; over two-thirds of all entrances into port by oceangoing vessels were into the US, Britain or Europe. Some vessels plied more distant trades, carrying guano or wool from S America, rice from the Far East, and coal or iron to Australia. In the 1880s these long-distance trades became more important because steam-powered vessels were less effective competitors than the sailing vessels had been, but the N Atlantic still remained the major trading area for Maritime fleets.

The new generation of vessels in the 1860s and 1870s was larger and better-built than ever before. Most oceangoing vessels had 3 masts and were rigged as ships or barques; they were generally between 400 and 2000 tons. The largest sailing vessel built in Atlantic Canada was the W.D. LAWRENCE, of 2458 tons. The average service life of these softwood sailing vessels rose from about 8 years in the 1840s to about 14 years in the 1880s, and this increased the chances of making a profit in the industry. Most of their masters and a large proportion of the sailors were from the Maritimes, but masters relied increasingly upon sailors born in other (particularly European) countries. The assumption that sailors on Canadian vessels were unusually uneducated and poorly disciplined is probably untrue: their literacy rates were as high as those for the general population, and, over time, vessels were able to sail with fewer men per tonne, which suggests that labour performance, as well as technology, may have improved.

There is no simple explanation for the decline of shipbuilding and shipowning in the Maritimes after the 1870s. It is often assumed that the industry failed because it was a sailing-ship industry, and after the 1870s wooden sailing ships could not compete with iron-hulled steamers. This explanation is not satisfactory because Maritimers knew about the advantages of iron and steam, and they might have purchased (and perhaps even built) such vessels themselves. Furthermore, there were still profits to be made from sailing vessels in the 1880s, even as Maritimers were withdrawing from the industry. Norwegians and others continued to employ sailing vessels after 1900, and various estimates suggest that reasonable profits could be made. Maritime shipowners were certainly discouraged by declining freight rates in the 1880s, but they appear to have withdrawn from the shipping industry because they perceived new opportunities for investment in landward industries in Canada. Canadian industries received substantial protection from the NATIONAL POLICY tariffs of 1879, and investment in new industries in the Maritimes grew rapidly in the 1880s. Although the Canadian government offered some protection to shipbuilders, there was little capital assistance for either shipbuilding or shipowning. Even Canadian coastal shipping was left unprotected, since foreign vessels were allowed to enter Canadian coastal trades. The old export trades in timber and fish were stagnating and offered little incentive to build new fleets. Canadian exporters required cheap shipping services, and these services could be provided by British, Norwegian and other fleets. In these circumstances investment capital shifted from the maritime sector to a broad range of landward industries. Maritimers continued to use sailing vessels in coastal trades and in fishing well into the 20th century, but as Canadians became preoccupied with INDUSTRIALIZATION, railways, and the development of the North-West, the age of "wooden ships and iron men" came to an end. See also MARCO POLO.

**Markerville**, Alta, UP, pop 57 (1981c), located 25 km SW of Red Deer. Founded 1888 by Icelandic settlers and named Tindastoll, after a mountain in Iceland, it was renamed for long-time Alberta dairy commissioner C.P. Marker, who had a government creamery located there. Markerville was the home of Icelandic poet Stephan G. STEPHANSSON, whose restored homestead is now a museum and provincial historic site (opened 1982).

ERIC J. HOLMGREN

**Marmot**, large, diurnal, burrowing RODENT of the SQUIRREL family, native to Eurasia and N America. Marmots are rotund and stocky, weigh 2-9 kg, and have thick fur, short bushy tails and small ears. Of 13 species, 4 occur in Canada, inhabiting grassy areas and rocky slopes of mountains and lowlands. Yellow-bellied, hoary and Vancouver Island marmots (*Marmota flaviventris*, *M. caligata*, *M. vanouvereensis*, respectively) are found only in the western provinces; the woodchuck (possible corruption of Cree, "wuchak") or groundhog (*M. monax*), in patchy distribution throughout Canada, excluding Newfoundland. The Vancouver Island marmot, found only in Canada, inhabits a few subalpine sites on the island. Marmots eat green plants and can become pests in vegetable gardens. They signal danger by shrill calls. Marmots hibernate in burrows for 4-8 months in winter; on awakening they may be almost half their autumn weight. Females bear 2-9 young after hibernation. The whimsical observance of Groundhog Day (Feb 2) recognizes marmots' impending emergence from a long winter's rest (much later in colder climates). See ENDANGERED ANIMALS.

J. MARY TAYLOR

**Marquette, Jacques**, Jesuit priest, missionary, explorer (b at Laon, France 10 June 1637; d at the mouth of a river later called the Père Marquette R, Mich 18 May 1675). Contemporaries regarded Marquette as a gifted linguist who founded the St-Ignace Mission and opened the Illinois country to missionaries. In the popular mind he is inextricably bound to Louis JOLLIET and the discovery of the Mississippi.

Father Marquette was ordained on 7 Mar 1666 and sailed for New France where he served at Sault Ste Marie and at the mission to the Huron and Ottawa at Chequamegon (SW shore, Lk Superior) before he founded the mission of St-Ignace on the Straits of Mackinac. Late in 1672 Marquette received orders from his superior, Father Dablon, to accompany Louis Jolliet. The expedition departed St-Ignace for the Mississippi on 17 May 1673 and reached lat 33°40' N lat near the mouth of the Arkansas R by mid-July. On 30 Sept they returned to the mission of St-Francis-Xavier (DePere, Wis) by way of the Illinois R and Lk Michigan. Exhausted and ill from the Mississippi voyage, Marquette journeyed back to the Illinois late in 1674 and opened the mission of La Conception among the Kaskaskia (an Illinois tribe). By spring 1675 he was too ill to continue his work and departed for St-Ignace but died on the NE shore of Lk Michigan.

C.E. HEIDENREICH

**Marriage and Divorce** Marriage remains one of the most important social institutions in Canada. Marriages can be dissolved through annulment or divorce, both of which involve a judicial decree and remarriage to another person can occur only after a previous marriage has been legally terminated through either device. There is, however, another form of marriage (the so-called common-law marriage) that does not involve a legal ceremony. This is a form of cohabitation that gradually confers rights and obligations to its participants which are not identi-

cal with but similar to those acquired through legal marriage. They are acquired through the act of living together and, where applicable, having a child together. Different provinces have different laws recognizing common-law marriages under different circumstances. Québec does not recognize common-law marriages.

Since the 1960s, marriage and divorce in Canada have been undergoing profound changes which have substantially altered the meaning of marriage, the probability of its ending in divorce and the circumstances attached to marriage. The vast majority of people (90%) marry at some point in their lives, although a substantial proportion will eventually divorce. In 1981 the average age at first marriage was 23.5 for brides and 25.7 for grooms. This has implications both during the marriage and towards its end. Women live on average longer than men (the life expectancy for a female born in 1986 has been estimated at 76.9 years and for a male born in the same year at 70.2 years) and a woman is therefore much more likely to die as a widow while a man is much more likely to die as a husband.

Until very recently, a rather strict division of labour between husbands and wives was the rule in the majority of marriages. In general, husbands were held responsible for the economic well-being of the family, and were considered the breadwinners, while wives were considered responsible for childcare, housework, keeping the family in good emotional and physical health, and generally for many of the service functions associated with families. In addition, farm wives worked on the farm and many wives in working-class households took in boarders or sold their household services in other ways to non-family members, contributing directly to their family's income. Since the beginning of the 1980s, however, the majority of Canadian wives are in the labour force, earning an independent income and participating in the economic functions traditionally associated primarily with husbands. This situation has reduced the economic dependency of wives on husbands and therefore shifted the balance of power within marriages. It has also meant that the majority of preschool children are cared for by somebody other than a parent during substantial portions of their day. In 1981, 52.2% of all preschool children (age 0 to 5) were in some form of shared child-care arrangement and 60.8% of all mothers with school-age children were in the labour force. Nevertheless, housework still tends to be seen primarily as a female task. Since 1978, all provinces have substantially changed their FAMILY LAWS, generally with the aim of assigning equal responsibility to husbands and wives with respect to all types of family responsibilities, including housework, child care and provision for the financial well-being of the family. As a consequence, in divorce settlements, housework and childcare are now generally recognized as one way in which a spouse can contribute to a family's overall economic well-being, and through which a spouse develops some claim to matrimonial assets.

Divorce law is under federal jurisdiction. In 1968 Canada's first unified divorce law was passed. At the time, divorce was made easier to obtain, although considerable legal and other difficulties remain. Divorce may now be obtained on the basis of a matrimonial offence (previously the only basis on which divorce was available) or on the basis of marriage breakdown. In the latter case, a couple must have lived 3 years apart before they can obtain a divorce. The divorce rate has been steadily rising in the latter part of this century but, following the changes in the divorce law, there was a sharp increase (from 54.8 divorces per 100 000 population in 1968 to 124.2 in 1969) and the increase since that time has continued at an accel-

erated pace. By 1980 there was a 40% chance that a marriage would end in divorce and, if current trends continue, the percentage will continue to increase. Divorce rates alone, however, are not a sufficient indicator of marriage breakdown because they do not include judicial separations, migratory divorces (ie, those granted in other countries) and desertions. Reasons for the tremendous rise in the divorce rate, a phenomenon that has occurred in virtually all industrialized countries, are not entirely clear, but contributing factors probably include longer life expectancies, which increases the possibility of differences in the individual development of wives and husbands; the greater labour force participation of women and improved social security, which has meant wives are less economically dependent on their husbands than in the past; the lessening of religious and social sanctions against divorce; and the movement towards a more individually oriented ethic which stresses self-actualization over maintenance of the family unit. All of these factors suggest that an increased divorce rate may be an indication that the expectations about marriage have risen and that today many people prefer a divorce to an unhappy marriage.

Where there are dependent children involved (this tends to be the case of slightly more than 50% of all divorces in the 1970s to early 1980s) divorce usually leads to the formation of one-parent households (see POVERTY). These households are primarily female-headed, because more than 75% of all dependent children involved in divorce are assigned to the custody of the mother, and about 15% are assigned to the custody of the father. This pattern has been remarkably stable between 1971 and 1980.

Given that a high proportion of marriages end in divorce, a substantial group of people in their middle years again become available for marriage. The majority of people who divorce remarry, although men are more likely to remarry than women. In 1980, 26.5% of all Canadian marriages contracted involved at least one partner who was previously married, and by far the largest component came from divorced rather than widowed people. Remarriage families involving dependent children who have 2 parents who are still alive but not married to each other have only recently become important as a large-scale social phenomenon. Questions of overlapping and competing responsibilities and rights of stepparents versus biological nonresidential parents are still in the process of being socially defined. Other questions involve the right of access of other relatives (such as grandparents) who are linked through a non-custodial parent to the child, and the relationship between step-siblings.

The trends that have been noted for Canadian families (eg, rising divorce rate and greater numbers of women in the labour force) are not restricted to Canada, but are typical of all highly industrialized nations, although significant national differences remain. Another common trend among industrialized countries is a sharp decline in fertility rates. In Canada, between 1960 and 1980, fertility rates have dropped by more than 50% in all age categories. At the same time, rate of births to unmarried women has increased, from 4.3% of all live births in 1960 to 12.8% of all live births in 1980. M EICHLER

**Marriage and Divorce, History of** Canadians have always followed the marriage pattern dominant in Western societies, eg, relatively late marriage, companionable unions and a significant proportion of individuals who remain unmarried. Before WWII, 9 out of 10 adults in Canada apparently had married at least once in their lives. The average age of grooms at first marriage was between 25 and 29, of brides, between 20 and 25.

Then, as today, 3 basic factors influenced the opportunity to marry and the timing of marriage. First, is the ratio of marriageable males to females. In Canada this ratio has varied widely over time. Normally the numbers of bachelors and spinsters have been more or less equal, but unmarried men often outnumbered unmarried women in times of high immigration and in frontier areas, while the converse was generally true in the growing industrial cities of central Canada from 1850 onward. Second, the strong tendency of men to marry women younger than themselves has affected the marriage chances of prospective brides and grooms in quite different ways. The selection of potential spouses for a woman has always been greatest when she was young; for males, on the other hand, the choice of mates expanded steadily as the males aged. Third, economic factors have always affected marriage opportunities, especially for men. Until recently a man could not marry until he could support a wife and the children who, almost inevitably, would soon follow.

Long before the founding of Canada, the Catholic and Protestant churches had established that marriage was a lifelong, exclusive union of one man and one woman who freely consented to join their lives for procreation and mutual comfort. But the various Christian denominations were divided on several issues. The Roman Catholic Church held marriage to be a sacrament; Protestants simply considered it sacred or blessed by God. Catholics believed the marriage bond lasted until death while Protestants admitted the possibility of divorce and remarriage in limited circumstances. Catholicism prohibited a broad range of unions among kinfolk, but offered some leeway in enforcing its rules; Protestantism imposed fewer restrictions on who one could marry, but did so absolutely. Despite these differences, broad agreement on the fundamentals of Christian marriage existed in western Europe after the Reformation.

From the dawn of European settlement in Canada, the marriage system reflected these traditions. As a result, the Christian concept of marriage has predominated throughout the history of Canada, even though notable exceptions have persisted in special circumstances, eg, marriages *à la façon du nord*, the consensual unions of white men and Indian or mixed-blood women in the northwestern fur trade.

Some evidence suggests the existence of arranged marriages among bourgeois families in New France, but for the most part men and women have always chosen their own spouses. Ethnicity, religion and class have played an important role in the process of mate selection, for Canadians have tended to marry within their own social groups. No doubt material concerns have never been far from view in many matches as well. Yet within these boundaries (and occasionally outside of them) personal attraction has been the most important motive for marriage in Canada. Historically the romantic basis of marriage was regarded with ambivalence. Although unions founded on personal choice and emotional attachment offered the promise of happiness and personal fulfilment through companionship, they also required lengthy, private courtship and contained hidden dangers, eg, the possibility of imprudently choosing a spouse by yielding to the dictates of the heart and not the mind. Another danger was the prospect of sexual intimacy before marriage, which was an offence against respectable opinion and religious teaching, and one which carried the risk of childbirth outside marriage. Censure of nonmarital sexual intercourse served 2 important functions. It affirmed high ideals of personal conduct, particularly for women, and it also constituted protection for the interests of women and children whose greatest economic

security, before the age of the WELFARE STATE, lay in marriage and family life.

For these reasons, family and community influences exerted strong control over courtship in Canada until almost the end of the 19th century. Couples exploring the possibility of marriage courted largely in their own homes under the watchful gaze of their families. They also passed time together in the homes of relatives and friends, in church, at community events, and out of doors on strolls, sleigh rides and incidental pastimes. These circumstances gave parents an effective control over courtships, especially those of their daughters. In urban middle-class circles, where "calling" and "at homes" formed part of customary social life, a mother admitted to the home only those young men who she considered fit companions for her daughters. The annual "coming out" ceremonies, so carefully arranged by mothers, formally placed young women in a marriage market regulated by adults. Urban working-class families has less influence over their courting young, for their children often worked and boarded away from home after mid-adolescence. Instead the families with whom youths lived often oversaw their conduct, though perhaps with something less than due parental care. In rural communities courtship also fitted in and around the common customs of social visiting, church attendance and everyday recreations.

From the 1880s onward the controls on courtship and youthful social life in Canada gradually relaxed. Parents exercised less formal oversight of late adolescence, though they continued to wield indirect influence through youth clubs, schools, residences, church groups and other institutions which increasingly framed the lives of the young. The transportation revolution after the turn of the 20th century also increased youthful independence. Greater mobility brought freedom from parental and community supervision, especially in larger cities. Generally speaking, the urban young achieved earlier and more extensive freedom than their rural counterparts, for they had easier access to the quasi-privacy that anonymity offers to city dwellers. In these circumstances courtship became an increasingly private matter.

Throughout the history of marriage in Canada the decision to marry has always belonged to the couple. But until the 1880s, a young woman's choice of a spouse was commonly subject to her parents' approval. From time to time, fathers and mothers refused to allow a daughter to wed the man of her choice, the usual justification being that the alliance was not in her best interest. In these circumstances a woman might defy her parents and marry against their will,

Incidence of Divorce in Canada by Year  
(Source: Statistics Canada)

Years	Frequencies	Rates per 100 000 population
1921	558	6.4
1931	700	6.8
1941	2 462	21.4
1951	5 270	37.6
1961	6 563	36.0
1967	11 165	54.8
1968	11 343	54.8
1969	26 093	124.2
1970	29 775	139.8
1971	29 685	137.6
1972	32 389	148.4
1973	36 704	166.1
1974	45 019	200.6
1975	50 611	222.0
1976	54 207	235.8
1977	55 370	237.7
1978	57 155	243.4
1981	67 671	278.0
1982	70 436	285.9

but she did so at the risk of estrangement from her family. The parental veto, however, was a heavily qualified power. Its strength declined as a daughter's age increased, and it could not be used more than once or twice without inviting defiance. During the 1880s women began to free themselves from this restriction, as they did from so many other constraints which until then had affected their lives. Thereafter, they usually married whom they pleased. Men, by contrast, had always been far less limited by parental wishes when choosing a spouse. From the earliest days of colonial settlement they were relatively free agents on the marriage market.

In the past, marriage in Canada was usually a religious rite. Civil marriage has always been possible, at least since the end of the French era, but until recently has been relatively uncommon. The secular custom of a honeymoon after the wedding developed slowly during the 19th century. Initially, only the well-to-do had money and leisure enough for a postmarriage vacation, but after 1850 the practice spread gradually throughout all social levels. The purpose of the honeymoon has changed considerably over time as well. At first, it took the common form of 19th-century social visiting. The recently married couple often travelled with relatives and visited friends and relations in distant communities. But by the end of the century, the honeymoon had become a private holiday for the newly wedded pair.

The history of divorce in Canada contrasts sharply with that of marriage for, while most Canadians married, divorce was extremely uncommon until after WWII. In fact, until that time, Canada had one of the lowest divorce rates in the Western world. Respectable opinion — articulated by social and religious leaders — condemned divorce as a threat to the family, and the strength of this opinion prevented relaxation of Canadian divorce laws. Consequently, access to divorce in Canada was extremely limited until 1968. For most of Canada's first century adultery was virtually the only ground for divorce and, before WWI, only NS, NB and BC had divorce courts, although Alberta, Saskatchewan and Ontario created them during the interwar period. In provinces without access to judicial divorce, the only alternative was an appeal to Parliament for a statutory divorce, an expensive process that limited relief to the wealthy. The most common alternatives were desertion, legal separation and divorce in an American jurisdiction which, though it had no legal force in Canada, seemed to satisfy public opinion.

PETER WARD

**Marriott, Joyce Anne**, poet (b at Victoria 5 Nov 1913). Marriott was a productive poet and poetry-educator in the 1940s, when she was also on the board of the famous pioneer literary magazine *Contemporary Verse* and otherwise active as an editor. She was renowned especially for the narrative poem "The Wind, Our Enemy." Her best-known collection was *Sandstone and Other Poems* (1945), though one of her earlier ones, *Calling Adventurers* (1941), won the Gov Gen's Award. After the war, Marriott stopped writing, only to return eventually with *Countries* (1971) and *The Circular Coast: Poems New and Selected* (1981). She thus proved herself a hardy survivor of the gifted generation of poets whose leading lights were and remain figures like Earle BIRNEY and Irving LAYTON.

**Marsh, Leonard Charles**, social scientist, professor (b at London, Eng 24 Sept 1906; d at Vancouver 10 May 1982). Marsh came to Canada in 1930 after studies at the London School of Economics. He was director of an interdisciplinary social-science research program at McGill 1930-41 and an early member of the group of social reformers which eventually became the LEAGUE FOR SOCIAL RECONSTRUCTION. He made major

editorial contributions to the league's influential book, *Social Planning for Canada* (1935, repr 1975). His *Canadians In and Out of Work* (1940), written almost 2 decades before John PORTER's *The Vertical Mosaic*, was the first significant analysis of the impact of social class on Canadian society. Marsh was research adviser on the federal Committee on Post-War Reconstruction 1941-44 and published his *Report on Social Security for Canada* in 1943 (repr 1975). Although the government paid little attention at the time, most of the major elements in his program had become law by 1966 and the basis of the modern Canadian SOCIAL-SECURITY system.

Marsh was welfare adviser to the UN Relief and Rehabilitation Administration (1944-46), professor and director of research at the School of Social Work, UBC (1948-64) and professor of educational sociology, UBC (1964-72). He retired in 1973 but continued to write and lecture, his writings reflecting his interests, which ranged from cats to music. His contribution to society, considered unparalleled by some, has not yet been adequately evaluated.

ALBERT ROSE

**Marshall, Kenric Rudolphus**, social worker (b at Winnipeg 21 Mar 1915). Educated in Winnipeg, Calgary and Toronto, Marshall worked in YMCA facilities at army camps during WWII and then as recreation director for Guelph, Ont. In 1955 he became executive secretary of the Korean Assn of Voluntary Agencies and consultant to the UN Korea Reconstruction Agency. In 1957 he became area planning director of the Social Planning Council of Metropolitan Toronto and in 1960 national director of the Canadian Save the Children Fund, a post he held until 1978. Marshall, a prominent figure in the involvement of Canadian volunteer agencies in overseas development, also served on several international boards directed to the same end.

ROBERT BOWHELL

**Marshall, Lois Catherine**, soprano (b at Toronto 29 Jan 1924). Lois Marshall began voice lessons at age 12 with Weldon Kilburn, whom she married 32 years later. Her first major engagement was in 1947 as soprano soloist in Bach's *St Matthew Passion*, with Sir Ernest MACMILLAN conducting the TORONTO MENDELSSOHN CHOIR and the Toronto Symphony. In 1950 she won the Royal Conservatory of Music's Eaton Graduating Scholarship and 2 years later won the Naumberg Award and made her New York debut. Her career included performances of all the great oratorios with the leading orchestras of the world, and she toured Europe, Britain, the USSR, Australia, New Zealand and N America in solo recitals, orchestral performances and concerts. She appeared with most of the important Canadian orchestras, performed at festivals, and joined other soloists such as Glenn GOULD, Louis QUILICO and Maureen FORRESTER. Though crippled by polio as a child, Marshall managed a limited opera career with companies such as the CBC Opera Co, the Canadian Opera Co and the Boston Opera Co. In the mid-1970s Marshall turned to the mezzo-soprano repertoire, especially German lieder. She has received the Molson Prize, is a companion of the Order of Canada, and was music director of Tribach, the festival commemorating J.S. Bach's 300th birthday held in Edmonton in 1985. MABEL H. LAINE

**Marsupialia**, order of MAMMALS belonging to the infraclass Metatheria, comprising about 250 living species, of which 2/3 are found in Australia. The Virginia opossum (*Didelphis virginiana*) is the only marsupial found in Canada. Marsupials differ from placental mammals in many anatomical details, especially in the reproductive system. In the vast majority of marsupials, no placenta is formed and the young are born in a premature state after a brief gestation. The young complete their development attached to a

Carleton Martello Tower, Saint John, NB (photo by Malak, Ottawa).

teat and protected by skin folds or a fully formed pouch (marsupium). Marsupials and placental mammals evolved at about the same time in the Cretaceous period (140-165 million years ago) from a group of primitive mammals, the pantotheres. The oldest fossils are from the Upper Cretaceous (70-80 million years ago) of N America. Marsupials are found in N and S America and Australia, which they may have colonized, via Antarctica, before continental drift moved Australia to its present location.

C.G. VAN ZYLL DE JONG

Reading: C.G. van Zyll de Jong, *Handbook of Canadian Mammals I, Marsupials and Insectivores* (1983).

**Martello Tower**, distinctive masonry FORTIFICATION used in defence of British N America in the first half of the 19th century. The name, which likely derived from references to a stone tower on Cape Mortella in Corsica, was first applied to thick-walled, round stone or brick defence works hastily constructed in Great Britain to resist a threatened invasion by Napoleon. The 16 squat, flat-roofed towers built in British N America from 1796 to 1846 were distributed as follows: Halifax (5), Saint John (1), Québec City (4) and Kingston (6). The Kingston towers, constructed 1846-48 at the height of border tensions with the US, were the most complex in design. None of the towers was ever subject to attack; 11 have survived.

JAMES MARSH

**Marten** (*Martes americana*), slender WEASEL specialized for life in the northern coniferous forests; found from Alaska and BC to Newfoundland and into the US. Males average 60 cm long and weigh 1 kg; females 54 cm and 650 g. The bushy tail is half the body length; feet are large with sharp, climbing claws. The colour is shades of brown with a yellow chest spot and blackish

Marten (*Martes americana*), a slender weasel whose habitat is the northern coniferous forests (photo by Wayne Lankinen/DRK Photo).

legs and tail. The large ears are whitish. Marten are solitary, except for the female and kits, which may travel as a group for several months. Expert climbers, they hunt in trees for squirrels and bird nests and on the ground for mice, voles, hares and birds. Insects, berries and even carrion are also eaten. Mating is in July-Aug and the litters of 1-4 young are born Mar-Apr. Sexual maturity occurs at 2 years. The species is highly valued for its soft, lustrous fur. The annual catch in Canada is 20-50 thousand but was once as high as 180 000. Forest fires and overkill have been the main causes of the decline. See FUR TRAPPING. IAN MCTAGGART COWAN

**Martin, Joseph**, lawyer, politician, premier of BC (b at Milton, Canada W 24 Sept 1852; d at Vancouver, 2 Mar 1923). Elected to 4 legislatures he was an agitator more suited to opposition than government. He was elected to the Manitoba legislature in 1883, became attorney general in the GREENWAY government in 1888, and in 1890 sponsored legislation ending the official use of French and public support for separate schools. He represented Winnipeg in the House of Commons 1893-96, and then moved to Vancouver to practise law. Elected to the BC legislature in 1898, he served as attorney general until 1900. In Feb 1900 he was asked to form a government but, unable to muster support, resigned after 3 months. He speculated in real estate and practised law 1903-08 and in 1907 edited and published the *Vancouver Guardian*. His legal business took him to Britain, where he represented East St Pancras at Westminster 1910-18. He nevertheless contested the Vancouver mayoralty in 1914 and founded the *Evening Journal* there in 1916. HAL GUEST

**Martin, Mungo**, or Nakapenkim, meaning a potlatch chief "ten times over," or Datsa, meaning "grandfather," Northwest Coast carver, painter, singer, songwriter (b at Fort Rupert, Vancouver 1 c1879-82; d at Victoria 16 Aug 1962), stepson of Charlie James (a recognized Kwakiutl carver), and tutor to Henry HUNT and Tony HUNT. As an authority on various aspects of his culture, Mungo Martin helped renew pride in Kwakiutl heritage. Martin was carving during the prohibition of the POTLATCH, and his first commissioned totem pole, *Raven of the Sea*, was carved c1900 at Alert Bay. In 1948 UBC asked Martin to take over their TOTEM POLE restoration program. Martin was not only considered an exceptional carver but was of invaluable service to the ethnographers, in the early 1950s recording 200 songs at UBC and at the BC Provincial Museum, Victoria. In 1952 he moved to Victoria to begin a replication program of old poles; the work continues in 1984 with Richard Hunt (son of Henry Hunt) being a carver-in-residence. In 1958 Martin finished the World's Tallest Pole, which stands in Beacon Hill Park, Victoria, and in 1961 he carved his last pole, which rests in Mexico. GERALD R. MCMASTER

**Martin, Paul Joseph James**, politician, statesman (b at Ottawa, 23 June 1903). First elected to the House of Commons in 1935, Martin quickly took a prominent place in Liberal ranks because of his impressive educational background in philosophy, international relations and law. PM KING appointed him parliamentary assistant to the minister of labour in 1943; he entered Cabinet in 1945 as secretary of state, and in 1946 became minister of national health and welfare. Faced with a government becoming increasingly conservative on social issues, Martin managed to introduce a system of health grants and, by threatening resignation, made PM ST. LAURENT accept national health insurance. He also undertook diplomatic assignments for the King and St. Laurent governments. In 1955 he negotiated an agreement that allowed the expansion of UN membership. Martin ran unsuccessfully

for the Liberal leadership in 1948 and 1958. In 1963 PM PEARSON appointed Martin secretary of state for external affairs, a portfolio he held until 1968, when he tried again for the leadership but lost to Pierre TRUDEAU. He was appointed government leader in the Senate (1968-74) and high commissioner to Britain (1975-79). JOHN ENGLISH

**Martin, Ronald Albert**, painter (b at London, Ont 28 Apr 1943). After finishing high school in 1964, Martin established a studio in London. He worked there until he moved to Toronto in 1983. His first one-man show was held in 1965 and since then he has exhibited widely. He represented Canada at the Venice Biennale in 1978. Martin's gridlike "World Paintings" of 1970 were succeeded by a series of large one-colour paintings in which the colour was applied vigorously by hand. From 1974 to 1980 he worked exclusively with black. In 1981 he began working again with colour organized in a grid structure. DAVID BURNETT

**Martin, William Melville**, lawyer, premier of Saskatchewan (b at Norwich, Ont 23 Aug 1876; d at Regina 22 June 1970). He was the second premier of Saskatchewan 1916-22, serving with considerable skill during a difficult transition period. Educated at U of T and Osgoode Hall, Martin moved to Regina in 1903 to practise law. Elected to the House of Commons for Regina in 1908 and re-elected in 1911, he resigned from Parliament in 1916 and led the provincial Liberals. He was elected to the legislature in a by-election in 1916 and was re-elected in the general elections of 1917 and 1921. On his voluntary retirement from politics in 1922 he was appointed a judge of the Saskatchewan Court of Appeal. He became chief justice of the Supreme Court of Saskatchewan in 1941 and held that post with distinction until 1961. D. H. BOCKING

**Martini, Paul**, figure skater (b at Toronto 2 Nov 1960). Favoured to win the 1984 Olympic gold medal in pair skating at Sarajevo, Yugoslavia, Martini and partner Barbara UNDERHILL gave 2 disappointing performances and finished in 7th place. They made a comeback a month later to defeat the Olympic gold medalists, Elena Valova and Oleg Vassiliev from the Soviet Union, and won the gold medal at the world championships in Ottawa. TERESA MOORE

**Martre, Lac la**, 1777 km<sup>2</sup>, elev 265 m, max length 76 km, is located in the NWT, 50 km W of Rae-Edzo and 150 km NW of Yellowknife, and 346 km S of the Arctic Circle. The settlement of Lac la Martre is located at the SE corner of the lake. The lake is fed by Lac Grandin and several smaller lakes and streams, and drains SE into the North Arm of GREAT SLAVE LK. Originally, it appeared as Martin Lk (in Aaron Arrowsmith's map of MACKENZIE's journey of 1789), but later took on its present name, presumably owing to the abundance of pine marten (*Martes americana*) in the area. DAVID EVANS

**Marxism** is a basic world view first developed by Karl Marx and Friedrich Engels in the 19th century. It has been adopted as the official ideology of communist governments in Europe, China, Cuba and elsewhere. It has spawned diverse movements, eg, Marxist-Leninism, Maoism, Christian Marxism, Marxist Humanism and Trotskyism, all of which can be found to some degree in Canada.

As a method of analysis, Marxism emphasizes the development of the forces of production — machinery, technology, labour skills, and the interaction among social classes, ie, who does the work and who gives the orders, who has the right to possession, ownership or consumption of the product. It also examines (in a method called "dialectical materialism") the way this "economic base" influences and

shapes the superstructure of society, ie, the family, school system and political system as well as art and culture, religion and all systems of ideas.

Marxism recognizes that massive historical transformations have produced new social systems, eg, slavery, feudalism, capitalism and socialism, which alter every aspect of daily life. But all hitherto existing social systems, according to Marxism, are divided into socioeconomic classes. The ruling class expresses its dominance through its ability to force the subordinate classes to turn over a portion of the products they produce (or the value of these products) to itself. One social system is distinguished from another in the way this economic surplus is extracted and the manner in which it is utilized. Surplus extraction is the basis of exploitation in the Marxist analysis and the basis of class conflict, which in turn is the fundamental dynamic in historical transformations. According to the Marxist analysis, when capitalism can no longer extract sufficient "surplus value," a major element of which is profit, the result is economic crises and widespread UNEMPLOYMENT. Marxist theory holds that these problems are inherent in the capitalist organization of society, through which ownership of the means of production is confined to a handful of people while the vast majority of people must sell their labour power in order to live, and that only the creation of a new economic order can overcome these problems. It advocates a planned economy that replaces the profit system as the motor force of the economy; public ownership of the major means of production; and economic democracy with community control over economic priorities and worker control over the organization of work.

Marxism was brought to Canada by British worker intellectuals in the first years of the 20th century. It was the dominant ideology in the earliest socialist parties of Canada and was fully adopted by the COMMUNIST PARTY OF CANADA when it formed in 1921. During the Stalin years, Marxism became a religious faith rather than a social science and stagnated in Canada as it did elsewhere, but over the past decade it has flourished, gaining a significant presence in Canadian scholarship. Prominent Canadian Marxist scholars include C.B. MACPHERSON, Stanley RYERSON, Leo Panitch, Bryan Palmer, Gregory Kealey, Michael Lebowitz, Dorothy Smith, Varda Burstyn, Patricia Connelly, R. James Sacouman, Pauline Vaillancourt, Jorge Niosi, Gilles Bourque, Carl Cuneo and John Saul. C. GONICK

**Mary Celeste**, brigantine built in 1861 at Spencer's I, NS, and originally named *Amazon*. She was wrecked off Cape Breton in 1867, salvaged, sold and in 1868 registered at New York and renamed *Mary Celeste*. In 1872 she was found adrift off the Azores, with no sign of her crew. The mysterious disappearance caused wild speculation, but the fate of the crew will never be known. JAMES MARSH

**Marystown**, Nfld, pop 6299 (1981c), inc 1951, is a shipbuilding and fish-processing centre, comprising the settlements of Marystown (formerly Mortier Bay) and Creston, on the E side of the Burin Pen. Marystown, having one of the finest natural harbours in Newfoundland, has been promoted historically as a free port. Probably frequented by French and BASQUE

fishermen in the 16th and 17th centuries, the area was settled predominantly by English and Irish fishermen by the early 1800s. In 1966 a shipyard and fish plant were constructed, providing much-needed alternative employment. One of the most efficient and best-equipped shipbuilding and ship-repair facilities of its size in N America, the yard is a crown corporation and produces mainly stern trawlers for the Newfoundland fishing industry, although it has the capacity to design and build vessels of all types up to 85 m long.

JANET E.M. PITT

**Mascarene, Paul**, born Jean-Paul, military officer, colonial administrator (b in Languedoc, France 1684/85; d at Boston, Mass 22 Jan 1760). A Huguenot émigré, Mascarene served throughout New England and Atlantic Canada 1710-40 as a military engineer and fluent negotiator with the Acadians and Indians. He was one of the first (1720) to analyse Great Britain's weakness in Nova Scotia, recommending a stronger military presence and unqualified loyalty from the ACADIANS. Mascarene became interim colonial administrator 1739, governor 1744, and successfully held Annapolis Royal against repeated French attacks 1744-46. He attributed his victory to the military support sent by Gov William Shirley of Massachusetts, and to his own policy of extracting neutrality rather than loyalty from the truculent Acadians, a tactic he vigorously defended as politically expedient. Mascarene returned to New England in 1751 and eventually settled in Boston.

LOIS KERNAGHAN

**Masks** were worn in religious and social ceremonies by native peoples throughout N America, and served to intensify the presence of the mythical animal or supernatural person represented. In the North, on the Northwest Coast, among some of the Plains tribes and all the eastern tribes, masks made of wood, basketry, pottery or hide were carved, painted and decorated with shell, bark, fibre, hair or feathers. They might depict either males or females. The designs and colours were always symbolic, and sacred masks had prescribed methods of consecration and handling. The most famous masks are those of the FALSE FACE SOCIETY. See also NATIVE PEOPLE, RELIGION; NORTHWEST COAST INDIAN ART.

RENÉ R. GADACZ

**Mason, John**, governor of the English colony in Newfoundland (b at King's Lynn, Eng 1586; d at London, Eng 1635). In 1615 he was appointed the second governor of the colony at Cuper's Cove (Cupids, Nfld), succeeding John GUY, and arrived in 1616 accompanied by his wife. He explored much of the island and used his findings in the first English map known to be based on personal survey and in writing *A Briefe Discourse of the New-Found-Land* (1620). He left in 1621 for New England, where he founded the colony of New Hampshire.

MICHAEL J. MCCARTHY

**Masse, Marcel**, politician (b at St-Jean-de-Matha, Qué 27 May 1936). He was a student of history and political science at U de M and abroad in London and Paris, and taught high school in Joliette, 1962-66. A strong Québec nationalist, he was a member of the Québec Assembly, 1966-73, and held several ministerial posts in the UNION NATIONALE government, 1966-70. He ran for the leadership of the UN in 1971, losing by only 21 votes and leaving the party to sit as an independent a few months later. In 1973 he joined a Montréal engineering firm. He was an unsuccessful federal Conservative candidate in 1980 but won election to the Commons in 1984. He was named minister of communications in the MULRONEY government and sat on 3 important Cabinet committees.

NORMAN HILLMER

Vincent Massey was Canada's first native-born governor general and chaired an influential royal commission on the arts (© Karsh, Ottawa/Miller Services).

**Massey, Charles Vincent**, politician, diplomat, governor general (b at Toronto 20 Feb 1887; d at London, Eng 30 Dec 1967). Vincent Massey is best remembered as Canada's first native-born GOVERNOR GENERAL. He was the grandson of Hart MASSEY who developed the farm-implement company started by Daniel MASSEY into a powerful international corporation, and the brother of actor Raymond MASSEY. His education was at U of T and Balliol College, Oxford, and he lectured in history at Victoria College, U of T, 1913-15. He then joined the army and served as a staff officer in Canada, ultimately working for the war committee of the Cabinet. He was president of Massey-Harris Co from 1921 until 1925 when he joined PM Mackenzie KING's Cabinet. But he failed to win a seat in Parliament, and in 1926 King made him Canada's first minister to the US where he served until 1930. In 1935 King named him high commissioner to Britain, a post he held until 1946. As a diplomat Massey was more successful on the social side than in the hard-slogging details of negotiation, but there was no doubt that in Britain particularly he had access to the highest quarters. His own prime minister, however, mistrusted his judgments on imperial questions, and the relations between the 2 were formal and tense.

After the war, PM Louis ST. LAURENT placed Massey in charge of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, a post for which Massey's status as a patron of the arts well fitted him, and his report in 1951 recommended the formation of a CANADA COUNCIL (est 1957). In 1952 Massey became governor general, a post he filled with distinction and in a manner that minimized the break with the past the appointment of a Canadian represented. In 1959 Massey left RIDEAU HALL and went into an active retirement. J.L. GRANATSTEIN

Reading: Claude Bissell, *The Young Vincent Massey* (1981).

**Massey, Daniel**, manufacturer (b at Windsor, Vt 24 Feb 1798; d at Newcastle, Canada W 15 Nov 1856). A prosperous Methodist farmer near Cobourg, Upper Canada, Massey became interested in farm machinery in the 1830s and invested in a foundry at Bond Head in 1847. In 1849 he moved to Newcastle and established the

Newcastle Foundry and Machine Manufactory. Massey's industrious habits and religious temperament were passed on to his son Hart, whose aggressive marketing technique and acquisition of patent rights to the latest American farm-machinery designs contributed to the firm's later success as the Massey Manufacturing Co. In 1890 the firm merged with its chief rival, A. Harris, Son, and Co, to become Massey-Harris Co Ltd (MASSEY-FERGUSON), Canada's largest manufacturer of farm implements. JOSEPH LINDSEY

Reading: P. Collins, *Hart Massey* (1977); M. Denison, *Harvest Triumphant* (1948); M. Gillen, *The Masseys* (1965); E.P. Neufeld, *A Global Corporation* (1969).

**Massey, Hart Almerin**, manufacturer, philanthropist (b in Haldimand Twp, Upper Canada 29 Apr 1823; d at Toronto 20 Feb 1896). Son of Daniel MASSEY, he propelled his father's Newcastle Foundry into a dynamic farm-implement producer by mergers, spirited sales and advertising techniques, and acquisition of patents for labour-saving American mowers, reapers and binders that transformed the productivity of Canadian agriculture (see AGRICULTURAL IMPLEMENTS). In 1870 he incorporated the Massey Manufacturing Co, which relocated in Toronto in 1879 and expanded significantly with the purchase of the Toronto Reaper and Mower Co, an American branch plant. Massey directed the firm's successful entry into foreign markets; it was the first N American firm of its kind to go abroad. In 1891 he merged A. Harris, Son and Co and other Canadian rivals to form Massey-Harris Co Ltd, of which he was president, 1891-96. A stern employer but genial Methodist patriarch who regarded his business as a trust from God, he contributed to many charitable, educational and religious institutions, and erected Toronto's Massey Music Hall and Fred Victor Mission in memory of his sons Charles Albert (1848-84) and Frederic Victor (1867-90). Massey's son Walter Edward Hart (1864-1901) was president of the firm 1896-1901 and active in advertising and sales activities. He promoted the pasteurization of milk and encouraged cultural endeavours, producing some of Canada's first staff magazines, including the literary journal *Massey's Magazine*, merged (1897) with the *Canadian Magazine*. Hart Massey's last surviving son, Chester Daniel (1850-1926), relinquished in 1901 his managerial responsibilities to Massey-Harris, an increasingly complex public corporation. He devoted himself to public service, administering Hart Massey's estate, reorganized in 1918 as the Massey Foundation, which supported numerous philanthropies and constructed Hart House and Massey College at U of T.

JOSEPH LINDSEY

Reading: P. Collins, *Hart Massey* (1977); M. Denison, *Harvest Triumphant* (1948).

**Massey, Raymond Hart**, actor (b at Toronto 30 Aug 1896; d at Los Angeles 29 July 1983), brother of Vincent MASSEY. His distinctive voice and craggy good looks made him indelibly associated with the role of Abraham Lincoln both on stage and on film. In Siberia, in Feb 1919, Massey mounted an army minstrel show with the Canadian forces before turning professional in July 1922 with the Everyman Theatre in England. He had already been an amateur at Appleby Coll, Oakville, Ont (1913-14), Oxford (1919-20) and Hart House Theatre, U of T (1921-22). In 1924 he played 2 parts with Sybil Thorndike in *Saint Joan* and in 1931 made his début on Broadway as Hamlet. Notable New York revivals of Bernard Shaw plays in which he starred were *The Doctor's Dilemma* (1941), *Candida* (1942) and *Pygmalion* (1945). His distinguished film career began in 1931 and included over 70 movies ranging from *The Scarlet Pimpernel* to *East of Eden*. In the late 1950s and 1960s he became known to a new generation as Dr Gillespie in the *Dr. Kildare* TV series.

DAVID GARDNER

**Massey College**, Toronto (designed by R.J. THOM, completed in 1963). At the height of international-style architecture in Canada, the design of Massey College seemed to break ranks, to look backwards or sideways, rather than forward. Considered 2 decades later, it appears ahead of its time, a remarkable anticipation of new directions in architecture. It is, as well, simply among the best buildings in Canada. Thom's design was the result of a 2-stage, limited competition held in 1960 by the Massey Foundation. In response to Vincent MASSEY's desire for a building that evoked his Oxford experience, Thom combined informality of layout with all-embracing order, a limited palette of materials dominated by brick and cast stone with richness of detail. See also ARCHITECTURAL COMPETITIONS; ARCHITECTURAL STYLES.

MICHAEL MCMORDIE

**Massey-Ferguson Limited**, with headquarters in Toronto, manufactures farm machinery and other equipment. Established in 1847 by Daniel MASSEY as the Newcastle Foundry and Machine Manufactory, the company became a sole proprietorship under his son, Hart Almerin MASSEY, in 1855, and in 1870 it became the Massey Manufacturing Company. The firm moved to Toronto in 1879 and merged with its chief competitor, A. Harris, Son and Company Limited (est 1857), in 1891. The new Massey-Harris Company, Limited was incorporated in 1891, becoming the largest company of its kind in the British Empire. In 1953 the company merged with the Ferguson companies to form Massey-Harris-Ferguson Limited; the present name was adopted in 1958.

From its earliest days the company acquired the rights to innovative machinery, making agricultural history with the Toronto Light Binder during the late 19th century and in 1927 acquiring the Wallis Tractor. The ideas of Harry Ferguson, developed during the 1920s, also gave the company an edge in tractor technology. In spite of financial difficulties in the early 1980s (necessitating federal government assistance from 1981), Massey-Ferguson continues to manufacture and sell farm and industrial equipment such as tractors, balers and multi-purpose diesel engines. It operates plants in Canada and overseas. In 1983 it had sales or operating revenue of \$1.9 billion (ranking 45th in Canada), assets of nearly \$2 billion (ranking 47th) and 27 609 employees. Its shares are widely held; foreign ownership stands at 73%.

DEBORAH C. SAWYER

**Massey Hall**, designed by C.R. Badgely, was built on Shuter St in Toronto by Hart A. MASSEY as a gift to the city at a cost of \$150 000. Known first as Massey Music Hall, it opened on 14 June 1894. Seating capacity of 4000 was reduced to 2765 when the building was redesigned in 1933. It was until the 1920s, when other cities began to erect concert halls, the only building in Canada designed primarily for musical performances. Massey Hall was the home of major local ensembles such as the TORONTO MENDELSSOHN CHOIR and TORONTO SYMPHONY, and the site of performances by great artists of the world, including Ignacy Jan Paderewski, Enrico Caruso and Vladimir Heifetz. It also has been used for many other types of events: a speech by Winston Churchill (1900), boxing matches, movies and folk, rock and jazz concerts. Roy Thomson Hall, completed in 1982, is now the main concert facility, but Massey Hall continues to be used for performances.

FREDERICK A. HALL

**Massicotte, Edmond-Joseph**, artist, illustrator (b at Montréal 1 Dec 1875; d at Sault-au-Récollet, near Montréal 1 Mar 1929). After studying at Montréal, Massicotte in 1892 began contributing illustrations depicting the popular customs and traditions of French Canada to such periodicals as *Le Monde illustré* and *L'Almanach du peuple*. The illustrations frequently record tradi-

tional customs no longer practised in Massicotte's lifetime. Drawn primarily from his imagination and accumulated documentation (some of it supplied by his brother, archivist Edouard-Zotique), and less frequently from on-the-spot sketches, his works betray a certain lack of dynamism. They give only an impression of authenticity and often impart moralizing, religious and nostalgic sentiments. By reducing and simplifying the number of pictorial elements, he sacrificed a certain sense of lively interaction, which allowed for easy recognition of the subject, however. Massicotte's illustrations, directed at the glorification of Québec rural life, traditions and customs, have become iconographical images for Quebecers.

ELIZABETH H. KENNELL

Reading: E.J. Massicotte, *Les Canadiens d'autrefois* (1981).

**Masson, Henri Leopold**, painter (b at Spy, Belgium 10 Jan 1907). Largely self-taught, Masson combines his narrative abilities with a fluid GROUP OF SEVEN style. He lived in Ottawa from 1921 and began exhibiting nationally in 1938 and internationally in 1946. His themes reflect his belief in the unity of nature and art. Cityscapes and landscapes reveal a sense of place and time. Still lifes and paintings of monks and choirboys, musicians, children, and a great variety of commonplace activities deal with subjects that he considers to convey the essence of life. He uses a loose, vigorous brush style in many media. His best works are full of detail and movement, with a broad range of colour, and convey a sense of immediacy to the viewer.

KATHLEEN LAVERTY

**Masson, Louis-François-Rodrigue** (b at Terrebonne, L C 7 Nov 1833; d at Montréal 8 Nov 1903). An MP 1867-82, Masson was minister of militia and defence 1878-80, encouraging French Canadian participation in the military. Ill health cut short his tenure in the Cabinet. He served in the Senate 1882-84 and again from 1890, and as lieutenant-governor of Québec 1884-87. An industrious amateur historian, he published *Les Bourgeois de la Compagnie du Nord-Ouest*, 2 vols (1889-90).

NORMAN HILLMER

**Masterless Men of Newfoundland**, legendary outlaw society (fl late 18th, early 19th centuries). According to tradition, for which there is little documentary evidence, they were Royal Navy deserters and runaway indentured servants from Newfoundland fishing plantations who fled inland to escape their harsh life. Led by Peter Kerrivan, an Irish-born deserter c1750, the Masterless Men are said to have inhabited the wild Butter Pot barrens of the Avalon Pen. Regarded as criminals by the authorities, they lived by hunting, fishing, stealing and illegally trading in isolated villages. They reputedly blazed Newfoundland's first roads, some for practical purposes, others as blind leads to confound pursuers. Two, possibly 4, of them were captured and hanged, but authorities never succeeded in breaking up the outlaw society, nor did they capture Kerrivan, who became a folk hero in Newfoundland lore. In the early 19th century, as social conditions improved, the Masterless Men allegedly moved to outports where they could work as independent fishermen.

EDWARD BUTTS

**Mathematics** is the science that studies numbers and spatial relationships. A principal division of mathematics subdisciplines is into the categories pure and applied.

Pure mathematics can be divided roughly into 3 major fields: geometry and topology, algebra and arithmetic, and analysis. It is complemented by logic, which deals with sets, the basic mathematical objects, their axioms and rules of inference.

**Geometry** studies figures, especially with regard to their rigid properties, and as a deductive science it began, like mathematics itself, with

the Greeks. Straight lines, triangles, circles, spheres and cubes are among the first figures studied. A typical theorem, or general statement arrived at deductively, is that a right-angled triangle is characterized by the Pythagorean property (ie, the square of the hypotenuse is equal to the sum of the squares of the other 2 sides). In the early period (600 BC-100 AD), the theory of conic sections (ellipses, hyperbolas, parabolas) was developed, as was trigonometry, important for ASTRONOMY. In addition, formulas for the area or volume of special figures were discovered and proved. The principal later developments were the introduction of co-ordinate geometry (Descartes) and of curvature (Gauss), the central notion of differential geometry. The discovery of non-Euclidean geometry is, in comparison, minor.

In co-ordinate geometry the points of a plane are labeled by 2 co-ordinates, its distances from the 2 axes, and familiar figures become the loci of points satisfying an algebraic equation. Thus, geometry is incorporated into algebra and the way is opened for the introduction of spaces of arbitrarily large dimension, important in mechanics. Curvature, in its simplest form, is a number attached to a surface at a point. The flatter the surface, the smaller the number (positive for a sphere, negative for a saddle-shaped surface).

**Topology** studies properties of figures or spaces invariant under deformation. It has had its greatest successes in higher dimensions and studies spaces by attaching algebraic and numerical invariants to them. For example, closed oriented surfaces are characterized by their genus (g). For the surface of a ball,  $g = 0$ ; of a doughnut,  $g = 1$ ; and of a pretzel,  $g = 2$ . The classification of 3-dimensional spaces, of much current interest, is still incomplete. The Gauss-Bonnet theorem connects topology and geometry in a typical way: the integral of the curvature over a closed surface equals  $4\pi(1 - g)$ .

**Algebra** studies general properties of the solutions of one or several equations; arithmetic or number theory is the study of solutions in specific domains or fields of numbers. Linear algebra, the highly developed theory of equations of degree one, is of importance throughout mathematics. The notion of eigenvalues and eigenvectors, which appear geometrically as the principal axes of an ellipsoid, is critical. All of algebra is pervaded by the concept of a group, a collection of elements which can be multiplied, such as operations on a Rubik's cube. The theory of finite groups has made great strides in recent years.

**Analysis** begins with calculus, the calculation of velocities and tangents (derivatives), lengths, areas and distances traversed (integrals), and maxima and minima. The central notion is that of a function, which expresses the way one variable depends upon another. The integrals of very few functions can be calculated explicitly; the attendant problems for algebraic functions have greatly influenced the development of geometry and arithmetic.

A differential equation is one connecting a function and its derivatives. Partial differential equations arise in all sciences. The equation is ordinary if there is only one independent variable and 2 of the basic problems are stability and the existence of periodic solutions. Much is known but the empirical data, found by computer, outstrip our theoretical understanding. The equation is called partial if there is more than one independent variable. Partial differential equations arise in the study of the propagation of waves and matter. In spite of an enormous theory, there are still basic phenomena that we do not understand, like turbulence, and to which ideas from probability, a discipline in its own right, are often applied. Derivatives and integrals require the use of limits, as do expan-

sions of functions in infinite series, such as a power series or Fourier series. The use of Fourier series, which express a function as an infinite sum of sines and cosines, is indispensable in the study of partial differential equations.

ROBERT P. LANGLANDS

### Applied Mathematics

Applied mathematics is any valid mathematics that arises in the evolution and dispatch of real problems. It may use all of the techniques of "pure" mathematics; the 2 differ in the sources of problems addressed and the uses to which solutions will be put. Therefore, applied mathematics can involve ENGINEERING, PHYSICS and other fields, as well as pure mathematics. The evolution and solution of a real problem may be divided into roughly 6 stages, each requiring somewhat different skills. However, there are no sharp boundaries between the stages.

**Recognition** In industry, the realization that a problem exists will usually come from an engineer, scientist or manager involved in the practical applications of a technology, and in a position to recognize that something needs improvement or that something is going wrong.

**Data Collection** After a problem has been recognized, some specific data will be required to define it. Such data may be experimental, statistical or both. Therefore, experimental design and statistical analysis are important tools of the applied mathematician.

**Formulation** When enough data has been collected to define the problem, it must be formulated in a way that is precise enough to work on, ie, a mathematical model must be made of the situation. The model must be simple enough to permit a complete analysis, but also sufficiently close to reality to be relevant to the real problem being considered. In the process, all irrelevant details, and all details of only minor importance, must be suppressed. This narrowing focus permits concentration on major effects. To decide what is of major and what is of minor importance demands considerable *savoir faire* and makes model building probably the most valuable and difficult task of the applied mathematician.

**Solution** After recognition, data collection and formulation comes solution. Different formulations of a problem are usually possible and, as one formulation may be easier to handle than another, the solution may vary in complexity. Often, general mathematical methods that are applicable in principle are not actually useful. This situation is especially true when a numerical answer, correct to a specified degree of accuracy, and at a reasonable cost of time and manpower, is required. The neatness and simplicity of most textbook problems cannot be guaranteed in the real world; however, neatness or elegance in a solution frequently comes with real understanding of the problem.

**Computation** Most problems require not only understanding but also an actual numerical solution. Computation of the relevant numbers frequently may be done more quickly and economically without using a computer; however, should a computer be required, proper programming is important. If a fast computer costs \$500/h of machine time, a good mathematician can effect a considerable saving through the way he prepares the problem for computation. For example, such problems arise in the computation of 3-dimensional partial differential equations involved in calculations of elasticity, weather predictions, etc.

**Communication** Since an applied mathematician must make his findings accessible to the people he works for, he must present his work in a style less compact and easier for a nonspecialist to read than that common in most mathematical journals.

MURRAY KLAMKIN

### History in Canada

Every Canadian university has a mathematics department and offers one or more programs in this field. The same is probably true of almost every university throughout the world, a reflection of the importance of mathematics in contemporary society. Mathematics came to prominence as a scientific discipline after the Renaissance, during the period historians call the Scientific Revolution (1450-1700), when brilliant astronomer-mathematicians such as Copernicus and Newton discovered the true nature of the solar system, with the sun at the centre and the planets revolving around it. The role that mathematics played in these major discoveries gave the discipline the stature it has maintained to this day.

The evolution of mathematics in NEW FRANCE followed closely on the heels of this newly acquired stature. Although there were no new discoveries, the quality of teaching was virtually equal to that found in colleges in France. The Jesuits founded Collège de Québec in 1635 and started to teach intermediate mathematics there in 1651. Until 1760 students were taught arithmetic, the rudiments of second-degree or quadratic equations, trigonometry, geometry and a little differential and integral calculus — all in one of the 2 final years of the 8-year course of studies. The first full professor was Martin Bouquet de St-Martin. In 1678 Louis XIV appointed him to the new royal chair of mathematics and HYDROGRAPHY in Québec City, his wish being that pilots for the St Lawrence R and surveyors and cartographers be trained in the colony. The chair was not abolished until the end of the French regime. The most celebrated appointee to this chair was Louis JOLLIET, the discoverer of the Mississippi R. Soon after Jolliet's death, the chair officially passed to the Jesuits.

After the Conquest, 1759-60, the Collège de Québec had to close, but the SÉMINAIRE DE QUÉBEC, which took over its operations, retained the same classical course structure. Encouraged by Abbé Jérôme DEMERS, the teaching of science and mathematics flourished, particularly around 1840. Soon, however, for sociological and religious reasons, it fell into disfavour. It was not until 1920 that the importance of science was re-established among Québec Francophones. In that year, Université Laval (Québec City) organized its École supérieure de chimie (which became its faculty of science in 1937) and Université de Montréal established its faculty of science.

Nothing significant in the field of mathematics occurred in English Canada until 1855. Of the few English-language universities in Canada, only University of Toronto offered programs with specializations, one being in mathematics and natural philosophy (the latter term signifying the physical sciences). However, each university had a mathematics and natural philosophy professor. Trained in Great Britain, these few professors brought with them the idea that science and TECHNOLOGY were central to the Industrial Revolution. A Canadian scientific community thus began to take shape and the need for communication among its members was felt almost immediately. In 1856 the *Canadian Journal of Science, Literature and History*, published under the aegis of the Royal Canadian Institute, accepted articles on mathematics and continued to do so until 1912. Professor J.B. Cherriman (U of T) was in charge of the section on mathematics and natural philosophy. In the 1870s the idea arose of more specialized university studies. In 1877 U of T launched its mathematics and PHYSICS programs, which became models for the rest of Canada during the first half of the 20th century. Other universities, eg, Queen's, McGill and Dalhousie, gradually moved in the same direction. During this time, science departments were being subdivided and

by 1890 almost all universities (with the exception of McGill) had at least one mathematics (no longer a "mathematics and natural philosophy") professor. At the same time, bursaries were offered for studies in mathematics, 2 each at U of T and Dalhousie.

Three mathematicians merit special mention for the impetus they gave to the establishment and development of mathematics programs at their respective universities: JAMES LOUDON of U of T, Alexander Johnson of McGill and N.F. Dupuis of Queen's. In 1890 all were members of the ROYAL SOCIETY OF CANADA. Founded in 1882, this society was originally divided into 4 sections, one of which was mathematics and natural philosophy. The society reserved a place for the mathematics publications of its members in its *Proceedings and Transactions*, thereby offering a new means of communication for the mathematics community. In 1878 the *American Journal of Mathematics* was founded at Johns Hopkins University, Baltimore, followed in 1886 by the American Mathematical Society which, from 1891 on, published its *Bulletin* and from 1900 on, its *Transactions*. Canadian mathematicians contributed regularly to these journals.

The number of mathematics departments increased during the first 2 decades of this century, as a result of the growing importance of mathematics in professional fields (eg, engineering). The University of Toronto was the first N American university to move into the field of actuarial science (ie, the calculation of INSURANCE and annuity premiums and dividends). The Canadian Institute of Actuaries, a professional society, was founded in 1907. In 1915 U of T awarded the first Canadian doctorate in mathematics to Samuel Beatty, who later became the head of that institution's mathematics department. McGill conferred the second Canadian mathematics doctorate in 1917. The U of T was increasingly taking the lead in Canada and held it until the end of the 1950s. One of the most notable figures in the department was undoubtedly J.C. FIELDS, renowned for his work in algebraic functions and one of those who managed to revive the International Mathematical Congress, meetings of which had been suspended after WWI. The first meeting after the war was held in Toronto in 1924. Fields, reacting to the lack of a Nobel Prize for the field of mathematics, began working to establish an equivalent prize. These efforts were successful in 1932, a few months after his sudden death. The Fields Medal, named in his honour, is now universally recognized as the greatest honour that can be conferred on a mathematician. In 1936 algebraist and geometer Harold S.M. Coxeter joined the department. An example of the high calibre of teaching then being provided in Toronto can be seen in the first years of the American William Lowell Putnam Mathematics Competition. Only undergraduates could participate in this competition and each university entered a team of 3 students. In the first year, 1938, the U of T team won first place over all the American universities. The competition rules prevented U of T from entering a team the following year, but in 1940, it won again, as it did in 1942 and 1946. In the 1983 competition, teams from 4 Canadian universities (Alberta, Memorial, Queen's, Waterloo) ranked among the top 10 (the others being California Institute of Technology, University of Chicago, Harvard, Princeton, University of Washington and Yale).

The end of WWII was a turning point for mathematics in Canada. During the war Canadian mathematicians became aware of their isolation, even within Canada. If they wished to meet, they had to participate in meetings of the American Mathematical Society. They therefore organized the first Canadian mathematical congress, held in Montréal in June 1945. This very successful gathering led to the creation of the Ca-

nadian Mathematical Society. In 1949 the society began publishing the *Canadian Journal of Mathematics*, an internationally recognized publication, to which was added the *Bulletin* in 1958. In 1950, still under the aegis of the congress, Professor R.L. Jeffery, from Queen's, organized a Summer Research Institute in Kingston, which brought together 10 mathematicians to conduct joint research. This type of meeting proved so fruitful that summer research institutes have been held annually in some universities. In the 1950s mathematics departments developed very quickly. Toronto lost its leadership, not because its quality of teaching had declined, but because departments in other Canadian universities had improved — a case of students surpassing their teachers. Graduate studies burgeoned everywhere. Because of the development of STATISTICS, operations research and COMPUTER SCIENCE, industry showed increasing interest in mathematics graduates. However, forecasts of major increases in the student population in the 1960s indicated that there would be a high demand for university professors. With the launching of the first Sputnik by the USSR in 1958, mathematics once again found itself in the public eye, and the "New Math" movement began. In the same year, the NATIONAL RESEARCH COUNCIL OF CANADA began to give grants to mathematician-researchers and 2 new societies were founded: the Canadian Information Processing Society and the Canadian Operational Research Society. The prodigious development of computer science and diversified interests among mathematicians and computer scientists later led to the subdivision of mathematics departments in almost all universities into a mathematics department and a computer science department, the most striking example being the creation in 1966 of the Faculty of Mathematics at the University of Waterloo, with its 5 constituent departments: pure mathematics, applied mathematics, combinatorics and optimization, applied analysis and computer science, and statistics.

In Québec francophone universities returned to the Canadian mainstream around 1945 after successfully overcoming the difficulties generated by the prolonged lack of a scientific tradition in that province. By 1970 the department of mathematics at Université de Montréal had acquired an international reputation under the direction of Maurice L'Abbé, and had established a Centre de recherche en mathématiques appliquées. Dr L'Abbé is now Executive Director of the Science Council of Canada. The early 1970s were truly a golden age for mathematicians in Canada. In 1961 Canadian universities had awarded 11 PhDs in mathematics; this number increased to 94 in 1973. The National Research Council in 1960-61 gave \$87 500 for mathematics research; the figure for 1972-73 was \$2 461 500. In 1961 there were about 250 university mathematics professors (assistant rank and higher) in Canadian universities; in 1973, about 1300. The Canadian Society for History and Philosophy of Mathematics was founded in 1973 and, a few years later, the Statistical Society of Canada, which now publishes the *Canadian Statistical Review*. In 1974 the International Mathematical Congress again met in Canada, this time in Vancouver.

The Canadian mathematics community, like other scientific communities, is affected by the movement of promising graduates to the US, a fact that further testifies to the level of excellence of instruction in Canadian departments. Mathematicians with international reputations who received their early training in Canada include Cathleen Morawetz (U of T), Courant Institute of Mathematical Sciences, New York; Robert Langlands (UBC), Institute for Advanced Study, Princeton; Israel Herstein (U of Man), University of Chicago; Irving Kaplansky (U of

T), University of Chicago; Louis Nirenberg (McGill), New York University; G.F. Duff (U of T), emeritus professor, U of T; Leo Moser (U of Man), U of A (d 1970); W.O. Moser (U of Man), McGill; Raoul Bott (McGill), Harvard. The new generation of Canadian mathematicians includes Robert V. Moody (now working at Université de Montréal), John Mallet-Paret (Brown University, Rhode I), Jerry Marsden (Berkeley), Robert Steinberg (UCLA), Frank Clarke (U de Montréal), Jack Edmonds (U of Waterloo), Stephen Cook (U of T), Marvin Shinbrot (U of Victoria) and David Brillinger (Berkeley).

The 1980s present a number of new challenges to the Canadian mathematics community. Connections seem to have been made among university departments, industry and government in such fields as statistics and computer science, where the future appears to hold promise. However, other areas of mathematics appear more sensitive to difficult economic conditions.

LOUIS CHARBONNEAU

Reading: M. Kline, *Mathematical Thought from Ancient to Modern Times* (1972).

**Mathematics and Society** The involvement of a society in MATHEMATICS is determined by cultural and functional factors. Mathematics has its own intrinsic beauty and aesthetic appeal, but its cultural role is determined mainly by its perceived educational qualities. The achievements of mathematics are recognized as being among the greatest intellectual peaks attained by mankind and, therefore, are seen as being worthy of study in their own right, while the heavy reliance of mathematics on logical reasoning is seen to have educational merit in a world where rational thought and behaviour are highly valued. Furthermore the potential for sharpening the wit and problem-solving abilities fostered by study of mathematics is also seen as contributing significantly to the general objectives of acquiring wisdom and intellectual capabilities. This cultural aspect affects all Canadians to some degree through our formal educational processes, reflecting the degree to which Canadian society is committed to "liberal" or "humanist" education. In particular, it is a point of view adopted by many professional mathematicians in their teaching and research activities.

The "functional" aspect of mathematics stems from its importance as the language of SCIENCE, ENGINEERING and TECHNOLOGY, and its role in their development. This involvement is as old as mathematics itself and it can be argued that, without mathematics, there can be neither science nor engineering. In modern times, adoption of mathematical methods in the social, medical and physical sciences has expanded rapidly, confirming mathematics as an indispensable part of all school curricula and creating great demand for university level mathematical training. Much of the demand stems directly from the need for mathematical and statistical modelling of phenomena. Such modelling is basic to all engineering, plays a vital role in all physical sciences and contributes significantly to the biological sciences, medicine, psychology, economics and commerce.

In addition, the rapid development of computing power has created its own demand for mathematical techniques and has permitted the implementation of large-scale mathematical models that would have been impractical before. Indeed, development of COMPUTER SCIENCE itself owes much to the contributions of mathematicians, and its continuing explosive growth draws on, and contributes to, mathematical science. For example, the analysis of algorithms, the structure of formal languages, ROBOTICS, logical design, and large-scale scientific computation may be seen as important components of computer science that require, and stimulate, mathematical analysis in their development.

The place of mathematics in society depends on the nature of the society and its ambitions. Canadian society has inherited the European traditions of cultural and scientific freedoms and it is reasonable to assume that these will be maintained. Also, from a prosperity based on the extraction of primary resources, Canada aspires to a leading role on the international scene as an industrialized nation, and as a producer of consumer goods and HIGH-TECHNOLOGY products. These aspirations are strongly influenced by the proximity of the US and, in particular, by Canadian economic dependence on that country. The role of mathematics in Canada, and of all the basic sciences, depends partly on the degree of economic independence chosen by Canadians now and for the future.

These comments indicate the context in which the past and present role of mathematics in Canada must be assessed and suggest a context for the future. They imply, first, that building on existing programs a relatively high level of mathematical literacy must be an objective of the primary and secondary school systems. This is necessary if the layman is to cope with the computer and information revolution and with the ever-increasing use of quantitative methods in governmental decision making. It is also a necessary foundation for the appreciation of modern scientific activities and the history of sciences, as well as for those wishing to participate in technical, scientific or mathematical subjects at a higher level. At the post-secondary level, Canada must maintain a strong tradition for mathematics education in all its forms and continue to maintain an active community of mathematicians engaged in research.

The extent to which such a commitment to mathematics is explicitly accepted by the Canadian public is questionable. For a large part of Canada's population, exposure to mathematics has been limited to something less than a current grade 12 high-school curriculum. Hence, the corresponding view of mathematics is narrow, extending little further than arithmetic, with a smattering of algebra, geometry, trigonometry and, possibly, formal calculus. Such exposure cannot extend in any substantive way beyond the state of mathematical knowledge achieved in the 17th century. With this limited view, it is practically impossible to conceive of the extraordinary volume, diversity and value of modern mathematical developments. Consequently, there are widely held misconceptions about the significance and usefulness of mathematics that leave the subject vulnerable to periodic and short-sighted popular demand for functional education. There is now a dearth of students in mathematics (and other fundamental sciences) at the university level. This lack results from materialist attitudes towards education prevalent through Canadian society in the last several years and will undoubtedly create difficulties in the availability of skilled manpower in the future.

The pervasive and ever-increasing use of mathematical methods in science, commerce and government implies that a well-informed public must be mathematically literate to some degree. In practical terms this means that, in the mainstream of primary and secondary education, there must be effective mathematical education, bringing students to a point where they can readily calculate and think in quantitative terms, where information presented graphically or in statistical terms is easily comprehended, and where the logic and precision demanded in communication with computers is appreciated. More generally, there is an ever-increasing need for people who are well trained in mathematics and are confident with the mathematization of problems in the world around us. Unfortunately, at a time when one would look for improvements in this regard, there is evidence that,

at least until recent years, the mathematical skills acquired by pupils in Canadian school systems have declined. Thus, there is a general need to ensure that traditional basic curricula, at least, are well absorbed. There is also evidence that a negative attitude, or a feeling of anxiety, towards mathematics is common in Canadian society and is even shared by many teachers of mathematics, especially at the primary level. Such considerations put responsibility on the mathematics community to recommend improvements in methods and curricula, and on governments and local authorities to ensure that high standards and, especially, proper hiring practices are maintained. See SCIENCE AND SOCIETY.

PETER LANCASTER

Reading: Klaus P. Beltzner et al, *Mathematical Sciences in Canada*, Science Council of Canada Background Study No 37 (1976).

**Mather, Bruce**, composer, pianist, educator, administrator (b at Toronto 9 May 1939). He studied first in Toronto, notably with Godfrey RIDOUT, Oskar MORAWETZ and John WEINZWEIG; then at the Paris Conservatoire with Darius Milhaud, Simone Plé-Caussade and Olivier Messiaen; at Stanford U, Calif; and with Pierre Boulez in Switzerland. A teacher at McGill from 1966, he has also taught at the Brodie School in Toronto and as a visiting teacher at the Paris Conservatoire. He has been a member of the executive of Ten Centuries Concerts and a director-member of the Société de musique contemporaine du Québec. He has performed several pieces of contemporary music, both solo and with his wife, pianist Pierrette LePage. In 1979 he won the Prix Jules-Léger for new chamber music, for his *Musique pour Champigny*. Many of his compositions are for small ensembles.

HÉLÈNE PLOUFFE

**Matheson**, Ont, UP, pop 966 (1981c), is located 296 km NW of NORTH BAY. Originally a fur-trading post called McDougall's Chute, its name was changed in 1912 in honour of the Ontario provincial treasurer. Located on the Temiskaming and Northern Ontario Ry (Ontario Northland), it initially served as a supply centre for the surrounding lumbering and agricultural communities. It is widely known for the devastating fire of 1916 that officially claimed 233 lives, although the loss was probably much greater. In the 1920s and 1930s gold and asbestos mining began in the area, and more recently tourism has also become important. MATT BRAY

**Matheson, Alexander Wallace**, lawyer, politician, premier of PEI (b at Bellevue, PEI 11 June 1903; d at Charlottetown 3 Mar 1976). First elected to the PEI Legislature in 1940, Matheson became minister of health and welfare under Premier J. Walter JONES and premier in 1953 when Jones retired to the Senate. Matheson vigorously promoted rural electrification to protect and strengthen farm life. Although the provision of modern services did improve life, the erosion of rural communities continued. Matheson resigned as party leader in 1961 following the defeat of the Liberals in the 1959 provincial election, but was re-elected by a large majority. He served as leader of the Opposition until his retirement from politics in 1965. In 1967 he was elevated to the bench. DAVID A. MILNE

**Mathieson, John Alexander**, lawyer, politician, judge, premier of PEI (b at Harrington, PEI 19 May 1863; d at Charlottetown 7 Jan 1947). Educated at Prince of Wales College, Charlottetown, he was a schoolmaster and lawyer before his election to PEI's assembly as a Conservative in 1900. He became premier in Dec 1911 after the resignation of the Liberal government. Within a month he led his party to a landslide election victory. As premier he obtained a constitutional guarantee that PEI would have at least 4 federal MPs. In 1917 he re-

signed to become chief justice of the provincial Supreme Court. He retired in 1943 because of infirmity.

IAN ROSS ROBERTSON

**Mathieu, Rodolphe**, composer, teacher, writer, pianist (b at Grondines, near Québec C 10 July 1890; d at Montréal 29 June 1962). Considered too avant-garde for his time because of Debussy's influence on his music, he gained recognition too late to inspire the generation that followed. Impressed first by the works of Scriabin, to which he was introduced by Alfred LABERTÉ, he devoted himself to composing only after studying with Alexis Contant (c1910). He then studied in Paris with Vincent d'Indy. In 1923 he received the first grant given to a composer by the Québec government. He taught in several institutions and, in 1929, founded the Canadian Institute of Music. HÉLÈNE PLOUFFE

**Matonabee**, Chipewyan leader (b at Prince of Wales's Ft c1737; d Aug 1782). A leading hunter of caribou on the barrenlands, Matonabee grew up in and around PRINCE OF WALES'S FT and was an important middleman in the fur trade between the HUDSON'S BAY CO and other DENE tribes farther W. In the 1750s he was an ambassador among the Cree and made at least one trip to the Coppermine R. Samuel HEARNE is justly famous for his overland voyage to the Arctic Ocean, but it was Matonabee who organized and made the trip possible, with his leadership and knowledge of the Indian way of travel and living off the land. He was a "leading Indian" of Prince of Wales's Ft — an important position in the fur trade, but not of broader political significance. Bound to the fortunes of the fur trade, he committed suicide when the French destroyed the fort in 1782.

DAVID LEE

**Matsqui**, BC, District Municipality, pop 42 000 (1981c), area 21 290 ha, inc 1892, is located between the Fraser R and the US border, 70 km E of downtown Vancouver. Its name, of Indian origin, likely means "a stretch of higher ground." It is situated in the Central Fraser Valley Regional Dist with LANGLEY on the W, ABBOTSFORD on the E and MISSION on the N. Its economic base is primarily agricultural, including labour-intensive activities such as berry and horticulture production, as well as cash-crop production and animal husbandry. Other elements in the economy include resource extraction (especially sand and gravel), manufacturing, processing, transporta-

tion, and trade and services. Clearbrook, the main business area, is one of the valley's main town centres with a developing office and administrative function. Matsqui is served by Fraser Valley College. ALAN F.J. ARTIBISE

**Matthews, Peter**, farmer, rebel (b in Marysburgh or Sidney Twp, Qué [later UC] 1789 or 1790; d at Toronto 12 Apr 1838). The son of Loyalists, Matthews was a prosperous farmer and leading figure in Pickering Township. Angry with government development policies he was persuaded to lead his neighbours to join the REBELLION OF 1837. He was captured, tried and executed. RONALD STAGG

**Mauger, Joshua**, colonial entrepreneur (bap in the parish of St John, Jersey 25 Apr 1725; d at Warborne, Eng 18 Oct 1788). Mauger arrived in Halifax in 1749 and evolved his position as navy victualler into a commercial and property empire, based initially on contraband trade with the French. He became Halifax's largest shipowner, building vessels, plying the coastal and W Indies trade, and supplying rum, lumber, mercantile goods and fish to a network of outpost stores. His distillery produced 50 000 gallons (190 000 litres) annually by 1766, and in a colony totally dependent on rum revenue, Mauger's position was preeminent. Although based in England after 1760, he used agents and his own influence to protect his NS interests and undermine the colonial administration. He was credited with the removal of Jonathan BELCHER, Lord William CAMPBELL and Francis LEGGE, governors hostile to the mercantile ascendancy. Mauger's complex involvement with NS underscores the bonds of subservience and influence that hindered that colony's early development.

LOIS KERNAGHAN

Reading: J.B. Brebner, *The Neutral Yankees of Nova Scotia* (2nd ed, 1969) and *New England's Outpost* (1927).

**Maugerville**, NB, UP, pop 249 (1981c), is located on the SAINT JOHN R, 8 km SE of FREDERICTON. It was founded by New England planters from Essex County, Mass, in 1763-64 and named in honour of Joshua MAUGER, who aided settlers in gaining title to their lands. Situated on rich alluvial soil in the Saint John Valley, it was the first successful English-speaking settlement on the river. During the AMERICAN REVOLUTION most inhabitants openly supported the American cause; several took part in an attack on Fort Cumberland in 1776, the only armed uprising against British authority in NS. When the province of NB was created at the end of the war, Loyalist leaders held the old Yankee residents suspect for their past sympathies and divided the township, retaining the name Maugerville for the upper half and renaming the lower section Sheffield. The growth of the mast-and-timber trade brought prosperity and the rich farmlands, flooded annually by spring freshets, provided much of the produce consumed in Saint John and Fredericton throughout the 19th and early 20th centuries. Today the farmers struggle to survive. The river, once bustling with sloops, barges and paddle-wheelers, now carries only pleasure craft. Yet the proud independent character of the first settlers is still evident in the farms tilled by their descendants. JIM SNOWDON

**Mavor, James**, scholar (b at Stranraer, Scot 8 Dec 1854; d at Glasgow, Scot 31 Oct 1925). Economist, economic historian, second professor of political economy and constitutional history at U of T, Mavor created a modern department of political economy, introduced the teaching of commerce at the honours level and began Canadian contract research in the social sciences. Educated in Glasgow, Mavor originally inclined towards socialism, but moved to the right before coming to Toronto. His representations brought the DOUKHOBORS to Canada. He wrote on many topics, including the economic history of Rus-

Alexander Wallace Matheson, premier of PEI 1953-59 (courtesy Public Archives of PEI).

sia, Canada's wheat economy, Manitoba government telephones, Ontario Hydro and applied economics. He ceased to teach in 1922 and retired in 1923. His descendants have been prominent in drama and the arts; his influence on Toronto's social sciences was felt into the late 1970s.

IAN DRUMMOND

**Maxville, Ont.**, Village, pop 836 (1981c), inc c1891, located SE of Ottawa. It began around 1869 and expanded rapidly when the Canada Atlantic Ry est a station there in 1881. It got its name from the many "Macs" of its Highland Scottish neighbourhood. Its population was 749 by 1901, but since has been virtually unchanged. With little industry, its main economic function has been to supply merchandise and services to the surrounding farm community. Less tangibly, but not unimportantly, it has emotional significance for Scots as a surviving concentration of the old "Scottishness" of its country, Glengarry. The Glengarry Highland Games, held annually in Maxville since 1948, are among the more successful of their kind, attracting some 20 000 every summer. The novelist Ralph Connor (Charles William Gordon) and British financier Sir Edward Peacock were born at St Elmo, 3 km NW of here. ROYCE MACGILLIVRAY

Reading: Royce MacGillivray and Ewan Ross, *A History of Glengarry* (1979).

**Maxwell, Edward**, architect (b at Montréal 31 Dec 1867; d there 14 Nov 1923). He apprenticed in Boston with Shepley, Rutan & Coolidge, who won a competition (1891) for the new Montréal Board of Trade. Maxwell returned to Montréal to supervise construction, and the contacts he made with prominent members of the Board of Trade helped to assure his success. In 1892 jeweller Henry Birks hired him to design a new store facing Phillips Square — now one of the city's architectural ornaments. Maxwell also designed numerous CPR stations and hotels, including the major western terminal at Vancouver (1897). The country estate planned for Louis-Joseph Forget at Senneville, Qué (1899), is a fine example of his residential work.

His younger brother **William Sutherland Maxwell** (b at Montréal 14 Nov 1874; d there 25 Mar 1952) became his partner in 1902. William had studied at the Ecole des beaux-arts in Paris, and the beaux-arts style is reflected in the design and planning of the Maxwells' buildings at this time, eg, in the Royal Bank branch at Westmount (1903) and the CPR station at Winnipeg (1904). Their grandest and most memorable works — the Legislative Buildings at Regina (1907) and the Montreal Art Assn Gallery (1911; now the Museum of Fine Arts) — display a skill at planning and composition that ranks with the best beaux-arts designs of the period. Their final achievement was the St-Louis wing and tower block of the Château Frontenac Hotel at Québec C, which was completed in 1924, a year after Edward's death.

Although William continued to practise, his work consisted mainly of additions and alterations to buildings designed earlier by the firm. Without the support of his brother, he seemed unable to revive the high level of creativity that had kept their office at the front rank of the architectural profession in Canada. ROBERT LEMIRE

**May, Wilfrid Reid**, "Wop," airman (b at Carberry, Man 20 Mar 1896; d at Provo, Utah 21 June 1952). He was a novice pilot on the Western Front being hotly pursued by Manfred, Freiherr von Richthofen, when the "Red Baron" was killed on 21 Apr 1918. May might have been his 81st victim but instead went on to become one of Canada's leading bush flyers in the postwar era, winning the McKee trophy in 1929. During WWII he helped set up the British Commonwealth Air Training Plan and was a pioneer in aerial "search and rescue" techniques.

BRERETON GREENHOUS

Mayflower, common name for the trailing arbutus (*Epigaea repens*), the provincial floral emblem of Nova Scotia (photo by Mary W. Ferguson).

**Mayflower**, common name for the trailing arbutus (*Epigaea repens*), a creeping, woody, evergreen plant belonging to the heath family (Ericaceae) and native to eastern N America. The only other member of the genus (*E. asiatica*) is native to Japan. The name mayflower derives from the very fragrant, white or rose-coloured, bell-shaped blossoms that appear during that month, and sometimes in Apr. Ants are attracted to the globular, capsule-shaped fruit. The mayflower grows in acidic sandy or peaty soils from Newfoundland to Manitoba, and has been the provincial floral emblem of NS since 1901. It is grown from seed because transplanting produces poor results.

CÉLINE ARSENEAULT

**Mayfly**, or shadfly, common names for small, fragile, soft-bodied insects comprising order Ephemeroptera [Gk, "living a day"]. About 2000 species are known worldwide; 300 in Canada. Eggs are deposited on clean, flowing water. The larval stage is aquatic and lasts a few months to 2 years, depending on the species. Larvae obtain oxygen through abdominal gills. Most feed on algae and particles of detritus; a few are predatory. Transformation to the terrestrial adult usually occurs at water surface. Mayflies are unique among winged insects, usually having 2 adult stages: the subimago, a rather dull creature with translucent wings, molts again within a few minutes to 24 hours, to the sexually mature

"Wop" May, WWI fighter pilot and one of Canada's leading bush pilots in the postwar era (courtesy Public Archives of Canada/C-57580/W.R. May Coll).

adult. Adults do not feed; most live only 1-2 days. Their long, shiny bodies end in 2 long appendages (cerci). The wings are membranous; forewings are large; hindwings, small or absent. Mayflies are an important food for fish and provide models for fishermen's lures. G PRITCHARD

**Maynard, Hannah**, née Hatherly, photographer (b at Bude, Eng 17 Jan 1834; d at Victoria 15 May 1918); **Maynard, Richard James**, photographer (b at Stratton, Eng 22 Feb 1832; d at Victoria 10 Jan 1907). The Maynards immigrated in 1852 to Bowmanville, UC, where Richard opened a boot and shoe business. Hannah learned photography, possibly in 1859 when Richard was in BC prospecting for gold. In 1862 they moved to Victoria, where Hannah began her "photographic gallery." Richard, who may have learned photography from her, did a panorama of Victoria harbour in 1864, and a decade later began a 20-year career as a landscape photographer, rivalling Hannah's portrait work. Among Richard's commissions were tours to inspect Indian villages (1873, 1874), an expedition to the Queen Charlotte Is (1884) and a trip to the Pribilof Is (1892). Hannah's most interesting photographs include experiments in the early 1890s with multiple images of herself and a young grandson, and photosculptures, where people are made to resemble statues or busts.

DAVID MATTISON

Reading: David Mattison, "The Multiple Self of Hannah Maynard," *Vanguard* (Oct 1980); C.W. Wilkes, *The Magic Box* (1980).

**Mayne Island**, 2327 ha, pop 546 (1981c), is one of the Gulf Is in BC. The island is named for British surveyor Lt R.C. Mayne. Excavated Indian middens near Active Pass suggest habitation for at least 5000 years. Active Pass, separating Mayne and Galiano islands, has large salmon runs and, because of tidal upwellings, large feeding waterfowl populations. Mayne I was the hub of the Gulf Is at the turn of the century on the strength of its resort hotels and wharves, which handled passenger ships plying the Str of Georgia between Victoria and New Westminster or Vancouver. Today, with the other islands, it is a retirement and summer tourism centre.

PETER GRANT

**Mayo, YT, UP**, pop 398 (1981c), is located on the Stewart R at the mouth of the Mayo R, 407 km N of Whitehorse. Originally called Mayo Landing, it was named after Alfred S. Mayo, an early prospector and trader. It became the landing point for riverboats on the Stewart R after gold was found nearby (1902). In 1919 the discovery of silver-lead deposits at Keno Hill transformed the town into a major transshipment point for ore. In 1949 a road was built to the Klondike Hwy and, as the riverboats went out of service, Mayo declined.

H. GUEST

**Mayor**, see MUNICIPAL GOVERNMENT.

**Mazankowski, Donald Frank**, politician (b at Viking, Alta 27 July 1935). After a period as president and general manager of an automobile and farm machinery dealership, Mazankowski was elected to the House of Commons as Conservative MP for Vegreville, Alta, in 1968. Bright and popular, he chaired the PC caucus 1973-76 and served as minister of transport and minister responsible for the CANADIAN WHEAT BOARD in the Clark government, 1979-80. He won the respect of the media, Opposition politicians and his officials, and registered a series of solid achievements, notably in the area of rail transportation. He was again named minister of transport by PM MULRONEY in 1984, as well as member of 2 important Cabinet committees.

NORMAN HILLMER

**Meadowlark**, robin-sized bird with bright yellow breast marked by a black crescent. Like blackbirds and orioles, it belongs to the Icter-

inae subfamily. Two species occur in Canada. Although their appearance is very similar, their songs are distinct. The western meadowlark (*Sturnella neglecta*) has an elaborate, flute-like song; that of the eastern meadowlark (*S. magna*) is a shorter, clear whistle. The former species occurs from the West Coast to eastern Ontario, the latter from central Ontario through the St. Lawrence Valley. The eastern meadowlark ranges S through Mexico and Central America to Brazil. Although some meadowlarks winter in southern Canada, most migrate a few hundred miles S. Meadowlarks nest on the ground in open grasslands, laying 3-7 eggs in a well-concealed, domed nest. They feed on insects during the breeding season and on weed seeds in fall and winter.

R.J. ROBERTSON

**Meagher, Blanche Margaret**, diplomat (b at Halifax, NS 27 Jan 1911). Meagher taught in Halifax 1932-42, when she became one of a few pioneering women in the Dept of External Affairs. She served under H.L. KEENEYSIDE in Mexico and Norman ROBERTSON in London, Eng, impressing them with her sound and independent judgement. From 1958 to 1961 she was ambassador to Israel, the first Canadian woman to hold that rank. She was from 1962 ambassador to Austria, and at the same time governor for Canada on (and later chairman of) the International Atomic Energy Agency. When ambassador to Sweden, 1969-73, she negotiated with representatives of the People's Republic of China towards the establishment of Sino-Canadian diplomatic relations.

NORMAN HILLMER

**Meat-Processing Industry** The Canadian slaughtering and meat-processing sector is made up of companies engaged in abattoir or packing operations. Products include fresh, chilled or frozen meats; cured meats (smoked, pickled or dry salted); fresh or specialty sausages; canned meat preparations; animal oils and fats; and tank-house products such as bone, blood, feather and meat meals and dry rendered tank-age.

The meat industry in Canada had its beginnings in 1605, when the French established PORT-ROYAL. A priority of the settlers was to develop animal husbandry so that the settlement could have a reliable, year-round source of meat and milk (see ANIMAL AGRICULTURE). Most Acadian farmers kept sheep and pigs and by the 1720s as many as 500-700 cattle and 2000 sheep were being exported each year to LOUISBOURG. In 1677 there were 3107 cattle and 85 sheep in NEW FRANCE. By the mid-1700s, the industry was well established, with an animal population of 50 013 cattle, 28 022 sheep and 28 562 hogs.

Meat slaughtering and processing is a highly regulated industry (see FOOD LEGISLATION). The first regulations in New France were passed in 1707 and made it illegal for a butcher to kill an animal without first informing a king's officer. The Crown's representative was required to carry out an inspection at the time of slaughter. The purpose was to prevent unnecessary slaughter and to ensure that the meat was fit for human consumption. Another early law, enacted in LOWER CANADA in 1805, was the Act to Regulate the Curing, Packing and Inspection of Beef and Pork, which required that all beef and pork be inspected upon slaughter. Until the early to mid-1800s, most of the meat processed for human consumption was handled by farm and village butchers, but by 1850 the meat packer emerged. During the early to mid-1800s, many local packers (actually large-scale butchering operations) engaged in slaughtering, curing and packing pork in salt during the winter months (the term "packer" came from the last function). Many leading companies in Canada's meat industry began between 1850 and 1870. F.W. Fearman set up operations in Hamilton, Ont, in 1852, sugar curing and smoking meats. William

E. Davies, a major force in the late 1800s, began business in Toronto in 1854 and, in 1874, built the first continuous hog-slaughtering facility in Canada in Toronto. In 1867 John Duff opened a retail business in Hamilton that eventually became part of Essex Packers Ltd.

The use of refrigerated railway cars in the 1860s and 1870s had a major impact. During the 1870s, mechanical refrigeration was introduced and soon adopted by meat processors. By 1871 the livestock population (about 2.5 million cattle, 3.2 million sheep and 1.4 million hogs) was large enough to support a sound packing industry. During the 1870s there were 193 packing plants employing 841 people. Annual sales were about \$3.8 million and capital investment was \$419 000. In 1879 the brothers Pat and John BURNS left Ontario for Winnipeg, which had only just been connected by rail with the East. Pat initially supplied beef to gangs laying rail and later established P. Burns & Co, later Burns Foods Ltd, western Canada's largest meat-packing company for most of a century.

From 1880 to 1890 the industry grew rapidly. The number of plants increased from 203 in 1880 to 527 in 1890. Most were small, but sales grew strongly, from nearly \$4.1 million in 1880 to \$7.1 million in 1890. During the 1890s many small companies were absorbed into larger operations; by 1900 only 57 packing facilities remained. However, capital investment more than doubled over this period, climbing from \$2.2 million in 1890 to \$5.4 million by 1900. Employment jumped from 1690 to 2416 and sales climbed from \$7.1 million to a new peak of \$22.2 million.

In 1906 J. G. RUTHERFORD, veterinary director and livestock commissioner for Canada, convened a meeting in Ottawa to discuss federal meat inspection with the major meat exporters: William Clark Co, Montreal; George Matthews Co Ltd, Hull, Qué; William Davies Co, Toronto; Harris Abattoir Co Ltd, Toronto; Gunns Ltd, Toronto; Whyte Packing Co, Stratford, Ont; F.W. Fearman Co Ltd, Hamilton, Ont; Canadian Packing Co, London, Ont; P. Burns & Co, Calgary, Alta; and Gordon-Ironside & Fares, Winnipeg, Man. On 3 Sept 1907 federal meat inspection became a reality: the Meat and Canned Foods Act and Regulations required antemortem and postmortem veterinary inspections of all food animals the meat of which would cross provincial or international borders. The law set rigid sanitation standards for plants using the federal inspection service. After 1907 the meat industry grew steadily except for periods following the 2 world wars. In both cases the industry had expanded to meet heavy wartime demand and was left with capacity far exceeding peacetime domestic and export demands. Consequently, some consolidation was needed.

**The Modern Industry** By 1950 the structure of the industry was firmly in place and 3 classes of companies emerged. Traditional, full-line slaughtering packers slaughter all species and process carcasses into fresh, cured, smoked, cooked and canned meats, sausage products, etc. Nonslaughter processors purchase carcass meat and prime cuts from slaughterers and specialize in one or more secondary processing operations. Purveyors prepare portion-ready cuts, mainly for hotels, restaurants and institutions. Industry growth continued into the 1960s, strengthening in the 1970s and 1980s. There were 157 companies in 1950, 210 by 1960. Employment increased from 20 522 to 25 946 and annual sales climbed from \$757 million to \$1.06 billion. In 1982 the value of factory shipments reached \$7.9 billion.

Slaughtering and meat processing is highly regulated in Canada. All companies engaged in interprovincial or export trade must be federally inspected. The regulations cover not only meat entering and coming from the plant, but also

plant sanitation procedures and plant construction. Over 95% of all meat and meat products produced in Canada comes from federally inspected plants. The industry must also comply with provincial legislation and often with municipal health requirements. The main federal agency involved with the meat industry is Agriculture Canada, particularly the Food Inspection Directorate, the Livestock and Poultry Division and the Meat Hygiene Division.

The industry is represented nationally by the Canadian Meat Council in Scarborough, Ont, with regional offices in Montréal and Winnipeg. All member companies operate federally inspected production facilities. In 1970, 453 plants were in operation; in 1981, 501, distributed as follows: Nfld, 4; PEI, 5; NS, 7; NB, 5; Qué, 130; Ont, 181; Man, 32; Sask, 32; Alta, 64; and BC, 41. Between 1970 and 1982 employment grew from 31 099 to 34 390 and the annual value of shipments jumped from about \$2.1 billion to over \$7.9 billion. But the cost of operations grew equally dramatically; materials and supplies increased from nearly \$1.7 billion in 1970 to \$6.3 billion in 1982. Costs of fuel and electricity rose from \$11.4 million to \$77.6 million.

Like other FOOD AND BEVERAGE sectors, the meat industry has very low profit margins, usually about 1.8% net profit on sales (in a straight meat-packing operation, it can be as low as 0.75%). Traditionally the meat industry has been a big exporter; exports are now about 15% of total sales. In 1982, 122 plants exported meat products to 72 countries; exports of red and fancy meats and edible by-products earned nearly \$800 million. Pork exports accounted for 25% of Canadian pork output. In 1982 the industry processed 3.8 million cattle at federally inspected plants and moved 13.4 million hogs into production. See BEEF CATTLE FARMING; GOAT FARMING; HOG FARMING; RABBIT FARMING; SHEEP FARMING.

ROBERT F. BARRATT

**Mechanical Engineering**, branch of ENGINEERING that deals with the design, construction and operation of machines. Machines are designed for an enormous variety of purposes, but most fall into 3 broad categories: energy conversion machines, including engines, heat exchangers, refrigerators, heat pumps, furnaces, motors, brakes, windmills and turbines; MANUFACTURING machinery, including lathes, drills, rolling mills, assembly-line robots and hand tools; and TRANSPORTATION machinery, including all vehicles, conveyors and pipelines, with their compressors and pumps. Mechanical engineering plays a role in the production of all goods and commodities; moreover, many consumer goods (eg, domestic appliances) are machines. Mechanical engineering contributes to AGRICULTURE through farm machinery; to the forest products industries (LUMBER AND WOOD; PULP AND PAPER) through FOREST HARVESTING equipment, sawmills, pulp mills, etc; to the MINING industry through mining machinery and ventilation equipment; to the PETROLEUM INDUSTRY through exploration and drilling equipment; to the CONSTRUCTION INDUSTRY through construction equipment, and ventilation, air conditioning, heating, plumbing and vertical transportation equipment in buildings; to the transportation industry through engines, vehicles and materials-handling equipment; to the ELECTRIC-POWER industry through hydraulic and steam-generating equipment; to the metals industry through furnaces, materials-handling equipment and forming machinery, eg, rolling mills and forges (see IRON AND STEEL INDUSTRY; METALLURGY).

**History** Mechanical engineering can be said to have started with the Industrial Revolution, when the advent of the steam engine as the source of large amounts of controlled mechan-

cal power produced a qualitative change in manufacturing TECHNOLOGY. It has evolved as advances in materials, control technology and design methods have led to continued improvements in machines of all kinds. The last 3 decades have seen an acceleration of that evolution, as the rapid growth of research in the engineering sciences provided the basis for quantitative improvements in machines, which continued to become more efficient, faster, more precise, more economical and capable of performing more functions. The growth in industrial uses of computers in CAD/CAM (Computer-Aided Design/Computer-Aided Manufacturing) in the last decade has increased that acceleration even more. Today, it appears that mechanical engineering stands on the threshold of another revolution, the result of the advent of cheap and reliable microelectronic devices, particularly sensors of various kinds and microprocessors which can be incorporated into machine elements (see MICROCHIPS). With microelectronics, machines can be "smart," ie, they can sense their environment and select the optimal response to it (see ARTIFICIAL INTELLIGENCE). The advent of smart machines will change what mechanical engineers do, what they must know and how they must be educated.

Canadian mechanical engineers have made many world-class contributions to technology, including self-propelled combines, harvesting equipment for forest industries, pulp and paper production machinery, and hydroelectric turbine generators. More recent achievements include the CANDU NUCLEAR-POWER generating system, the aircraft engines of the PT-6 family developed by Pratt & Whitney Canada, Ltd, the SNOWMOBILES and LRC trains designed by Bombardier, Ltée, and the CANADARM manipulator for the NASA Space Shuttle developed by Spar Aerospace Ltd.

**Education and Societies** Technical training in Canada probably began in the workshops of railways, factories and some schools. Formal courses in mechanical engineering followed establishment of schools and colleges of engineering or practical science in eastern Canada in the late 19th century. In 1982, 24 Canadian universities offered accredited, 4-year degree programs, leading to an honours bachelor's degree. Most also offered postgraduate programs leading to the master's and PhD degrees. Degrees and diplomas in Mechanical Engineering Technology, with courses of study ranging from 2 to 4 years, are offered at institutes of technology and at numerous community colleges.

Canadian mechanical engineers have 2 principal professional and technical organizations: the mechanical engineering branch of their provincial engineering association and the Canadian Society for Mechanical Engineering. CSME was founded in 1970 as a constituent society of the Engineering Institute of Canada. Both the provincial associations and CSME hold technical meetings and produce publications containing professional and technical news. CSME also publishes *Transactions* in which research developments are reported. A biennial technical conference, the Canadian Congress of Applied Mechanics, provides a forum for discussion of current research. Canadian mechanical engineers are also active in many foreign and international technical societies. See MACHINERY AND EQUIPMENT INDUSTRY.

T A BRZUSTOWSKI

**Medal**, decorated piece of metal, usually a disc, awarded for merit or issued to commemorate an event or person. Medals have essentially the same significance in Canada as elsewhere in the Western world. Usually little noticed, they are nevertheless honoured. A distinction is commonly made between military medals, worn on the person as marks of official commendation, and other sorts. In English the latter are often

"Kebeca Liberata" medal (reverse), silver, designed by Jean Mauger and struck in France, 1690 (courtesy Public Archives of Canada).

differentiated, somewhat inaccurately, as "medallions"; in French, "médaille" is understood comprehensively and "médaillon" given its correct applications.

Although a few early medals alluding to Canada were created in France and Britain as commemorative pieces, Canadians became more familiar with medals through the British military; when Canadians began to sponsor medals for their own purposes, after about 1850, they looked primarily to British sources. At the turn of the 20th century, many medals were being struck in Canada, by Ellis of Toronto and then by Caron of Montréal, and Canadians ordered medals from France as readily as from Britain; few came from the US. Since WWII Canadian medals have generally been designed and fabricated at home. There is, however, no specifically Canadian school of design, Canadian medals today reflecting broad international trends rather than particular heritages. Québec, though more influenced by France, does not have a markedly distinctive medallic tradition, but recent Prix du Québec medals have been innovative in design.

The National Medal Collection, at the Public Archives of Canada, Ottawa, contains medals of all types, and the Canadian War Museum, Ottawa, has the leading military collection. Château Ramezay, Montréal, and the Glenbow Museum, Calgary, have notable medal collections.

#### **Military Medals and Civilian Bravery Awards**

Canadians know military medals through the striped ribbons often worn by people in uniform. Emanating from the sovereign, official medals were traditionally the same as the British, until the establishment of Canada's own HONOURS System. Since combat awards have effectively lapsed since the KOREAN WAR, the ribbons most commonly seen today represent commemorative or long-service medals, or United Nations medals for PEACEKEEPING operations.

There have been Canadian recipients of all 13 British military gallantry awards, given for 3 levels of bravery. The VICTORIA CROSS is open to all ranks of all services, but the others vary according to rank or service. Officers' decorations are crosses, whereas those for other ranks are circular. The Canada Medal, established 1943, was never awarded. Current DECORATIONS FOR BRAVERY, instituted within the Honours System in 1972, are not military awards.

Campaign medals rewarded participation rather than individual conduct. The first, the Military General Service Medal, covered a period including the WAR OF 1812. Canadian recipients included militiamen and Indians. Among the clasps identifying particular battles were those denoting the BATTLE OF CHATEAUGUAY, CRYSLER'S FARM and Ft Detroit. The Canada General

Service Medal, for the years 1866 and 1870, recognized service against the FENIAN raids and in the RED RIVER REBELLION, and the North-West Canada Medal recognized service in the NORTH-WEST REBELLION. The first war medal for Canadians only was the Canadian Volunteer Service Medal of WWII, and the first British war medal with a distinct Canadian version was for the Korean War. Medals also went to members of 19th- and 20th-century arctic expeditions. Military commemorative medals for jubilees and coronations went originally to contingents sent to England, but distribution later widened, eventually to include selected civilians. The 1967 Canadian Centennial Medal and the Canadian 1977 Queen Elizabeth II Silver Jubilee Medal resemble military medals and are worn as such, but they were widely distributed throughout the whole community. Long service and good-conduct medals, originally British, then for colonial forces, gave way in 1930 to a number of Canadian awards. In 1949 all were replaced by the single Canadian Forces Decoration.

The Police Exemplary Service Medal was instituted in 1983 within the Canadian Honours System. Other police and firefighting medals are awarded by provincial governments, local authorities or unofficial bodies. Before the institution of Canada's own decorations for bravery, Canadians received British awards, including the GEORGE CROSS, for heroism in nonmilitary circumstances. Early in this century the Dept of Marine issued, in the name of the Canadian government, medals for lifesaving at sea.

**Commemorative and Prize Medals** The earliest medal directly pertaining to Canada was the French "Kebeca Liberata" medal celebrating the repulse of a British attack on Québec in 1690. Later French and British medals commemorated Canadian events of the 18th century. Unique to Canada were the special medals presented to Indian chiefs at treaty signings and on other significant occasions. These imposing, normally silver, medals were often worn around the neck.

Early Canadian medals included Catholic medalets, TEMPERANCE medals and individually engraved presentation pieces. Educational and agricultural prizes became popular after about 1850, and the 1860 visit of the Prince of Wales inspired an upsurge in medals. CONFEDERATION was commemorated by a magnificent allegorical medal.

In 1873 the Governor General Medals, personal gifts awarded mainly for academic achievement, were inaugurated. They portray each successive incumbent with spouse on the obverse, and the coat of arms on the reverse. Originally made by Wyon in England, they have been struck since 1947 at the Royal Canadian Mint. Some provinces issue lieutenant-governor medals as academic awards. Only the Québec series (1884-1966) regularly bore the portraits and arms of the respective incumbents. Until 1934 they were usually struck in France, and thereafter in Montréal by Lamond.

Noteworthy commemorative medals were the Québec Tercentenary Medal (1908), the George-Etienne Cartier Centenary Medal (1914) and the Confederation Diamond Jubilee Medal (1927). Many prize medals are given at Canadian universities, the earliest having been awarded at McGill. Other educational institutions, municipalities, learned or professional associations and sports or hobby clubs issue prize or commemorative medals. In 1924 the ROYAL SOCIETY OF CANADA established its first of 12 now awarded.

Canada's 1967 CENTENNIAL inspired many medals. Commercial mints, especially the Franklin Mint (formerly Wellings), subsequently began to manufacture commemorative medals directly for the collectors' market. Agricultural fairs spawned many medallic souvenirs and awards. The Toronto Exhibition (later CANADIAN NATIONAL EXHIBITION) inaugurated its impressive series

of medals in 1879. Each year since 1897 there has been a different medal, first struck by Ellis, then by Roden and Birks.

**Medallic Art** Despite its long-respected status in Europe, the art of the medal has not been much appreciated in Canada until recently. Formerly, medals represented a venerable honorific tradition, but their appearance had only to be dignified and conventionally correct. The earliest medals produced in Canada combined customary heraldic, decorative and typographical elements; some emulated the classical style of the British family of medallists, the Wyons, who supplied many medals to Canada. Early Canadian medals were the work of unidentified engravers. Today many of the stylistically conservative medals produced in Canadian mints are similarly unsigned.

The first medals by well-known Canadian artists were created early in the 20th century by Louis-Philippe HÉBERT and Alfred LALIBERTÉ, both of them sculptors who had been to France. Emanuel Hahn and Robert Tait MCKENZIE, also distinguished sculptors, designed medals between the wars. Since the 1960s Dora DE FÉDERY-HUNT, a medallist of international reputation, has designed many struck medals, but has also familiarized Canadians with the cast medal, now favoured by many European artists. A number of Canadian artists have been inspired by her example, sometimes creating medals purely as works of art. Canadian pieces are regularly included in the major biennial exhibitions of contemporary medallic art staged in Europe by FIDEM (Fédération Internationale de la Médaille). The limited "consumer" base still hampers Canadian medallic art, although a few mints, notably the Royal Canadian Mint, La Mond, Lombardo and Sherritt, strike a significant number of commissioned medals. *See also* COINAGE. N.M. WILLIS

**Media Ownership** Western societies are relying increasingly on communication through various media and relatively less on face-to-face contact to organize and co-ordinate activities, disseminate knowledge and information, educate and entertain. It is expected that mediated communications will expand in importance as we enter the INFORMATION SOCIETY.

Conditions of access to the media — the implicit and explicit rules governing who may and who may not distribute messages, the nature of the messages distributed, the terms under which messages may be received and by whom — are of vital political, social and cultural importance. Those individuals and groups that possess and exercise relatively unencumbered rights to distribute messages through the media can influence large audiences and thereby help shape societal development; conversely, those who are prevented from so participating are muted and may be politically ineffectual.

Two important and interrelated factors help determine conditions of access to the media: the pattern of ownership, which shapes incentives for media use; the bundle of rights accompanying ownership, which can modify, or even eliminate, restrictions that could otherwise inhere in ownership. The bundle of rights and duties is primarily an outcome of law, but also may be influenced by traditions and ethical precepts adhered to by the owner. *See* COMMUNICATIONS LAW.

The pattern of media ownership has 4 major constituents:

**Owner Characteristics** Owners may be distinguished by the sector in which they reside: government, private, co-operative. Within each sector additional distinctions can be made. Government, eg, comprises 3 levels, each of which can, in principle, have media holdings. Moreover, managers of government-owned media can have varying degrees of independence from

their proprietors, depending on the goals set for the media. Likewise, in the private sector, many variations are possible: ownership can reside with family-run businesses; with large, professionally managed, publicly traded corporations; with religious, political or social organizations for reasons extending well beyond profit incentives; and so on. Particularly troublesome, from a public policy perspective, is conglomerate ownership of the media, where by media holdings constitute but a portion of the firm's economic domain; conglomerate ownership can create incentives for the manipulation or suppression of news that impinges on the diversified activities of the parent company. Other important characteristics of owners include nationality and language. In media studies, media owners are also often classified by social class in order to detect possible bias resulting from social stratification.

**Concentration of Control** Concentration refers to the number and size of competing outlets within a market or audience grouping, eg, newspapers in a community. Concentration indicates the degree of monopoly power enjoyed by the media owner(s) and hence the owners' power in determining conditions of access within the relevant market. The "marketplace of ideas" is premised on notions of equitable access to the media by all segments of society.

**Cross Ownership** refers to common control over different media genres (eg, print, film, electronic). It indicates the extent to which inter-media competition thrives or is restricted.

**Vertical Integration** is the extent to which media owners create, select or otherwise determine messages. It exemplifies the interrelationship between media ownership and the variable bundle of rights and duties accompanying ownership. The telephone industry, for instance, although largely monopolized and dominated by conglomerate enterprises, is proscribed by law from tampering with the messages transmitted. Moreover, access to telephone facilities for message originators must be provided by telephone companies on a "just and reasonable" basis, without "undue preference" or "unjust discrimination"; regulatory bodies (at the federal level of government, the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION) endeavour to ensure that these conditions are met. In declaring telephone companies to be common carriers, government has reapportioned rights from the owners of the medium to the general public in order to diffuse control over the origination and reception of messages in this inherently monopolized medium (*see* TELEPHONES).

The Canadian newspaper industry is a contrasting example. Current legal conceptions of press freedom, originating in a former era of greater newspaper competition, endow owners with much autonomy in selecting and creating editorial content, subject to general laws pertaining to libel, sedition, obscenity and official secrecy (*see* LAW AND THE PRESS). In the past, when newspaper competition was more vigorous and entry into publishing easier, this policy of apportioning rights to the owners of the press as surrogates for the public, rather than with the public directly, may not have been unduly restrictive inasmuch as individuals who lacked a forum could (in theory) start a new paper (*see* NEWSPAPERS).

Newspaper competition has dwindled in recent decades, however; indeed, some critics conclude that freedom of the press now resides principally with the few companies that own newspapers. The 1981 Royal Commission on Newspapers (Kent Commission) questioned the desirability of maintaining the owners' current high level of power over editorial content.

In 1980 2 chains, Southam and Thomson, together accounted for 59% English-language

daily newspaper circulation and for 48% of national daily newspaper circulation. SOUTHAM INC published 14 daily newspapers and owned nearly 50% of 2 other dailies. It also published 39 business periodicals, including the weekly FINANCIAL TIMES. It had a substantial interest in radio, television and cable-vision systems through SELKIRK COMMUNICATIONS LTD. Thomson Newspapers Ltd, the other major Canadian chain, owned 40 Canadian dailies and 12 weeklies. The Canadian operations, however, constituted but a small portion of the multinational conglomerate whose activities extended into wholesaling and retailing, real estate, oil and gas, insurance, travel and tourism, financial and management services, high technology communications, trucking, and so forth. In Canada, Thomson controls Hudson's Bay Co and its subsidiaries. Other major daily newspaper companies in Canada include TORSTAR CORPORATION, the Sun Group, the IRVING GROUP, Gesca (a subsidiary of POWER CORPORATION) and QUEBECOR INC.

The monopolistic nature of newspaper publishing can be further highlighted by noting that, in 1984, only 6 communities enjoyed local competition among 2 or more newspapers in the same language with separate ownership. Moreover, the major common source of news-gathering and distribution for all dailies, CANADIAN PRESS, is owned by the dailies, with Southam and Thomson being the largest participants. Through subsidiaries, such as Broadcast News, Canadian Press also serves the broadcasting industry.

The Royal Commission on Newspapers recommended measures to stimulate competition, erode monopoly and decrease the editorial autonomy of the owners. None of the commission's major recommendations have been implemented by the government.

Ownership of the periodical press is also highly concentrated. MACLEAN HUNTER LTD in 1979 accounted for about 32% of English-language and about 40% of French-language consumer magazine advertising revenues. In 1978 Maclean Hunter received 56% of revenues accruing to English-language business periodicals and 61% of revenues flowing to French-language business periodicals. Maclean Hunter also has a strong presence in Canadian radio, television, cable television, and in daily newspapers (through the Sun Group). The second-largest business periodical publisher is Southam which, in 1978, accounted for 30% and 27%, respectively, of the English and French business press (*see* MAGAZINES).

While a vibrant and competitive domestic BOOK PUBLISHING industry exists in Canada, the industry is nonetheless dominated by foreign owners. Although Canadian-controlled companies produced about 78% of the new Canadian titles published in 1979, Canadian firms accounted for under one-third of total revenues from book sales in Canada.

BROADCASTING, which is predominantly Canadian owned, is less highly concentrated than either telephones or newspapers, although levels of concentration are still quite high. The most recent data compiled indicate that in 1975 the 2 largest television broadcasters, BATON BROADCASTING INC and Télé-métropole, together accounted for 24% of private-sector advertising revenues, and that the 4 largest companies (including Southam-Selkirk Communications Ltd and Western Broadcasting) accounted for 40% of revenues. However, the existence of a strong public-sector component, represented by the CANADIAN BROADCASTING CORPORATION and certain provincially sponsored networks, increased ownership diversity. These government-owned undertakings do not pursue profit maximization as the private sector does, and consequently conditions of access are liberalized for the system as a whole. In addition, for both the

private and public sectors, access is to some extent regulated by the CRTC; without Canadian content quotas as administered by this body, Canadian performers and other creative talent would largely be foreclosed from private-sector television owing to the cost disadvantage facing Canadian productions compared to American imports.

The 10 largest radio chains in 1975 controlled 75 stations, accounting for 44% of private-sector revenues. The 4 largest, CHUM LTD, Standard Broadcasting, Western Broadcasting, and Southam-Selkirk, are also major television broadcasters. For example, in addition to owning 21 radio stations from Vancouver to Halifax, Chum Ltd owns 5 television stations and is licensed to program a national music video channel for cable systems.

The CABLE TELEVISION industry, termed a component of the broadcasting system by the Broadcasting Act, is also highly concentrated nationally. The largest multisystem owner, ROGERS CABLESYSTEM INC, in 1980 accounted for 30% of Canadian subscribers, while the top 3 companies (Rogers, Télécable Videotron Ltée and Maclean Hunter) accounted for about 50% of subscribers. Cable systems are local monopolies. Conditions of access to cable systems are subject to regulation by the CRTC.

Industrial incentives for concentration of control stem primarily from the pursuit of profit. Profits can be increased by raising revenues, by lowering costs, or both. Monopoly control gives a firm power to increase prices whereas competition erodes this power; consequently, concentration of control can allow higher revenues. Likewise, costs per viewer or reader can be reduced as a firm increases its audience, since the costs of the content tend to be stable as additional audiences are reached. One method of increasing audience size is by eliminating competitors.

Similarly, vertical integration between the means of transmission (the media proper) and the content transmitted is an outcome of the quest for profit. Vertical integration can shore up or create monopoly at stages of production that otherwise would be competitive. In 1923, for example, Famous Players Canadian Corporation attained dominance of FILM exhibition through its vertical integration with Paramount Pictures (US); these proprietary links enabled Famous Players, under the guidance of N.L. Nathan, to seize control of its principal rival by eliminating the latter's major source of feature films.

Levels of concentration, cross ownership and foreign ownership are outcomes of government policy, both explicit and implicit. Government bears explicit responsibility for ownership patterns and the accompanying bundle of rights and duties in broadcasting insofar as each broadcasting undertaking is licensed by the government. Government is implicitly responsible for ownership patterns, and for the accompanying bundle of rights and obligations, in nonregulated media industries. Canada's weak combines legislation allowed K.C. IRVING to acquire all 5 English-language daily newspapers in NB; it sanctioned the same-day closing of rival papers owned by Thomson and Southam in Ottawa and Winnipeg, respectively; and approved Thomson's sale to Southam of its interest in the Vancouver *Province* while Southam was proprietor of the Vancouver *Sun*. It may well be that the power of media owners to shape public opinion is feared by government to such an extent that monopolies can be formed and can persist with little likelihood of redress.

Existing patterns of ownership are being strained by technological developments, principally the integration of cable television with communication satellites and the replacement of analog transmission by digital transmission

techniques (see SATELLITE COMMUNICATIONS). These developments have 2 main effects. First, they increase national and international communications at the expense of local and regional communications owing to the economies of scale attained through larger audiences and the technological ease with which these larger audiences can be reached; eg, the electronic transmission of the Toronto *GLOBE AND MAIL* via satellite to Vancouver (and other communities) for local printing, and the proliferation of specialty television services delivered nationally by cable systems interlinked by satellite. Second, previous distinctions between telephone, television, print, film, data communication, and so forth are being eroded as all forms of mediated communication are increasingly encoded digitally for electronic transmission; the differences that remain concern the bandwidth used and the nature of the terminal device to which the messages are destined.

These trends have important implications for ownership patterns and on conditions of access. First, to the extent that national and international communications are economically favoured by these technological developments, access by local groups seeking a local audience may become increasingly difficult; national and multinational ownership of communications firms may be favoured rather than local and regional ownership. Second, since distinctions among hitherto separate media are being blurred, an increasing number of mergers can be expected among erstwhile print, electronic and film concerns that wish to decrease direct competition. Third, inasmuch as the means of transmission exhibits strong monopolistic characteristics (one domestic satellite carrier, Telesat Canada; one cable company in each market; one telephone company in each locality), measures to prevent vertical integration between message origination and selection on the one hand and transmission on the other become even more vital.

ROBERT E. BABE  
Reading: P. Audley, *Canada's Cultural Industries* (1983); W. Clement, *The Canadian Corporate Elite* (1975); W. Lippman, *The Public Philosophy* (1955); G. Marcel, *Man Against Mass Society* (1978); Royal Commission on Newspapers, *Report* (1981).

**Medical Devices Industry**, sometimes referred to as the health-care products industry, is made up of companies that manufacture, import or export diagnostic or therapeutic products used in health treatment, including those for veterinary use. Imports play a dominant role in supplying the domestic market and the proportion of imports allowed into Canada duty free is very high. As a result, distributors outnumber manufacturers and many manufacturers also import complementary lines.

Products in the medical devices industry range from relatively low-technology, mass-produced items such as surgical dressings to highly capital- and technology-intensive industries manufacturing radiation-therapy devices, heart pacemakers and computer-assisted diagnostic equipment. The most recent survey of the industry was done in 1978 by the Dept of Industry, Trade and Commerce. Of the 178 companies responding, almost half were entirely Canadian owned, about 10% had minority Canadian participation, and the remainder were entirely foreign owned. About 16 000 people were employed in the medical devices industry in 1977; the industry is heavily concentrated in Ontario and Québec, which accounted for about 87% of employment. In the same year, about 485 companies manufactured or distributed medical devices in Canada and about \$9.4 million was spent on research and development in radiation, diagnostic and therapeutic equipment, clinical laboratory instrumentation and diagnostic, therapeutic and monitoring equipment.

The combined value of domestic and export

markets for health-care products was estimated at about \$860 million in 1977; the value of exports was estimated at about \$60 million. Imports supplied about 75% of the domestic market; exports represented more than 20% of domestic shipments. Both provincial and federal governments have programs and incentives to encourage exports. Considering Canada's small population, its share of total world markets for medical devices (3% in 1977) is large.

Medical devices are controlled by Health and Welfare Canada regulations authorized by 8 federal Acts. Two bureaus administer the regulations. The Bureau of Medical Devices ensures that only safe and efficient medical devices are sold in Canada and watches for potential hazards, deficiencies in performance and unsubstantiated claims made by manufacturers. The Radiation Protection Bureau sets standards for radiation safety. The hazards of X-ray machines, MICROWAVE equipment, and LASER and ultrasonic devices are evaluated and controlled by regulation.

The industry in Canada is represented by the Canadian Assn of Manufacturers of Medical Devices (CAMMD), a trade association that includes manufacturers, distributors and importers. The CAMMD Award for Medical Achievement is presented annually to an outstanding Canadian for work in health care carried out in Canada.

T. SYKES

**Medical Drug Abuse** Although medicines have been misused for as long as they have been available, a universally accepted definition of the term "drug abuse" does not exist. Broadly, drug abuse can include any failure to comply with the prescribing physician's orders, eg, forgetting to take medication or taking less or more than directed. Commonly, however, the term "drug abuse" denotes the self-administration of psychoactive substances in a deliberate attempt to alter mood, perception, thought and behaviour. In addition to the illicit drugs, several classes of prescription medications affect brain function in this manner. If a psychoactive substance produces effects perceived as beneficial (either as a pleasurable sensation or as relief from a state of depression or anxiety) the user may take the drug repeatedly. The cycle of administration and reward may become so well established in some users that they become psychologically and possibly physically dependent on the drug and other more constructive methods of coping with problems become less important. Social problems, family breakdowns and unemployment may result (although it is true that such problems may have initially encouraged the use of mood-altering drugs). Medical complications are also common; individuals develop a "tolerance" for the drug, ie, as the body adapts to the presence of the substance and the desired effect decreases in intensity, users compensate by increasing the dosage, thus also increasing the risk of dangerous side effects (eg, barbiturate-induced cessation of breathing). When administration is discontinued suddenly, the body continues to compensate for the drug; with many drugs, this unmasked compensation causes withdrawal symptoms, which are usually opposite to the initial effects of the drug. For example, withdrawal from sedatives is characterized by signs of hyperexcitable nerve cells (anxiety, tremors and, in severe cases, seizures and hallucinations) while withdrawal from stimulants is characterized by lethargy and mood depression.

The psychoactive prescription drugs subject to abuse can be categorized as opioid analgesics, sedative-hypnotics and stimulants. Other drugs used in PSYCHIATRY, such as the antipsychotic tranquilizers, the antidepressants and lithium, produce effects that normal individuals find unpleasant and they are therefore seldom used

for nonmedical reasons. However, they are not always taken as directed, and their misuse can cause untoward effects.

Opioid analgesics (sometimes termed narcotic analgesics) are either derived from the opium poppy or manufactured synthetically. They include heroin, morphine, methadone, meperidine and codeine. They are used medically primarily for the relief of pain, although they are also employed to suppress a cough, and occasionally in the treatment of severe diarrhea. Their dependence liability is generally high, and for this reason, some (such as heroin) may not be prescribed legally in Canada. Over the past 10 years, nonmedical users of prescription opioids in Canada have increased so greatly in number that they outnumber heroin users in some treatment populations. Users obtain drugs illegally by means of forged prescriptions, by thefts from pharmacies or by feigning the symptoms of a painful, difficult-to-diagnose disorder (eg, low back pain). Favoured drugs include the analgesics meperidine (demerol R), oxycodone (in the form of Percodan R) and codeine, and the cough suppressants hydromorphone and hydrocodone (in Dilaudid R and Novahistex DHR cough syrups, respectively). Unlike street heroin, prescription opioids are pure, and many are effective when taken by mouth. Oral use also eliminates the risks associated with injection. Those dependent on prescription opioids suffer the same side effects as heroin users and are treated in the same manner, ie, by methadone substitution or in drug-free therapeutic communities. Because of the high dependence liability of opioids, physicians are more reluctant to prescribe them for patients with chronic pain. Other non-pharmacological therapies are being explored. In terminally ill patients, effective and long-lasting pain relief is of primary importance and analgesics are not withheld unless the side effects become life threatening. The difficulty is making these drugs readily available to those who need them while restricting their availability to illicit users.

The many prescription drugs that slow the activity of the central nervous system are called sedative-hypnotics. They include the barbiturates, general anesthetics, anti-anxiety tranquilizers (eg, benzodiazepines) and a number of nonbarbiturate sedatives. These substances are prescribed to relieve anxiety, to induce sleep, to prevent or treat epileptic seizures, or to produce surgical anesthesia. All can create dependence in some individuals.

The barbiturates have been used since the early 1900s. Although their dangers were universally recognized (severe respiratory depression, high-dependence liability and life threatening withdrawal reactions), safer alternatives did not exist until recently. The number of prescriptions has decreased significantly, however, since the introduction of the benzodiazepines into Canada in the 1960s. The short-acting barbiturates such as secobarbital (seconal R) are still used illicitly, since they take effect quickly and produce the most euphoria. They are often administered to enhance the effects of other sedative-hypnotics or to terminate the unpleasant effects of a long stimulant binge.

The benzodiazepines (13 different kinds were being sold in Canada by 1984) were originally thought to be unusually safe and to have a very low dependence liability. For this reason they are heavily prescribed both for treatment of anxiety — eg, diazepam (in Canada sold under 10 trade names, including Valium, and generically by 3 companies), chlordiazepoxide (Librium R), oxazepam (Serax R) — and for induction of sleep, eg, flurazepam (Dalmane R) and triazolam (Halcion R). Physicians agree that these drugs are safe for short-term uses (ie, less than 4 weeks), but the value of long-term drug therapy is questionable. When long-term ad-

ministration of tranquilizers is stopped, the original symptoms of anxiety often reappear. This state may be temporarily enhanced by the emergence of withdrawal symptoms, which are generally less severe than those induced by barbiturates or alcohol, but can still motivate the individual to resume drug use. Some evidence suggests that the long-term use of these drugs can adversely affect memory and other aspects of brain function. Physicians are increasingly reluctant to prescribe benzodiazepines for longer than a month without supervision. In Canada, as elsewhere, they are prescribed to women about twice as frequently as to men, and to the elderly much more often than to the young (see WOMEN AND HEALTH). Those suffering from chronic diseases are also likely to receive these medications. These imbalances have generated considerable discussion about prescribing practices, particularly among those who feel that tranquilizers are being prescribed to women for problems that could be best handled by more constructive means. Although Canadian data suggest that the great majority of benzodiazepine users (between 90–95%) take their medication as prescribed, given the large number of prescriptions, the remaining 5% constitute a significant number of individuals, some of whom require medical assistance to stop use. Benzodiazepines (especially diazepam) are sometimes used nonmedically, often to enhance the effects of other psychoactive drugs including alcohol.

The nonbarbiturate sedative hypnotics offer few therapeutic advantages over the benzodiazepines. Of these, methaqualone has been the most heavily abused, although the problem does not appear to be as severe in Canada as elsewhere. This drug is no longer manufactured legally in the US, although small amounts are still made in Canada. The licit supply available for diversion of this drug to the street has decreased, but illicit consumption of other drugs of this class may increase as a consequence.

The term "stimulants" refers to a broad category of agents that includes the amphetamines and related drugs, as well as cocaine, caffeine and nicotine. The amphetamines were formerly prescribed for several disorders such as obesity, mood depression and lethargy. However, their ability to produce profound stimulation and euphoria led to epidemics of use in Japan, Sweden, the US and other countries. Because of their high dependence liability and their ineffectiveness as long-term appetite suppressants, their use as "diet pills" was strictly curtailed in Canada in 1972. The prescribing of amphetamine and methylphenidate (Ritalin R) was limited to a few disorders that included the treatment of hyperactive children and of narcolepsy. The use of some drugs (eg, phenmetrazine) was discontinued altogether, and other less potent appetite suppressants such as diethylpropion (Tenuate R) were reclassified as controlled drugs under the Food and Drugs Act. Since the mid-1970s there has been a significant drop in the abuse of both licitly manufactured amphetamines and illegally synthesized methamphetamine. However, the consumption of illicit cocaine and of over-the-counter mild stimulants (such as ephedrine, phenylpropanolamine, caffeine and propylhexadrine), which are sold as decongestants and "wake-up" preparations, has risen. All of these drugs, when taken in sufficient quantities, can produce toxic side effects.

**Medical Education** There are 3 distinct phases of medical education. The first is undergraduate education, in which students with prior university education (the minimum requirement is 2 years) are taught the basic knowledge, skills and attitudes of the physician. Upon completion of

undergraduate study students are awarded the degree of medical doctor (MD). Second, to be eligible for a licence to practise, all MDs must complete at least one year of internship during which time they work under supervision in a hospital or clinic, gaining practical experience and being given increasing responsibility for the care of patients. Many graduates choose to undertake a minimum 2-year training program leading to the certificate of the College of Family Physicians of Canada; others enter 4- or 5-year programs leading to certification in one of the 44 medical specialties recognized by the Royal College of Physicians and Surgeons of Canada. The third and most recently developed phase is continuing medical education. This includes all programs of independent or supervised study through which practising physicians seek to keep abreast of the latest developments in medicine of concern to them.

Undergraduate and postgraduate education is provided exclusively by Canada's 16 university medical faculties. Continuing education is provided by the medical faculties, by various national, regional or local professional societies, by hospitals or pharmaceutical companies, and by other agencies or groups.

**History of Medical Education in Canada** The first program of medical education in Canada was created in 1824 at the Montreal Medical Institution, which 5 years later became the Faculty of Medicine at McGill University. By the turn of the century, schools had been established at McGill, University of Toronto, Laval (which had schools both in Québec City and Montréal — the latter eventually becoming the Medical Faculty of Université de Montréal), Queen's, Dalhousie, University of Western Ontario and University of Manitoba. An eighth school at University of Alberta in Edmonton was opened in 1913. By 1950 additional schools had been established at University of Saskatchewan, University of Ottawa and University of BC.

Two events in the early 20th century profoundly affected the quality of medical education in Canada. The first was the publication in 1910 of *Medical Education in the United States and Canada* by the Carnegie Foundation for the Advancement of Teaching. Written by Abraham Flexner and based on his visits to the 155 schools of medicine then existing in the 2 countries, the publication proposed that acceptable schools of medicine must have high standards for the admission of students, must be part of and subject to the rigorous academic standards of a university, must base their educational programs on a scientific approach to medicine and must encourage the scholarly research of their faculties.

So profound was the impact of the Flexner Report that within 15 years of its release most of the schools identified as substandard (nearly half of the total) had closed their doors forever. Although no Canadian schools were closed, standards at the weakest were greatly improved. The second important influence was the formation of the Medical Council of Canada in 1912. The council established a single standard examination for the graduates of all medical schools in Canada which was eventually accepted by all provincial medical licensing authorities as a criterion for awarding licences. As a result, the quality of medical education across the country became more standardized and, just as important, medical graduates became free to move from one part of the country to another with the reasonable expectation that their credentials would be recognized and accepted.

The next major influence on medical education was the publication in 1964 of the report of the Royal Commission on Health Services. The commission, under its chairman Mr Justice Emmett HALL, was established to investigate the provision of health services. It concluded that

the supply of physicians provided by the 12 medical schools was insufficient to meet the country's needs without continued reliance on high levels of immigration of physicians trained in other countries. This led to the almost immediate establishment of new schools at McMaster University, University of Calgary and Memorial University, and to the accelerated development of the school at University of Sherbrooke. Along with the opening of these 4 new schools, existing faculties increased their enrolments. As a result, the total enrolment of first-year medical students in Canada rose from 1133 in 1964 to 1882 by 1982.

#### **Different Approaches to Medical Education**

Prior to WWII the curricula in Canadian medical faculties had generally evolved from that first established at McGill, which was in turn based on the Edinburgh model. Strong emphasis on bedside teaching was introduced at McGill by William OSLER in the 1880s. The curriculum consisted of 2 years of lectures and laboratory exercises in the basic sciences of (with greater or lesser emphasis) anatomy, physiology, biochemistry, bacteriology, pathology and pharmacology, followed by 2 years of clinical instruction in hospital wards. The Flexner tradition, with its emphasis on the theoretical basis of the fundamental medical sciences, shaped the basic sciences teaching. In contrast, clinical instruction emphasized the practical aspects of medical care and was based almost entirely on the exposure of students to hospital patients.

Scientific knowledge, much of which was quickly absorbed into medical practice, increased dramatically during and after WWII. Consequently the already crowded curriculum of medical students expanded as well. At about this time a new breed of clinical teachers appeared in the medical schools. Young men and women, attracted by the increasing support available for research and by the opportunities a research career could offer, were no longer satisfied with training only in the clinical disciplines but sought a broader and more profound theoretical grounding in one or more of the basic sciences. They became the forerunners of the new generation of clinical scientist-teachers who now strongly influence all medical faculties.

By the late 1950s and early 1960s Canadian medical faculties were staggering under the stresses of a rapidly expanding body of knowledge that could not be adequately conveyed in the curriculum then in use. Medical students became increasingly frustrated and vocal about the volume of information they had to learn, the relevance of which was not always apparent. In response, most schools started introducing students to patients in the first rather than the third year, in order to provide a framework of relevance for the basic sciences that still had to be taught. To accommodate the change, basic science laboratory exercises were either reduced in number or eliminated.

Many schools adopted integrated or "systems" curricula in which the basic and clinical features of such systems as the cardiovascular, musculoskeletal, respiratory or digestive were taught in integrated blocks. The students learned, in a co-ordinated sequence, the basic sciences of the particular system as they were learning its clinical features, diagnosis and management. It was expected that the systems approach would provide students with a conceptual framework on which they could base their diagnosis and treatment. In the "new" curricula, lecture and laboratory were no longer relied upon as the principal educational tools. Seminars and tutorials were emphasized. To cope with the growing body of knowledge that had to be absorbed, schools also encouraged students to assume more responsibility for their own education, and to develop their problem-solving skills.

The most radical of the new curricula, and one that attracted worldwide attention, was the "problem-based learning" approach adopted at McMaster. In this curriculum, small groups of students, under the guidance of an instructor, worked together in collecting and integrating information, either from books and journals or from faculty consultants, to solve problems devised for them by the faculty. The program emphasized teamwork between students and faculty. The faculty made no pretence at providing students with an encyclopedic fund of medical knowledge, but assumed that after the experience of a problem-based curriculum students would have developed the ability and self-reliance to deal with the clinical problems they might encounter in practice. Critics of the program claim that the performance of its graduates has been consistently below the average for graduates of other Canadian schools and that failure rates have been higher. On the other hand, graduates of McMaster have been accepted into some of the most prestigious postgraduate training programs in N America and elsewhere, where they have received highly favourable ratings. The curricula at McMaster and Calgary are both concentrated into 3 undergraduate years, with only a month of vacation per year. Both faculties admit older students, generally in their mid- or late twenties, who are assumed to be mature and experienced enough to cope successfully with such demanding programs of study.

In contrast, the universities of Montréal and Saskatchewan admit younger than average students. The 5-year programs of these schools are designed to provide students with greater opportunities to "ripen" into their roles as future physicians. The other medical schools have 4-year curricula, as do almost all others in N America.

**Accreditation of Medical Schools** Since 1934 schools in Canada have been regularly accredited by the US body now called the Liaison Committee on Medical Education. With the advent of universal medicare in Canada in 1970, the patterns of medical care and practice in the US and Canada began to diverge, making it necessary for Canada to adopt a system of accreditation more appropriate to the country's needs. Accordingly, in 1979 the Committee on Accreditation of Canadian Medical Schools was formed as an independent body to examine and attest to the quality of educational programs in Canadian medical schools. Schools in Canada are now jointly accredited by both bodies, with the assurance that Canadian schools meet Canadian standards.

**Emerging Issues** By 1984 medical schools were graduating exactly the number of doctors the Hall Commission had decided that Canada would need by the middle 1980s. Unfortunately the commission's projection of Canada's population growth between 1964 and 1984 was an overestimate, and as a result the physician population is now growing (proportionately) at a faster rate than the rest of the population. Planning for Canada's physician needs is complicated by a number of factors. First, the number of women physicians is rising rapidly, and because they choose different specialties and practice locations from men, their potential influence on the distribution of physicians and the availability of certain skills is important. Second, large numbers of doctors emigrate from and immigrate to Canada. Shifts in the migration of physicians can be quite sudden and are not easily influenced by legislation or regulation. For many years Canada has had a negative "balance of trade" in physician labour power, with an annual net loss equivalent to the output of 2 of its medical schools. Future changes in emigration and immigration can be expected to have a major impact on the supply of physicians

in Canada. Third, in the next 30 or 40 years the percentage of Canada's over-65 population will double and Canada will require more physicians trained to meet the health needs of the elderly. Fourth, in 1980, 500 Canadians who had been unable to gain admission to a Canadian medical school were enrolled in schools abroad, many of which do not meet Canadian accreditation standards. These students expect to return and practise in Canada, and this will affect both the size and the quality of the available pool of doctors. Fifth, new technologies and therapeutic procedures may have the effect of reducing health manpower needs in the future.

DOUGLAS WAUGH

Reading: S.E.D. Shortt, ed, *Medicine in Canadian Society* (1981).

**Medical Ethics** are concerned with moral questions raised by the practice of medicine and, more generally, by health care. Because of the increasing importance of health care to an aging population within a society wealthy enough to afford it, and because of the increased complexity of health care, and the reduced reliance upon tradition and authority in moral matters, debate over issues in medical ethics has grown more intense. Certain issues present particularly difficult ethical dilemmas.

**Physician-Patient Relationship** How much information is a patient entitled to receive before accepting or refusing treatment? Is a physician or other health provider ever permitted to deceive or withhold information from a patient? To what extent, if any, may a physician's personal moral or social beliefs influence his or her relationship with and advice to a patient? The Hippocratic Oath, which is still administered in many (but not all) medical schools, omits any reference to a moral obligation on the part of physicians to be honest with their patients. Traditional medical ethics were paternalistic; information was given or withheld as doctors thought best. Since the beginning of the 20th century, however, courts in the US, Britain and Canada have ruled that a "mentally competent" adult patient is entitled to all information necessary to give "informed consent" to treatment. Nevertheless, ascertaining the true wishes of a patient may not always be easy, eg, the patient may be seriously ill, drugged, in pain, depressed, and may be less than fully rational and competent. As a result, physicians are not necessarily released from the obligation of using their own judgement to determine, at least in the short run, what is best for the patient.

**Reproductive Technology and Medical Interventions** Besides the issue of ABORTION, questions have been raised about artificial methods of inducing pregnancy (eg, by donor artificial insemination and *in vitro* fertilization); about gestation, eg, surrogate motherhood; and about various contraceptive techniques and surgical sterilization procedures.

**Death and Dying** When breathing and heart-beat are temporarily sustained by machine in a patient without brain function, is that patient alive or dead? Should it be permissible, for example, to harvest organs from such an individual for the purpose of organ transplantation? Is a health practitioner permitted to provide life-sustaining treatment to a patient who has forbidden medical treatment? Does the dying patient have the right to be assisted should he or she wish to commit suicide? In these questions the value of "sanctity of life," that every life must be preserved at all costs, is frequently at odds with the value of the "quality of life," according to which an individual has a right to a humane and dignified death. Whether and when to use technology to prolong the life of infants with severe genetic diseases is one of the most difficult decisions health-care practitioners and society must make, and involves again

the conflict between "sanctity" and "quality." Those who advocate what is sometimes called "medical vitalism" support the former and argue that the potential abuse of quality-of-life judgement is enormous; their opponents argue that concern for relief of suffering and a dignified death will help promote a society more sensitive to human life (see DEATH AND DYING).

**Special Patient Populations** Who should decide treatment on behalf of severely handicapped newborns (or any group who cannot speak for themselves), and on what basis should these decisions be made? In some ethnic groups, an extended family (including grandparents) is involved in the rearing of children. Are there therefore special circumstances in which the extended family should be involved in medical decisions regarding newborns?

**Economic and Social Policy** Do patients have a right to health care regardless of expense? When patients' needs exceed available health-care resources, how should those resources be distributed? Considerations of social welfare have traditionally been used to justify intervention into the physician-patient relationship, eg, physicians have been required to report on patients with gunshot wounds or communicable diseases. The question arises, to what degree should health professionals act in accordance with the best interests of their society?

**Research and Experimentation Upon Human Beings** When is experimentation upon children justified? Is it ethical to proceed with an experiment that requires the subject of research not to know whether the drug he is taking is a sugar pill or pharmacologically active?

**Individuals and Organizations Involved in Medical Ethics** Legal and governmental bodies are concerned primarily with the public regulation of health practices. The Law Reform Commission of Canada established the Protection of Life Project in 1976. This group has issued reports and recommendations on topics such as the definition of death, euthanasia and the withholding of treatment, and behaviour control techniques. Provincial law-reform commissions have also issued reports on aspects of ethics and health care, eg, children's consent to medical procedures (Alberta, 1975); artificial insemination (Saskatchewan, 1981); and new forms of human reproduction (Ontario, 1984). Views of legislators on some issues of medical ethics may be expressed in provincial Acts governing the conduct and licensure of the health professions, as well as in special enactments (eg, Manitoba's Act on defining death, and the Human Tissue Gift Acts, governing transplantation, that were adopted by a number of provinces). Cases brought before courts may involve the judges in intricate questions of medical ethics, such as whether physicians are obliged to advise patients against relatively useless surgery (*Zamparo v Brisson*, Ontario Court of Appeal, 1981), and whether a physician, when informing a patient of the risks and benefits of a medical procedure, should take into account the patient's economic situation (*Reibl v Hughes*, Supreme Court of Canada, 1980).

Organizations of health professionals are involved in establishing codes of ethical behaviour on behalf of their membership. Some have committees charged with enforcing ethical behaviour, or with studying ethical problems that arise in the profession. A code of ethics for physicians established by the Canadian Medical Association (CMA) has been revised on a number of occasions. In 18th-century England, a long, highly detailed code was formulated, but current codes usually consist of a brief set of abstract principles that need to be supplemented by guidelines governing implementation. The codes do not, of course, preclude the occurrence of serious conflicts and ambiguities, and in fact may sometimes help inspire them. Also, while a

code may represent the ethical view of the profession, physicians are not necessarily familiar with it. As far back as 1880, an editorial in the *Canada Lancet* complained that most doctors were not familiar with the code, and a 1983 survey of 300 Toronto physicians found that 68% had never read the code and 84% could not say whether references were made in it to abortion or to organ transplantation.

Legislation may require professional associations to establish committees to monitor ethical conduct. Independent committees on ethics have been established by the CMA, the Royal College of Physicians and Surgeons of Canada and the Canadian Pediatric Society. Some lay associations and church groups also issue statements representing members' views on specific issues in medical ethics, eg, the United Church of Canada issued a report on ethics and genetics in 1978.

Courses on medical ethics became widely available in the 1970s. Most Canadian universities and some colleges offer at least one and sometimes several undergraduate courses. Graduate instruction is also available in some Canadian universities, largely within departments of philosophy, theology or religious studies. Because of year-to-year variations, it is difficult to say what proportion of medical schools include ethics within the curriculum. For several decades prior to the 1970s, however, formal ethical instruction included within the medical curriculum was the exception; today it is the rule.

Research into aspects of medical ethics is conducted by individual scholars from many disciplines, including the health professions, the humanities and the social sciences. In addition, research institutes investigating questions of medical ethics have been established in a number of Canadian cities including Toronto (the Cardinal Carter Centre), Montréal (Centre de Bioéthique) and London, Ont (the Westminster Institute). Institutions involved in research have commonly established ethics committees to review the ethics of proposed research programs. These committees are likely to refer to guidelines on the ethics of research established by the Medical Research Council of Canada (1978) and by the Social Sciences and Humanities Research Council of Canada (1979). Increasingly, hospitals and other institutional providers of health care are establishing internal ethics committees to consider their own practices and those of their staff. See BIOETHICS.

BENJAMIN FREEDMAN  
Reading: T.L. Beauchamp and J.F. Childress, *Principles of Biomedical Ethics* (1979); Law Reform Commission of Canada, *Euthanasia, Aiding Suicide and Cessation of Treatment* (1983); *Criteria for Determination of Death* (1979) and *Medical Treatment and Criminal Law* (1980); W.T. Reich, ed, *The Encyclopedia of Bioethics* (1978).

**Medical Jurisprudence**, broadly defined, covers the relationship between a patient and a health-care provider such as a doctor, nurse, dentist, physiotherapist, or even an institution such as a HOSPITAL. The law has established standards, it regulates practice and provides a mechanism for patients to claim compensation in the case of an injury. The source of the law may be statutes (provincial or federal) or judge-made law. While the legal principles set out by judges in case law are generally consistent throughout Canada, there are some variations in legislation from province to province.

Medical jurisprudence is concerned with many basic and profound issues, such as a patient's right to consent to health care. Every person, including children who understand the nature and consequences of treatment, has the right to be fully informed of the risks of a procedure and to choose whether to proceed with it or not (see MEDICAL ETHICS), even if refusing treatment will result in the death of the patient. In 1980 the Supreme Court of Canada stated that the standard for the disclosure of risks must

be what the reasonable patient would want to know and not what health-care professionals customarily choose to explain. Another basic legal principle is the requirement that in carrying out health care, a person or institution must exercise reasonable skill, knowledge and judgement. This standard is derived from the custom or common practice of the profession or group, ie, that a doctor must perform as a reasonable doctor would in the circumstances (see MALPRACTICE). If this standard is not met and a patient suffers injuries as a consequence, the health-care provider may be found negligent and have to pay monies to the patient as compensation. Very complex issues arise when the proposed medical treatment is experimental or when it involves organ transplantation, artificial insemination or *in vitro* fertilization. Then, not only must the right of the individuals involved be considered but the values and goals of society as well.

A number of problems have emerged from modern medical practice where the "team" approach to health care is used and where the hospital assumes a major role as a health-care provider. Very often a patient may be cared for by many highly trained doctors and nurses, and frequently there is an overlap in their functions; in many cases that have gone to court it is clear that each member of the team has deferred to the others his or her responsibility in decision making or communication, with the result that the patient has received substandard care. Cases have also arisen concerning whether or not a nurse should carry out a doctor's orders when she believes that they will be harmful to the patient. The law states that if a nurse carries out such an order she may be negligent and, as in the case of a lethal overdose of a drug, might even be charged under the CRIMINAL CODE.

Hospitals have assumed a greater role in providing health care and are increasingly being held accountable to patients. The earliest hospitals were charitable institutions and were shielded from liability by the courts, but modern hospitals are large, complex organizations that as far as the public is concerned constitute the heart of the health-care system. A hospital as an employer is liable when any employee is held to have injured a patient through negligence. However, a hospital also has certain direct responsibilities to a patient, including the duty to select competent and qualified employees and to instruct and supervise them; to provide proper facilities and equipment; and to establish systems necessary to the safe operation of the hospital. Courts have recently noted that the public expects hospitals to provide competent medical treatment. For example, in the emergency department of a hospital a patient may receive medical treatment by a doctor who is provided by the hospital but who is not an employee of the hospital. Whether the hospital should be liable when such treatment is substandard remains to be resolved by the courts.

Law suits by patients against health-care providers are increasing. Resort to the legal process brings difficulties for all parties. In some provinces the patient may have to make a preliminary application to the court for an order allowing him to gain access to his health records. Litigation is slow and costly, and those sued are usually concerned that the allegations made against them may affect their reputations. Even if the patient is successful, money can never compensate for the loss suffered. However, there is at present no alternative to the law suit for resolving a patient's claim for compensation. The alternative of reporting a health-care professional to his or her governing body for discipline, while sometimes effective for that purpose, does not result in compensation to a patient.

ELLEN PICARD  
Reading: T.D. Marshall, *The Physician and Canadian Law* (2nd ed, 1979).

**Medical Research** ranges from fundamental research to applied technology. Fundamental research involves investigation into biological functions; knowledge thus derived may then be applied in clinical research to help understand specific diseases and to develop cures or methods of prevention. Applied technologies result from both fundamental and clinical research in the form of vaccines, drugs, instrumentation, diagnostics, prostheses and other health care products. Physicians, biologists, biochemists, biomedical engineers, chemists, dentists, veterinarians, health economists, nurses, physicians and pharmacists are among the health professionals involved in medical research.

The discovery of **INSULIN** in 1921 by Frederick BANTING, J.J.R. MACLEOD, Charles BEST and James COLLIP, the most celebrated event in Canadian medical research, spurred development of biomedical research in Canada, and led to the establishment of the Connaught Laboratories and of the Banting Institute at U of T. Since that time, research in Canada has been conducted into areas such as molecular biology, immunology, nutrition and metabolism, reproductive biology, CANCER, behavioural sciences, genetics, developmental biology, DENTISTRY, microbiology, drugs, OCCUPATIONAL DISEASE, health care organization, environmental health hazards, and the biology of human populations. In addition, Canadian researchers are examining the function and diseases of particular organs such as the skin (dermatology), the blood system (hematology), the kidney (nephrology), the eye (ophthalmology), the ear, nose and throat (otolaryngology), the stomach and intestines (gastroenterology), the endocrine glands (endocrinology), the respiratory system (respirology), and connective tissue disorders. The range of accomplishments is impressive. Twenty-eight Canadians have received the Gairdner Award for outstanding achievements in Canadian medical science. Research at the U of T in cardiovascular surgery alone has contributed significantly to the overall treatment of HEART DISEASE. Canadians have been responsible for major developments in heart pacemakers, heart-lung machines to oxygenate blood and correct heart defects, and the first coronary care units. Hans Selye broke new ground in the understanding of STRESS. In the neurosciences Canadians have made major contributions to the knowledge of the central nervous system and its related diseases. The Montreal Neurological Institute (MNI est in 1934), is an important centre for neuroscience research. Its founder, Wilder PENFIELD, not only pioneered the technique of brain-mapping, which is conducive to the better understanding of localized functions of the brain, but also built the MNI into an internationally known training centre. Research at the MNI has led to improved surgical and nursing techniques for the management of spinal lesions, to the development of electroencephalography to treat conditions such as epilepsy, and to a deeper understanding of cognitive and other behavioural changes associated with brain lesions. Noninvasive imaging techniques, in conjunction with a new understanding of neurotransmitters, help researchers understand the way the various parts of the brain and nervous system grow, develop, take on specific tasks, and repair and replenish themselves.

#### Support for Medical Research

The federal government, provincial governments, voluntary agencies and private foundations, industry and foreign sources all contribute to the support of biomedical research in Canada, including equipment, operating costs, research training and technical assistance.

**Federal Funding Agencies** The Medical Research Council of Canada was established by

#### Gairdner Foundation International Awards

Date of award	Canadian recipients	Area of achievement
1959	W.G. Bigelow	hypothermia method of open-heart surgery
	A.C. Burton	cardiovascular physiology
1963	M.L. Barr	insight into cell genetics and discovery of the Barr body
	J. Genest	vascular physiology and hypertension
1964	G.D.W. Murray	cardiac physiology and pathology and cardiac surgery
1965	C.P. Leblond	autoradiography for cellular biology and research on the thyroid gland
1967	D.H. Copp	calcium homeostasis, identification of the hormone calcitonin which alters blood calcium levels
	P.J. Moloney	immunology and diabetes
	J.F. Mustard	the role of platelets in thrombosis and atherosclerosis
	B. Chown	human blood groups and hemolytic disease of the newborn
1969	R.B. Salter	musculoskeletal disorders and orthopedic surgery
	E.A. McCulloch & J.E. Till	spleen-colony technique for leukemia treatment
1971	C.H. Best	insulin
1972	O. Hornykiewicz	Parkinson's disease and physiology of the brain
1973	H.E. Johns	cobalt and high-energy radiotherapy
1974	J.H. Quastel	biochemistry
1975	J.D. Keith	congenital heart disease
	W.T. Mustard	cardiovascular surgery
1976	K.J.R. Wightman*	educator, physician and leader
1977	H.G. Friesen	biochemistry and physiology of hormones which stimulate milk production (lactogenic hormones)
1978	S.O. Freedman & P. Gold	carcinoembryonic antigen
1979	C.R. Sriver	genetic disease
	C. Fortier*	scientist, teacher and scientific adviser
1980	I.B. Fritz	regulation of fatty-acid metabolism
1981	J.H.C. Wang (with W.Y. Cheung)	discovery of calmodulin
	L. Siminovich*	geneticist, adviser on science policy, leader of Canadian academic community
1984	K. Krnjevic	research on the mechanisms of brain cell communication
	R.L. Noble	discovery of important anticancer drug vinblastine
	D.G. Cameron*	educator, physician and initiator of training programs for both clinicians and clinician-scientists

\* Indicates receipt of the Gairdner Foundation Wightman Award, an award for Canadians who have demonstrated outstanding leadership in medicine and medical science

Parliament in 1960 to promote, assist, and undertake basic, applied and clinical research in the health sciences and to advise the minister of the Dept of National Health and Welfare on matters of health research. MRC evolved from the Associate Committee of Medical Research, established in 1938 at the National Research Council of Canada. During WWII, the committee divided into a number of subcommittees; after the war, the Division of Medical Research replaced the committee and this subsequently became the MRC.

MRC supports over 50% of direct medical research expenditures in Canada. It provides support, on the basis of scientific excellence as determined by national peer review, for research and for training of health-science researchers in the health-science faculties. These include the departments and laboratories of the 16 medical schools, 10 dental schools and 8 pharmacy schools and their affiliated HOSPITALS and institutes across the country. In 1983-84 the Medical Research Council spent \$137 million contributing to medical research across Canada.

Research relating to health-care delivery has been supported at the federal level primarily by the National Health Research and Development Program in the Dept of National Health and Welfare, a program which grew out of the annual Public Health Grants started in 1948. (The MRC was precluded from support of public health research until 1976 when Parliament removed this restriction.) NHRDP provides grants to encourage research that is required by the department to fulfill its mandate to promote, protect, maintain and restore the health of Canadians. Researchers may belong to any of the 4 general health fields of health-care organization, environmental health hazards, lifestyles or the biology of human populations.

**Provincial Funding Agencies** Provincial agencies in Alberta, BC, Manitoba, Ontario, Québec and Saskatchewan contribute to medical research and training through such organizations as the Alberta Heritage Foundation for Medical Research and le Fonds de la Recherche en Santé du Québec.

**Voluntary Funding Agencies** Voluntary agencies, which are generally "disease specific," play a major role in medical research. For example, the Canadian Cancer Society supplies 80% of the National Cancer Institute of Canada's granting monies for research into cancer.

Research costs, such as salary support, capital expenses to construct laboratories, and animal care facilities, are generally paid by the institutions where the research is conducted. They receive funds for this purpose through provincial governments and private donations.

#### Structure of Medical Research

Medical research is highly decentralized in universities and teaching hospitals and their affiliated institutions throughout the provinces. Canada is one of a small minority of countries which does not have significant government laboratories devoted to biomedical research. While this decentralization links research with professional training and health-care delivery, it makes it difficult to define or maintain a national focus for concerted programs, especially as health care and education are provincial responsibilities. However, in 1982 federal and provincial representatives identified several health areas of national concern (cancer, accidents, arthritis and joint disorders, cardiovascular and cerebrovascular diseases, maternal and infant health problems, MENTAL HEALTH and respiratory diseases). The MRC and other funding agencies are providing support for research in these areas. In 1983, the federal Cabinet approved in principle a federal framework for medical research that emphasizes the provision of high-quality training, a balance between basic and applied

research, and a balance across regions and disciplines (with special attention to areas of national health concern), and the utilization of new knowledge for improved health care. Within this federal strategy, elaborated in the MRC's Five Year Plan, the MRC undertook to continue the development of a strong research base, and to promote research in areas of national concern and in the more efficient transfer of new knowledge to health-care systems.

#### Issues in Medical Research

Some critics of medical research charge that advances in medical research have led to little improvement in health status. Some blame this on inadequate communication among workers in the health sector and recommend an increase in the number of clinicians conducting research to improve the introduction of new knowledge into health care and increase treatment-oriented research. Others charge that the conservative nature of the peer review system precludes progress of innovative science, and they advocate the participation of a greater variety of health professionals in medical research, eg, nurses and pharmacists, who have received less support in Canada than basic and clinical researchers. The absence of a strong health-care sector industry with a solid commitment to research, or of adequate long-term funding, are other problems that have been identified. There is also ongoing debate about the appropriate balance between curiosity-driven and targeted research, and between research oriented towards costly, technologically sophisticated medical treatments and more broadly based epidemiological and environmental medicine.

Ethics is another important issue in medical research. Although the MRC has helped to establish guidelines (favoured by many because of their flexibility) for safe and ethical practices with respect to human experimentation, research with animal subjects and use of hazardous and infectious substances, these are technically only binding on researchers supported by the MRC. In fact, many groups voluntarily comply with these guidelines. Some critics advocate legislation defining safe and ethical medical research practices on the grounds that laws are more enforceable than guidelines. Canada has no law that protects research volunteers or ensures that they are fully informed of the purpose or possible dangers of the drug or procedure being tested. Through its committee on Ethics of Experimentation the MRC is currently revising its ethical guidelines. Groups such as the Centre for Bio-ethics at the Clinical Research Institute of Montréal and the Westminster Institute for Ethics and Human Values are increasingly asked to advise researchers on ethical issues in medical research.

#### Future of Medical Research

The health-care system in Canada is changing. Developments such as the increased recognition of the contribution of environmental and behavioural factors to mental and physical health, the growing focus on cost containment and the allocation of scarce resources, the significant rise in the number of women in medicine, the increased need for chronic-disease care in an aging population, the trend towards home care and away from hospital care, and the increase in hospital-based research institutes will all influence the nature and extent of medical research.

Many of the discoveries of medical research, such as those which have recently offered new abilities to manipulate genes, to perform *in vitro* fertilization and embryo experimentation, to transplant organs and to screen for genetic problems, will continue to require excellent research by scientists. However, the growing social and ethical issues raised by medical research will necessitate closer co-operation between scientists

and the Canadian public. Scientists can help the public understand the implications of new knowledge, and the public needs to exercise its responsibility in guiding the extent, conduct and application of medical research in Canada.

**Medical Research Council** is a departmental CROWN CORPORATION established 20 May 1969 to promote research in the health sciences in Canada. It maintains a program of support to research trainees and investigators, and to research programs in Canadian universities, hospitals and related institutions. The council has a number of awards programs designed to provide advanced training at the predoctoral and postdoctoral level. It reports to the federal minister of national health and welfare.

**Medicine, Contemporary** The years since 1939 have seen great changes in Canadian medicine. In the ARMED FORCES, served, during WWII, by many of Canada's most talented medical practitioners and specialists, medical services were responsible for advances in the management of wounds and shock, for research on infections, motion sickness and high-altitude aviation, and for perfecting methods of preventing blackout during rapid descent of fighter planes. The effectiveness of penicillin against many bacterial infections was established when the drug was provided (largely through the efforts of the Connaught Laboratories in Toronto) to the Canadian armed forces at the time of the invasion of Europe after D-Day.

During the early postwar years the Dept of Veterans Affairs organized medical and HOSPITAL services for veterans. Some of the hospitals were closely associated with university medical schools, with the result that medical teaching and research were carried out in the hospitals and the staffs of the hospitals were in most cases members of the medical faculty. This arrangement, which ensured a high level of medical care for veterans and provided universities with teaching facilities, continued until the 1970s when the Dept of Veterans Affairs' hospitals were converted to general hospitals under the provincial hospital programs.

In the 1940s Saskatchewan and BC developed hospital insurance programs; Saskatchewan also provided medical coverage. In 1957 the federal government began to give assistance to the provinces for programs of hospital services and in 1968 a countrywide medical-care program was developed (see HEALTH POLICY). In 1984 the federal government passed new legislation designed to discourage user fees for hospital services and extra billing by physicians.

**Diagnostic and Treatment Methods** Many advances in diagnosis and DISEASE treatment have occurred since 1945. The development of a large number of antibiotics has provided means of combatting bacterial infections (the successful treatment of tuberculosis is an outstanding example) although the ability of some bacteria to develop resistance to antibiotics is of increasing concern. Many viral diseases are now controlled by the use of vaccines. For example, the last epidemic of poliomyelitis in Canada occurred in the mid-1950s; it is no longer a threat as a result of effective vaccination programs. The introduction of new methods of diagnosis in cardiac disease, such as catheterization of the heart by the introduction of small catheters into the heart chambers and the coronary arteries, has provided the means of precise diagnosis of valvular and coronary artery disease (see HEART DISEASE). The use of radioactive isotopes and the recently developed nuclear magnetic resonance method of examination has enabled cardiologists to assess the state of the heart muscle. Surgical pro-

cedures involving correction of congenital heart defects, valvular abnormalities and coronary artery disease are being carried out in many centres across Canada. The widespread use of cardiopulmonary resuscitation in hospitals and by paramedical personnel has resulted in recovery in many cases of cardiac arrest. Pacemakers have enabled patients with life-threatening cardiac rhythm problems to survive many years. The development of coronary care units and intensive care units in hospitals has resulted in the much improved management of patients suffering from severe illness or injury.

Canada has made a significant contribution to the field of CANCER diagnosis and early detection with the "Pap" smear tests for uterine cervical cancer. Programs for the early detection of breast cancer by self-examination and mammography have also been developed. Canadian scientists were responsible for the development of the "cobalt bomb" used in radiation treatment of cancer, and for the discovery of the vinca alkaloids, chemotherapeutic agents used in the treatment of many types of cancer. Cancer diagnostic treatment and research centres have been established in many cities in Canada.

The availability of radioactive isotopes (used in the diagnosis of many conditions, including cancer and disease of the lungs) from centres such as Chalk River, has led to the development of the specialty of nuclear medicine. The diagnosis and treatment of certain conditions, eg, thyroid disease, has been greatly improved. The development of dialysis units and kidney transplants for chronic kidney failure have enabled patients to carry on useful lives, in many cases, for several years.

Centres for the treatment of the many types of ARTHRITIS have been established in many Canadian communities, greatly assisted by the Canadian Arthritis Society. These centres provide an integrated program of treatment including medical, physiotherapy and occupational therapies and social service assistance. New medications and developments in surgery involving replacement of joints with plastic or metal materials have improved the outlook of patients suffering from chronic arthritis.

The management of patients with mental illness has changed quite markedly in recent years. Patients suffering from depression and schizophrenia can now be treated with various types of medication, thus avoiding long periods of hospital care. Outpatient community treatment clinics and departments of PSYCHIATRY based in general hospitals have also been established.

Early ambulation after surgical operations has been very effective in preventing postoperative complications such as venous clotting, lung congestion and general muscle weakness. Anaesthetic methods have improved so that extensive surgical procedures can be performed even on elderly patients. Cardiac surgery and neurosurgery have made great advances. Kidney transplants are now common and a few cardiac and lung transplants have been carried out. Surgery of the blood vessels has progressed with the use of artificial replacement materials. The provision of blood transfusions by the Canadian RED CROSS SOCIETY has made possible many of the advances in surgery. Emergency departments of hospitals have been provided with personnel and equipment to handle serious injuries, because trauma continues to be a major cause of disability requiring surgery. Microsurgery has made possible the repair of small blood vessels and operations on the ear to relieve deafness. The LASER beam in OPHTHALMOLOGY is used in the treatment of some retinal diseases.

The understanding and treatment of epilepsy has advanced, and there has been considerable improvement in the outlook of patients with strokes because of extensive study of this common affliction by Canadian neurologists. The

treatment of berry aneurysms of the arteries of the brain by neurosurgeons has been an outstanding Canadian development.

The application of ultrasound to many conditions, eg, liver and gall bladder disease, obstetrics, and cardiac function, has improved diagnosis. New developments in X-ray equipment have greatly increased the precision of diagnosis by this means. The introduction of computerized axial tomography (CAT scanner) revolutionized the diagnosis of intracranial conditions, spinal cord lesions, abdominal masses and other conditions. The application of fiber optics to diagnostic instruments has greatly enhanced the examination of the stomach, duodenum and colon. This modification of equipment has allowed the catheterization of the common bile duct without surgical intervention and in some cases impacted gall stones can now be removed without surgery.

In obstetrics the emphasis has been on careful prenatal investigation, to discover high-risk situations in order to anticipate and prevent complications during delivery. The prenatal programs of preparation of the mother for the birth of the baby have allowed for delivery with a minimum of anaesthesia. Other advances in the management of pregnancy include fetal monitoring during delivery, ultrasound examination of the fetus and placenta, and examination of the intrauterine amniotic fluid for genetic abnormalities in the fetus. Recently, *in vitro* fertilization of the mother's ovum has been carried out in Canada, resulting in successful pregnancies for women who could not otherwise have borne a child. Departments of PEDIATRICS have changed considerably in recent years. Infectious diseases have declined markedly in incidence, isolation hospitals have been closed. Emphasis has been directed toward neo-natal intensive care nurseries, congenital diseases, child neoplastic conditions and adolescent problems.

Diagnostic laboratories have also changed radically with the introduction of automated methods of analysis. For example, the electron microscope has increased the ability of the pathologist to examine the details of cell structure. Immunological abnormalities have been demonstrated in blood serum analysis; genetic abnormalities have been recognized by chromosomal examination. All of this has assisted the physician to diagnose more precisely clinical conditions.

Some medical faculties have established divisions of SPORTS MEDICINE to study and treat the special needs of those engaged in athletic activities.

Emphasis has been paid to the rehabilitation of patients after injuries, following the development of disabling illnesses and after surgical procedures such as amputations. A specialty of rehabilitation medicine has been recognized, and rehabilitation centres have been established in many Canadian communities. Patients with paraplegia, strokes and other neurological and musculoskeletal diseases benefit from these programs, which include physiotherapy, occupational therapy, speech therapy and the use of facilities such as therapeutic pools.

Increased medical attention is being paid as well to the particular problems of the AGING population. A large proportion of medical and hospital care is devoted to the needs of individuals above 65 years of age. Many patients in the older age group become disabled to the extent that they require continuous hospital care. The need for extended care or chronic care hospital facilities has always been greater than the supply. Recently, geriatrics (the study and care of aging individuals) has been recognized as a specialty.

For patients with terminal illnesses, some hospitals have established special hospice facilities

that administer to the patients' physical, emotional and spiritual needs.

**Medical Education and Qualification** Prior to 1964, when the report of the Royal Commission on Health Services (Hall Report) recommended an increase in the number of medical graduates, there were 11 medical faculties in Canada. In the next few years 4 new medical schools were established: McMaster University, Université de Sherbrooke, University of Calgary and Memorial University. This expansion of medical schools was made possible by the establishment by the federal government of the Health Resources Fund, by which \$500 million was made available for the provision of facilities for education of health personnel. Programs of postgraduate education leading to family practice and specialty practice have been organized in all of the medical schools in Canada.

The Royal College of Physicians and Surgeons of Canada, est 1929, provided a means whereby a qualification in the specialties could be developed. This qualification, based on a prescribed period of training under supervision, and an examination, is recognized by provincial licensing bodies. Québec provides a separate qualifying procedure. In 1984 the Royal College provided qualification in a total of 41 specialties. The College of Family Physicians of Canada was formed in 1954, recognizing special competence in family or general practice after 2 years of approved postgraduate training and an examination (SEE MEDICINE, GENERAL PRACTICE). By examination and after a year of postgraduate internship, the Medical Council of Canada provides a qualification which is recognized by the provincial licensing bodies as a requirement for licensure to practise medicine. Québec has a separate qualification for the practice of medicine (SEE MEDICAL EDUCATION).

**Medical Research** in Canada was greatly stimulated by the formation of the Medical Research Council of Canada in 1960. The council established a policy of supporting medical research in universities by grants-in-aid, support for research fellows, research scholars and research associates. In 1960 the budget of the Medical Research Council was \$2.3 million; by 1984 it had increased to \$153.2 million. Additional funds have been provided through federal health grants for research in PUBLIC HEALTH, MENTAL HEALTH and delivery of health care. Among the many organizations that provide funds for medical research are the National Cancer Institute, the Canadian Cancer Society, the Terry Fox Fund, the Canadian and Provincial Heart associations, the Canadian Arthritis Society, the Canadian Lung Association and the Canadian Kidney Foundation.

Medical researchers in Canada have contributed to the understanding and surgical treatment of congenital heart disease; to knowledge of the development of thrombosis, arteriosclerosis and the function of platelets; to the use of hypothermia in cardiac surgery; to the discovery of calcitonin, a hormone involved in the control of calcium metabolism; to the identification of cells of female individuals by cytological characteristics; to the development of the technique of auto radiography; to advances in the diagnosis, treatment and prevention of haemolytic disease of the newborn; to the discovery of the gastrointestinal hormones, gastric inhibitory peptide (GIP) and motilin; to developments in the understanding and treatment of hypertension, the nature of stress and its effects; to the discovery and significance of carcinoembryonic antigen (CAE) and the discovery and development of the vinca alkaloids and their application in some types of cancer; to the clinical investigation of the nature, causes, treatment and prevention of strokes; and to increased knowledge of renal physiology and of the causation and prevention of kidney stones.

The health professions have become increasingly concerned with prevention of disease and injury, not only as a means of improving the health of their patients, but also to reduce the cost of health care. To this end they have advocated the use of seat belts and participation in suitable FITNESS activities, and supported anti-SMOKING campaigns and information programs concerning diet.

The outstanding advances in many branches of medicine in the past 40 years have led to improvement in the treatment and prevention of illness and injuries, but have also created problems, eg, the rapidly increasing cost of providing all available health care universally. The health professions and the public must also confront ethical problems that have arisen with technical advances (SEE MEDICAL ETHICS).

R.B. KERR

**Medicine, General Practice** General practice is the branch of medicine concerned with providing care (known as "primary and continuing care") to patients irrespective of their age, sex or type of problem. In Canada general practice is also known as "family practice" and general practitioners are also known as "family physicians." General practice as a medical discipline is usually referred to as Family Medicine.

A number of features make general practice a distinctive part of the medical profession. General practitioners (GPs) usually enter into a long-term relationship with their patients which enables the physician to treat illness with a full knowledge of a patient's life history, medical history, social and family relationships, and personal values or preferences. GPs see each of their patients on the average 4 times a year. These visits provide excellent opportunities for health education and the early detection of disease. Between 80-90% of illness episodes are managed entirely by the GP.

When specialized help is needed, the GP arranges a consultation with or a referral to the appropriate specialist. The growth of specialization and the technological development of medicine have added greatly to the complexity of medical care; GPs are often instrumental in co-ordinating the patient's care and in explaining the implications of diagnostic investigations to patients and their families.

When GPs live in the communities in which they practise, particularly rural communities, they can gain valuable knowledge of the working and living environments of their patients. Most GPs still visit their patients at home and the great majority of general practitioners in Canada admit and care for their own patients in hospital. Prenatal, postnatal and well-baby care are important parts of this kind of medicine; about 50% of babies born in Canada are delivered by general practitioners.

**The Development of General Practice** In the 19th and early 20th centuries, virtually all doctors were GPs. Since the 1930s there has been an enormous growth in the number of major medical specialties, and since the 1950s, a great deal of fragmentation into subspecialties. As a result, certain procedures (eg, major surgery) which were formerly the responsibility of GPs have increasingly become the province of full-time specialists. At the same time, many specialists, by limiting their practice to narrower fields, can no longer provide primary care. In some specialties, however (notably paediatrics and obstetrics), there are practitioners who offer primary and continuing care to certain age groups.

The rapid growth of specialization after WWII was followed by a decline in the numbers of GPs, a decline paralleled in other countries and in other professions, where the relationship be-

tween generalists and specialists became an issue. Since that time, however, a number of factors have contributed to a renaissance of general practice, including the founding in 1954 of the College of General Practitioners, renamed in 1967 the College of Family Physicians. The college has provided the intellectual and academic leadership that has enabled GPs to redefine their role in a more complex society. Instead of seeing themselves as "jacks of all trades," GPs are now members of a well-defined medical discipline, based on an integrated knowledge of clinical medicine and human behaviour, with special skills in the prevention and early diagnosis of disease and the complex long-term care of patients. The college has encouraged the emergence of general practice as an academic discipline in the universities and the development of post-graduate training programs in family medicine. The first chair of family medicine was established at University of Western Ontario in 1968; today all 16 medical schools in Canada have academic units of general practice and post-graduate training programs. About 450 trainees graduate from these programs each year. In 1969 the College of Family Physicians held its first certification examination in Family Medicine. There are now some 4900 certificants of the college.

As a result of these developments, Canada's health-care system seems to have attained a balance between generalists and specialists. In 1981 there were 19 232 general practitioners and 19 078 specialists. General practice has become a popular career choice for medical graduates, especially women graduates. Some problems still exist, for example, there are insufficient training positions for all graduates entering general practice and a substantial number are therefore entering practice without a specific preparation for their role; and the role of the GP in the large urban hospital — especially the teaching hospital — is in flux and is not yet clearly defined.

In the future, the growing proportion of old people in the population will make the care of the aged an increasingly important aspect of general practice, and the high cost of hospital care and complexity and fragmentation of medicine will make it essential to have a well-trained and highly skilled body of generalists.

IAN R. MCWHINNEY

**Medicine, History of** Medicine in Canada arguably began centuries before the French settled the shores of N America, but because the native people passed on their traditions orally, the only written accounts of their practices and beliefs were recorded by the white explorers and settlers. Most aspects of native medicine were integral to a religious system in which disease was ascribed to magical causes and therefore required magical cures, provided generally by a SHAMAN, or medicine man. But native people also treated illness with some highly effective plant remedies (eg, oil of wintergreen, bloodroot, high bush cranberries, *see* PLANTS, NATIVE USES) and physical procedures such as SWEAT LODGES and massages. It was from an Indian that Jacques Cartier learned of a cure (brewed from twigs and bark of white spruce or hemlock) for scurvy. Systems of native medicine began to break down after prolonged contact with European settlers and their imported, often EPIDEMIC diseases (eg, measles, typhoid, typhus, diphtheria and smallpox (*see* NATIVE PEOPLE, HEALTH)).

European medicine at the time of settlement was evolving into an identifiably scientific discipline, although theories and knowledge about disease developed very slowly. Most of the first medical practitioners from France were barber surgeons, trained only by a rough and ready apprenticeship, or apothecaries who were theoretically limited to providing remedies ordered

by a doctor but usually functioned as semi-trained general practitioners. Many of these men were of questionable character but others, eg, Robert Giffard and Michel SARRAZIN, dedicated their lives to serving the colonists. Giffard, a barber surgeon who arrived in Québec in 1627, was the first physician at the HÔTEL-DIEU, a HOSPITAL (4 rooms, 2 closets) originally founded by a religious order from France (*see* NURSING). The practice of combining the offices of barber and surgeon may have derived from the almost universal custom of bleeding patients as a panacea for virtually every ill. All that was required was a sharp knife and a knowledge of where to locate the major veins. Surgery was limited to operations on the arms, legs and the surface of the body and head. Internal operations usually resulted in the patient's death. The use of drastic measures to induce vomiting and purging were also commonplace.

Sarrazin, who arrived in New France in the second half of the 17th century, was appointed surgeon-major of the French troops in Canada and later official physician of the Hôtel-Dieu. In that capacity he became famous for helping hundreds of colonists recover from typhus. He was also an acclaimed botanist.

Despite the combined hazards of climate, disease, hunger and Indian attack, by 1763, when New France was ceded to the British, Montréal and Québec City were thriving small cities. The medical system imported by the British was similar to that used by the French. Military surgeons continued to dominate the practice and organization of the profession. However, there was a change in that the anglophone doctors took control of the cities, leaving the francophone doctors to serve the poorer areas.

Arriving in what was to become Ontario, LOYALISTS brought army surgeons with them as well, but also civilian physicians. These men usually had great difficulty making a living because the population was small, the fees low and the prestige of the medical profession very shaky. They often held other jobs, such as operating a farm or a store.

The settlers in Upper Canada were afflicted by acute infectious diseases, injuries of all kinds, periodic malnutrition and serious recurrent illnesses such as "fever and ague" (malaria). When they could obtain the services of a physician they often did, but frequently treated themselves with home remedies and botanic cures based on native peoples' prescriptions. Midwives usually assisted at childbirth. The situation was much the same in the other Maritime provinces. Halifax, the largest city in the area, had a substantial medical population, including many military surgeons, and a number of hospitals. The poor could obtain some medical services from dispensaries or the workhouse. Many early Maritime doctors established successful second careers. Abraham GESNER, educated in London, was a doctor, geologist, mineralogist and the discoverer of kerosene. Dr J. Webster was also an historian, Sir Andrew MACPHAIL a writer, Dr Charles TUPPER a politician. Another Maritime doctor, David Parker, who worked in the asylum for the poor in Halifax, was the first physician in Canada to operate with the help of anesthesia.

In the West, most of what was to become the Prairie provinces and BC were controlled by the Hudson's Bay Co, which employed its own doctors. William Fraser TOLMIE, who emigrated to Vancouver as a surgeon and trader for the HBC, and for whom Mt Tolmie in BC is named, was a botanist, geologist and later, a member of the legislature. He may have performed one of the first modern operations on the West Coast when he removed a tumour from the breast of a sailor. Tolmie had brought stethoscopes from Scotland; surgical instruments provided to him on his arrival in BC included "an Amputating, two

trephining, two eye instruments, a lithotomy and a cupping case, beside two midwifery forceps, and a multitude of catheters, flexible and silver sound bougies, probangs, tooth forceps." A colleague of Tolmie's, Dr John MCLOUGHLIN, born in Lower Canada, became representative of the HBC in the West.

During the 19th century, immigration to Canada, particularly from Britain and the US, increased dramatically. Among the immigrants were many notable physicians, such as Christopher Widmer (who became known in Upper Canada as the "Father of Surgery") and W.R. Beaumont, a prolific inventor of surgical instruments. Widmer practised at York Hospital (later the Toronto General). The first medical schools in Upper Canada had been established in the 1820s. One of the first, the Talbot Dispensary, was opened by the reformer Dr Charles DUNCOMBE, but closed when its benefactor, Thomas Talbot, withdrew his support, suspecting correctly that Duncombe was using the dispensary as a stepping stone into politics. Indeed, many of Canada's early doctors became actively involved in politics. A second school, which eventually (1870) became the medical department at Victoria University, was founded by the reformer Dr John Rolph. In 1824 the Montreal Medical Institution, later absorbed by the medical faculty of McGill University, was established by Dr W. Caldwell and his associates.

The founding of medical schools in Canada was inspired by various motives, including the desire of doctors (who invariably founded the schools) to teach along lines of which they approved and to ensure a source of income for themselves. They were supported by those who felt that many Canadians who sought education in the US were being inadequately trained and were being exposed to dangerous democratic principles. In the US, many medical schools became commercial operations willing to lower standards to attract students, but in Canada the schools sought affiliation with universities and in an effort to discourage charlatans and to raise the low esteem in which doctors were held by the public, maintained high standards of entry. By the 1850s, students in medical schools in Canada typically attended lectures on "Materia Medica and therapeutics, Anatomy and Physiology, Principles and Practices and Surgery, Midwifery and the Diseases of Women and Children, and Medical Jurisprudence." There was some dissection but little laboratory work (it was not until the mid-1870s, when William OSLER took over the chair at McGill, that microscopes would be used in any extensive way). The dissecting rooms were known as "dead-houses." The one associated with the medical school established in London, Ont, was not untypical. In makeshift quarters (a dining room of an old cottage), the room contained "two tables, a few chairs, a pile of sawdust, a shovel in the corner, old coats and aprons and hooks along the walls. A trapdoor in the floor led to the cellar where 2 large vats, filled with ancient wood alcohol and other things, permeated the whole building with their odours." New medical students were initiated into dissecting by being forced down to the cellar to retrieve the cadavers. Dr D.C. MacCallum has left a record of the situation at McGill in the mid-19th century, where he prepared the dissections that were to be part of the anatomy professor's lectures the following day. He was compelled to pass several hours at night in the dissecting room, which was "dismal and foul-smelling." He wrote that his only company was "several partially dissected subjects and numerous rats which kept up a lively racket coursing over and below the floor and within the walls of the room." The procuring of cadavers, used for anatomical studies and medical research, was often risky. Some students in Québec paid their medical fees by taking bodies

from the cemetery near Côte des Neiges. Such incidents led finally to amendments in the Act regarding anatomy and thus indirectly aided the development of Canadian medicine.

From the late 1700s, efforts to regulate the medical profession had provoked controversy between universities and boards of examiners over whether a medical degree constituted a licence to practise. The number of charlatans and incompetents practising medicine had proliferated, partly because the public preferred them, having no social or scientific reason to choose regular doctors. In both Upper and Lower Canada licensing bodies had existed since the late 1800s. In Lower Canada a board appointed by the governor had been formed under the authority of a British Act of Parliament to prevent unlicensed persons from practising medicine. Later attempts to define the profession in Lower Canada produced tension between French and English doctors until the College of Physicians and Surgeons of Lower Canada was finally created in 1847. In 1849 the Act creating the corporation was amended to provide automatic membership in the college to those engaged in practice in 1847. In 1839 a group of Toronto physicians, many of them trained in Britain, were incorporated as the College of Physicians and Surgeons of Upper Canada, but its incorporating act was disallowed in 1840. In 1869, under the Ontario Medical Act, a new College of Physicians and Surgeons of Ontario, empowered to examine would-be practitioners and university graduates, was incorporated. In 1867 the CANADIAN MEDICAL ASSOCIATION was formed. Overall, the mid-19th century was a turbulent period in the Canadian medical profession, which was torn by divisions between English and French doctors, and between those trained in Canada and those trained elsewhere.

As the population of British N America increased, so did its susceptibility to epidemics. In 1832, 1834, 1849 and during the 1850s, cholera epidemics ravaged the country. In 1832 the disease spread from Québec City to most of the towns and cities in Upper Canada in only 3 weeks. In 1854 an Italian, Filippo Pacini, had described the cholera vibrio visible through a microscope, but it was not until the germ theory, established by Louis Pasteur, was reluctantly accepted that the cause of cholera was isolated. Robert Koch, a German researcher building on the discoveries of Pasteur, also discovered the germs that caused diphtheria, typhoid and tuberculosis.

During the cholera years in Canada, doctors disagreed over whether the disease was contagious. There was a tendency to see it as a disease of the blood; treatments included bleeding, massive doses of calomel and opium, and cauterizing. As early as 1834, however, William Kelly, a surgeon of the Royal Navy, had suggested there was a relationship between diseases and sanitation, particularly clean water. Local boards of health were established to enforce quarantine and sanitary laws. By the end of the 19th century PUBLIC HEALTH was being promoted through a variety of enactments regarding IMMIGRATION restrictions, protection against the sale of tainted food, and provision of adequate sanitation. Public resistance to these measures was intense, as it was to compulsory vaccination. For example, although a smallpox vaccine was introduced into Canada in the early 1800s by a Nova Scotia doctor, smallpox epidemics ravaged the country until the 1900s, when the value of the vaccination was finally understood.

Two other major discoveries in medicine also occurred in the mid-1800s. The first was the discovery, in the 1840s, of anesthetic, which rendered surgery painless. Two Canadian doctors later made major contributions to developments in anesthesiology. In 1923, W.E. Brown of U of T established the value of ethylene as an anes-

thetic, and in 1942 Dr Harold Griffith advanced the science of anesthesia by his use of curare (commercially, Intocostin), a plant extract used by South Americans as an arrow poison. The second discovery, by the Englishman Joseph Lister, derived from Pasteur's work. Lister proved that the recovery rate of patients suffering wounds could be drastically improved if the wounds were disinfected (Lister first used carbolic acid for this purpose). At that time, surgeons at the Toronto General, like surgeons everywhere, operated in frock coats, usually holding their knives, when not in use, in their mouths. Instruments were washed in a cursory fashion or wiped on a towel. Lister's antiseptic treatment was described in Canadian journals within a few months of Lister's experiments and was being used in operating rooms of the Toronto and Montreal General Hospitals by 1869, but most Canadian physicians initially resisted the technique and the attempts by Archibald Malloch, an Ontario surgeon who had worked with Lister in Glasgow, to teach Lister's principles of antiseptics. Thomas RODDICK is credited with being the first doctor to base procedures at the Montreal General on these principles.

By the 1850s Canadian women had begun to demand access to medical schools, but until the 1880s virtually all female physicians practising in Canada (eg, Emily Howard STOWE, Jennie Kidd TROUT) had trained with doctors or in schools outside Canada. In 1883 the Women's Medical College, affiliated with Queen's, and the Woman's Medical College, affiliated with U of T and the University of Trinity College, opened. Both institutions offered only the required course work, not degrees, but after 1895 students of the Ontario Medical College for Women, successor to the Toronto school, could take the exams of the medical school of their choice. Medical training for women was subsequently offered at Dalhousie (1890), University of Western Ontario (1890s) and U Man (1891), but the universities of McGill, Laval and Montréal did not open their doors to women until much later. Early female practitioners, such as Elizabeth Matheson in her work in the NWT and Maude ABBOTT in her work on congenital heart disease, among other accomplishments, made significant contributions to Canadian medicine.

Many Canadian doctors eg, John Schultz, John Sebastian HELMCKEN, Clarence HINCKS, and John RICHARDSON, helped influence the development of their own country not only as physicians but as politicians, inventors, explorers, writers, soldiers and community leaders. Many others, including Robert MCCLURE (whose work was described in W.H. Auden's and Christopher Isherwood's *Journey to War*), Florence Murray, Davidson BLACK and Norman BETHUNE, became known for their work outside of Canada in countries such as China and India. Of the 19th-century doctors who contributed to the prestige of Canadian medicine abroad, the most eminent was William Osler. Educated at the Toronto School of Medicine and at McGill, over time he was professor of medicine at the University of Pennsylvania, was appointed to John Hopkins Hospital and Medical School, and became Regius Professor of Medicine at Oxford. Author, in 1892, of *The Principles and Practice of Medicine* (which indirectly helped inspire the foundation of the Rockefeller Institute of Medical Research), he contributed to science through his discovery of blood platelets and his investigations into heart disease, malaria and tuberculosis. His emphasis on the study of anatomy and on bedside teaching transformed medical teaching in N America. His colleague, Dr Francis SHEPHERD, introduced new scientific methods of teaching at McGill and, like Osler, emphasized the importance of a grounding in anatomy in understanding medicine.

Tentative advances in medical research in Canada were accelerated by the discovery (1921) of INSULIN by Frederick BANTING, Charles BEST and J.J.R. MACLEOD. Because of their success and the increased interest in medical research, government became involved in financing and more studies and institutes of medical research were established. For example, in 1934, Wilder PENFIELD, funded by the Rockefeller Foundation, founded the Montreal Neurological Institute, which drew together the disciplines of neurosurgery, neuropathology, neurology and related basic sciences and consequently transformed the study of the brain.

As WWII approached, medical practice was

Norman Bethune, shown here during the Spanish Civil War, in which he organized the first mobile blood-transfusion service (courtesy Public Archives of Canada/PA-124407).

changing slowly, influenced by the discovery that a number of serious diseases could be controlled by immunization. Health in general was improving, largely because of better diet and nutrition and more effective public health measures. Hospitals had become safer places for the sick, and surgical procedures were more sophisticated and more likely to achieve satisfactory results. The discovery of sulfa drugs in the 1930s was a harbinger of the discovery of antibiotics. In the early 1950s, a vaccine, which the Connaught Laboratories at U of T had helped develop, defeated the feared disease of polio.

CHARLES ROLAND

**Medicine Bundles** were the focus of most Plains Indian rituals. A bundle might be a few feathers wrapped in skin or a multitude of objects such as animal skins, roots, or stone pipes inside a rawhide bag. Every article had significance and called for a special song whenever its owner exposed it to light. Songs and a sacred myth belonged to the bundle itself. Fixed rules of inheritance governed the sale of a particular bundle. Formal transfer was a solemn ceremony and the new owner had to learn the significance of all objects in the bundle, details of visions to which they owed their origins, and songs that established their validity. Feasts were given for bundles by both owners and nonowners. See NATIVE PEOPLE, RELIGION.

RENÉ R. GADACZ

**Medicine Hat**, Alta. City, pop 40 380 (1981c), inc 1906, is located on the CPR main line and the Trans-Canada Hwy about 300 km E of CALGARY. Nestled in the valley of the S SASKATCHEWAN R, it is a park-studded retreat amidst the surrounding flat and treeless prairies. A council of 8 aldermen and a mayor govern the city.

**History** According to an Indian legend, a Cree medicine man lost his headdress while fleeing across the S Saskatchewan from a bloody battle against the Blackfoot. His disheartened tribesmen surrendered and were massacred. This is the most likely explanation of Medicine Hat's name. With the arrival of the CPR here in 1883, a tent town sprouted up around the station and slowly a community emerged. The commercial production of natural gas and clay led to the manufacturing of pottery, bricks and tiles. Milling, canning, brewing and some smelting followed. Medicine Hat grew most rapidly during the first decade of the 20th century. By 1911 it had a population of 5600.

**Economy** Although Medicine Hat is located in an agricultural region of large ranches, wheat farms and some irrigated lands, the abundance of natural gas permitted it to build a small but vigorous industrial sector. In 1921 Medalta Stoneware became the first western Canadian plant to sell a manufactured product E of the Lakehead. Northwest Nitro Chemicals (now Western Co-operative Fertilizers) built a large fertilizer plant in the city in 1955. Five years later Medicine Hat built Brier Industrial Estates, which welcomed as one of its first occupants a Goodyear tire plant. Both the greenhouse and petrochemical industries have profited from local supplies of natural gas.

**Cityscape** Medicine Hat is an oasis with many parks and sporting facilities. Its college, art gallery, museum, Fire Hall Theatre and Little Symphony Orchestra enhance local cultural life. The Medicine Hat Tigers play in the Western Junior Hockey League.

Sanctuary general, Kommos excavations (photo by Joseph W. Shaw).

**Medicine Wheels**, circles of stones over 6 m in diameter, are ceremonial in origin, though related to TIPI rings used to weight down skirts of tipis. They contain lines of stones radiating from the centre, like spokes on a wheel. Smaller rings or wheels are sometimes walled structures, probably used by SHAMANS seeking supernatural power and knowledge (see MANITOU). Artifacts, chips, scrapers, knives and points are sometimes found in association with them. See also BRITISH BLOCK CAIRN; NATIVE PEOPLE, RELIGION.

RENÉ R. GADACZ

**Mediterranean Archaeology** Archaeology derives understanding of past civilizations through excavation and a study of remains. Although Canada did not have its own schools nor Canadian universities their own excavations in the Mediterranean until recently, Canadian scholars have nevertheless long contributed to Egyptian, Greek and Roman archaeological studies; eg, Charles T. Currelly, first director of the ROYAL ONTARIO MUSEUM (ROM), excavated at Abydos [Abdu, Egypt] and Homer A. Thompson spent over 50 years working in the Agora at Athens, Greece. In 1961 the CANADA COUNCIL began to support archaeological research, and in 1969 extended that support to full funding, a policy continued by the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA. Substantial funding has allowed a burgeoning of exploration organized by Canadian academics.

In Italy, University of Alberta took a lead in both the study and excavation of ancient remains, particularly through a series of research projects, first in the late 1960s at Gravina di Puglia (near Bari) in association with the British School at Rome, then in the early 1970s at Monte Irsi (near Irsina) in collaboration with Marie O. Jentel and Edith M. Wightman. At San Giovanni di Ruoti in the Apennine hills, an excavation was begun in 1977, directed by Alastair M. Small and Robert J. Buck, participants in the earlier projects. The excavations have revealed a large, prosperous, rural villa rebuilt many times between the 1st and 5th centuries AD. The latest phase, dated 460-530 AD, represents a discovery of buildings probably unique in Italy. Because bones, shell and carbonized seeds are well preserved, much information has been recovered about Roman farming practices over 6 centuries. This exemplary project in environmental archaeology will provide evidence for a reappraisal of Roman land use. Another project initiated in 1977 was a surface survey of the lower

Liri Valley, S Latium, by Alexander G. McKay and Edith M. Wightman, sponsored by McMaster University. Here too the results will lead to a great increase in data on land use in various periods of Roman history and to a detailed occupational history of the region.

In Greece, the first excavation permit awarded a Canadian team went to Joseph W. Shaw, sponsored by University of Toronto and ROM. In 1976 Shaw began investigations at Kommos on the S coast of Crete under the auspices of the American School of Classical Studies at Athens. Work on this Minoan harbour town, linked by road with Phaistos, has led to remarkable discoveries: well-preserved houses of the second millennium BC and a unique Greek sanctuary in use from early Protogeometric through early Roman times, below which are monumental buildings of late Minoan date. The stratigraphy on the site is excellent and valuable ceramic series have been established. A second Canadian team, led by John M. Fossey, professor at McGill and first director of the Canadian Archaeological Institute at Athens (CAIA), surveyed the site of Khostia in Boeotia in 1979, and the following year returned for a season of exploration of the town and its surrounding territory. Here the main emphasis was on recovering the history of Khostia, not only in classical but also in prehistoric times, with concern for natural resources and climate. In 1982 the current director of CAIA, E. Hector Williams of UBC, obtained a permit to survey Stymphalos in the Peloponnese. This led to the first complete plan of the remains, and the discovery that Stymphalos was established in the 4th century BC with a street plan organized around a regular grid.

Three Canadian teams have been working in Egypt. Donald Redford of U of T, closely involved in reassembling the temples erected by Pharaoh Akhenaten (c1375-58 BC) at Karnak from a computerized study of some 40 000 pieces of sculptured reliefs, began excavations in 1975 in E Karnak. Here he identified the foundation of one temple, and ascertained that after its destruction the area was abandoned for 500 years, then reoccupied for domestic and industrial purposes from the 8th to 4th centuries BC, and thereafter abandoned permanently. John S. Holladay, Jr, also of U of T, has been directing since 1979 a multidisciplinary regional study of the transit corridor linking Egypt and Asia, the

Wadi Tumilat region of the eastern Nile Delta, with special emphasis on Tell el-Maskhuta, which appears to have been founded in the 7th century BC and survived until the 2nd AD. One important result has been the construction of a stratigraphically dated body of Egyptian pottery for the period c609 BC-135 AD. The third team, led by Anthony J. Mills of ROM, in 1978 began a systematic survey of the Dakhleh Oasis, at over 3000 km<sup>2</sup> the largest in the Egyptian Sahara. By 1983 the field survey was complete, with over 400 sites recorded; and there have been geomorphological studies as well as floral, faunal and palynological sampling. The results should provide a history of the oasis's settlement and its external connections and an understanding of the environmental factors associated with an oasis and of the effects that man and the area have had on each other.

Intense Canadian involvement in the archaeology of Italy, Greece and Egypt has been very recent and a direct consequence of the support offered archaeological research by the Canada Council and SSHRC. This activity and support led to the establishment of CAIA and the Canadian Academic Centre in Italy, both in 1978, and the Canadian Institute in Egypt in 1980, all now united under the aegis of the Canadian Mediterranean Institute. It is to be hoped that with these institutions our links with the Mediterranean past will be strengthened and our indebtedness better acknowledged. See also CLASSICS; ARCHAEOLOGY.

C.W.J. ELIOT

*Reading:* Summary reports on most of the Roman and Greek excavations can be found in *Classical News and Views*, or its successor *Classical Views*, published by the Classical Association of Canada; and on Egyptian projects in *Archaeological Newsletter*, published by ROM.

**Medley, John**, bishop (b at Chelsea, Eng 19 Dec 1804; d at Fredericton 9 Sept 1892). As the first Anglican bishop of Fredericton, Medley spent 47 years building up the church physically and spiritually. Educated at Wadham Coll, Oxford, and friend of Edmund Pusey, he was active in the English ecumenical movement, which stressed the improvement of church music and architecture. A known Tractarian, his High Church sympathies were viewed with suspicion by his LOYALIST congregation. Consecrated bishop of Fredericton in 1845, he embarked on a series of annual parish visitations and dedicated himself to building a cathedral at Fredericton and developing a cathedral choir school. The cathedral, designed by architect Frank Wills with furnishing designed by William Butterfield, was consecrated in 1853. Medley supported free pews, free-will offerings and the development of diocesan synods. He was the author of *Hymns for Public Worship in the Diocese of Fredericton* (1855, 1863, 1870).

TERRY THOMPSON

**Mégantic, Lac**, 26 km<sup>2</sup>, elev 395 m, 75 m deep, is located in southern Québec, 6 km from the US border. The lake is the source of the Rivière CHAUDIÈRE; the town of Lac Mégantic is nearby. Discovered in 1646 by Father Drouillette, it was only settled about 1700 by the ABENAKI, who gave it the name *Namesokanjik*, meaning "place of the fish." Bordered to the S and E by the Appalachians, the lake is fed by a network of valleys that drain the surrounding forests. Once used to float timber, it is now popular with fishermen and vacationers. In 1776, during the American Revolution, Col Benedict ARNOLD's troops used Lac Mégantic and the Chaudière to attack Québec City from Boston.

JEAN-MARIE DUBOIS AND PIERRE MAILHOT

**Mégantic Hills**, part of the Appalachian Region of Québec — a region 800 km long by 60-150 km wide lying S of the St Lawrence R between the American-Canadian border and the Gulf of St Lawrence. The region, formed by the alignment of many mountain chains (the chief ones being the Notre Dame mountains in

Gaspé), spreads to the SW into New England, as the White and the Green mountains, and to the NE into Newfoundland. The highest peaks are Jacques Cartier (1268 m) and Albert (1151 m) in Gaspé, and Mégantic (1105 m) in the Eastern Townships. The region's main city is SHERRBROOKE in the Eastern Townships (pop 715 000 in total). Colonized primarily by LOYALISTS in the 18th century, it was the principal mining region in Canada in the 19th century, especially for COPPER. It now produces ASBESTOS and lumber as well as fish products in the Gaspé.

JEAN-MARIE DUBOIS

**Mégantic Outlaw**, see MORRISON, DONALD.

**Megaprojects**. The term megaproject was already inappropriate when, in the early 1970s, it was first applied to very large capital projects such as the JAMES BAY PROJECT and the Syncrude tar-sands project in northern Alberta. "Mega" denotes a factor of millions; in fact the proper prefix for Canada's giant ENGINEERING schemes of the 1970s and 1980s would have been "giga" (ie, billions) because their common characteristic was a price tag of billions of dollars. In the energy field alone, construction of major projects costing more than \$200 billion was planned in Canada during the 1980s. A single offshore oil-production platform, serving up to 36 undersea wells, carried a 1982 price tag of more than \$1.5 billion.

The whole concept of megaprojects was thrown into question when the long list of megaprojects proposed in the 1970s was wiped out by the recession of the early 1980s. Megaprojects can only thrive in an atmosphere of certainty. Ten-year, 20-year, or even 50-year commitments, involving billions of dollars and thousands of man-years, can only be undertaken with assured finances, good product demand, a supportive political environment and fail-safe technology. Without this certainty, megaprojects can easily become white elephants.

Canada is a huge country blessed with a great wealth of natural RESOURCES — the ideal environment for megaprojects. Its history is often told as a sequence of what were, in the context of their times, megaprojects: Ontario's WELLAND CANAL and RIDEAU CANAL; the CANADIAN PACIFIC RAILWAY and CANADIAN NATIONAL RAILWAYS; the war mobilizations; the HYDROELECTRIC systems; the TransCanada and Westcoast natural-gas PIPELINES; the Interprovincial and TransMountain oil pipelines; the TRANS-CANADA HIGHWAY, ALASKA HIGHWAY and Canol pipeline; the ST LAWRENCE SEAWAY; the Canadian deuterium-uranium (CANDU) nuclear reactors; and the Syncrude tar-sands project. All were built for one or more of 3 overriding national purposes: transportation, energy or defence.

In addition to mere size and scope, megaprojects involve a long-term perspective that often verges on crystal-ball gazing. Megaprojects are usually designed for a future that will not begin for 5-10 years and will extend for a further 25-30 years. Moreover, the megaproject usually does not enter the economic system gradually but represents a quantum leap in productive capacity. Hence, there must be a huge, unsatisfied demand to be met when the project begins operation, or the project must meet old demands more cheaply and efficiently. Old suppliers (eg, clipper ships around Cape Horn, imported oil, oil-fired electrical plants) are abruptly displaced by the arrival of a railway, heavy-oil plant or massive hydroelectric development.

The earliest and most persistent critics of major projects are usually accountants. Even proposing a project carries substantial financial risk: the Canadian Arctic Gas consortium spent over \$100 million before its MACKENZIE VALLEY PIPELINE was rejected in 1977; the Alsands group

spent a similar amount before abandoning the tar-sands venture in 1982. In Canada, where the long-term real return on capital has averaged 7%, investors want a potential profit at least 7% higher than the expected rate of inflation. Hence, investors require assurances from governments about tax rules, prices and regulations that will apply. Governments have a parallel concern that the social benefits of a project exceed its social costs, and that the same benefits (eg, oil supply, transportation, employment) could not be obtained more cheaply by other means. For example, megaprojects are generally built in the hinterland but benefit metropolitan centres — sometimes out of the province or even out of the country (see CHURCHILL FALLS). Governments must judge whether the boom-and-bust trauma suffered by remote regions is worth the benefit to the industrial heartland.

The calculations of "opportunity cost" and "benefit/cost" are intimately entwined with the basic economics of the projects themselves. During the 1970s the inflation rate for energy projects was a daunting 1.5 times greater than the general rate. With the recession of the early 1980s came the concern that there might not be a demand for the megaprojects' high-priced production when it eventually came to market. Forecasts of annual energy-demand growth in Canada were reduced from as high as 7% to around 2%, with some predictions of zero or negative growth rates for many years. Consequently, several ELECTRIC-POWER projects were shelved. The collapse of expected energy price increases dimmed enthusiasm for virtually all megaprojects. Long-term national strategy (for energy security, BALANCE OF PAYMENTS, economic infrastructure, defence, etc) can override discouraging economic factors, but such planning demands extraordinarily clear long-range vision, seldom evident among politicians facing election every few years. Federal and provincial elections, such as Manitoba's 1981 campaign, have centered on megaprojects (see ENERGY POLICY). Uncertain political support was frequently cited by businessmen as the reason they abandoned tar-sands megaprojects in the early 1980s.

Even after the cancellation in early 1982 of the \$13-billion Alsands tar-sands project and the indefinite postponement of Esso Resources Canada Ltd's \$12-billion COLD LAKE heavy-oil project, nearly 200 major, energy-related projects, with a total cost of \$226 billion, were planned to start in western Canada between 1982 and 1995. Proposals included completion of a world-scale PETROCHEMICAL complex in BC and Alberta, development of major coal mines, tapping and transporting of arctic oil and gas, liquefying BC natural gas for shipment to Japan, upgrading heavy oil, adding new electrical production and transmission capability and increasing railway capacity.

The largest single megaproject underway in 1982 was the \$50-billion James Bay hydroelectric development in northern Québec. Other proposed megaprojects in eastern Canada included more CANDU nuclear reactors in NB, Québec and Ontario; developing TIDAL ENERGY projects in the Bay of FUNDY, NS; tapping the oil and gas off NS and Newfoundland; building natural-gas pipelines through Québec and the Maritimes; and producing synthetic fuels from Cape Breton coal (see COAL).

All of these technologies attempt to take advantage of "economies of scale," ie, the larger a facility, the lower its unit cost of production. This was the conventional wisdom for generations of engineers and economists, but much of its validity rests on an assumption of financial, economic and political stability. Amid the uncertainties of the early 1980s the tenet was re-examined critically and found wanting for a number of reasons. First, a very large project is vulnerable to malfunction. Thus, it would be

unwise to depend too much on one technology (oil-sands projects or CANDUs) that might be shut down completely by some hidden flaw or hazard. The Syncrude project, for example, was plagued in its first years by fires, freeze-ups, breakdowns and accidents that abruptly halved or even cut off its 125 000-barrel/day output. Second, smaller projects can be built in modules, with a continuing labour force and design improvements as mistakes are found in earlier models; cash flow from the first units can help pay for subsequent ones (substantially reducing the financial risks), and the timing of additional units can be altered to match shifts in price, demand and competition. Third, the regulatory process is simpler and quicker for smaller projects. Fourth, some technologies (eg, *in situ* tar-sands extraction, high-pressure oil processing) are not notably cheaper on a huge scale. Other technologies (mining, pipelining, railroading) have obvious economies of scale, but even they were being questioned in the new climate of the 1980s. Some previously ignored concepts, eg, free-running turbines to tap the hydroelectric power of tides and rivers without dams, could revolutionize project engineering in the coming decades. Companies are hedging their bets on megaprojects, eg, "prebuilding" the profitable southern portion of the Alaska Highway gas pipeline and postponing the riskier \$40-billion northern portion.

In retrospect, many technologies seem to go through a dinosaur age, an era of eventually untenable gigantism, followed by a focus on smaller, more manageable ventures. The one certainty is that not all the megaprojects on the drawing boards will be built. ROBERT D. BOTT

**Megarry, Archibald Roy**, publisher (b at Belfast, N Ire 10 Feb 1937). Megarry became publisher and chief executive officer of the *Toronto Globe and Mail* in 1978 and was responsible for establishing its national edition. Megarry moved to TORSTAR CORP, the owners of the *Toronto Star*, in 1974 as vice-president of corporate development. Four years later, he switched to the *Globe and Mail*, where he maintained that paper's reputation for quality while expanding foreign coverage and giving more space to "life-style" coverage. In 1983 he was elected a member of the Club of Rome. J.L. GRANATSTEIN

**Meighen, Arthur**, lawyer, politician, businessman, prime minister of Canada (b at Anderson, Ont 16 June 1874; d at Toronto 5 Aug 1960). As MP, 1908-26; leader of the Conservative Party 1920-26, 1941-42; PM, 1920-21, 1926; and senator, 1932-41, Meighen was a prominent, controversial public figure for nearly 30 years. He was unequalled as a parliamentary debater, combining great knowledge of public business, a sharply analytical and critical mind, a gift for lucid extemporaneous speech and an aptitude for the adversarial atmosphere.

Shortly after graduating from U of T in 1896, Meighen moved to Manitoba and established a law practice at Portage la Prairie. Five years after entering the House of Commons in 1908 he was appointed solicitor general in Sir Robert Laird BORDEN's ministry and 2 years later added the post of secretary of state. In the 1917 Union government he became minister of the interior and one of the Cabinet's dominant members. He was instrumental in devising and defending a number of disputed measures, among them the Military Service Act, the Wartime Elections Act, and bills nationalizing several private transportation companies and uniting them with others in the CANADIAN NATIONAL RAILWAYS. As acting minister of justice in 1919 he was prominent in ending the WINNIPEG GENERAL STRIKE, thus incurring the bitter enmity of part of the labour movement.

Meighen succeeded Borden as PM in 1920 against the advice of most of his fellow minis-

Arthur Meighen was an unequalled parliamentary debater in his time. The 9th prime minister of Canada, he served only 2 very brief terms 1920-21 and June-Sept 1926 (courtesy Public Archives of Canada/C-5799).

ters, who believed he was temperamentally unsuited and handicapped by his connection with these contentious policies. His one notable achievement in that office came at an imperial conference, where he argued successfully against the British government's plan to renew the Anglo-Japanese alliance. At home things went from bad to worse in a situation complicated by the rise of a new political force, the PROGRESSIVE PARTY, which attracted much support in the Prairies and rural Ontario. In the general election of Dec 1921 his government was defeated and he became leader of the Opposition to the Liberal administration of Mackenzie KING. During the ensuing 4 years the Conservatives made a strong recovery and in the election of Oct 1925 won a plurality of seats. King was able to retain office with the support of the remaining Progressives until a serious scandal in the Customs Dept was exposed. Faced with a motion of censure that seemed certain to pass, King sought to have Parliament dissolved. When Gov Gen Lord BYNG refused, King resigned and Meighen again took office. But his government was soon defeated in the Commons and in the resulting election, whereupon he retired as party leader and joined a Toronto investment company. In 1932 PM BENNETT appointed him to the Senate, which he reluctantly left after 9 years to resume the Conservative leadership. His attempt to re-enter the House of Commons in a 1942 by-election failed and, disillusioned with politics, he retired once again to devote himself to his business interests. ROGER GRAHAM

Reading: Roger Graham, *Arthur Meighen*, 3 vols (1960-1965); J.L. Granatstein, *The Politics of Survival* (1967).

**Meighen, Maxwell Charles Gordon**, financier (b at Portage la Prairie, Man 5 June 1908), son of PM Arthur MEIGHEN. After studying at RMC and U of T and serving in WWII, Meighen took over the group of investment companies founded by his father. Chairman and director, Canadian General Investments Ltd, in 1961 he entered the consortium of financiers, headed by J.A. MCDOUGALD, that owned the huge Argus Corp. As an Argus director he was also a member of the boards of some of the largest Cana-

dian companies, including Domtar, Massey-Ferguson, Dominion Stores and Hollinger Mines. He resigned from Argus in 1978, when it was taken over by Montegu and Conrad BLACK and H.N.R. JACKMAN. JORGE NIOSI

**Meisel, John**, educator, public servant (b at Vienna, Austria 23 Oct 1923). He is known to academics as a leading student of Canadian politics and to the public as chairman of the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC). Meisel was educated at schools in Czechoslovakia and, after his family came to Canada, at U of T and London School of Economics. In 1949 he joined the politics dept of Queen's and, after switching research interests from international relations to politics, he published ground-breaking work on the 1957 and 1962 general elections as well as other studies on the Canadian political system. He served on a number of royal commissions in research capacities, and in 1980 the Clark government named him as head of the CRTC. He served there until 1984 (and his return to Queen's) and presided over the introduction of pay-TV into Canada. J.L. GRANATSTEIN

**Melfort**, Sask, Town, pop 6010 (1981c), inc 1907, is located in central Saskatchewan, 85 km SE of Prince Albert. The first settlers came to this area in 1892 and began a settlement called Stoney Creek about 2 km from the present townsite. In 1902 the settlement was moved to its present location where it was surveyed by the CNR. Mrs Reginald Beatty, the first lady settler in the district, was asked by railroad officials to name the town and chose the name of her family place in Scotland. Melfort is the centre of one of Saskatchewan's richest agricultural areas, the Carrot R valley, a territory that has never known drought or severe crop failure. DON HERPERGER

**Melon** (*Cucumis melo*), annual, viny PLANT of the Cucurbitaceae family. The most important cultivated groups are cantaloupe (*C. melo* var. *cantalupensis*), muskmelon (*C. melo* var. *reticulatus*), winter melon (*C. melo* var. *inodorus*) and sugar melon (*C. melo* var. *saccharinus*). Watermelon (*Citrullus vulgaris*) belongs to a different genus of the same family. Melons originated in Asia and were found by Christopher Columbus on Isabella I in 1494. Cantaloupe is grown mainly in Europe. What are known as cantaloupes in N America are muskmelons; they have a pleasant flavour and aroma and can be served as an entrée or dessert. Winter melons ripen late and lack the scent and rough rind of the muskmelon. Melons need warm temperatures and a frost-free growing season of at least 120-140 days; these factors limit their cultivation in Canada to southern Ontario, the OKANAGAN VALLEY of BC, southern Alberta, southern Manitoba, and drier parts of the ANNAPOLIS Valley, NS. A hardy variety of muskmelon, Far North, was introduced by Ukrainian settlers in the southern prairies. To hasten their development, muskmelons may be grown in greenhouses or under cover in the field. Irrigation is important during dry spells, especially in the period up to formation of the melon. Melons are susceptible to wilt diseases and mildew, and to cucumber beetles and aphids. HUGUES LEBLANC

**Melville Jones, Geoffrey**, physiologist, medical doctor (b at Cambridge, Eng 14 Jan 1923). Melville Jones is a pioneer in aviation medical research in Canada, specializing in research on the body's vestibular system (balancing organs in the inner ear), and its role in problems of disorientation in flight environments. He has also studied the brain's ability to adapt to conflicting information from several bodily sensory systems, particularly the relationship between vestibular and visual sensory information. Melville Jones began his aviation-related medical re-

search as an RAF scientific officer, studying problems in high-altitude respiration and escape, long-duration flying fatigue, and pilot disorientation. In 1961, after coming to Canada, he inaugurated McGill's Aviation Medical Research Unit as its director. He has examined physiological adaptation to zero-gravity among Skylab astronauts and collaborated in research on physiological zero-gravity adaptation among space-shuttle astronauts. He has received numerous awards and honours.

LYDIA DOTTO

**Melville, Lake.** 3069 km<sup>2</sup>, is a tidal extension of HAMILTON INLET on the rugged E coast of Labrador. Linked to the inlet on the E by a narrows, the lake extends 140 km inland to its 2 western arms, Goose Bay and Grand Lk. At places the water reaches depths of 300 m. Circled by rocky mountains and hills, the lake receives several major rivers that drain a large part of Labrador, including the Naskaupi and the CHURCHILL. An air-force base was built at HAPPY VALLEY-GOOSE BAY during WWII; another settlement is North West River, a former trading post. The name refers to Viscount Melville (1742-1811), a prominent British politician.

DANIEL FRANCIS

**Melville Island.** 42 149 km<sup>2</sup>, fourth-largest of the QUEEN ELIZABETH IS., NWT. Its western half is hilly, with elevations reaching 775 m, and sustains small ice fields. The eastern half is a rolling plateau with elevations generally below 300 m. Vegetation is scant, but well-vegetated broad valleys and coastal flatlands support a relatively high muskoxen population. Caribou numbers are low, owing to recent adverse climatic events. The island was discovered 1819 by Lt W.E. PARRY, who named it after Viscount Melville, first lord of the Admiralty. Promising natural-gas and oil deposits were found recently on and around the island.

S.C. ZOLTAI

**Melville Peninsula.** NWT, approximately 400 km long and 100 km wide, joined to the Canadian mainland by Rae Isthmus, is bounded on its W side by Committee Bay and separated from BAFFIN I. in the N by Fury and Hecla Str; it faces FOXE BASIN in the E. Uplifted through faulting associated with the Foxe Basin structural depression, it is an erosional remnant of a once widespread sheet of sedimentary rocks that mantled the core of the Canadian SHIELD. It is made up of 2 distinct physiographic regions, with by far the larger part consisting of a dissected plateau that becomes quite mountainous on the W side, rising as high as 900 m. In the NE corner is a narrow, low-relief coastal plain of more recent limestone. The Precambrian material forming the upland is 1600 million years old, metamorphosed and granitized Shield. Most of the rocks have been moderately folded and more intensive folding raised the low mountains in the W. The faults and intrusions associated with the peninsula's general uplift have become the focus of erosion, and steep-walled canyons, 90-175 m deep, have developed. In conjunction with some of the intrusions, formations of iron-ore deposits have been found, assessed as an important addition to Canada's iron-ore inventory. The high concentration of natural uranium in lake sediments and waters of southern Melville Pen has been traced to igneous rocks intruded into the Shield bedrock.

DOUG FINLAYSON

**Member of Parliament.** member of the HOUSE OF COMMONS elected in single-member constituencies. Predominantly from densely populated areas, as a group they have a high level of education and many are lawyers. They are mostly male and most are middle-aged. Most are elected on a party "label" but some may sit as independents. In recent years few have had prior experience, politically, in public office, although many have had local office-holding experience. Their careers are usually short-lived, because of

electoral vicissitudes. Policymaking is the domain of Cabinet and the senior public service; MPs as a group have less effect in policy formation, although some MPs claim a strong voice in CAUCUS and in Commons committees. Part of an MP's representative role is responding to the grievances of constituents. There are 282 MPs (1985).

ROBERT J. JACKSON

**Mémoires de l'Amérique septentrionale**, a learned and entertaining natural history of Canada, was the journal kept by Louis-Armand de Lom d'Arce, baron de LAHONTAN, during his travels in New France, 1683-94. Published as vol 11 of *Nouveaux voyages* (1703), the memoirs duplicate information from vol 1, an epistolary travelogue. Lahontan's memoirs describe the geography, native peoples and flora and fauna of the colony, and outline its trade and politics and its importance to Europe. Lahontan's lists and essays, occasionally unreliable, include false accounts of fictitious tribes from the Long R, which he claimed to have discovered; his portrait of the Indian helped to create the image of the "noble savage" popular in 18th-century Europe. The complete *Voyages* went through 13 editions in 14 years, including the author's own English translation (1703; ed R.G. Thwaites, 1905). A facsimile of the 1703 French text was published in Montréal (1974). MICHÈLE LACOMBE

**Memorial University of Newfoundland**, St John's, fd in 1925 as Memorial University College, a memorial to Newfoundlanders who died in WWI. Memorial received university status in 1949 after Newfoundland joined Canada. In 1961 it moved from its crowded, centrally located campus to 89 ha on the city's northern outskirts. A second campus, the Sir Wilfred Grenfell College, was opened 1975 in Corner Brook on the island's W coast. Memorial has 6 faculties (arts, science, education, medicine, engineering and business administration) and 4 schools (graduate studies, nursing, physical education and athletics, and social work). Because it is the province's only university, Memorial has to meet a wide variety of needs. It has therefore established a number of special divisions, including the Centre for Cold Ocean Resources Engineering, the Extension Service, the Folklore and Language Archive, the Institute for Research in Human Abilities, the Labrador Institute of Northern Studies, the Marine Sciences Research Laboratory, the Maritime History Group, the P.J. Gardiner Institute of Small Business Studies and the Oxen Pond Botanic Park. Memorial is one of the largest universities in eastern Canada, with high academic standards in teaching and research and a wide, multi-purpose program.

**Ménard maître-draveur** (1937), novel by Félix-Antoine SAVARD, is the last classic example of the didactic Québec roman du terroir, "novel of the land," basing its lyrical descriptions of rural life and its appeal to colonize the interior upon the author's firsthand experiences as a pastor in new settlements near La Malbaie. Savard revisits MARIA CHAPDELAINÉ (1916), incorporating excerpts into his novel and effectively writing a sequel to Hémon's romance. A farmer who prefers logging, Ménard bemoans the exploitation of Québec's resources by unnamed strangers, encouraging his daughter Marie to marry le Luçon rather than le Délié, who would sell his inheritance to "foreigners." Following his son's death in a log jam, Ménard, rendered insane by

his quest to confront the enemy, obsessively tracks the elusive le Délié. Savard revised his poetic novel in 1938 (simply adding a glossary), 1944, 1960 and 1964; Alan Sullivan translated the first edition as *Boss of the River* (1947), Richard Howard the 1964 text as *Master of the River* (1976).

MICHÈLE LACOMBE

**Mennonites**, a Protestant religious-cultural group, numbering over 600 000 adult members in 41 countries. Mennonites first arrived in Canada from the US in 1786 and there are now about 190 000 Mennonites in Canada (1981c). They date their separate Christian identity to the ANABAPTIST movement of the early 16th-century Reformation. Baptism (not of infants but of mature voluntary believers) and a communion service, which included foot washing as a symbol of humility and service, were the Anabaptists' only sacraments. The movement soon spread to the northern German states and the Netherlands, where Menno Simons (after whom the Mennonite denomination is named) assumed the leadership in 1536. Through prolific writing, preaching and tireless organizational work he strengthened his people. However, even the peaceful "Mennists" were persecuted and thus were scattered in all directions. The Swiss-South German Mennonites went mostly westward, settling in Alsace and the Palatinate and, by the end of the 17th century, in Pennsylvania. The Dutch-N German went mostly eastward, forming settlements in present-day Poland, and by the end of the 18th century in Russia. The Mennonites' relative isolation and self-sufficiency within closed communities, combined with their conviction that religion was a way of life, produced a unique socio-religious culture. Thus the Mennonites who came to Canada, all of whom spoke Germanic dialects, were perceived as a minority group with both religious and ethnic characteristics.

The first migration into Canada brought about 2000 Swiss Mennonites from Pennsylvania to Upper Canada after the AMERICAN REVOLUTION. They acquired land from private owners in the Niagara Peninsula and in York and Waterloo counties. This group was followed by Amish Mennonites (named after Bishop Jacob Ammon, a conservative leader of the late 17th century). From 1825 to the mid-1870s about 750 settled on crown land in Waterloo County and adjacent areas.

In the 1870s the russification policies of the Russian government caused 18 000 Dutch Mennonites — one-third of the total in Russia — to leave for N America. The promise of land, cultural and educational autonomy, and guaranteed exemption from military services attracted about 7000 of them to southern Manitoba. The opening up of HOMESTEAD lands in the North-West Territories attracted Mennonites from Prussia, Russia and the US between 1890 and WWI. They were joined by many from Manitoba, who established 2 reserves in Saskatchewan, and others from Ontario. Conspicuous in the US in 1917 brought more Mennonites to the Canadian Prairies. The largest immigration occurred in the 1920s, when 20 000 Mennonites took the opportunity to escape the effects of the Bolshevik Revolution. Most of this group settled on the Prairies. WWII caused over 12 000 Mennonite "displaced persons" to migrate from Russia and Germany. Most of them settled in urban areas, the most rapidly growing urban community being Winnipeg. In recent decades many Mennonites have immigrated from the US, Mexico and Paraguay.

The basic unit of Mennonite institutional life is the congregation. There are nearly 1000 congregations throughout Canada, tied together in about 30 congregational families of 2 types: those representing older and more conservative traditions whose unity is symbolized by a single membership register and a single bishop (eg,

Arrival of the first Mennonites in Winnipeg, Man. 1874 (courtesy Glenbow Archives).

Old Order Mennonite Churches); and those representing newer structures called "conferences" (eg, the Conference of Mennonites in Canada, the Canada-Mennonite Brethren Conference and Mennonite Church Region I). Most congregational families are members of provincial, national and continental central committees. The headquarters of the Canadian Mennonite Central Committee is in Winnipeg. An annual budget of more than \$10 million is applied to foreign and domestic programs which include development, relief and peace projects (see PACIFISM; PEACE MOVEMENT). Prominent Mennonite periodicals include the German-language *Mennonite Rundschau*, *Der Bote* and *Die Mennonitische Post*, and the English-language *Mennonite Brethren Herald*, *Mennonite Mirror* and *Mennonite Reporter*. Their total circulation is about 45 000. Mennonite voluntary associations promote music, the arts, folk and heritage festivals, research and writing, welfare institutions, nursing homes, retirement centres, psychiatric units, insurance and tourism.

Mennonites differ in their attitudes toward innovation in religious and cultural life. Some believe that the Kingdom of God comes to the faithful who live an exemplary life in communities. Others insist that it cannot come without penetration of, adaptation to, and involvement

in, the world. Among both the Swiss and the Dutch are conservative groups that have successfully perpetuated traditional rural modes of life, unchanging clothing styles, the German language and liturgical forms. The Old Order Amish and Old Order Mennonites have also succeeded in continuing a traditional farming style. Other Mennonites have adjusted and integrated with society. Mennonites are no longer limited to their Swiss and Dutch traditions and ethnic backgrounds. There are many Canadian Mennonites of French, Chinese, Indian and Anglo-Saxon extraction, and about 40% of Mennonite marriages in 1981 were mixed.

As a church, emphasizing separation from the state and social nonconformity, Mennonites have always resisted the influence of state-run public schools. In the early 1980s about 10% of 18 000 Mennonite elementary children were in 50 private schools; slightly more secondary (grades 7-13) students were in 8 private high schools; and about 500 of 3600 post-secondary students were in 4 church colleges. A network of 5 BIBLE SCHOOLS instructs nearly 400 students annually. Students seeking training for the ministry usually go to one of 4 Mennonite seminaries in the US.

Politics have represented a paradox among Mennonites. On the one hand, they had a high doctrine of the state, believed in the coming of the Kingdom of God on Earth, and from time to time lived in semiautonomous communities which functioned like mini-states. On the other hand, Menno Simons had taught the believers

to separate church from state and to avoid the magistracy (in his time the source of persecution). Today, most Mennonites vote, and a number have served in municipal, provincial and federal governments.

Except for conservative minorities, Mennonites in Canada are undergoing rapid change; but a strong emphasis on the family and the role of religion, specific programs to keep the young people (youth organizations, camps, choirs, service programs), special schools and a dynamic congregational life minimize the losses to the larger, secular community.

Reading: Frank H. Epp, *Mennonites in Canada*. 2 vols (1974, 1982).

**Menou d'Aulnay, Charles de**, sea captain, governor of ACADIA (b in France c1604; d at Port-Royal [Annapolis Royal, NS] 1650). Although best known for his disputes with rival Acadian governor Charles de Saint-Étienne de LA TOUR, d'Aulnay was a determined and resilient colonial promoter who grappled over a 15-year period with the intractable problems associated with the colonization of Acadia. Of noble descent, he saw naval service as lieutenant to his cousin Isaac de RAZILLY, and went to Acadia 1632 when Razilly became governor. On Razilly's death in 1635, d'Aulnay assumed his powers and was later formally commissioned to govern Acadia. La Tour claimed similar powers, and their rivalry was only ended by d'Aulnay's military victory on the Saint John R 1645. Military supremacy did not solve for d'Aulnay the problem of how to bring real social and economic stability to the colony. After his accidental death by drowning in 1650, Acadia lapsed again into internal strife. His most lasting achievement was the establishment of the Acadian people at PORT-ROYAL. JOHN G. REID  
Reading: A. H. Clark, *Acadia* (1968); John G. Reid, *Acadia, Maine and New Scotland* (1981).

**Mens Rea**, "guilty mind" (Lat), refers to the mental state that must generally accompany a prohibited act before it can legally be considered a crime. Different offences require different mental states; some require intention, eg, to commit theft; some knowledge, eg, that property possessed is stolen. In the case of some offences (viz, those of "strict" and "absolute liability"), no mens rea requirement exists. LEE PAIKIN

**Mental Health**, in the early years of the mental-health movement, was often defined as the absence of symptoms of mental illness. Since that time, attempts have been made to relate mental health to a concept of psychological well-being and to certain capacities of individuals, eg, the capacity to perceive reality "objectively," to be flexible in meeting new situations and to understand another's point of view. However, no clear line divides the mentally healthy from the mentally unhealthy, and in addition, the definition of mental health is relative and is dependent on cultural context. The characteristics of a mentally healthy person in one milieu may seem very different from those of a mentally healthy person in another. The World Health Organization's definition of health as "a state of complete physical, mental and social well-being, and not merely the absence of disease or infirmity" implies that perfect "health" is an unattainable ideal, and this point of view is also reflected in the concept of mental health, as no person will exhibit all the symptoms of mental health all the time. Freud's definition of health as the capacity "to work and to love" is widely accepted by mental-health specialists as simple and accurate, and does not reflect the legal or moral considerations which often colour attempts to describe mental health.

Hippocrates was one of the first writers to challenge the belief in supernatural causes of mental illness, a belief that had prevailed since

Martin's Old Order Mennonite meeting house, north of Waterloo, Ont (photo by Hunsberger Photography).

ancient times. Hippocrates claimed that mental disease had a physiological and natural basis. An astute observer, he described in clinical detail a number of mental conditions now known as phobias, mania, depression and paranoia. By the Middle Ages, however, attempts to explain mental illness through rational mechanisms were replaced by theories of demonology and witchcraft. Those who opposed the habit of attributing mental disorders to possession by the devil included Johann Meyers (1515-88), considered the father of PSYCHIATRY, and Paracelsus (1493-1541). Philippe Pinel (1745-1826), director of 2 institutions in Paris for the mentally ill, was one of the first reformers to advocate a humane approach to mental patients. In England the Society of Friends (Quakers) supported the work of reformer William Tuke (1732-1819) who established a country retreat for the mentally ill, who, although treated kindly, were expected to undertake manual labour. In the 19th and 20th centuries the work of Sigmund Freud revolutionized the psychological understanding of individuals and the concepts of mental health.

### Mental Health in Canada

In 1714 the HÔTEL-DIEU in Québec provided a ward for women who were mentally ill and later took in about 12 men, but treatment of the mentally ill both in New France and British N America was primarily a family responsibility, and patients who could not be cared for at home were placed in jails and poorhouses under deplorable conditions, eg, overcrowding, poor sanitary conditions, inadequate food and heating, and no intervention or treatment. The mentally ill, often caged or kept in barred rooms, were thought to be morally unfit and were treated essentially as sinners. Asylums for the insane were opened in 1835 in Saint John, NB, and in 1841 in Toronto. The latter, which was begun in an abandoned jail, was transferred to a wing of the Parliament Buildings and finally to headquarters at 999 Queen Street.

Changes in care in Canada and the US were initiated by Dorothea L. Dix (1802-1887), Richard M. BUCKE, Charles K. CLARKE, Clifford W. Beers (1876-1943) and Clarence N. Hincks (1885-1964). Dix, a Massachusetts schoolteacher, wrote, lectured and informed the public and legislators about the deplorable conditions in mental institutions. She was successful in influencing a number of state legislatures either to establish or improve their mental institutions, and because of her efforts a mental hospital was built in St John's in 1885. She also lobbied the Nova Scotia legislature and oversaw the building of a hospital for mental patients in that province. Dr Richard Bucke was appointed superintendent of the Asylum for the Insane in Hamilton in 1876 and a year later of the asylum in London, Ont. He believed mental illness was a "failure of the biological process by which mankind adapts to change." In his attempts to reform the crude and often cruel treatment of mentally ill patients he abandoned the practice of pacifying the inmates with alcohol, ceased to "restrain" the patients, opened an infirmary to treat the patients' physical ills, and inaugurated regular cultural and sports events in which the patients were encouraged to participate.

Dr Charles Clarke was an assistant superintendent at Hamilton asylum in the early 1880s, and later superintendent of the asylum at Kingston, Ont. By 1887 he had changed the asylum from a jail to a hospital and was instructing nurses and attendants in the care of the mentally ill. He ceased to restrain inmates and organized many of them into a musical band as part of their therapy. By 1893 he was advocating that the term "asylum" be dropped and that special hospitals be constructed for the mentally ill.

A Connecticut engineer and founder of the mental-health movement in N America, Clifford Beers had suffered an episode of mental disorder at the age of 18 while a sophomore at Yale University. At one point he was hospitalized in the Hartford Retreat, which had been founded by Dr Eli Todd 71 years earlier. He was also housed in other psychiatric institutions, and was aware of the appalling treatment and physical abuse suffered by patients. On his release, he wrote *A Mind That Found Itself*, in which he described his experiences. In 1908, the year his book was published, he founded the National Committee for Mental Hygiene. Dr Clarence Hincks was born in St Marys, Ont, the only child of a schoolteacher and a Methodist minister. His interest in mental health was partly the result of his own experiences with severe depression. In 1918, with Beers's help, he organized the Canadian National Committee for Mental Hygiene, which later became the Canadian Mental Health Association. Both organizations were influential in promoting mental-health issues in both the US and Canada. After WWI, he toured asylums across Canada, and was shocked by what he found. In 1920, with Beers, he organized the International Committee for Mental Hygiene (which in 1948 became the World Federation for Mental Health, headquartered in London) and helped plan the first International Congress on Mental Hygiene, which was held in Washington in 1930. He was one of the first physicians to recognize the value of prevention and of treating sufferers of mental illness before they were incapacitated. His work led to the development of child-guidance clinics for the early detection and prevention of mental illness. Perhaps because of the psychoanalytic focus on the development of children or because of Hincks's conviction that mental health began in childhood, academic interest in child development began in earnest during this time. Hincks persuaded benefactors to fund the St George's School for Child Study at U of T and the McGill University Nursery School and Child Laboratory in Montréal in 1925. A psychologist, Samuel Laycock (1882-1971), came under the influence of the charismatic Hincks during one of Hincks's visits to the West. He became professor of educational psychology in 1927 at University of Sask and director of education for the Mental Hygiene Committee in 1929.

WWII profoundly affected attitudes towards mental health. The medical examinations of

recruits revealed that thousands of apparently healthy adults suffered mental difficulties. This knowledge affected public attitudes towards mental health, and stimulated research into preventive measures and methods of treatment. It has also led to a better understanding of the emotional needs of children and of the role of stress in causing mental disorder. Indeed, it is commonly held today that symptoms of much mental illness are a response to everyday or unusual stresses and are probably transitory.

**Treatment of Mental Illness** Mental illness is the most pervasive health problem in Canada. Universal medicare in Canada includes coverage for psychiatric illness (as well as any other medical condition), but all mental-health problems are not necessarily psychiatric problems, and there has been a significant increase in demand for care for the full range of behavioural and adjustment problems. Mental illness may be treated by family physicians, psychiatrists, psychologists, social workers and psychiatric nurses, but these professional groups have not met all of the mental-health needs. Specific problems, such as those involving ALCOHOLISM or SMOKING, have led to the development of very large and sophisticated self-help groups, eg, Alcoholics Anonymous, founded in 1935. There are other groups whose aim is the development of healthier life-styles or healthier dietary habits and who offer structured programs and group support to achieve these ends.

In the past 2 decades, research towards evaluating the psychotherapeutic, behavioural and biochemical interventions for mental-health problems has increased. For example, both effectiveness and cost studies of home treatment versus hospital psychiatric treatment have recently been carried out in Montréal. Findings from these studies have allowed a clearer understanding of the usefulness of such interventions and have pointed the way toward innovative approaches.

JOHN T. GOODMAN

**Mer de l'Ouest** ("Western Sea"), originally the goal of EXPLORATION during the French regime, was the stuff of wishful thinking obligingly corroborated by Indians. Initially thought to be an inland sea somewhere W of the Great Lakes, it gradually blended in imagination with the Pacific. The search for the Mer de l'Ouest had

Map by Delisle and Buache, 1752, showing the imaginary Mer de l'Ouest in the lower right (courtesy Public Archives of Canada/NMC-21056).

a useful function, since the argument that exploration must be financed by the FUR TRADE served ambitious traders well in their efforts to secure monopoly privileges from the royal authorities. The imaginary Mer de l'Ouest finally came to rest in the region around Lk Winnipeg, where, in the middle of the buffer zone marked off by the Cree and Assiniboiné around the English at Hudson Bay, LA VÉRENDRYE, his sons and their successors established a network of trading posts after 1730.

THOMAS WIEN

**Merasty, Angélique**, see BIRCH-BARK BITING.

**Mercantile Bank of Canada** has head offices in Montréal. Citibank, North America, holds a 24% interest in the Mercantile Bank, which operates a general banking business through 13 branches and one representative office. As of Oct 1983, it had annual sales or operating revenue of \$476 million, assets of \$4.1 billion (ranking 18th among banks and financial institutions in Canada) and 826 employees. The bank is 24% foreign owned.

DEBORAH C. SAWYER

**Mercantilism**, economic theory that there is a fixed amount of wealth in the world, and that a nation's prosperity depends on its success in accumulating wealth by exporting more than it imports. It was put into effect through commercial policies designed to produce a favourable balance of trade, through colonial policies that developed colonies as exclusive markets and sources of raw materials, and, in England, through NAVIGATION ACTS, which made the shipping and marketing of colonial goods the monopoly of British merchants and shippers. Mercantilism was intended to benefit European powers, but was not wholly disadvantageous to the colonies, providing a protective mantle for early development. However, it left colonial economies dependent on staple production (see STAPLE THESIS) and obstructed their industrial development. Though less rigid than the French system, English mercantilism brought no fundamental changes to the colonial economy after the CONQUEST of New France (1760). The system was dismantled with the repeal of the CORN LAWS in 1846 and the Navigation Acts in 1849, and the elimination of duties that had favoured colonial timber. See ECONOMICS.

JAMES MARSH

The mercantilist system was highly profitable to merchants, such as these shown in a French port preparing manifested goods for the colonies. The engraving appeared in 1675 in a manual dealing with all aspects of business (from Jacques Savary, *Le parfait négociant*, 1675).

**Mercier, Honoré**, lawyer, politician, premier of Québec (b at St-Athanase, Qué 15 Oct 1840; d at Montréal 30 Oct 1894). A founder of the PARTI NATIONAL, he was the first Québec political leader to assert that the Québec government was the national government of Quebecers, and is therefore considered a father of Québec nationalism.

A Liberal, he helped found the short-lived Parti national in 1872, in an attempt to win electoral support by dissociating the Liberals from the PARTI ROUGE, and won election to the House of Commons for Rouville. Defeated federally in St-Hyacinthe in 1878, he won the provincial election in that riding the following year. In 1883 he became leader of the provincial Liberal Party, and in 1885 he headed a group of Liberals and dissident conservatives who rejected their parties' respective stands on the Louis RIEL affair. At the head of the revived Parti national, Mercier was the first Québec leader to win large popular support; by keeping alive the feelings aroused by Riel's hanging, he and his party won the election held late in 1886 and he took office as premier 29 Jan 1887. In office he settled the issue of the JESUITS' ESTATES as well as the quarrels that surrounded the creation of a distinct university in Montréal. Mercier's government encouraged railway building and colonization of undeveloped lands, creating a department of agriculture and colonization in 1888, with Curé Antoine LABELLE as deputy minister. Mercier also called the first interprovincial conference of premiers since Confederation and led the movement to force the federal government to recognize the principle of provincial autonomy in administrative and fiscal matters. Implicated in the BAIE DES CHALEURS SCANDAL, Mercier was removed by the lieutenant-governor in Dec 1891. A subsequent investigation could not prove that Mercier was personally involved and he was re-elected in the 1892 provincial elections, but his party was soundly beaten. A man of considerable style and a noted orator, Mercier collected various foreign honours during his premiership. DANIEL LATOUCHE

**Mercure, Pierre**, composer, producer, bassoonist, administrator (b at Montréal 21 Feb 1927; d accidentally near Avallon, France 29 Jan 1966). Mercure, always seeking a new, multimedia language, learned French music and became an orchestrator with Claude CHAMPAGNE. He studied in Paris, notably with Nadia Boulanger and Darius Milhaud and in 1951, in Tanglewood, Mass, was introduced to dodecaphony by Luigi Dallapiccola. Mercure was the first producer of TV music programs on Radio-Canada. Influenced by Pierre Schaeffer during a second stay in Europe, he turned to ELECTROACOUSTIC MUSIC and, after organizing the Semaine internationale de musique actuelle (1961), returned to Europe to study electronic music. He left a rich legacy of ballet music (especially *Structures métalliques I* and *II* and *Tétrachromie*) and of chamber, electronic, vocal and orchestral music. His *Cantate pour une joie* has been performed several times, including during the Olympic Games in Montréal in 1976. HÉLÈNE PLOUFFE

**Mercury** (Hg), silvery white metal, also known as quicksilver. It is the only common metal existing as a liquid at ordinary temperatures (melting point: -38.87°C) and is a good conductor of heat and electricity. Mercury and its compounds have been used for centuries, eg, in the making of vermilion, a red paint, and in early treatments for syphilis. Mercury was used to extract gold from rock and sand. Production of caustic soda and chlorine in mercury cells is gradually being replaced because of mercury's toxicity. Because it has a high rate of thermal expansion, it is used extensively in thermometers. Its primary use is in electric switches, mercury-vapour lamps, batteries, catalysts and dental and agricultural compounds. Mercury

and many of its compounds are toxic and mercury chloride is used as an insecticide and rat poison. Mercury is recovered primarily by roasting ores containing the MINERAL cinnabar, a red mercury sulphide. Historically, the major producers have been Spain, the US, Italy and Yugoslavia. Virtually all mercury produced in Canada was obtained from the Pinchi Lk deposit in north-central BC, which closed in 1976.

Mercury is a cumulative poison and becomes increasingly concentrated in the food cycle of aquatic life and may reach dangerous levels in fish. Highly toxic levels can cause irreversible damage to the nervous system and the brain. The phrase "mad as a hatter" refers to the occupational disease resulting from contact with the mercury used in the early manufacture of felt hats. Mercury poisoning has occurred among native people dependent on fish and much of the freshwater fishery in Canada has been destroyed by mercury pollutants such as industrial wastes and agricultural insecticides. J.J. HOGAN

**Meredith, John**, painter (b at Fergus, Ont 24 July 1933), brother of William RONALD. John Meredith Smith (known professionally since 1951 as John Meredith), studied at the Ontario College of Art 1950-53, and had his first solo exhibition in 1958. Meredith's work is informed by a belief in the human presence as the ultimate subject of art; it is based on knowledge gained through experience rather than theory, on instinctive understanding. In early works (1958-62), abstract vertical stripes, dark and tonal in colour, take on first vegetal and then human connotations, projecting a pervasive sense of primordial mystery. Paintings from the period 1962-66 generally present large-scale images and brilliant colour, often used to optical and psychological effect. Coloured-ink sketches then became the basis for paintings; his work at the same time became increasingly complex, concentrated and obsessive. These exceptional paintings of the later 1960s achieve a forceful presence, not through scale alone but also through an insistent, overall interaction of colour, related and recurring motifs and linear patterning. Works of the early 1970s frequently evoked the Orient through their titles and subtle asymmetries, but by the 1980s his paintings became simplified, looser and more open.

**Meridian, First or Principal**, is the line of longitude forming the main backbone of the Dominion Lands Survey System — a plan devised in 1869 for the subdivision of the territory about to be purchased by the federal government from the HBC into a rectangular system of square townships numbered northerly from the FORTY-NINTH PARALLEL and E and W of a given meridian. The Principal Meridian, sometimes referred to as the Winnipeg Meridian, ran northward from a point on the 49th parallel 10 miles (16 km) W of Pembina, where astronomical observations had been made to determine the exact position of the parallel in that location. The point was selected to avoid the settled cultivated areas taken up along the Red R prior to the survey. It has a longitude of 97°27'28" W. The other initial meridians are spaced at intervals of about 4° of longitude and are numbered westerly and easterly from the Principal Meridian. N.L. NICHOLSON

**Merlin**, see FALCON.

**Merrickville, Ont**, Village, pop 984 (1981c), located on the Rideau R, 55 km SW of Ottawa. It was founded by the LOYALIST William Merrick, a millwright, to utilize the local falls for gristmills and sawmills, and became a major lock point on the RIDEAU CANAL. It remains one of the best preserved 19th-century Ontario villages, with over 100 designated historic build-

ings, including one of 4 blockhouses (1826-32) built to defend the canal, the Merrick sawmill and tavern, and the house in which Col by lived. Harry F. McLean, railway contractor and eccentric philanthropist, was a longtime resident. The local economy is based on 2 foundries, a pottery, 2 rehabilitation institutions and tourism.

K.L. MORRISON

**Merritt, BC, City**, pop 6500 (1983e; 6100, 1981c), inc 1911, is located in the Nicola Valley of south-central BC, at the junction of the Coldwater and Nicola rivers, about 12 km S of Nicola Lk and 100 km by road S of Kamloops. The Thompson and Okanagan tribes of the Interior SALISH first inhabited the area. Fur trader Alexander Ross visited the region in the winter of 1813. The great fur brigades, with hundreds of horses carrying packs of fur between Ft Kamloops to the N and Ft Langley on the lower Fraser R, used routes through the valley 1848-60. Settlement began and cattle ranches were established in the 1860s. Coal, discovered in the 1860s, was being mined here in the early 1900s. The town of Forksdales was renamed Merritt in 1907 after William H. Merritt, promoter of the failed Nicola, Kamloops and Similkameen Ry. Merritt became a mining boom town and prospered until the Great Depression, when it went into receivership. The province ran community operations until 1952. The growth of the lumber industry and the opening of large COPPER mines in the region in the 1950s and 1960s made Merritt the commercial centre of the Nicola Valley. The region around Merritt is famous for its fishing lakes and the rolling hills of the cattle country. Nearby Douglas Lk Ranch is the largest in Canada at 220 000 ha and over 15 000 head of cattle.

JOHN R. STEWART

**Merritt, William Hamilton**, soldier, businessman, politician (b at Bedford, NY 3 July 1793; d at Cornwall, Canada W 5 July 1862). "A Projector," as he styled himself, he epitomized what John Beverley ROBINSON called the defining characteristic of American society, the "anticipating spirit." Merritt considered enterprise and commercial activity as the quintessential aspect of the American and English character. He believed that Providence had "ordained that Nature should do her part & leave it to the ingenuity [sic] of Man so to improve." Confident that the "mind is never satisfied" and certain that industry rather than idleness conferred "the greatest peace of mind," Merritt proposed and undertook policies and projects to transform Upper Canada into a great commercial emporium. Although he was an assemblyman in pre- and post-union Upper Canada and president of the Executive Council in the second Baldwin-La Fontaine administration, politics were secondary, at best complementary, to his policies on public works, transportation and trade. He is best remembered for the WELLAND CANAL (chartered 1824).

ROBERT L. FRASER

**Messer, Don, and the Islanders** For close to 40 years the sounds of "old-time" music meant Don Messer and the Islanders. Donald Charles Frederick Messer (b at Tweedside, NB 9 May 1909; d at Halifax 26 Mar 1973) started playing the fiddle at age 5, learning basic skills and traditional melodies from family and friends. By age 7, he was performing at local dances and social events. In 1929 he began his radio career with a show on CFBO, Saint John. In Sept. 1939, he moved to Charlottetown where he formed "The Islanders" for station CFYC. The personnel of the Islanders changed many times but there were several constants: bass player, Julius "Duke" Nielsen; clarinetist and announcer, Ray Simmons; drummer, Warren MacRae; and pianist, Waldo Munro. The singers were Marg Osburne, who joined in 1947, and Charlie Chamberlain, with Don since 1934.

In 1959, "Don Messer's Jubilee" started a

10-year run on CBC TV. Its cancellation (1969) met with great protest and the show was syndicated from CHCH TV in Hamilton until Messer's death. Don Messer's TV and radio shows, his extensive personal appearances across the country, combined with more than 30 LPs, brought traditional fiddle and dance music into homes across Canada. His shows provided important exposure for younger artists including Stompin' Tom CONNORS, Fred McKenna, Vic Mullen, Graham Townsend and Catherine McKinnon. Several collections of his music have been published. His papers and music are now kept in the NS Public Archives, and one of his fiddles is on display in the Country Music Hall of Fame in Nashville.

RICHARD GREEN

**Metallurgy** is the art, SCIENCE and TECHNOLOGY of making metals and alloys into forms suitable for practical use. Some metals are found in their "native" or free elemental form (eg, GOLD, SILVER, COPPER), and a limited number can be produced from seawater, notably magnesium. However, most metals are extracted from naturally occurring MINERAL compounds found at or near the earth's surface (see MINING). In Canada most non-ferrous metals (eg, copper, ZINC, NICKEL, LEAD) are produced from sulphide ores. The steps in extracting metals from their ores are mineral processing, which processes mined ore into concentrates and tailings (wastes); chemical extraction, which separates concentrates into metals and slag and leach residues; and refining, which produces refined metal and by-products.

#### Mineral Processing

Mineral processing, also referred to as ore dressing, mineral dressing or milling, involves the chemical and physical treatment of the ore to upgrade the valuable mineral component, before the metal-extraction stage. This processing eliminates as much of the waste portion as possible. Two principal steps are involved: comminution and separation.

**Comminution** is liberation of the desired mineral (eg, nickel sulphide, copper sulphide) from the waste (gangue) by crushing and grinding. The ore is crushed, generally in the dry state, by jaw crushers and cone crushers. After crushing, the particle size of ore is about 2-20 mm. The crushed ore is then ground in ball mills and rod mills to particle sizes less than 75  $\mu$ m. Grinding is usually carried out in water to minimize dust. The degree of grinding depends on the size and distribution of the valuable mineral in the ore.

**Separation** of the desired mineral from the gangue produces an enriched portion (concentrate) and a discard portion (tailings). Separation is performed by taking advantage of differences in the physical and chemical properties of the minerals. Property differences that are used for this purpose include density, radioactivity, magnetism, electrical conductivity and surface reactivity.

The most commonly used property, surface reactivity, has proven to be very selective, particularly for sulphide ores. The separation process based on this property is called flotation. In flotation, air is bubbled through the pulp (a mixture of finely ground ore and water) in a tank which is agitated vigorously to break the air into fine bubbles. The valuable mineral is picked up by the bubble and floated to the surface to form a stable froth, which is skimmed off. The gangue particles are not affected and remain in the pulp to form the tailings.

The principle of flotation is based on surface tension forces. For an air bubble to stick to a particular mineral surface, the mineral must be hydrophobic (water repellent). To make the mineral particles hydrophobic, small amounts of organic chemicals called collectors are added to form a monomolecular (ie, one molecule thick) layer on the surface. Typical examples of collectors are sodium oleate and xanthates. To en-

sure stability of the bubble, frothers (ie, heteropolar, surface-active organic chemicals such as pine oil and cresol) are added. Flotation is very selective and can be used to concentrate very low-grade ores.

The concentrates produced through mineral processing are drastically reduced in bulk and weight compared to the original ore. For example, 100 kg of copper ore containing as little as 1% metal in the form of a sulphide can be upgraded to 4 kg of concentrate containing 25% copper, a reduction of 96% in the weight of the initial ore.

#### Chemical Extraction

Unlike metal oxides, metal sulphides cannot be directly reduced to the metallic state. Additional complications are introduced by the invariable presence of iron sulphides in the nonferrous sulphide concentrates. Extraction processes are often referred to as pyrometallurgical (high-temperature processes, eg, smelting, roasting, distilling, etc, involving furnaces) or hydrometallurgical (aqueous-solvent processes, usually operating near room temperature). Most metal-extraction processes involve both high temperatures and aqueous solution treatments. There are a number of paths which can be followed to produce metals from sulphide concentrates.

**Copper** In the case of copper, the principal mineral in the concentrate is chalcopyrite ( $\text{CuFeS}_2$ ). The traditional process for producing copper from this concentrate involved roasting, smelting, converting and refining. Roasting is the heating of the sulphide concentrates in air to temperatures of about 600-700°C to oxidize partially the iron sulphides to iron oxides and sulphur dioxide gas. The solid products of the roaster together with a flux (silica) are then melted in a furnace (smelting) to separate and remove the oxide components as slag and the enriched copper-iron sulphides as matte. The liquid matte is transferred to a converter where the remaining iron and sulphur are removed by air blown through the matte (converting). The iron is oxidized, then slagged with the addition of silica; the sulphur forms sulphur dioxide gas.

The resulting product is "blister" copper of more than 98% purity. The impurities are present in the concentrate and remain in the copper during processing. Some of these impurities (eg, zinc, tin, iron and sulphur) may be removed by a fire-refining step, in which air is blown into the molten copper to oxidize selectively the impurities to form a slag or oxide gas. The slag is then skimmed off and the copper is covered with charcoal to prevent further oxidation. At this stage the copper contains approximately 1% oxygen. Traditionally, most of this oxygen was removed by inserting and agitating a freshly cut tree trunk below the copper surface (poling). Today, natural gas is usually used to reduce the oxygen content to about 0.13%. This grade of copper, referred to as "tough pitch" copper, is sold to manufacturers. Sometimes precious metals are present in the copper in very small amounts. These cannot be removed by fire refining and the copper must undergo an additional refining process, electrolytic refining.

In electrolytic refining, fire-refined copper is cast in the form of a large block, which acts as an anode. The block is placed into a copper sulphate solution (an electrolyte, ie, solution in which electrical current is carried by ions) together with a thin sheet of high-purity copper, which serves as the cathode. Direct current is passed through the anode, electrolyte and cathode, resulting in the transfer of copper from the anode to the electrolyte as copper ions and the migration of these ions to the cathode surface, where pure copper is deposited. The precious metals do not dissolve but drop to the bottom of the refining cell. They are referred to as anode

slime. The slimes are collected periodically for the recovery of gold, silver and PLATINUM group metals. The refined cathode copper is melted and cast into shapes for industrial use. There are 3 copper refineries in Canada: at Montréal (NORANDA MINES LTD), one of the largest in the world; Copper Cliff, Ont (International Nickel Company of Canada); and Timmins, Ont (Kidd Creek Mines Ltd).

In the late 1940s, INCO developed a new technology, "flash smelting," to smelt copper concentrates at Copper Cliff. By using pure oxygen, INCO technicians were able spontaneously to ignite the sulphide concentrates, thus combining the roasting and smelting steps. This process requires no fuel for smelting and also permits the efficient collection of sulphur dioxide gas for liquefaction. INCO was the first company to use pure oxygen in metal extraction and to produce liquid sulphur dioxide from sulphide concentrates.

In the late 1960s, Noranda developed a continuous copper-making process using a single furnace (the Noranda Reactor). This reactor is a horizontal cylinder in which roasting, smelting and converting operations are combined. The concentrates and flux are fed in at one end and the surface of the bath is kept turbulent by oxygen-enriched air (23.5% O<sub>2</sub>) blown through tuyeres (nozzles) located at the side of the reactor. The matte or copper produced is tapped from one side and the slag from the end of the vessel. The slag contains substantial amounts of copper and is treated by a mineral-processing operation in which it is crushed as it cools slowly. The copper-containing components are floated to produce a 40% copper slag concentrate for recycling to the reactor. This process has been in operation at Noranda, Qué, since 1973.

**Nickel** In Canada, 2 main methods are used to produce nickel: one is a leaching process; the other is based on roasting, smelting and converting processes similar to those used in copper production. In the leaching process, developed by Sherritt Gordon Ltd and used at Fort Saskatchewan, Alta, the sulphide concentrate is mixed with ammonia leaching solution and oxygen (compressed air at 689-758 kPa) and heated to 80°C. The nickel, copper and COBALT present in the concentrate form soluble ammonia complexes. The solution containing the dissolved metals is separated from the residue. The copper is precipitated out from the solution as copper sulphide by increasing the acidity of the solution and by use of hydrogen sulphide. Metallic nickel is then produced in powdered form by reducing the solution with hydrogen gas at 3445 kPa and 200°C. The nickel-free solution is then treated with hydrogen sulphide to recover cobalt as cobalt sulphide. Finally, the metal-free solution is evaporated to form ammonium sulphate, which is sold as fertilizer.

Three variations of the roasting, smelting and converting route are practised in Canadian plants. At INCO's operation in Thompson, Man, the nickel sulphide concentrate is roasted, smelted and converted to remove iron and part of the sulphur (as in the copper process). The product, nickel sulphide (Ni<sub>3</sub>S<sub>2</sub>), is cast into anodes and dissolved electrolytically, using a sulphate chloride electrolyte, to produce pure cathode nickel. The anode residues are treated for the recovery of elemental sulphur and precious metals. This is a unique process patented by INCO.

Since the nickel concentrate produced at INCO's Sudbury plant also contains some copper, the product after roasting, smelting and converting contains both nickel sulphide (Ni<sub>3</sub>S<sub>2</sub>) and copper sulphide (Cu<sub>2</sub>S). By slowly cooling a molten mixture of these 2 sulphides in an insulated mold over a period of 3 days, it is possible to produce large crystals of nickel sulphides, copper sulphides and a small amount of copper-

nickel alloy containing most of the platinum metals. The nickel sulphide is separated from this mixture by grinding and flotation. The metallic alloy fraction is removed magnetically and treated for recovery of nickel and precious metals.

The remaining nickel sulphide is then oxidized to form nickel oxide by a roasting operation at approximately 1050°C. The nickel oxide is then reduced either with coke (a dense substance distilled from coal) in a reverberatory-type furnace or with hydrogen in a fluid-bed roasting furnace to produce metallic nickel. The nickel is further refined electrolytically at a plant at Port Colborne, Ont. An alternative high-pressure carbonyl process has been developed by INCO and has been in operation since 1973 at their Sudbury plant. In this process, carbon monoxide gas is passed over nickel at a pressure of 6895 kPa and a temperature of 170°C. A nickel carbonyl gas is formed which is purified by distillation. The purified nickel carbonyl is then decomposed at 200°C to form high-purity nickel pellets or powder and carbon monoxide gas which is recycled.

Falconbridge Nickel Mines at Falconbridge, Ont, process their nickel-copper sulphide concentrates by roasting, smelting and converting steps. The product from the converting operation, a copper-nickel sulphide matte, is shipped to Norway for recovery of metal. The sulphur dioxide gas from the roasters is used to produce sulphuric acid.

A number of nonferrous metals are produced from oxide minerals. Two examples are given.

**Magnesium** is produced in Canada by Chromasco near Renfrew, Ont. The process, invented and developed in Canada during WWII by L.M. PIGEON, is referred to as the Pigeon Process. Calcined dolomite (MgO.CaO) is mixed with ferrosilicon and then placed in a tubular stainless steel retort which is evacuated to approximately 0.003 kPa. One end of the retort is heated to about 1180°C; the other is cooled. The magnesium vapour that forms condenses in the water-cooled end as a dense, coherent deposit. The magnesium crystals so formed are removed, melted and cast into ingots.

**Uranium** In Canada URANIUM is extracted from various minerals such as pitchblende, uraninite and brannerite. The ore containing these minerals is crushed, ground and treated with sulphuric acid, under either atmospheric or high pressure conditions, to dissolve the uranium. The solution containing the uranium is separated from the solid residue and purified by ion exchange or solvent extraction techniques. The uranium is then precipitated out from the solution as an ammonium or magnesium diuranate. This material is filtered, dried and shipped to the refinery in Blind River, Ont, where it undergoes further purification to produce nuclear-grade compounds such as uranium oxide (UO<sub>2</sub>) and uranium fluoride (UF<sub>6</sub>).

#### Environmental Considerations

Canadian metallurgical plants are generally located in sparsely inhabited areas near the mines. As a result, ecological problems were not given much consideration until recently. In general there were no facilities to capture or fix the sulphur dioxide gases; all gases were vented through stacks to the atmosphere. However, with the greatly increased knowledge of the influence of poisonous gases on the environment and in the face of increasing public apprehension, the control of pollutants from metallurgical plants is of utmost concern to modern industry (see AIR POLLUTION). The principal pollutants from nonferrous operations in Canada are particulate materials and the sulphur dioxide gas which is responsible for ACID RAIN. The control of solid particulate matter has been brought about by elaborate gas-cleaning equip-

ment such as venturi scrubbers, cyclones, filter bags and electrostatic precipitators. The control of smelter gases is much more difficult. Approximately 98% of the sulphur which enters the plant in the form of sulphides leaves as sulphur dioxide gas. This emission, through the formation of acids and other compounds in the atmosphere, can cause serious damage to human health, vegetation and property. In order to protect the environment it is necessary to capture the sulphur dioxide and convert it to a marketable product or to an inert solid waste which can be safely stored. The most common conversion treatment is to produce sulphuric acid. However, depending on the economics and concentration of the sulphur dioxide gas, other products include elemental sulphur, liquid sulphur dioxide, ammonium sulphate and gypsum. In Canada sulphuric acid and liquid sulphur dioxide are produced by nonferrous smelters. See IRON AND STEEL INDUSTRY; MINERAL RESOURCES.

**Metcalf, John**, author (b at Carlisle, Eng 1938). Metcalf received a BA from U of Bristol and lived in Eng until 1961 when he immigrated to Canada. He has published 3 collections of short stories, *New Canadian Writing* (1969), *The Lady Who Sold Furniture* (1970) and *The Teeth of My Father* (1975); 2 novellas, *Girl in Gingham* (1978); 2 novels, *Going Down Slow* (1972) and *General Ludd* (1980). He has also edited numerous anthologies of short stories and has written one book of literary criticism, *Kicking Against the Pricks* (1982). A witty satirist, Metcalf is a master of the short story and relentless in his jibes against the Canadian literary establishment. SHARON DRACHE

**Metcalf, Charles Theophilus Metcalfe, Baron**, governor general of British N America 1843-45 (b at Calcutta, India 30 Jan 1785; d at Malshanger, Hampshire, Eng 5 Sept 1846). He was educated at Eton and in 1801 joined the Indian Civil Service, where he earned a reputation as a talented and judicious administrator. He succeeded to his father's baronetcy in 1822, and later was appointed provisional governor general of India. Between 1838 and 1842 he served as governor of Jamaica.

Metcalf arrived in Canada early in 1843 to replace Sir Charles BAGOT, with instructions to make no concessions towards RESPONSIBLE GOVERNMENT, the principle on which was founded Bagot's existing Reform ministry headed by Louis-Hippolyte LAFONTAINE. In Nov 1843 he provoked his ministers' resignation by making appointments without their advice. For some 9 months he carried on the government with the aid of a single minister, Dominick Daly. In Aug 1844 he formed a Conservative administration headed by William Henry DRAPER, and was sustained at the polls by a small majority in Nov 1844.

Afflicted with cancer of the face, Metcalf laboured under the most difficult personal circumstances, yet he devoted long office hours to official business. He moved the capital to Montréal, negotiated pardons for the rebels of 1837-38 who had been deported to Australia, consolidated Lord SYDENHAM's work in the civil service and gave generous financial support to many cultural and philanthropic causes. In Nov 1845 the progress of his disease giving him no other choice, he resigned his office and left for England. As a reward for his service, he had been created Baron Metcalfe of Fern Hill early in 1845, but his titles became extinct when he died.

JACQUES MONET, SJ

**Meteor, Meteorite, Impact Crater** The solar system contains many small objects travelling in individual orbits about the sun. When such a particle collides with Earth, interaction with the

upper atmosphere produces a flash of light called a meteor, which typically endures for less than one second near heights of 90 km. Large particles produce spectacular meteors and, in rare cases, part of the object survives to reach Earth's surface and is then called a meteorite. Huge meteorites are not slowed much by the atmosphere and their violent collisions with Earth blast out "impact" or "meteorite" craters.

The vast majority of meteorites are fragments of COMETS. When a comet is heated during passage near the sun, particles separate from the nucleus and the more stony material withstands the effect of solar heating and continues in its own orbit, which resembles the comet's orbit. Over thousands of years, the particles disperse around the entire orbit and into a stream of appreciable width. When Earth crosses such a stream, a meteor shower can be seen, and one observer can typically see 5-50 meteors per hour, all meeting Earth from the same direction and with constant velocity. A shower may last only hours or many days and is likely to occur every year. With time, streams disperse so that the meteors blend into a general background of sporadic meteors. Meteors enter the atmosphere at speeds of 11-72 km per second.

RADAR and spectroscopic meteor observations have been Canadian research specialties. A radar beam reflects from the column of electrified gas produced by a meteor's passage; the method is sensitive for very small particles. A meteor's spectrum can be recorded photographically or by television techniques, and spectrum analysis (ie, SPECTROSCOPY) reveals which atoms are abundant in the particle and hence, indirectly, something of the chemical composition of comets.

Except for lunar samples, meteorites provide our only chance to study material from space by laboratory techniques. Most meteorites are "stones," with a thin, black fusion crust; about 5% are "irons," composed of a nickel-iron alloy; a smaller number are "stony-irons." Analysis of meteorites yields vital clues about the early history of the solar system because some have had relatively simple chemical and thermal histories. It is not clear whether any large chunks of cometary material are strong enough to survive impact with Earth's atmosphere. Most, possibly all, meteorites appear to be derived from asteroids by mutual collisions. Their orbits appear to have been modified by Jupiter's gravitational field in tens of millions of years to permit collision with Earth. About 3000 different meteorites are known, of which nearly 50 have been found in Canada. Observations with a network of cameras in western Canada indicate that a

meteorite of at least 100 g falls somewhere in Canada daily, but very few are ever recovered.

Impact craters are formed by the expanding shock wave when a giant meteorite, weighing hundreds to millions of tonnes, strikes the ground at high velocity. The MOON and several other planets and satellites retain impact craters for very long periods, but on Earth EROSION usually removes the surface evidence in a few million years. Subsurface ROCK, however, is permanently damaged by the shock wave and can be used to identify very ancient craters. A major program to study impact craters was begun during the 1950s by C.S. BEALS, the Dominion Astronomer. Two dozen features in Canada, ranging from 3 to 95 km in diameter, have been confirmed as impact craters in this pioneer study, of which the Nouveau Québec Crater is the most recent.

IAN HALLIDAY

Reading: D.W. Sears, *The Nature and Origin of Meteorites* (1978).

**Meteorology** is the SCIENCE that studies the atmosphere and atmospheric phenomena, using data about temperature, humidity, CLOUD, WIND, etc. Its ultimate aim is to explain the structure and functioning of the atmosphere using the basic laws of PHYSICS. The major theoretical divisions are physical and dynamic meteorology (very closely related and often coupled under the title atmospheric physics) and synoptic meteorology. CLIMATOLOGY is the branch of meteorology most concerned with WEATHER, CLIMATE and CLIMATE CHANGE.

#### Physical Meteorology

Physical meteorology links meteorology and physics in studies of 3 core topics: electromagnetic radiation, meteorological thermodynamics and cloud physics. Related topics include stratospheric physics, atmospheric electricity, optics and ACOUSTICS.

**Radiation** Solar radiation is received by Earth mostly as visible and near-infrared light. About 30-35% is lost to space by reflection from clouds and the Earth's surface. Most, however, is absorbed by the Earth's surface and re-emitted as infrared radiation, which is absorbed by water, carbon dioxide (CO<sub>2</sub>) and pollutants in the air. In the long term, the solar radiation received by Earth and its atmosphere at any point is balanced by infrared radiation emitted to space. Temporary imbalances, eg, the summer surplus and winter deficit in incoming solar radiation in Canada, result in large seasonal temperature changes, except where moderated by oceans. Radiative exchange processes are of central importance in computer models for long-range WEATHER FORECASTS and climate change. Radiation is used extensively in REMOTE SENSING of weather elements from satellites, aircraft and surface instruments.

**Meteorological Thermodynamics** assumes that air is a mixture of dry air and water vapour, each characterized by temperature, pressure and density, interrelated in an equation of state. Temperature variations cause pressure changes that drive the winds. Local cooling causes condensation and the release of latent heat. Complex interactions among the state variables, clouds, winds and radiation are studied with the aid of the laws of thermodynamics and computer simulation.

**Cloud Physics** is the study of cloud and precipitation particles and the physical processes that take place in natural and artificial clouds. Water vapour condenses on tiny hygroscopic particles called condensation nuclei to form cloud and fog droplets. At temperatures far below freezing, water vapour condenses on soil particles and other freezing nuclei to form ice crystal clouds. In favourable circumstances, droplets and crystals grow into raindrops and snowflakes, or even hailstones, by collision and coalescence and by transfer of water vapour

from droplets to crystals in a mixed cloud (see ICE). Scientific experiments on modification of clouds, fog and precipitation for purposes of rainfall enhancement, HAIL suppression, visibility improvement and forest-fire suppression have been conducted in Canada with mixed results since about 1950 (see RAINMAKING).

The stratosphere (upper atmosphere) imposes thermodynamic constraints on air motions in the weather layer (troposphere) below, and acts as a reservoir for gases and fine particles that influence radiation streams. LIGHTNING, ionization and the air-earth current are elements of atmospheric electricity. Electrical processes are thought to be important in the physics of clouds and precipitation. Atmospheric optics and acoustics embrace studies of transmission, reflection, refraction and diffraction of light or sound. The results are applied to such phenomena as RAINBOWS, mirages, scintillation, wind sounds and echoes, and to the use of light and sound in remote sensing as in laser or acoustic RADAR, cloud photography and the sonic anemometer-thermometer.

K D HAGE

#### Dynamic Meteorology

Dynamic meteorology is the science of atmospheric motions. Because the Earth's atmosphere is a complex physical system subjected to a number of external influences, such as heating and cooling by the LAND and OCEAN masses, a wealth of phenomena involving air motion are observed. The largest is the belt of westerlies, ie, winds blowing from W to E, circling the Earth in the middle latitudes. These westerlies are normally disturbed and forced to wander northward and southward in a snakelike fashion. The core of this meandering current, the jet stream, normally located 10-12 km above sea level, can have winds of over 300 km/h. The wavy structure of the jet stream is caused by the deflecting effect of large mountains such as the Rockies, by heating or cooling by the underlying surface and by travelling vortices measuring as much as a few thousand kilometres in diameter. These vortices can be viewed as clockwise or counterclockwise circulations superimposed on the main westerlies and causing the latter to be deflected around them. Some of the larger vortices can remain nearly stationary for periods of several days; smaller, weaker vortices are swept downstream by the jet current. There is, therefore, an intricate interplay between the jet stream and the vortices, each affecting the other in ways that depend on their relative strengths and configurations.

Near the Earth's surface the circulation is dominated by the vortices because the jet stream becomes feeble at low altitudes. These are the systems seen on sea-level weather maps on which are drawn isobars — lines connecting points of identical pressure. In the Northern Hemisphere, clockwise vortices have a high central pressure (anticyclones), while counterclockwise vortices have a low central pressure (cyclones); in the Southern Hemisphere the opposite circulations around "high" and "low" are observed. Lows are normally associated with areas of cloud and, often, precipitation; highs are usually accompanied by clear skies. Far less frequent but much more violent is the hurricane, or typhoon, one of the most intense and feared storms. Ranging in size from about 100-1000 km, they are normally found only in the tropics and subtropics. On a still smaller scale is the THUNDERSTORM, with a typical dimension of 5-10 km, and the destructive TORNADO, typically having a diameter of a few hundred metres and winds estimated at up to 500 km/h.

Dynamic meteorology uses the laws of hydrodynamics and thermodynamics to investigate various types of atmospheric circulations. The former describe how various forces, eg, gravity acting on a parcel of air, will affect its velocity;

the latter provide information on the temperature change that results when a certain amount of heat is added or extracted from the air. The procedure may be most easily visualized if the atmosphere is subdivided into a large number of imaginary volumes (cubes or similar shapes). If all forces acting on the volume and the velocity of the air are known, it is possible to compute the displacement of the air over a period of time. Similarly, if at a given instant the temperature inside a given volume is known and the amount of heat entering or leaving it can be determined, it is possible to compute what the temperature inside the volume will be some short time later. This is fundamentally the method used to produce weather forecasts by electronic computers. Calculations are most accurate when volumes are small; hence, forecasts for large regions, such as a continent or hemisphere, are feasible only on powerful computers.

JACQUES DEROME

#### Synoptic Meteorology

Synoptic meteorology is the analysis of meteorological data, obtained more or less simultaneously from a large geographical area, in order to present a comprehensive and nearly instantaneous picture of the state of the atmosphere. Frequently, data will be obtained over an extended period so that the development of meteorological systems may also be studied. Synoptic meteorology is very closely related to physical and dynamic meteorology and to general climatology, and may be considered a synthesis of these disciplines. Phenomena of interest to the synoptic meteorologist occur on many spatial and temporal scales. Major hemispheric circulation patterns (including jet streams) in the middle and upper troposphere (lower atmosphere) typically span 10 000 kilometres or more and may persist for weeks or months. These major circulation patterns tend to control and interact with smaller-scale phenomena, eg, cyclones and anticyclones.

Cyclones are vortices having a relatively low central pressure. At the Earth's surface, the air tends to spiral inward toward the centre of the cyclone where it is forced to rise. Since the rising air will be cooled by adiabatic expansion (ie, expansion that occurs without the addition of heat) at a rate of about 1°C per 100 m, some of the water vapour will condense to form cloud droplets. If there is sufficient moisture and if the air ascends high enough, precipitation will occur. Anticyclones have a relatively high central pressure. Near the Earth's surface, the air generally spirals outward from the centre. Near the centre of an anticyclone, the air is generally subsiding; consequently, clouds tend to dissipate and fair weather is frequently observed.

Cyclones and anticyclones occur in middle latitudes and are one of the principal means by which heat and moisture are redistributed throughout the atmosphere. Solar heating in equatorial regions and cooling in polar regions will create strong horizontal thermal gradients. These gradients represent sources of potential energy which, under suitable conditions, may become available for conversion into kinetic energy. It is now generally accepted that cyclones form in order to accomplish this energy conversion. During the period of development (cyclogenesis), a cyclonic wind field will be initiated (increase in cyclonic kinetic energy). This will occur at the expense of the thermal gradient (decrease in potential energy). At the same time, the kinetic energy is also being destroyed by friction and other dissipative processes in the atmosphere.

Synoptic meteorology is used in weather forecasting to follow the development and evolution of cyclones and anticyclones, as well as a myriad of associated structures such as air masses and fronts (boundaries between dissimilar air masses). In this task the meteorologist is assisted

by mathematical models of the atmosphere which are run on digital computers. This interaction between the synoptic meteorologist and computers is the essence of modern weather prediction.

**Methodism**, originally a movement within the Church of England in Britain, led by John Wesley (1703-91), who encouraged personal holiness and a disciplined (hence "methodical") Christian life. It was distinctive in its Arminianism, the belief that individuals are free to accept or reject God's grace, and that it is possible to attain "perfection" (the overcoming of a will to sin) in this life. The movement was first represented in what is now Canada by one of Wesley's followers, Laurence Coughlan, who began to preach in Newfoundland in 1765. Yorkshire settlers around Chignecto, NS, in the 1770s were the first sizable group of Methodists in the Maritimes. William BLACK, of the next generation, became the greatest Methodist preacher and organizer in the Atlantic colonies. Following the arrival of Loyalist Methodists after the American Revolution he worked with the American Methodist Episcopal Church, but before long he began to recruit preachers from England and in 1800 Methodists in the Maritimes joined the English Wesleyan Conference. Subsequent immigration strengthened ties with England, making Maritime Methodism dependent on English policies, deferential to dominant Anglican elites, and conservative. Not until 1855 did Maritime Methodists gain partial autonomy, in the new Conference of Eastern British America.

Methodism exercised its strongest influence in Upper Canada. Methodists were among the Loyalist founders and many more among "late loyalists" who flocked into UC before the war of 1812. With them came Methodist Episcopal "saddle bag preachers" whose zeal and adaptability made them highly effective in frontier conditions. After the war, UC Methodists laboured increasingly under suspicion of being "pro-American" and in 1828 they sought a remedy by severing their American connections. In 1833 they negotiated a union with the more conservative English Methodists who had first entered the colony in 1817. The resulting Wesleyan Methodist Church fell apart in 1840 but was renewed in 1847. Methodists who rejected the union formed a continuing Methodist Episcopal Church in 1834 and attempted to maintain close ties with their American counterparts. Continued English immigration brought more evangelical groups to UC: Primitive Methodists (1829), Bible Christian Church (1831) and New Connexion Methodists (1837).

Under Egerton RYERSON, founding editor of the *Christian Guardian*, Methodists became involved in UC politics as a result of their determination to deny the C of E's claim to be the colony's

established church (see ANGLICANISM). Support for religious and civil equality did not lead to political radicalism and Ryerson's early sympathy for William Lyon Mackenzie and the Reform Party soon waned. In both the REBELLIONS of 1837 and the 1844 election, when loyalty was an issue, Ryerson and most Methodists followed a moderate path. Its concern for community life made the Methodist Church the most "Canadian" of denominations and encouraged Methodists to view their church as a nation-building force. Inspired partly by the forces leading to CONFEDERATION, the Wesleyan Methodist Church, the Conference of Eastern British America, and the New Connexion Church united in 1874, and in 1884 the Methodist Episcopal Church and the smaller Methodist bodies were added to form the Methodist Church. The Free Methodists, who entered from the US in 1876, were few and have remained separate. The new Methodist Church was governed by a national quadrennial conference and annual area conferences, with the participation of laymen (but not women) at all levels. It continued earlier missions among Canadian Indians in several regions and conducted substantial overseas work in Japan (1873) and West China (1892).

Methodist commitment to education was expressed in Upper Canada Academy (1836), Cobourg, UC (Victoria College after 1841); MOUNT ALLISON Academy (1843), Sackville, NB, (a university after 1858); and Wesley College (1877), Winnipeg, which joined with the Presbyterian Manitoba College to form United College (1938). Secondary schools included Belleville Seminary (1857), later Albert College (1866); Stanstead Wesleyan College, Qué (1873); Alma College, St Thomas, Ont (1877); and Mount Royal College, Calgary (1910).

With the settlement of western Canada the Methodist Church endeavoured to hold the allegiance of Canadians migrating westward and of British settlers, and to promote the assimilation to Protestant Canadian culture of the thousands of non-Anglo-Saxons who poured into the West before WWI. This endeavour was closely associated with the SOCIAL GOSPEL. Many Methodists saw increased state intervention in economic and social life as essential in establishing the Kingdom of God on Earth. The Methodist Church and most members were vociferously patriotic during WWI, a struggle they believed would purge the nation and prepare the way for a new social order. At the end of the war several church bodies adopted Christian socialist platforms, but subsequent rejection of such policies testified to the church's dominant conservatism. When the Methodists entered the new UNITED CHURCH OF CANADA in 1925, they carried both radical and conservative traditions with them. At that time the church had 2061 ministers, 418 352 members, and many adherents.

**Métis**, one of several historically variable terms (*michif*, *bois brûlé*, *chicot*, halfbreed, country-born, mixed blood) used in Canada and some parts of the northern US to describe people of mixed N American Indian-European descent.

It is important to define specific meanings for the term as used in this discussion, while cautioning that writers, past and present, have not achieved consensus on the matter. Written with a small m, *métis* is an old French word meaning "mixed," and it is used here in a general sense for people of dual Indian-white ancestry. Capitalized, *Métis* is not a generic term for all persons of this biracial descent but refers to a distinctive so-

Interior of the gallery of the Methodist Meeting House in Hay Bay, Ont, built in 1792 (photo © 1984 Hartill Art Associates).

Métis traders, c1872-75 (courtesy Public Archives of Canada /PA-4164).

ciocultural heritage, a means of ethnic self-identification, and sometimes a political and legal category, more or less narrowly defined. (Alberta's Métis Betterment Act of 1938, eg, defined Métis as persons "of mixed white and Indian blood having not less than one-quarter Indian blood," not including those people already defined under Canada's INDIAN ACT as treaty or nontreaty Indians.) This complexity arises from the fact that biological race mixture (Fr, *métissage*) by itself does not determine a person's social, ethnic or political identity. Many N American whites have some Indian ancestry, and rates of European genetic admixture among status-Indian groups in eastern and central Canada range in some instances from 20 to over 40%. Biologically, *métissage* has gone on since earliest European contact, but over time and in different areas people of that ancestry have grown up and lived out their lives in a vast variety of circumstances, leading them and their descendants to be categorized and to classify themselves by many different criteria.

On Canada's Atlantic seaboard, Métis families and communities were identifiable in the 1600s, although not classified according to race. Early and often casual unions between European fishermen and native women from Acadia to Labrador produced uncounted progeny who matured as Indians among their maternal relatives. Those among the MALISEET were known as "Malouidit" because so many of their fathers came from St Malo on the Brittany coast of France. In Acadia, many French took Indian wives, and some communities became largely Métis. The *capitaines des sauvages* who served the French governors as interpreters, intermediaries and distributors of annual presents to the Indians were commonly of mixed parentage.

Some such offspring were born of formal church marriages, as Acadian families such as the Denys and d'Entremonts forged both kinship and trading ties with the MICMAC. During the 17th century French officials supported such marriages in hopes of better converting the Indians and building up the population of NEW FRANCE. "Our young men will marry your daughters and we shall be one people," Samuel de CHAMPLAIN reportedly told his Indian allies; and subsequent administrators continued to encourage those mixed unions which were church sanctified.

Problems arose, however. Both the Indians and the French traders who sojourned among them had a distressing tolerance for unions un-

blessed by Christian rite, and many Frenchmen took up "savage" ways themselves. As New France began its second century, policy shifted against intermarriage — reflecting, too, the increased availability of white wives within the colony, both FILLES DU ROI and native-born. The ideal of "one people" (French, incorporating Indian and Métis) faded. Countless families, both French and Indian, had become genetically mixed, but Indian communities, as such, were not assimilated. Nor did biological *métissage* in eastern Canada yield a biracial population that persisted as socio-culturally or politically distinct. Indeed, despite their numbers, people of mixed descent are difficult to identify in early records of New France; they either remained among their mothers' kin as Indians or were baptized with French names, and in almost all instances went on record solely as French.

The official discouraging of mixed unions in New France was probably one among many factors that fostered the growth of the first distinguishably Métis communities, around and beyond the Great Lakes from the 1690s on. Many men who evidently preferred the freedom and opportunities of life in the Indian country to the regulation of church and state in the home colony found livelihoods at the trading and military posts that were carrying French influence into the interior of the continent. Their native families, whom they might or might not legitimize in the missionaries' terms, had formed nuclei of settlement at several dozen localities by the time the British conquered Canada in 1763. Numerous American and Canadian towns and cities (eg, Detroit and Michilimackinac in Michigan; Sault Ste Marie in Ontario; Chicago and Peoria in Illinois; Milwaukee, Green Bay and Prairie du Chien in Wisconsin) had their origins in these informal biracial communities. The sizes of these populations are sporadically reported. As of 1700, the Jesuit missionary Étienne de Carheil was deploring the lewdness and apostasy of the hundred or more VOYAGEURS and COUREURS DE BOIS residing with native women around Michilimackinac.

Carheil and other outsider-critics to the contrary, these communities achieved a moral and social order of their own. French Catholicism remained a part of their heritage, even if attenuated by isolation. Indian constraints also set moral limits. Unions with Indian women involved commitments to and reciprocities with Indian kin and neighbours, and earned their own descriptive term, marriage *à la façon du pays*, "according to the custom of the country." Fathers often lived out their lives with these families, whether formally employed at the forts or sub-

sisting as *gens libres*, freemen who supplied the posts or served intermittently as guides, interpreters or voyageurs. Game, fish, wild rice and maple sugar furnished sustenance, supplemented by the small-scale slash-and-burn or "burnt-stump" agriculture that may have caused Great Lakes Métis to be labelled *bois brûlés* or *chicots*.

While these communities were growing during the 1700s, a biracial population of a rather different character was becoming noticeable to the north of the Great Lakes watershed. RUPERT'S LAND, the region draining into Hudson Bay, was granted by Charles II of England in 1670 for the exclusive trade of the HUDSON'S BAY COMPANY. After the Treaty of Utrecht in 1713 granted Hudson Bay to the British, HBC posts there became permanent residential enclaves among the predominantly CREE Indians, who, as "Homeguard" traders and provisioners, were basic to the company's survival and success. As around the Great Lakes, white women were absent; and Indians eager to consolidate trade and friendship offered wives to the Europeans in "the custom of the country." HBC employees, however, violated strict company rules if they accepted. The HBC directors in London, strongly aware of the costs and problems of maintaining posts so remote from their home base in so northerly an environment, sought rigid controls on the numbers of post dependants. Needs to maintain security at the forts and to minimize expenses and sources of friction with the Indians reinforced company concerns to maintain servants' celibacy and chastity and, in turn, the employees' efforts to keep transgressions off the record. By the 1740s, however, when officer James Isham reported that traders' native offspring around the posts had become "pretty Numerous," the HBC London Committee had to acknowledge the limits of its control. By 1810 the company had given some attention to both the responsibilities and the rewards of educating and training these progeny into "a colony of very useful hands."

These early Hudson's Bay offspring did not become classed as a separate ethnic/racial entity in these years. Even if the company could not suppress country marriages, it could and did suppress the growth of dependent post communities and free traders by removing from the bay all British servants who retired or were dismissed and by encouraging Indians to disperse to their hunting grounds each winter. A very few HBC officers' native sons gained permission to travel to Britain; most offspring were assimilated among the Cree Homeguard, and a few became company servants, sometimes classed by 1800 as "Natives of Hudson's Bay" or even as "English."

The HBC data to 1810 show that biological mixing in itself was insufficient to occasion Métis "ethnogenesis" — the rise to recognition and self-consciousness of a new racial-political-cultural group. These HBC offspring lacked the distinct community and economic base upon which to build a separate identity. Through much of the 18th century, company rules gave their trader-fathers good reason to be circumspect about their existence. HBC word usage also muted their distinctiveness. It was in New France, and in British Canada after 1763, that Métis, *bois-brûlé*, and later, halfbreed, came into use; HBC men lacked such terms until they picked them up from the Canadians in the early 1800s. If language is any guide to thought, perhaps HBC writers also lacked (although they later learned) the increasingly judgemental racial/blood consciousness shown by some of their Canadian FUR-TRADE counterparts by the early 19th century.

Events of the late 1700s and early 1800s brought great changes for both British and Canadian fur-trade offspring. Around the Great

Lakes, Britain's 1763 conquest of New France may have heightened a Métis sense of separateness as the new regime intruded. The leadership of the Montréal fur trade became British, in fact mainly Highland Scottish, as the NORTH WEST COMPANY gained strength in the 1780s; francophones whose experience and skills continued to be basic to the trade were relegated to lower ranks. In 1794 JAY'S TREATY fixed the US-Canadian boundary around the Great Lakes. In following decades, US white settlers and governments displaced and disorganized numerous Métis communities around the lower lakes, leading many to migrate northwest towards Minnesota and Manitoba.

It was in Manitoba that the Métis became conspicuous in Canadian history. By 1810 they had established roles as buffalo hunters and provisioners to the NWC. As NWC supply lines lengthened to ATHABASCA and beyond, the Red R heartland was central to the Montréal traders. Accordingly, when in 1811 Thomas Douglas, fifth earl of SELKIRK, reached an agreement with the HBC to found the colony of ASSINIBOIA with a band of Scottish settlers, the NOR'WESTERS and their native-born employees and associates saw it as a direct threat to their trade, livelihood and territorial interests.

Events of the next decade are well known: the Pemmican War, the SEVEN OAKS killing of Gov Robert SEMPLE and several colonists in 1816, the often violent conflicts between the HBC and NWC, and the final merger in 1821. Less recognized is the fact that each company's RED RIVER COLONY involvement was intensified in part by the presence of its own native-born constituency. The growing numbers of "Hudson's Bay natives" were a factor in the HBC decision to support the colony. Servants with "country" wives and families lobbied for the founding of a community where they could retire and have lands, livelihoods, schools and other amenities. The HBC itself hoped to reduce costs by relocating dependent post populations in a place where they could become self-supporting under company governance.

The Nor'Westers and their Métis associates had a more complex relationship. The NWC claimed less control over its Métis and freemen, many of whose biracial connections long predated its arrival in the Northwest. In the conflict, this fact served the NWC well, for no matter what support it actually gave to Cuthbert GRANT, Jr, and his Métis cohorts, it could and did argue that these men were defending an identity and interest of their own. Nor'Wester William MCGILLIVRAY admitted in a letter of 14 Mar 1818 that Grant and the others were linked to the NWC by occupation and kinship. "Yet," he emphasized, "they one and all look upon themselves as members of an independent tribe of natives, entitled to a property in the soil, to a flag of their own, and to protection from the British government." Further, it was well proved "that the half-breeds under the denominations of bois-brûlés and metifs [alternate form of Métis] have formed a separate and distinct tribe of Indians for a considerable time back."

From 1821 to 1870 Red River's overwhelmingly mixed-descent population continued to reflect its dual origins: Montréal, the Great Lakes and Prairies, and the NWC; and Britain, the Orkney Is (a major HBC recruiting ground) and Rupert's Land. The extent to which these subgroups were allied is debated. Some argue for their solidarity on the basis of their numerous intermarriages, business ties, and shared involvements in the BUFFALO HUNT, the HBC transport brigades, and LOUIS RIEL's provisional government of 1869-70. A contrary view emphasizes the split between the Roman Catholic Francophones and the Protestant anglophone "country-born," as they were sometimes known. The debate reflects in part the complex-

ity of the evidence and the fact that many individuals, such as members of the Alexander Ross family, suffered personal ambivalence about their Indian heritage and about Métis political activism.

Whatever their internal ties and tensions, the rapidly growing population of "half-breeds" in the Northwest was, by the 1830s, increasingly seen as a racial aggregate as racial interpretations of human behaviour gained ground. As such, they were often stereotyped and disparaged, as by HBC Gov George SIMPSON in his characterizations of the company's "halfbreed" clerks and postmasters from the mid-1820s to 1832. Simpson showed biases that were common among other Europeans (clergy, colonists) arriving in Red River and the fur-trade country and among numerous scientific and popular writers of the period; attributes of race or "blood" were linked with cultural and behavioural traits to produce deterministic judgements that science later proved untenable. Such views, applied to biracial groups, covered a wide range; such hybrids were everything from "faulty stock" or a "spurious breed" to "the natural link between civilization and barbarism," as Alexis de Tocqueville put it in the 1830s. Daniel Wilson, writing of the Red River half-breeds in 1876, moved beyond such interpretations. Racial traits, he suggested, did not set limits to adaptiveness or potentials. Besides demonstrating "a remarkable aptitude for self-government" in their organization of the buffalo hunt, the Red River Métis showed "capacity for all the higher duties of a settled, industrious community."

Events from the mid-1800s onwards offered few outlets for the qualities that Wilson perceived. The 1840s and 1850s saw Métis challenges to the HBC trade and administrative monopoly in Red River: the trial and freeing of trader Pierre-Guillaume Sayer in 1849, and the anti-HBC lobbying efforts in London by Rupert's Lander Alexander Kennedy ISBISTER. Other events soon overshadowed the HBC question: the intensifying eastern interest in developing the West (heightened by Henry Y. HIND's glowing report of its agricultural potential), Confederation and the 1870 transfer of Rupert's Land to the Canadian government. The consequent efforts of government surveyors to map Red River without regard for local residents' holdings touched off Louis Riel's establishment of a provisional government and the RED RIVER REBELLION of 1869-70. The Canadian bargaining with Riel led to passage of the MANITOBA ACT, securing the admittance of a small portion of the present province to Canada with provincial status and, most important for the Métis, stating that 1 400 000 acres (566 580 ha) would be allotted for the children of the half-breeds.

The promised land base was lost in the next decade, however. The settlers and troops who arrived in the new province from 1870 on were hostile to the Métis, many of whom were "beaten and outraged by a small but noisy section" of the newcomers, according to a report by the new governor, Adams Archibald. Métis landholders were harassed, while new laws and amendments to the Manitoba Act undermined Métis power to fend off speculators and new settlers. Of the approximately 10 000 persons of mixed descent in Manitoba in 1870, two-thirds or more are estimated to have departed in the next several years. While some went N and some S to the US, most headed W to the Catholic mission settlements around Ft Edmonton (Lac Ste Anne, St Albert, Lac la Biche) and to the S Saskatchewan R, where they founded or joined such settlements as St Laurent, Batoche and DUCK LAKE.

As they grew, several of the latter communities sought to secure clear land titles from the Canadian government. Lt Gov Alexander MORRIS thought in 1880 that the claimants' case was

clear: "They will, of course, be recognized as possessors of the soil and confirmed by the Government in their holdings." He urged that Métis still depending on the buffalo hunt have land assigned to them as that resource failed. The government, however, ignored Métis concerns while at the same time negotiating the major Indian treaties and pre-empting land for RAILWAYS. In deep frustration, the Saskatchewan Métis took up arms under Louis Riel and Gabriel DUMONT in the NORTH-WEST REBELLION of 1885.

Métis defeat at BATOCHE and the execution of Riel set off a second dispersal, particularly to Alberta, and a renewed weakening of their political influence and cohesiveness. Sir John A. MACDONALD in 1885 viewed them as without distinct standing: "If they are Indians, they go with the tribe; if they are half-breeds they are whites." Where Métis individuals did receive land allowances (or money equivalents), they usually were granted them in paper scrip — transferable certificates which unscrupulous speculators often pressured them to sell cheaply on the spot (see INDIAN TREATIES). The "scrip hunters" who followed the Treaty No 8 Half-Breed Commission in 1900 as it made its awards to Métis in the Dene settlements bought up many \$240 scrip certificates for cash amounts of \$70 to \$130.

From 1885 into the mid-1900s, poverty, demoralization and the opprobrium commonly attached to being "halfbreed" led many people of Indian descent to deny or suppress that part of their heritage if they could. In 1896 Father Albert LACOMBE, concerned for Métis interests, founded St Paul des Métis NE of Edmonton, on land furnished by the government. For financial and other reasons, the colony failed as a formal entity by 1908, and settlers from Québec began to dominate the area. Here, as elsewhere, the Métis who remained found themselves on the lower socioeconomic levels.

Some other developments after 1900 were more positive, however. In 1909 the Union nationale métisse St-Joseph de Manitoba, founded by former associates of Riel and others, began to retrieve from Métis documents and memories their own history of the events of 1869-70 and 1885, resulting in A.H. de Tremaudan's *History of the Métis Nation in Western Canada* (1929). The 1920s and 1930s saw the rise of new leaders — notably James Patrick (Jim) BRADY and Malcolm NORRIS — who, as prairie socialist activists, built a new political and organizational base to defend their people's interests. Many Métis and ex-treaty Indians had been squatters on crown lands in N-central Alberta. Threatened by a federal plan to place these lands under provincial jurisdiction, Joseph Dion and others organized petitions and delegations to the Alberta government to seek land title for the squatters. After Brady and Norris joined the movement in 1932, the first of several provincially based organizations was founded — the Métis Assn of Alberta, open to all persons of Indian ancestry. Its efforts led to the province's appointment of the Ewing Commission to "make enquiry into the condition of the Half-breed population of Alberta" in 1934-36. Despite reverses, the association eventually secured land for MÉTIS SETTLEMENTS and passage of the Métis Betterment Act in 1938. In the same year the Saskatchewan Métis Society (later the Assn of Métis and Non-Status Indians of Saskatchewan) was founded.

Since the mid-1960s Métis political activity has intensified with the founding of numerous other organizations, eg, the Manitoba Métis Federation, the Ontario Métis and Non-Status Indian Assn, and the Louis Riel Métis Assn of BC. Confronting such issues as the federal government's White Paper of 1969 and the Constitution of 1982, Métis have repeatedly faced questions about whether to pursue their concerns jointly with status or non-status Indians or through their own channels. From 1970 to 1983

the NATIVE COUNCIL OF CANADA represented Métis interests on the national level. For the 1983 First Ministers Conference, however, the 2 NCC seats were both allocated to nonstatus Indian delegates; and the Métis National Council was formed to secure distinct Métis representation there and elsewhere.

**Métis Settlements** Located across the northern part of Alberta, the Métis settlements of Paddle Prairie, Big Prairie, Gift Lake, East Prairie, Caslan, Kikino, Elizabeth and Fishing Lake form the only Métis land base in Canada. They comprise 501 810.18 ha, much of it covered by forest, pasture and farmland. The present population is about 4000.

Métis settlers are the descendants of European fur traders and Indian women who emerged as a distinct group on the Prairies towards the early part of the 19th century. Following the NORTH-WEST REBELLION of 1885, many Métis moved to the N and W. After a period of political agitation among landless Métis in Alberta during the Depression, the provincial government passed the Métis Betterment Act in 1938. Lands were set aside for Métis Settlement Associations, although 4 of the settlements (Touchwood, Marlboro, Cold Lake and Wolf Lake) were later rescinded by order of the Alberta government. A distinct Métis culture combining Indian and Euro-Canadian values and modes of expression is practised in the Métis settlements. For example, jigging, a favourite form of dance, mixes the reels of Scotland and France with the chicken dance of the Cree. A distinct Métis language combining Cree, French and English words is still spoken alongside English. Most of the residents in Métis settlements are Catholic, although they still retain Indian spiritual beliefs and customs. Education in most of the settlements is provided by the Northland School Division of the Alberta government. In recent years the settlements have emphasized the need to make their children's schools more responsive to the cultural values and history of the Métis.

Employment in the settlements is generated by commercial fishing, logging, farming, ranching and energy projects. During the past decade Métis settlers have emphasized the economic development of their land. They have established a plan for the development of a mixed economy that will combine traditional economic activities (farming, ranching, lumbering, hunting, fishing, trapping) and new industrial and commercial ventures. Among the new enterprises are a garment factory at Caslan and a buffalo ranch at Kikino.

The local government structure is a Settlement Association that holds the land and resources for its residents. Each association has a council of 5, elected by the membership. The council, along with the provincial government, has decision-making powers on matters affecting the settlements. In 1975 the Alberta Federation of Métis Settlement Associations was established to be the political voice of the settlements and to litigate their rights in court. The Métis Betterment Act established a trust fund in which all resource revenues were to be deposited. With the discovery of rich oil and gas deposits on the settlements in the 1960s, a dispute arose over the ownership of subsurface resources. The settlers, citing the Act, asserted their rights to the revenues, but the provincial government, to date, has refused to accede to Métis demands.

ALBERTA FEDERATION OF MÉTIS SETTLEMENT ASSOCIATIONS

**Metlakatla Pass Sites** Metlakatla Pass, or Venn Passage, located 4 km W of PRINCE RUPERT on the northern BC coast, is a narrow, protected channel, 5 km long, separating Digby I from Tsimpsen Pen. The area is noted for its density of archaeological sites: archaeologists have discovered 40 sites along its shores — 27 are shell middens which represent the remains of ancient Indian villages; 13 are petroglyph or rock art sites, which consist of low-relief carvings on boulders or rock outcrops (see PICTOGRAPHS AND PETROGLYPHS). The people who occupied the area at the time of European contact were the Coast Tsimshian. Traditionally, all 9 tribes of Coast Tsimshian had permanent winter villages in the Metlakatla Pass area. Excavations conducted at several of these village sites since 1966 suggest that Metlakatla Pass has been occupied for approximately 5000 years. See also ARCHAEOLOGY; PREHISTORY.

DAVID J.W. ARCHER

**Metric Commission Canada**, est 1971 by the Metric Commission Order, comprises a chairman and up to 20 part-time commissioners whose mandate it is to advise the minister of industry, trade and commerce on metric conversion and assist in the development of metric conversion plans. It also has responsibility for disseminating information on METRIC CONVERSION to the public. The commission and its operations have been controversial, especially in the eyes of those groups who oppose "metrication."

**Metric Conversion** is the process of making metric units, eg, metre (m), litre (L), kilogram (kg), degree Celsius (°C), the common units of measurement in Canada. Although the metric system was legalized in Canada in 1871, the British imperial system of units, based on yards, pounds, gallons, etc, continued to predominate. In the 1960s, with rapidly advancing technology and expanding worldwide trade, the need for an international measurement system became increasingly apparent. Britain decided to convert to the metric system and the US was studying a similar move. A number of Canadian associations representing diverse interests, including consumers, educators and professionals, made representations to the government favouring the metric system. In Jan 1970 the White Paper on Metric Conversion in Canada set out Canadian government policy. It stated that a single, coherent measurement system based on metric units should be used for all measurement purposes, including legislation. In line with this policy, the Weights and Measures Act was amended by Parliament in 1971 to recognize the *Système International d'Unités* (SI), the latest evolution of the metric system, for use in Canada. Also in 1971, Parliament passed the Consumer Packaging and Labelling Act, requiring that metric units be shown on labels of most consumer products.

To implement metric conversion the govern-

ment established in 1971 a Preparatory Commission, later called Metric Commission Canada. The commission's role was to ensure a planned and co-ordinated conversion in all sectors of the Canadian economy, to disseminate information on metric conversion and to advise the government on necessary actions. Beginning in 1973 the commission organized over 100 sector committees, with members from national associations and major organizations representing business and industry, consumers, labour, health, education and government. Each sector committee was responsible for preparing a sector conversion plan and monitoring its implementation. Twelve commission steering committees, the federal government's Inter-departmental Committee for Metric Conversion and the Inter-governmental Metric Conversion Committee, made up of provincial government representatives, played co-ordinating roles. The commission as a whole approved sector conversion plans developed through consensus. Thus, Canada's metric conversion relied on the voluntary efforts of numerous committees and subcommittees, with some 3000 participants from the private and public sectors contributing their expertise.

Metric conversion was launched as a 4-phase program with guideline dates endorsed by the federal government. The Investigation Phase was essentially completed in 1975. The Planning Phase, during which sector committees drafted the plan of activities, was largely completed in 1980. The Scheduling Phase, to co-ordinate the timing of plans, neared its end by 1981. The Implementation Phase gained significance from 1975, with forecasts for overall completion extending into the 1980s.

The process of replacing imperial units with SI units in all kinds of documents, measuring devices, manufacturing processes, products and packages involved a countless variety of tasks. The technical basis for the change to SI units was established by 2 national standards of Canada, the *International System of Units (SI)* and the *Canadian Metric Practice Guide*, first published in 1973 by the Canadian Standards Association and approved by the Standards Council of Canada. After choosing appropriate SI units, practical approaches to implementation were debated by sector committees, with each sector determining policies and strategies to suit its interests. Soft conversion (arithmetical conversion of pre-existing measurement values) versus hard conversion (round, rational values in metric units, possibly requiring physical change in product size) was a major issue. Dual dimensioning, the use of both imperial and metric measurements, was another area of controversy. Dependence on the US for many parts and products was a constraint for many sectors. The dedicated efforts of Canadian industry allowed conversion to proceed with few major problems, although implementation took 2-5 years longer than planned. Among the leaders in metric conversion were such major sectors as the automotive industry, petroleum, forestry, wood, pulp and paper, grain handling, feed and seed, chemicals, electric power, mining, steelmaking and construction.

Metric Commission Canada recognized that the general public should become familiar with metric units early in the program. Education and public-awareness programs were important considerations to ensure public understanding and acceptance of the change to metric units. With the co-operation of all provinces, schools prepared to teach mainly the metric system. A series of metric conversion events exposed the general public to simple metric units in everyday life; extensive information campaigns accompanied each change. The first such event was the announcement of temperature in degrees Celsius in weather forecasts beginning

1 Apr 1975. From Sept 1975 rainfall and snowfall were quoted in millimetres and centimetres, respectively. The next significant change (Sept 1977) was the introduction of road signs showing distances in kilometres and speed limits in kilometres per hour. Concurrent with this change, cars with speedometers and odometers graduated in metric units were produced. In Jan 1979 service stations started pricing and dispensing gasoline and diesel fuel in litres. In Dec 1980 (the cutoff date for using imperial length units) fabrics and home furnishings were required to be advertised and sold only by the metre and centimetre. Conversion of weighing scales in retail food stores created political controversies. After 3 pilot areas (Kamloops, Peterborough and Sherbrooke) completed scale conversion in the summer of 1979, national conversion was postponed by the government of the day, resuming in Jan 1982. Cutoff dates were established for different areas, extending up to Dec 1983. After that, store-weighed food items could be priced and advertised only by kilogram or 100 gram quantities and sold only in metric units. Conversion involved some 35 000 retail food stores across Canada. Steadily over the years, metric units became normal for most products and services. However, metric units did not receive much support in real estate or in sports (except track and field and swimming).

Metric conversion proceeded voluntarily in many sectors, but federal and provincial legislative action was required in some. Regulations on the use of metric units for WEIGHTS AND MEASURES in retail trade were established and enforced by the government (based on industry recommendations) for the protection of consumers and retailers against unfair practices and confusion in comparing products. Even so, the government did not escape criticism for imposing mandatory use of metric units to the exclusion of old units. Opponents of metric conversion pointed to the costs at a time of inflation and economic weakness, the danger of being out of step with the US and the invasion of a foreign language of measurements upon a Canadian heritage bound to imperial measurements. In various parts of the country opponents challenged metrication through the courts.

The new Conservative government reaffirmed the commitment to metric but revoked the required use of metric alone in some cases, eg, gasoline and diesel fuels and home furnishings. Defendants of metric measurements have cited many benefits besides export trade and international standardization. SI is simple because of its decimal nature and the absence of a multiplicity of units with conversion factors. The universality of SI symbols (regardless of language) and the convenience of having a single unit for a physical quantity makes communications clearer. Upgrading of many technical standards and rationalization of product sizes and containers are side benefits. All these will lead to long-term cost savings, despite initial conversion expenses. In the final analysis, pressures of technology and the marketplace make metric conversion inevitable. N. GANAPATHY

**Metropolitan Government** is a form of urban REGIONAL GOVERNMENT used in metropolitan centres with a population over 100 000. The modern concept of metropolitan government originated in the US in the early 20th century as an attempt to devise institutions that could cope with urban growth.

The classic dilemma for municipalities in a metropolitan centre is that area-wide concerns are not met by a policymaking apparatus of similar scope. There are 3 basic problems. Policy co-ordination among local units of government is difficult in land-use and transportation planning and decisions made in one locality will fre-

quently have detrimental consequences for its neighbours. Policy inequities result because each municipality provides services based upon its own tax base (see MUNICIPAL FINANCE); only those suburbs with extensive industry can provide high-level services with low residential taxation and normally the core city is hard-pressed on both counts. Policy accountability is fragmented because the numerous municipalities grapple with individual problems but no one unit of government is responsible for the well-being of the metropolitan region. The idea of federation was central to proposed reforms. Municipalities would unite to provide specific common services by delegating that authority to a new level of metropolitan government but would otherwise remain autonomous. The first steps to metropolitan governance were usually intermunicipal co-operative agencies (often known as special-purpose districts) created to provide water transit or sewerage facilities.

The creation of Metropolitan Toronto in 1954 was an important breakthrough for N American metropolitan government reform. Acting on the recommendation of the Ontario Municipal Board, the province federated the city of Toronto and its 12 suburbs as a metropolitan corporation. Although the municipalities retained their separate existences and a portion of their councillors also served as metro councillors, the metropolitan corporation assumed a wide range of functions that have increased over the years. In 1967, in a comprehensive reorganization, the number of local municipalities was decreased to 6. Metro Toronto served as the model for the regional governments of Ottawa-Carleton (1969), Hamilton-Wentworth (1974) and the metropolitan corporation of Greater Winnipeg (1961-1971). But, in Winnipeg, the metro council was directly elected and its responsibilities fewer. Both the Montréal and Vancouver regions have metropolitan governments although they undertake fewer functions than that in Toronto, and Vancouver is technically based upon a system of special-purpose districts. Winnipeg (since 1971) and Calgary each have one local government coterminous with the metropolitan area.

The basic problem with metropolitan government in Canada has been that it is a political compromise. Few governmental responsibilities were transferred entirely to the new level. For example, metropolitan governments would sell water wholesale to municipalities who were responsible for local deliveries; build freeways, although municipalities controlled local roads and parking; issue area-wide plans, but leave municipalities the power to issue building permits. Tension has resulted because 2 levels of government are in competition with each other. The conflict in Winnipeg became so severe the provincial government was forced to abandon the metropolitan approach in favour of unitary government. JAMES LIGHTBODY

Reading: D.J.H. Higgins, *Urban Canada and its Government* (1977).

**Metropolitan-Hinterland Thesis**, a theory of historic relations between a large, powerful urban community (metropolis) and the surrounding territory (hinterland), which the metropolis dominates through mainly economic means. Formulated by economic historian N.S.B. Gras in the 1920s, it has since the 1950s been widely applied and extended in Canadian history to illuminate the growth of urban power, REGIONALISM and generally the interplay of central and territorial forces. Gras conceived 4 stages in the rise of a major city to metropolitan dominance: it first harnessed the commercial life of a wide adjacent territory, then centered its industrial activities, built up its transport network and finally provided financial services to, and so more controls over, the hinterland. Later, it appeared that these were better regarded

as key attributes of economic metropolitanism than as stages operating in straight sequence. The concept was also widened to include noneconomic aspects such as the political power wielded by metropolitan centres, especially as seats of governments, or the social, cultural and informational holds they may acquire. In any case, metropolitan-hinterland relations remain reciprocal, producing complementarity as well as confrontation in complex patterns that may involve whole sets of urban centres, as well as overlapping, changing hinterlands.

J.M.S. CARELESS

**Meulles, Jacques de**, chevalier, INTENDANT of New France 1682-86 (d at Orléans, France May 1703). De Meulles, despite explicit instructions, was embroiled in confrontation with Governor LA BARRE throughout his term. In 1684, when the minister, Seignelay, neglected to send cash to pay the troops who were sent to control the increasingly threatening Iroquois nations, de Meulles used playing cards as money, promising redemption the following year. This expedient of using PLAYING-CARD MONEY was frequently resorted to thereafter and was a forerunner of modern paper money. In 1685 the new governor, DENONVILLE, accused de Meulles of greed and illegal trafficking, thereby causing his recall to France. FRANCE BEAUREGARD

**Mewburn, Sydney Chilton**, lawyer, soldier, politician (b at Hamilton, Canada W 4 Dec 1863; d there 11 Aug 1956). Called to the Ontario Bar in 1885, he became commander of the 13th Royal Regiment of Hamilton in 1910. During WWI, Mewburn rose rapidly as a military administrator and had reached the rank of major by 1917. He supported PM Sir Robert BORDEN in the conscription crisis of that year and, after being elected Unionist member for East Hamilton, he became minister of militia and defence in Borden's government. He resigned in 1920, after demobilization had been completed, but continued to sit as member for East Hamilton until 1925. DAVID EVANS

**Mézy, Augustin de Saffray de**, chevalier (d at Québec C 6 May 1665). De Mézy was chosen first governor of New France under direct royal rule 1663-65. The colonial administration was reorganized on his arrival and the Conseil Souverain established. The question of new appointments to the council led to public quarrels between the governor and Bishop LAVAL, whose civil powers overlapped with those of Mézy. Bishop and governor also fell out over procedures for the election of a *syndic* to represent the people of Québec. The colonial minister ordered an investigation into Mézy's rather violent and arbitrary rule, but the governor died before it could be carried out. ALLAN GREER

**Mi-Carême** Mid-Lent, in French Canadian tradition, is the time when people dress up in disguise and go from house to house asking for treats, singing and dancing in the MUMMING tradition. An interesting variation is found in parts of ACADIA, where the Mi-Carême becomes a kind of St Nicholas figure: a person disguised as an old woman mummer distributes treats to good children. Mi-Carêmes are also used as frightening figures, and as bringers of children (in place of storks or cabbages). NANCY SCHMITZ

**Michaux, André**, botanist, explorer (b near Versailles, Fr 8 Mar 1746; d on Madagascar 11 Oct 1803?). He compiled the first N American flora which includes many plants collected in Lower Canada in 1792. Michaux learned about practical horticulture in France before embarking on a series of botanizing expeditions in Europe, Persia (1782-85) and the US (1785-96). After meeting Peter POND in June 1792 he visited

Montréal and Québec before proceeding by canoe up the Saguenay R. through unexplored territory to Lac MISTASSINI. Michaux kept a diary and collected numerous new plants (his herbarium is in the Muséum nationale d'histoire naturelle, Paris). According to contemporary records, Michaux was a quiet, independent and simple man, more at ease with the natives than with his fellow Frenchmen. He wrote *Historie des chênes de l'Amérique* (1801) and *Flora boreali-americana*, 2 vols (1803), both edited by his son, François-André. JUDITH F.M. HOENIGER

**Michener, Daniel Roland**, politician, governor general of Canada 1967-74 (b at Lacombe, Alta 19 Apr 1900). Educated at U of A (1920), Michener attended Oxford as a Rhodes scholar, where he became friends with L.B. PEARSON. Michener practised law in Toronto from 1924, was an Ontario MPP, 1945-48, and a Cabinet minister 1946-48. Describing himself as "a small 'I' liberal and a capital 'C' Conservative," he was MP for Toronto St Paul's 1953-62. Speaker of the House 1957-62, he was civilized and witty but clashed frequently with PM John Diefenbaker. After Michener suffered defeat in the 1962 election PM Pearson appointed him high commissioner to India 1964-67, and governor general in 1967. Michener and his accomplished wife, Norah, democratized the office (curtailing the curtesy, for example), and were among the busiest and most creative of vice-regal couples. Among the Michener innovations were frequent state visits abroad, periodic meetings with provincial lieutenant-governors, and the establishment of an Honours Secretariat (the Order of Canada having been instituted in 1967) at Rideau Hall. NORMAN HILLMER

**Michikamau Lake**, 2031 km<sup>2</sup>, elev 460 m, max length 102 km, max width 49 km, is located in southwestern LABRADOR near the Québec border. Today the lake is part of the 6527 km<sup>2</sup> SMALLWOOD RESERVOIR system. DAVID EVANS

**Micmac** The origin of the name *Micmac*, which identifies both a people and their language, is unclear, though it may derive from *nikmaq* ("my kin-friends") used by the 17th-century French as a greeting for the tribe. Alternative names for the Micmac, which can be found in historical sources, include Gaspesians, Souriquois, Acadians and Tarrantines. At the time of European contact, Micmac-speaking peoples occupied the coastal areas of the Gaspé and the Maritime provinces E of the SAINT JOHN R. drainage. They continue to occupy this area as well as settlements in Newfoundland and New England, especially Boston. The number of registered Micmac is about 10 000, with another 5000 (approximately) nonstatus persons of Micmac heritage (see INDIAN). Estimates of aboriginal population range from 3000 to 35 000, with 20 000 being a reasonable figure.

Micmac is among the Wabanaki cluster of Eastern Algonquian languages, which include the various ABENAKI dialects and the Penobscot and MALISEET-Passamaquoddy languages. Maritime PREHISTORY extends 11 000 years into the past, but the date of arrival of Algonquian speakers into the area remains uncertain (see NATIVE PEOPLE, LANGUAGES).

Aboriginal Micmac settlements were characterized by individual or joint households scattered about a bay or along a river. Communities were related by alliance and kinship. Leadership, based on prestige rather than power, was largely concerned with effective management of the fishing and hunting economy. Painting, music and oratory were encouraged. The Micmac were among the first peoples to be affected by European activities in the New World and underwent early depopulation and sociocultural disruption. They attempted to profit from the FUR TRADE by serving as intermediaries between

Ornate Micmac coat presented to Capt O'Halloran at a Micmac tribal council held at Burn Church Point, NB, 1841 (courtesy National Museums of Canada/National Museum of Man/S77-1834).

Europeans and groups farther W. As their trade advantages disappeared, they tried to exploit a military alliance with the French (see IROQUOIS WARS).

After British suzerainty was established, the Micmac were subjected to conscious attempts by government to alter their life-style. Most moves to establish them as agriculturalists failed because of badly conceived programs and encroachments upon reserved lands. Their employment as labourers effected irreversible change: crafts, cooping, the porpoise fishery, and road, rail and lumber work integrated the Micmac into the 19th- and 20th-century economy, but left them socially isolated. A forced relocation scheme in the 1950s posed the greatest threat to them as a distinctive people. The Micmac have been able to salvage some of their traditional culture in political decision making, religion and language. The rate of unemployment for reserve communities is extremely high in a region with high unemployment, but there are a number of successful musicians, artists, writers and business and professional persons among the Micmac. See also NATIVE PEOPLE, EASTERN WOODLANDS and general articles under NATIVE PEOPLE. HAROLD FRANKLIN MCGEE, JR

Reading: A.G. Bailey, *The Conflict of European and Eastern Algonkian Cultures, 1504-1700* (2nd ed, 1969); Harold Franklin McGee, Jr, ed, *The Native Peoples of Atlantic Canada* (1984); B.G. Trigger, ed, *Handbook of North American Indians*, vol 15: Northeast (1978).

**Microblade Technology**, defined by arctic archaeologists as part of the Arctic Small Tool and Northwest Microblade traditions, was in its earliest phase coterminous with late Paleo-Indian complexes traced ultimately to NE Asia. The technology reached western Alaska by 9000 BC, central Alaska by 8500 BC, eastern Alaska and the West Coast by 7000 BC, the southern Yukon and the northern interior of BC before 4000 BC, and western Mackenzie District by 2500 BC. The basic and distinctive Arctic Small Tool tradition is typified by delicately flaked end- and side-blades, scrapers, burins and burin spalls, in addition to microblade technology. The large range of cutting, carving, and scraping implements were produced by specialized manufacturing techniques probably derived from non-Eskimo cultures of northeastern Asia and northwestern N America. See also PREHISTORY.

RENÉ R. GADACZ

**Microchips and Transistors** Microchips or microelectronic chips (also called semiconductors or integrated circuits) are essential components of all computerized systems. They form the basis of a \$20-billion, worldwide industry. The breathtaking pace of technological change in microchips (every year or 2 their capacity doubles while prices are halved) permits them to be used not only in sophisticated electronic systems but in many consumer products (eg, personal computers, calculators, video games, cars, sewing machines, video-cassette recorders and microwave ovens). The revolution in consumer electronics of the 1970s and 1980s largely results from microchip advances. If comparable progress had been made in automobiles, a Rolls Royce would cost \$10 and could be driven around the world on 5 L of gas.

Microchips are silicon wafers on which intricate patterns of transistors are laid down. Transistors function as switches which control electric signals passing through the chip. In the past 2 decades, researchers have packed increasing numbers of transistors onto wafers about the size of a thumbnail. Chips containing tens of thousands of transistors are called large-scale integration (LSI) chips, while those with hundreds of thousands to a million transistors are called very large-scale integration (VLSI) chips. By the early 1980s, chips with more than 250 000 transistors were on the market, and a million-transistor chip is expected before the end of the decade. This complexity has been compared to a street network: if the simpler chips of the 1960s have the complexity of the street layout of a small town, VLSI chips have the complexity of a street network of big-city density covering the N American continent.

Technologies based on VLSI chips are faster and more reliable, smaller and more portable, cheaper and more energy efficient than those just a generation older. It has been estimated that a product with 10 standard chips will cost 20-30 times more to produce than one using a VLSI chip. Developments in VLSI chips are blurring the traditional distinction between computer hardware (ie, physical components) and computer software (instructions that tell the system what to do) because often the instructions are put right into the VLSI chips. This integration reinforces the growing importance of custom and semicustom chips designed to perform specialized functions. Standard or "off-the-shelf," general-purpose chips dominated in the 1970s and 1980s, but it is expected that by the end of the decade the worldwide market for custom chips will reach \$25 billion, more than half the semiconductor market. Semicustom chips are projected to show greatest growth, 62% annually between 1983 and 1986. They are made by combining a number of "cells" in novel ways to create chips that can do special tasks, or by using partially prefabricated chips tailored in the late stages of fabrication for special functions. Semicustom chips are cheaper and less complicated to design and make than are full custom chips. New technologies (eg, computer-aided design, automated assembly lines and ion-beam write-on-wafer devices) are expected to reduce greatly the cost of producing specialized chips.

Chip production is divided into 2 phases: design and fabrication. The first is the most expensive and time-consuming: designing a chip with 60 000 to 70 000 transistors can take dozens of man-years and millions of dollars. Computer-aided design (CAD) systems will automate much of this work, but it seems unlikely that human designers will be totally displaced (see ROBOTICS). Fabrication involves laying down the intricate patterns of transistors and their connections, often on several layers of silicon. At present, 40 or more processing steps are needed, but new technologies for "writing" circuit patterns onto the wafers may cut this number in half.

Microchip, the "brain cell" of modern-day computers (courtesy Canapress).

A handful of Canadian companies, notably Northern Telecom Ltd of Mississauga and Mitel Corp of Ottawa, have in-house "foundries" (fabrication facilities) to make specialized chips for use in their own products. Recently, Northern and Mitel have made these facilities available to outside users, but there has been no open fabrication plant available to the Canadian ELECTRONICS INDUSTRY since the failure in 1975 of Microsystems International Ltd, which tried to compete in manufacturing general-purpose chips. Most Canadian companies now import chips and are growing concerned that access to the most advanced chips will be severely curtailed or even cut off. In 1983, after a 2-year recession, the semiconductor industry was bracing itself for another worldwide explosion in demand. Canadian companies were already facing long delays (up to 40 weeks) for some chips and others were virtually unavailable. Another problem was that the US, the major source of chips, began restricting the outward flow of microchip technology because it feared a loss of its technological edge and was preparing for a battle with Japan for world dominance in semiconductors.

In 1982 the SCIENCE COUNCIL OF CANADA reported that, unless Canada develops its own custom-chip manufacturing capability, "the electronics industry will forever be dependent on foreign sources . . . and the diffusion of the silicon chip throughout Canadian industry will be in the form of imported products." In 1983 an ALBERTA RESEARCH COUNCIL report stated that Canada's industry will continue to stagnate without advanced chips. This report recommended that Alberta build a microchip-design and -fabrication facility as part of the province's industrial diversification into HIGH TECHNOLOGY. In 1983 the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL, a federal agency that supports university research, initiated a 5-year, \$17.5-million program to establish a nationwide network of CAD stations that will permit universities to do advanced microchip design and testing. The council is also studying setting up one or 2 national microchip-research centres.

LYDIA DOTTO

**Middle Power** During and after WWII Canadians became increasingly aware that although they should not aspire to the privileges and responsibilities of a great power, they and other countries of comparable consequence could not settle for the role of small powers. In the various conferences in which the UNITED NATIONS was designed, Canada, Australia and medium-sized countries of Europe and Latin America curbed the intentions of the greater powers to dominate all aspects of the UN. In the early postwar years there was a need for middle powers, less directly involved in world economics and politics, to fulfil intermediary UN roles, particularly in conflicts arising from the disengagement of colonial powers in the Middle East, S Asia, and

Africa. The Scandinavian countries, Canada, Brazil, Yugoslavia, and others proved useful in seeking compromises and formulas for agreement, as well as in staffing the PEACEKEEPING operations required when truces were established. The term "middle" thereby developed a mediatory connotation as well. Recently, as the 2 superpowers emerged in a special classification, there has been a tendency to refer to Britain, France, Germany and Japan as middle powers.

JOHN W. HOLMES

**Middleton, Sir Frederick Dobson**, soldier (b at Belfast, Ire 2 Nov 1825; d at London, Eng 25 Jan 1898). Middleton was educated at Sandhurst and commissioned in the 58th Regiment in 1842. His early service was in Australia, Norfolk I and New Zealand, and he distinguished himself during suppression of the Indian Mutiny. After stationing in England, Gibraltar and Malta, he came to Canada in 1868 with the 29th Regiment and remained as an instructor with the Canadian Militia and then was commandant 1874-84 of Sandhurst. In July 1884 he was appointed commander of the Canadian Militia, and to him fell the task of organizing and leading the expedition during the NORTH-WEST REBELLION of 1885. The organization was accomplished with speed and efficiency, but after an initial brush with the rebels at Fish Creek, Middleton became cautious and his tactics at the decisive battle of Batoche were ponderous. Nevertheless the campaign was successfully concluded and a grateful Canadian Parliament voted Middleton a monetary award, while the British government made him a KCMG and promoted him lieutenant-general. He retired in 1890, but his plans to take over the presidency of a Canadian insurance company were spoiled by a minor scandal involving the misappropriation of furs during the North-West Rebellion. In 1896 he was appointed keeper of the crown jewels, Tower of London.

R.C. MACLEOD

Reading: Desmond Morton, *The Last War Drum* (1972).

**Midewiwin**, or Grand Medicine Society, a closed ritual society of doctors (shamans, medicine men) among the Upper Great Lakes Algonquian (Ojibwa and Lk Winnipeg Salteaux). The organization recognized 4 or more grades of membership; even the lowest required a long period of instruction and payment of fees. Each grade was marked for the individual by changes in facial painting and the use of a particular MEDICINE BUNDLE. The Midewiwin developed during the early 18th century as a response to European influence, and associated ceremonies and dances involved the use of trance. Initiates were repositories of tribal traditions that were integrated into myth and legend. See also NATIVE PEOPLE, RELIGION.

RENÉ R. GADACZ

**Midge**, name given to several groups of small, slender-bodied FLIES. In Canada, nonbiting midges (chironomids), biting midges (ceratopogonids) and gall midges (cecidomyiids) are most important. About 500 species of chironomids are known in Canada; many more await discovery. They reach the northern limit of land, forming an increasingly large component of insect fauna in northern latitudes. Larval stages are mostly aquatic and may form much of diet of fish. Minute ceratopogonids (no-see-ums) can be a scourge in midsummer and seem undeterred by repellents. They are transmitters of bluetongue virus of cattle and sheep, and of protozoan bird diseases. In Canada, 180 species are reported; not all are pestilential. Their predatory larvae inhabit mud or moist soil. Cecidomyiids are known as gall midges, although not all larvae form plant galls. The notorious Hessian fly, larvae of which bore into wheat stems, is a cecidomyiid. Some larvae are fungus feeders, including some serious pests of commercial mushrooms. Others are predatory. Canadian

cecidomyiid fauna has been little investigated, with 100 species recorded of a fauna estimated to exceed 1000.

G.C.D. GRIFFITHS

**Midland**, Ont, Town, pop 12 132 (1981c), inc as a village 1878 and as a town 1887, is located on Midland Bay, an inlet of GEORGIAN BAY. It is about 145 km by road N of TORONTO. The area was part of HURONIA before the arrival of Europeans and STE MARIE AMONG THE HURONS (some 2 km outside present-day Midland) was the first European settlement to be established inland from the St Lawrence Valley. Founded by Jesuit missionaries in 1639, Ste-Marie was a base for missionary work among the HURON until it was abandoned in 1648-49. The present reconstruction as well as the nearby Jesuit Martyrs' Shrine and Wye Marsh Wildlife Interpretive Centre attract hundreds of thousands of visitors every year. Midland also serves as a "waterway" to the popular Thirty Thousand Islands of Georgian Bay.

Modern development of the town began with the arrival of the Midland Railway from Port Hope via Beaverton in 1871. The railway stimulated the logging industry and the town developed extensive harbour facilities and grain elevators. Today, light manufacturing includes world-famous Leica cameras, television picture tubes and automobile parts.

PATRICK D. GRUBER

**Midnight Sun** In the Arctic in the summer, the sun shines all night long. Robert W. SERVICE had this in mind when he used the phrase in his ballad "The Cremation of Sam McGee" (1907). The expression "land of the midnight sun" has often been used to refer to Canada's arctic region and, more loosely, to the Yukon and the Northwest Territories.

JOHN ROBERT COLOMBO

**Mignault, Pierre-Basile**, legal author, judge (b at Worcester, Mass 30 Sept 1854; d at Montreal 15 Oct 1945). Educated in Montreal, where he completed brilliant law studies at McGill (1878) and later taught civil law (1914-18), Mignault was a prolific writer on various topics in Quebec law. He is now chiefly remembered for his monumental treatise *Le droit civil canadien* (9 vols, 1885-1916) which is still cited as an authority in Quebec courts. He sat as a judge of the Supreme Court of Canada (1918-29). Many of

The Martyrs' Shrine, Midland, Ont, commemorates the martyred Jesuit missionaries of the 17th century (courtesy Canapress).

his judgements, written in French and English, are considered authoritative statements on the CIVIL LAW in Canada. JOHN E.C. BRIERLEY

**Migration** is defined restrictively as a regular movement between alternate sites, one of which is usually a breeding location. More broadly, it can involve any significant movement of ANIMALS (or even plant seeds). Canadians think of migration primarily as the movement of BIRDS: southward in fall, northward in spring. Such movements may be short, as with horned LARKS which nest in the Prairie provinces and winter just S of the border, returning as early as February. Most migrating passerine (perching) birds and SHOREBIRDS go farther, many to Central and S America. The long-distance champion, the arctic TERN, nests at Churchill, Man, and winters in the Antarctic. North-south movements may follow broad fronts or well-defined flyways as with WATERFOWL. Routes may be identical in both directions or differ, as with the lesser golden PLOVER, which flies S along the Atlantic coast from the Canadian Arctic to Argentina in the fall, but returns N through the Canadian prairies. Similar migrations, southward in fall and northward in spring, are shown by monarch BUTTERFLIES, DRAGONFLIES and some BATS. Some species, however, migrate S in spring, N in fall, eg, Heermann's GULLS which after breeding move from Mexico and southern California to coastal Vancouver I, and various Southern Hemisphere SEABIRDS going to the Atlantic and Pacific coasts. Some birds move altitudinally, usually downslope in winter, up in summer. In contrast, spruce and blue GROUSE move downslope in spring, up in fall.

Barren-ground CARIBOU in northern Canada and Alaska move in a generally circular pattern, wintering near the Peel and Porcupine rivers and calving along the Beaufort Sea. Movements of aquatic animals necessarily follow the configurations of water bodies. SALMON and EEL spawn in fresh water yet spend much of their lives in oceans. Other seasonal movements include those of freshwater FISHES between lakes and rivers and those of SEALS, WHALES and TURTLES in oceanic waters. FROGS, SALAMANDERS and GARTER SNAKES show more localized annual movements. Garter snakes winter and mate in interlake Manitoba and summer in nearby marshy areas.

Many such regular movements involve individuals returning annually to the same breeding area, wintering site or migratory stopover. Species that breed or feed in less stable habitats may alter the precise sites of their activity from year to year, but still migrate regularly. Other migrations are less regular, eg, species such as cross-bills and snowy owls, which feed on fluctuating food supplies, show "irruptive" or "invasion" types of migration. Some species, such as Clark's nutcracker, undergo much less regular eruptions from their usual range. Other variations are exemplified by partial migrants, such as blue jays and black-capped CHICKADEES, in which only some populations migrate; and by monarch butterflies in which one generation moves south, the next north.

Migratory movements were first documented as a result of observations of diurnally moving flocks, especially along coasts and mountain passes where concentrations occur, or at sites like POINT PELEE where night migrants concentrate during the day. Being restricted in time and place, such observations supply limited data. Movements of many species, such as night-migrating birds, underwater animals and wind-blown spiders, are not readily observed. Early observers recognized migratory movements of large birds, but explained the mysterious disappearance of small birds by assuming they hibernated in the mud, rode on the backs of large birds or changed into other species (not entirely

foolish, as many species change plumage). Banding or other forms of marking helped in defining migration routes of bats, birds, fishes and dragonflies and, in some cases, in finding the winter range (eg, for chimney swifts, monarch butterflies). Banding has also revealed unexpected patterns of movement, such as the northward movement of Florida-nesting bald EAGLES and the "leap-frog" pattern of some species, eg, the American ROBIN, in which northern-nesting populations winter farther S than do southern-nesting ones. RADAR tracking and transmitters on birds, large mammals and even tiny fishes are helping to define such movements even more precisely. An early observer, seeing birds flying at night silhouetted against the moon, thought they must migrate there. A commentator, thinking that was too far, suggested that PASSENGER PIGEONS moved to an undiscovered satellite between Earth and the moon. Moon-watching has since proved a useful technique in documenting movements.

Factors governing timing, routes taken and reasons for migratory movements are among the great mysteries of science. Experiments performed by William ROWAN in Alberta showed that the effects of photoperiod on physiological processes triggered migration in many birds. Light also governs the daily vertical movements undertaken by some PLANKTON. Weather, although not important in triggering broad timing, is undoubtedly an evolutionary factor and influences precise timing, exact routes and sometimes even reverse movements in birds. Wind is a major influence in movements of some INVERTEBRATES and plant seeds that depend on passive dispersal (see POLLINATION). The superb navigational skills of many birds, turtles and fishes seem to be determined by a complex array of factors, including landmarks, celestial patterns, sun's position, magnetic forces and (in fish) chemoreception. The relative importance of each factor remains controversial.

Evolutionary pressures for migration are also controversial. The reasons why migrations occur away from harsh temperatures, dry seasons and scarce food are obvious; return movements from attractive habitats are probably based on longer-term factors, eg, reducing competition for food or other resources, past patterns of GLACIATION, continental drift and deep-routed traditions. Much remains to be learned about this complex subject.

MARTIN K. McNICHOLL

Reading: R. Baker, ed, *The Mystery of Migration* (1981).

**Mikita, Stan**, hockey player (b at Sokolce, Czech 20 May 1940). Born Stanislaus Gvoth, he took the name of his uncle after moving to St Catharines as a boy. He played junior hockey for St Catharines and joined Chicago Black Hawks 1959-60. A smooth-skating centre and superb playmaker, he won the ART ROSS TROPHY (leading scorer) in 1964, 1965, 1967 and 1968. He received the HART TROPHY (most valuable player) in 1967 and 1968, and after an early career marred with penalties, received the LADY BYNG TROPHY (most gentlemanly player) in 1967 and 1968. He was first all-star centre from 1961-62 to 1963-64 and from 1965-66 to 1967-68. He played his entire career with Chicago, retiring after the 1979-80 season. His 1467 career points in regular season play rank him (in 1984) third all-time among NHL scorers, his 926 assists are second only to Gordie HOWE and his 541 goals ranked him fifth. His 59 goals, 91 assists and 150 points in playoffs ranked third among NHL players.

JAMES MARSH

**Military and Staff Colleges** The 3 Canadian Military Colleges (formerly Canadian Services Colleges) educate and train officers and officer cadets for ARMED FORCES CAREERS, ROYAL MILITARY COLLEGE opened 1 June 1876 at Kingston, Ont. Royal Naval College of Canada, authorized by

the 1910 NAVAL SERVICE ACT, opened at Halifax, NS in 1911; as a result of the 1917 HALIFAX EXPLOSION it moved to RMC, then in 1918 to the former British dockyard at Esquimalt, BC. It closed June 1922, and for 20 years naval cadets attended Royal Naval College, Dartmouth, Eng. As a result of wartime expansion the new Royal Canadian Naval College, Royal Roads, opened near Esquimalt in 1942. It accepted Air Force officer cadets in 1947 and then, along with RMC, became a tri-service military college in 1948. In 1952 Collège militaire royale (CMR) was established at St-Jean, Qué, primarily for French-speaking officer cadets. Today, both CMR and RMC offer courses in French, and all 3 colleges offer university degrees: RMC since 1959, CMR since 1971 (with UNIVERSITÉ DE SHERBROOKE) and Royal Roads since 1975. In 1984 RMC had 710 cadet students, CMR 548, and Royal Roads 229; all had female students.

After commissioning, an officer's professional development and education may include courses at staff schools and colleges. The Canadian Forces Staff School, Toronto (which opened 1960 as RCAF Staff School, a part of Air Force College), prepares junior officers for basic administrative and planning staff duties. The Canadian Land Forces Command and Staff College, Kingston (opened as a Canadian Army Staff College during WWII), offers a tactics-oriented course for operational command and staff duties. The Canadian Forces Command and Staff College, Toronto (opened as the RCAF Staff College in 1943), prepares air, land, and naval officers for command and staff positions as lieutenant-colonels. National Defence College, Kingston, est 1947, provides senior officers and civil servants with the opportunity to study broad questions of national policy and international affairs.

STEPHEN HARRIS

**Military Aviation and Aircraft** Military aviation began with WWI. When the war started each major belligerent possessed a few primitive aircraft; before it ended large fleets of fighters, general-purpose machines, torpedo carriers, large flying boats, heavy bombers and cigar-shaped dirigibles were in use. Despite some pre-war urging from aviation pioneers J.A.D. MCCURDY and F.W. BALDWIN, Canada had no air service when it went to war; nevertheless, about 22 000 Canadians flew with British squadrons overseas in WWI. At home Canadian Aeroplanes, Ltd (Toronto) produced 1200 training planes for the Royal Air Force and 30 Felixstowe flying boats for the US. No other combat aircraft were built in Canada until 1938. In 1919 Britain gave Canada about 100 aircraft: an assortment of trainers, fighters, bombers and flying boats. Another 12 flying boats were received from the US. These were the first planes flown by the Canadian Air Force, an interim force (1920-23) preceding the Royal Canadian Air Force (1924). In creating the RCAF, the government adopted the view that military aviation could be justified only if it served peaceful purposes. Consequently, most early flying by the RCAF consisted of such activities as topographical surveys, forest and fishery patrols, and anti-smuggling operations. In 1934, when war again threatened, the RCAF had 166 aircraft, only 28 of which were military types. In a belated attempt to rearm, the government found that the only military aircraft available were obsolete planes about to be discarded by the British. Out of necessity some of these were purchased, and others were manufactured in Canada even though they were outdated. On the eve of war, apart from 19 Hawker Hurricanes obtained from the UK in 1939, Canada's operational aircraft consisted of outmoded biplanes.

Canadian AVIATION industry burgeoned during WWII, producing about 15 000 military planes — two-thirds of which were trainers

for the BRITISH COMMONWEALTH AIR TRAINING PLAN. The others were operational types of British or American design: Bristol Bolingbroke, Consolidated Cansos, Curtiss Helldivers, Handley Page Hampdens, de Havilland Mosquitoes, Avro Lancasters and Hurricanes. However, only the Bolingbroke and Cansos were directly available to the RCAF. The Helldivers went to the American Navy and the others to the Royal Air Force, the result of a British-American agreement to pool Allied aircraft. Although this was perhaps unavoidable and was strategically advantageous, it caused considerable concern to the RCAF, which had to bargain with its allies for front-line aircraft for home defence. The 48 Canadian squadrons operating overseas were equipped with aircraft supplied by the British Air Ministry. Understandably, after the war the RCAF resolved to keep Canada in the forefront of military aviation with the capability to produce its own fighter aircraft. RCAF squadrons were involved in the DIEPPE raid, NORMANDY, the BATTLE OF THE ATLANTIC and bomber raids over Germany. During the war, the RCAF became the third-largest air force of the Western Allies.

Since 1948 Canadian military aviation has had several distinct roles: to deter aggression, to assist UN PEACEKEEPING operations and to support ground and naval forces in defence exercises, and to assist in search and rescue missions. Owing to Canada's commitment to NATO to keep Western defences on par with the military strength of the Warsaw Pact nations, over half the 650 Canadian aircraft fleet is composed of fighters; the rest are transports, ocean reconnaissance and naval planes and helicopters. In 1948, compelled by East-West tension to upgrade its air defences at home, Canada equipped 6 squadrons with its first operational jet fighter, the British-made Vampire. For the defence of Europe the RCAF contributed 12 squadrons of F-86 Sabres, the only Allied aircraft equal to the Soviet MiG-15. The RCAF Sabres, and also those flown by the air forces of Great Britain, Greece, Turkey and Italy, were manufactured under licence by CANADAIR LTD of Montréal. Two Sabre versions, V and VI, powered by the Canadian-designed and manufactured Orenda engine gave outstanding performance. The AVRO CF-100 CANUCK, a long-range, all-weather plane equipped with 2 Orenda engines, was the first military aircraft wholly designed and built in Canada. It made its appearance in 1953, replacing the Vampires in N American defence; in addition 4 CF-100 squadrons were assigned to Europe to meet the need for all-weather fighters. In the 1950s Canadian and American air-defence organizations were integrated under the NORAD Agreement and the completion of a continental radar defence network. Previously, the Canadians and Americans had foreseen the requirement for an aircraft of advanced design that could effectively exploit the advantages of this system. The RCAF was depending on the AVRO ARROW, but owing to prohibitive costs of development and political considerations the Arrow was abandoned in the experimental stage. The cancellation was considered a disaster for the military aviation industry in Canada and practically ensured that future aircraft would have to be purchased abroad.

In the next decade, 3 American fighters were procured: CF-104 Starfighters (1961) and CF-5 Freedom Fighters (1968) for deployment in Europe and CF-101 Voodoos as replacements for the CF-100s in 1961. The CF-104s and CF-5s were manufactured under licence by Canadair. Both types reflected the tremendous impact of modern technology. The CF-104s, for example, then the fastest combat planes in the world, had computerized navigation and firing-control systems that required only monitoring by the pilot. However, the single-engined aircraft had a dismal record, suffering numerous crashes.

The CF-18 twin-engined fighter, which was chosen in 1982 to become Canada's standard fighter of the 1980s, is a highly advanced and extremely costly weapon (courtesy McDonnell Douglas Corporation).

The next major purchase, beginning in 1982, was the McDonnell Douglas CF-18, a twin-engined versatile fighter with a maximum speed of Mach 1.8 (almost twice the speed of sound). Armed with air-to-air or air-to-ground guided missiles, it will replace the other 3 fighters. The aircraft reflects the impact of technology to a greater degree than its predecessors. Standard instrumentation is replaced by cathode-ray tubes and an eye-level printout of all functions enables the pilot to monitor aircraft performance without moving his head. Described as a flying computer, the CF-18 has been surrounded by controversy because of escalating costs and questions over the advisability of extreme reliance on advanced technology.

FRED HATCH

**Military Engineers**, soldiers specially trained to apply engineering science and technology to war. Their tasks include building roads, bridges, railways, airfields, field fortifications, and anti-tank and other obstacles; laying and removing demolition charges and mines; and spearheading amphibious assaults by preparing invasion beaches for subsequent landings. Volunteer companies served in the militia from 1859, and in 1903 the Canadian Engineers Corps was added to the Permanent Force. The "sappers," who were renamed the Corps of Royal Canadian Engineers in 1936, served overseas in both world wars where, in addition to normal duties, they provided mining and tunnelling companies at the front, in Britain, and at Gibraltar. In peacetime Canada's army engineers have conducted land surveys, built bases and other defence installations, and contributed to northern development through the construction of dams, bridges, roads, and airfields. STEPHEN HARRIS

**Military Recruiting**, the practice of persuading people to serve in the ARMED FORCES. Although military service is compulsory in some countries, the Canadian tradition has been to maintain volunteer forces (for exceptions, see CONSCRIPTION; IMPRESSMENT). This places considerable pressure on recruiting officers to find sufficient numbers of suitable, willing candidates. When unemployment is widespread, the simple prospect of having a job may persuade young men and women to enlist. In wartime strong appeals are made to patriotism, honour and the citizen's duty to serve. In peacetime recruiters may challenge the young adult's love of adventure, but more recently they have emphasized that the trades training and education available in the armed forces are applicable to civilian employment once an individual's military career is over. In 1984, about 500 recruiting officers and civilians in 37 locations visited hundreds of high schools and colleges across the country to attract the personnel required to keep the Canadian Forces up to their established strength of approximately 82 000 officers and men. STEPHEN HARRIS

**Military Service Act**, 29 Aug 1917, invoked to reinforce the CANADIAN EXPEDITIONARY FORCE in France. The war was going badly, casualties were enormous, and Canada's contribution in manpower compared unfavourably with that of other countries. Voluntary enlistment had been uneven, and the military believed they could not maintain the Canadian Corps at full strength without CONSCRIPTION. Encouraged by English Canadians and the British, PM Sir Robert BORDEN introduced the Military Service Act. Riots broke out in Québec. The Act was unevenly administered, and there were numerous evasions and many exemptions. By the end of the war only 24 132 conscripts had reached the front. The act's military value has been questioned, but its political consequences are clear. It led to Borden's Union government and drove most of his French Canadian supporters into opposition, as they were seriously alienated by this attempt to enforce their participation in an imperial war. RICHARD A. PRESTON

**Militia Acts** provided manpower for defence. Until the 1850s such acts in Upper and Lower Canada, NS, and NB usually imposed compulsory service on males between 16 and 50 or 60, with annual or more frequent enrolment musters. This institution, the Sedentary Militia, was unorganized and untrained. The acts also authorized service battalions for transport duties, etc, or for operations. This Active Militia was composed of volunteers, supplemented if necessary by the ballot (selection by lot). In 1846 an Active Militia 3000 strong was provided for in the PROVINCE OF CANADA. In 1855 much of Canada's British garrison left for the Crimea, and patriotic excitement enabled approval of legislation for an Active Militia of 5000 to be equipped, trained and paid. In 1856 additional Active Militia companies without pay were authorized.

Fearing invasion during the AMERICAN CIVIL WAR, John A. Macdonald introduced a bill (1862) to provide an Active Militia of 50 000, to be selected by ballot if necessary, and to be equipped and paid for 28 days' training. The bill's defeat brought about the fall of his government. In 1863 PM John Sandfield Macdonald provided that the Sedentary Militia would be retained and service battalions could be called out for 6 days' drill a year; 35 000 volunteers would be equipped but not paid. George Cartier's Militia Act of 1868 retained the theory of conscription, but recognized voluntary training as the backbone of the Dominion's militia system: 40 000 infantry, organized in companies in military districts, formed an Active Militia. The Militia Act of 1883 added permanent staffs for militia schools, the nucleus of a permanent force.

In 1904, after a series of confrontations between British general officers commanding the Canadian Militia and the minister of Militia and Defence, a Militia Act set up the Militia Council of civilians and military officials, including a chief of the General Staff. The bill doubled the Permanent Force to 4000 to provide a garrison to replace the British at Halifax. The 1922 National Defence Act brought the Militia, the Naval Service, and the Canadian Air Force together under the Dept of NATIONAL DEFENCE. See ARMED FORCES. RICHARD A. PRESTON

**Milk River**, located in the extreme SE corner of Alberta, is the only river in Canada to flow into the Gulf of Mexico drainage basin. It has its source in Montana, flows N into Canada and then S to join the Missouri R near Fort Peck, Montana. In Alberta the river cuts a spectacular canyon, 150 m deep and over 1.5 km wide in places, straddling the Canada-US boundary. The river flows through the Canadian Dry Belt where precipitation is as low as 200 mm and temperatures of 38°C are not uncommon. The

rare geomorphological process of "piping" along the canyon walls has created a unique landscape of disappearing streams, dry valleys, "sink-holes," blind valleys, waterfalls, natural bridges and caves.

JAMES MARSH

**Milkweed** is the common name for perennial, herbaceous plants of genus *Asclepias*, family Asclepiadaceae (from Gk physician Aesculapius). One hundred species occur worldwide; 13 are native to Canada. Except for butterfly weed (*A. tuberosa*), all Canadian species have milky juice with toxic properties. Leaves are simple; flowers grow in large clusters. Seed pods are generally large, often containing hundreds of seeds, each with a silky parachute. In nature, several species (eg, butterfly weed) are highly regarded "showy" plants. Six species are listed as Canadian WEEDS, the most important of these being common milkweed (*A. syriaca*), found from Manitoba to the Maritimes and abundant in southern Ontario and Québec. It spreads by creeping underground rootstocks and by seeds. In Ontario, it was grown for fibre and latex rubber during WWII; other economic uses have been suggested. It is a source of nectar for monarch and other butterflies. Indians valued its medicinal properties, and used the fibre for rope and weaving. See PLANTS, NATIVE USES. PAUL B. CAVERS

**Millar, Charles Vance**, lawyer (b at Aylmer, Ont 1853; d at Toronto 31 Oct 1926). An able lawyer, sportsman and practical joker, he is best known as creator of the Stork Derby. By his will Millar, a bachelor, left the bulk of his estate to the mother who, in the 10 years following his death, gave birth in Toronto to the largest number of children. The ensuing contest inspired worldwide interest and much litigation before the validity of the bequest was upheld by the Supreme Court of Canada and the money distributed among 4 winning mothers. The question of whether Millar intended his will to take effect or merely to amuse his lawyer friends remains in doubt.

MARK M. ORKIN

**Millard, Charles Hibbert**, labour leader (b at St Thomas, Ont 25 Aug 1896; d at Toronto 24 Nov 1978). Originally a carpenter by trade, Millard helped organize United Auto Workers Local 222, which he led in the historic 1937 OSHAWA STRIKE. From 1938 to 1939 he was Canadian UAW director. Between 1940 and 1943 he was on the executive of the Canadian Committee for Industrial Organization (CIO), the Canadian Congress of Labour (CCL), the United Steelworkers of America, and the Packinghouse Workers' Organizing Committee. Millard helped negotiate the merger of the 2 labour congresses and was elected VP of the CANADIAN LABOUR CONGRESS at its founding convention (1956). In 1956 he also became director of organization for the Confederation of Free Trade Unions in Brussels. A staunch CCF supporter, he was elected to the Ontario legislature twice (1943, 1948). He also ran unsuccessfully for Parliament several times. In 1961, he supported labour's participation in formation of the NEW DEMOCRATIC PARTY.

LAUREL SEFTON MACDOWELL

**Millenarianism** (from the Lat *mille*, "thousand" and *annus*, "year"). Its religious significance comes from Revelation 20:1-6, where John predicts that Satan will be bound for 1000 years. In Christian theology, millenarianism refers to the expectation of the Kingdom of God on Earth, in which the returning Christ will rule men for 1000 years before the Last Judgement puts an end to history altogether. Although part of the inheritance of all Christian groups, this doctrine has been pushed into the background by most of the larger churches. In contrast, it is vital to many smaller sects active in Canada such as the MORMONS, JEHOVAH'S WITNESSES and SEVENTH-DAY ADVENTISTS. Historically, expectation of millennial deliverance has become particu-

larly intense at times of great social stress, such as the Crusades or Black Death in medieval Europe or the Protestant Reformation. It is in such a context that one should place Louis RIEL, who preached a message of millennial salvation to the Métis of Canada as their society was being overwhelmed by white immigration.

Originally a Judeo-Christian concept, millenarianism is now applied by anthropologists and sociologists to parallel phenomena in non-Christian settings, eg, the Ghost Dance of 1890, when many Plains Indian tribes anticipated the destruction of the white man, accompanied by rejuvenation of the earth and the return of the buffalo in unprecedented numbers. Among thousands of such movements are the "cargo cults" of Melanesia, the Black Muslims of the US, the Rastafarians of Jamaica (now also in Canada), and the followers of the People's Temple who committed mass suicide in Guyana in 1978.

THOMAS FLANAGAN

**Miller, Frank**, politician, premier of Ontario (b at Toronto 14 May 1927). He graduated from McGill University in chemical engineering in 1949 and worked for Rubberset Company Ltd in Gravenhurst, Ont, and Alcan in Arvida, Qué. He was a General Motors dealer in Bracebridge, Ont, and operator of several resorts in the Muskoka area. He was councillor in Bracebridge 1967-70 and was elected Conservative MPP for Muskoka in 1971, 1975, 1977 and 1981. As minister of health 1974-77, his move to close some small-town hospitals created public controversy, but he became increasingly adept at defusing confrontation. He was minister of natural resources 1977-78, minister of treasury and economics 1978-83 and minister of industry and trade 1983-85. Considered the most conservative of those who sought to replace William DAVIS, he made a commitment to maintain the social service network built up in Ontario during the previous 41 years of Conservative government. He won the leadership on the third ballot in January 1985 and became premier in February.

JAMES MARSH

**Miller, Frank Robert**, air chief marshal (b at Kamloops, BC 30 Apr 1908). Miller joined the RCAF in 1931 and commanded training schools in WWII before proceeding overseas in 1944 as a station commander. He rose to vice-chief of the air staff 1951-54, but left the air force to serve as deputy minister of national defence 1955-60. He became chairman, Chiefs of Staff, 1960-64, and chief of the defence staff 1964-66. As Canada's first COS, he presided over the integration of the 3 service headquarters and the command organization of the Canadian Armed Forces. Quiet, gracious and possessing a diplomatic nature influenced by his engineer's training, Miller is the only man ever to hold both the top permanent civil and military positions in the Dept of National Defence.

NORMAN HILLMER

**Miller, George Martell**, architect (b at Port Hope 1855; d at Toronto 17 Apr 1933). Designer of many fine neoclassical structures in Toronto, he came to the city in the early 1880s, taught at the Mechanic's Institute and began to practise architecture in 1885. Among his buildings are the Lillian Massey Building at U of T, the old Haverall College on Jarvis St, and the Toronto General Trust Building. He was also architect for the Canadian General Electric Building, Peterborough, Ont; the Ontario Ladies College and the House of Industry, Whitby, Ont; and the MacDonald Building, Ontario Agricultural Coll, Guelph.

ANDREA KRISTOF

**Miller, John Henry**, actor-manager (b at London, Eng 1 Feb 1859; d at New York 9 Apr 1926). Henry Miller was 14 when his parents brought him to Toronto and in 1876 he made his stage debut at the Grand Opera House, with Mrs Morrison's resident Toronto stock company in *Amy*

*Roberts*, the dramatization of Walter Scott's *Kenilworth*. He achieved recognition with Daniel Frohman's Lyceum Theatre in New York, and toured opposite such Canadian stars as Clara Morris and Margaret Anglin. Miller evolved into a meticulous director and went into management at New York's Princess Theatre in 1905; building his own Henry Miller Theatre in 1916.

DAVID GARDNER

**Miller, William Lash**, educator, chemist (b at Galt, Ont 10 Sept 1866; d at Toronto 1 Sept 1940). When he died Miller was described as the greatest chemist Canada had produced; he was certainly the most colourful. A graduate in CHEMISTRY from U of T (1887), Miller then earned 2 PhDs in Germany, joining the teaching staff at Toronto in 1891, where he served for 46 years. Possessed of extraordinary clarity of thought and a forceful personality, Miller was an inspiring yet terrifying teacher. His greatest scientific strength lay in his mastery of the chemical thermodynamics of Willard Gibbs, learned from Ostwald at Leipzig. His greatest weakness (also learned from Ostwald) was his refusal to use or teach the atomic and molecular theories that formed the mainstream of 20th-century chemical thinking. Toronto became an important centre of chemical research, and a roster of Miller's pupils includes a remarkable number of important chemists.

W A E MCBRYDE

**Miller and Cockriell Case** (1977) J.H. Miller and V.J.R. Cockriell, charged with the murder of a policeman, argued the incompatibility of the penalty imposed by law with the Canadian Bill Rights of 1960. The Supreme Court ruled that the death penalty for the murder of a policeman or prison guard is not "cruel and unusual punishment" in the sense that the expression is used in the Bill of Rights. Since 14 July 1976, CAPITAL PUNISHMENT has been abolished in Canada although a narrow provision for it still applies to those in military service. In *McCann et al v The Queen et al* (1976) federal court judges found that solitary confinement under particular conditions could be considered cruel and unusual punishment.

GÉRALD-A. BEAUDOIN

**Millet**, general term applied originally to any small-seeded CEREAL or forage GRASS used for food or as animal feed. Most are restricted to the tropics or subtropics; they are rare in Canada. The most important exception is proso millet (*Panicum miliaceum*), an annual grown for birdseed in Ontario; has also been used as livestock feed in most provinces. In the USSR, it is a major source of grain and flour. In the 1970s, a brown-to black-seeded form of proso millet invaded Ontario and Québec. This WEED, resistant to triazine herbicides, has become a serious problem in corn and bean fields. Ripe seeds scatter readily and are distributed primarily by farm machinery. Seeds are strongly dormant and survive for years in the soil. The seed hull remains attached to the root system through the life cycle. If roots can be excavated, this feature allows positive identification.

PAUL B. CAVERS

**Millidge, Thomas Edward**, vessel owner and builder (b probably at Saint John 18 Dec 1814; d there 5 Aug 1894). He was the principal 19th-century registrant of newly built tonnage at Saint John Port of Registry. His mother, Sarah Simonds, and his cousins, the Gilberts, linked him to 2 of the leading families of the town. Although Millidge began acquiring vessels during the 1830s, the bulk of his tonnage was registered in the 1850s. While carrying on a lumbering business, he served as president of the Bank of New Brunswick (to 1858) and also invested in railways and ferries. By the 1860s Millidge was operating the family shipyard on the Kennebecasis R. From that point, his commercial pursuits tapered off. At his death he had no heir to carry on the family business. GERRY PANTING

**Millipede** (class Diplopoda), terrestrial, usually elongate arthropod, with a small head and short antennae. Typically, the body is very hard and subcylindrical, but often with platelike expansions making the animal appear flattened. Body comprises 11-100 or more similar segments which, except for the first 3-4, consist of fused pairs of true segments. The first and last true segments and the anal plate lack appendages. The second, third and, usually, fourth segments each bear one pair of legs; other segments, 2 pairs. Some appendages, in functional adults, are modified for reproduction. Despite the name millipede ("thousand-footed"), the number of legs is less than 400, generally less than 200. Newly hatched millipedes have 3-4 pairs of legs; the number increases following successive molts. About 10 000 species are known worldwide, mostly from tropical regions. More than 60 species are known to occur in Canada. About 10% of these, particularly in the East, have been introduced from Europe. Tropical millipedes sometimes grow to 30 cm; in Canada largest species barely attain 8 cm; many common species are less than 1 cm long and 1 mm in diameter. In western Canada, fossils of marine, millipede-like arthropods, not directly ancestral to any living group, are known from the mid-Cambrian (530 million years ago). Cylindrical millipedes usually burrow in soil; "flat backs" occupy matted, rotting vegetation. A few spend periods on the surface, mainly at night. Millipedes are important in soil formation in some deciduous and tropical forests. Virtually all feed on decayed matter or fresh vegetation. One or 2 species have been considered to be crop pests but, usually, damage done follows other injury to plants. An alarmed millipede typically coils itself into a spiral; some flat-backs are incapable of coiling; very short, exotic species may roll into a ball. Millipedes often protect themselves by noxious body secretions. Those of large, tropical species may cause skin and eye inflammation. Canadian species are harmless.

D.K. McEWAN KEVAN

**Millman, Peter MacKenzie**, astronomer (b at Toronto 10 Aug 1906). Educated at U of T and Harvard, Millman was an astronomer at U of T 1933-41 and served in the RCAF during WWII. After 9 years at the Dominion Observatory, Ottawa, he transferred to the NATIONAL RESEARCH COUNCIL in 1955 as head of upper-atmosphere research. Millman's own speciality was the spectroscopic study of meteors, for which he was awarded the J. Lawrence Smith Medal of the US National Academy of Sciences. He traced meteors by radar and in the 1950s was chairman of the Canadian government's interdepartmental committee on unidentified flying objects. Millman was an officer of the Int Astronomical Union and presided over its committee on planetary-system nomenclature 1973-82.

DONALD J.C. PHILLIPSON

**Milne, David Brown**, artist, writer (b near Paisley, Ont 8 Jan 1882; d at Bancroft, Ont 26 Dec 1953). Milne's initial recognition was in the US and he did not enjoy in Canada the attention that his contemporaries in the GROUP OF SEVEN received. Succeeding generations of artists, however, have generally given him (or J.W. MORRICE) the highest acclaim among Canadian painters (see PAINTING).

As a child Milne drew constantly. Before he embarked for New York City in 1903 to become an illustrator, he had taken a correspondence art course and experimented with photography. He studied at the Art Students League (1903-05), attended lectures by Robert Henri and William Chase, and visited galleries, especially Stieglitz' 291. Finally, he decided to be a painter rather than an illustrator. He exhibited vivacious and avant-garde paintings regularly with leading art societies from 1909, at the Montross Gallery,

*Sparkle of Glass* (c1927), oil on canvas, by David Milne. The artist forged several influences into a unique and powerful expression (courtesy National Gallery of Canada, Vincent Massey Bequest, 1968).

in the famous Armoury Show (1913) and in the Panama-Pacific Exposition (1915) where he won a silver medal.

In 1916 Milne and his wife Patsy (m 1912) moved to Boston Corners in upstate NY, where his work achieved a different power, both productive and innovative. He joined the Canadian Army in 1917 and after WWI painted for the army in England and France. He returned to NY State and painted prolifically, even during summer projects in the Adirondacks. In 1923-24 he spent a winter in Ottawa trying unsuccessfully to establish himself in Canada. He finally returned to Canada in 1929 (separating from his wife in 1933), and from then on painted in Ontario, mainly in Temagami, Toronto and at Baptiste Lk near Bancroft. His work became known after he sought the patronage of Alice and Vincent MASSEY, who organized several exhibitions, the first of which was seen by Douglas DUNCAN, who later became Milne's agent and dealer, and Alan Jarvis, later director of the National Gallery.

Milne's art was formed by both American and French impressionism and by Henri Matisse's fauvism. Claude Monet, especially in the aesthetic unity of his paintings, was the most pervasive influence. Milne forged these influences into his own powerful way of seeing and painting. He endowed the simplest subjects — houses, barns, flowers, trees and still lifes — with majestic stature. Figures appear frequently in his work in New York and Toronto, but the landscape dominated until the last 10 years of his life when a series of fantasies emerged. These may have been inspired by Kathleen Pavey, whom he met in 1938 and who became his second wife, and certainly by the birth of his only child, David, in 1941. Nevertheless the strong biblical references in them suggest a symbolic understanding of life, death, rebirth and resurrection. The *Ascension* series best illustrates his serious intent, but the *Noah and the Ark* series shows also that he could be amused by his biblical reinterpretations.

Approximately half of Milne's paintings are oils and half are watercolours. The National Gallery of Canada and the Winnipeg Art Gallery both have excellent collections of his work. *Billboards* (1912), *Painting Place* (1930), *Boston Corners* (1917), *Raspberry Jam* (1936) and *White Poppy* (1946) are fine examples of his work at different periods. Milne also invented a method of making colour drypoints and he returned to this medium sporadically over 20 years (1927-47). Many critics consider these drypoints his finest works. Milne's unpublished letters to his friend James Clarke, the Masseys and others, his "Autobiography" (1947) and his journals are a rich store of observations, thoughts and descriptions unparalleled in Canadian art.

DAVID P. SILCOX

Reading: David P. Silcox, *David Milne* (1967); Silcox and David Milne Jr., eds, "David Milne: His Journals and Letters of 1920 and 1921," *Artscanada* 30, 3 (Aug 1973); J. O'Brien, *David Milne: The New York Years 1903-1916* (1981).

**Minas Basin** is the broadest part of the S-eastern head of the Bay of FUNDY, and lies entirely within NS. It merges westward into Fundy, through Minas Channel, 5 km wide, and eastward into Cobequid Bay, and is widest (30 km) S of Parrsboro, NS. Its depth, generally less than 40 m, is over 100 m in Minas Channel. The bottom consists of large sand bodies swept by strong tidal currents, changing to mud flats nearer the shore. Its daily tidal range of 15-16 m is among the highest in the world. The N shore is straight, with small coves and islands, and cliffs rising to 100-200 m; the S shore is mainly low, with undulating good agricultural land and hayfields on former salt marshes. Farming includes mixed cattle husbandry, vegetable growing, egg production and apple growing. Coastal marshes in the SW were a focal area of ACADIAN French settlement in the early 17th century. Major towns are WOLFVILLE, WINDSOR and Parrsboro. GRAND PRÉ, dating from Acadian times, is a national historic park. I.A. BROOKES

**Miner, John Thomas**, "Jack," conservationist, lecturer (b at Dover Center, Ohio 10 Apr 1865; d at Kingsville, Ont 3 Nov 1944). He moved to Kingsville with his family in 1878 and helped in the family tile business. He developed an early passion for nature and spent much of his time in the forest. He became an avid and skillful hunter, known for good humour and boundless energy. A hunting accident fatal to his brother and other family tragedies diverted his energy into religious zeal and passion for conservation. He tried to attract geese to his property (1904), establishing in 1908 one of the first bird sanctuaries in N America, officially declared a provincial crown reserve in 1917. Miner's many lectures on the sanctuary throughout N America and Europe inspired similar efforts elsewhere and instilled a conservation ethic in many people, eventually earning him the Outdoor Life Gold Medal and the OBE. His attitude towards predators as "evil vermin" has been much criticized, but was typical before the ecological importance of predation was understood. His 1927 warnings against pollution of the GREAT LAKES were prophetic. Miner early recognized the importance of international co-operation in migratory bird conservation and, before banding was regulated, obtained bands from Percy A. TAVERNER and tagged thousands of waterfowl, placing biblical scriptures into the bands. National Wildlife Week, proclaimed in his honour, his sanctuary and 2 autobiographical books continue as his legacy. MARTIN K. McNICHOLL

**Mineral**, element or chemical compound formed in nature by inorganic processes. Minerals may be composed of one element such as carbon (diamond) or gold, or of several elements. Most minerals are characterized by a definite chemical composition, expressed by a chemical formula indicating the types of atoms and their numbers. These atoms are arranged in an orderly 3-dimensional pattern forming a crystalline material. Some solids (including natural glasses) and liquids (eg, water, mercury) lack the orderly atomic arrangement and are referred to as mineraloids. COAL, PETROLEUM and amber, lacking both a definite chemical composition and an orderly atomic structure, are not minerals, although they are referred to as MINERAL RESOURCES. Pearls, CORAL and shells are composed of crystalline calcium carbonate but are not minerals because they were formed by living organisms. Laboratory grown (ie, synthetic) compounds are also nonminerals, although their

chemistry and structure may be identical to naturally occurring minerals.

There are about 3000 known mineral species; about 80 new species are discovered yearly. To establish a new species, all data relating to the mineral, including its chemical, structural, physical and optical properties, must be approved by the Commission on New Minerals and New Mineral Names of the International Mineralogical Assn. The association also judges the acceptability of the proposed name. Minerals are named in various ways, some in honour of a person (eg, weloganite, after Sir William E. LOGAN), a locality (athabascaite), an institution (mcgillite), the chemical composition (cobaltite), or a distinctive property such as colour (azurite) or magnetism (magnetite). Many names are derived from Latin or Greek words describing characteristic features, eg, albite [Lat *albus*, "white"] or rhodonite [Gk *rhodon*, "rose"]. All accumulated scientific data concerning the newly named mineral are published in a recognized international journal, such as the *Canadian Mineralogist*, for dissemination worldwide.

Minerals occur as components of rocks and, less commonly, as concentrations in rocks. Individual minerals may be readily recognized in coarse-textured rocks (eg, granite) but not in fine-grained rocks (eg, lava, shale). Concentrations of minerals range from small occurrences to large deposits and are formed by various processes, including solidification of mineral-bearing solutions in rock openings (eg, fissures, cavities), precipitation from mineral-rich waters as in springs and saline lakes, and solidification of gases during volcanic eruptions. In each case, minerals grow when appropriate temperature and pressure allow atoms in magma (molten rock), solutions or gases to group together into the basic, mineral-forming building blocks.

Structurally, minerals are grouped into 7 crystal systems, each giving rise to characteristic geometrical shapes. These systems — cubic (isometric), tetragonal, hexagonal, trigonal, orthorhombic, monoclinic and triclinic — are derived from 7 basic boxlike forms, each made up of atoms arranged in a precise and orderly fashion. During crystal growth, these basic building blocks align themselves symmetrically in 3 directions to produce a crystalline solid. If there is sufficient space during growth, a crystal with smooth geometrical faces, reflecting its internal structure, may form; usually, growth conditions are not ideal and minerals form as masses of generally microscopic crystals or in other aggregates (fibrous, powdery, flaky, globular, etc).

### Mineral Identification

Minerals are defined and identified on the basis of their chemical composition and structure. A chemical analysis may range from a test for the presence of one or a few elements to a complete quantitative analysis. The techniques may be simple (eg, a flame test) or may involve sophisticated instruments (eg, electron microprobe, optical spectrograph). Minerals may, however, be identified without use of elaborate laboratory equipment. The most noticeable properties are those influencing appearance.

**Form or Habit** refers to the characteristic shape in which the mineral is formed. It may be fibrous (asbestos), lamellar or scaly (mica), platy (barite) or globular (hematite). Crystal forms, such as cubes and octahedra (fluorite and magnetite), rhombs (calcite) and 6-sided prisms (quartz and beryl) may also be readily recognized.

**Colour**, if constant, as in the metallic minerals (gold, copper, chalcocopyrite), may be diagnostic. Other minerals (eg, spinel, fluorite, corundum) may occur in various colours. Colour in minerals results from atoms or structural defects (colour centres) that absorb certain portions of the spectrum of light; the unabsorbed portion is

reflected or transmitted to the eye as colour. The colour of the powdered mineral (its streak) is more reliable than that of the intact mineral. The streak is produced by rubbing the mineral across an unglazed porcelain plate. Yellow, brown or black sphalerite has a cream-white streak; black or reddish brown hematite has a dark red streak. Some minerals produce a fluorescent colour when exposed to ultraviolet light, eg, the white, tungsten-ore mineral scheelite fluoresces bluish white, a property used in prospecting for it. Minerals that continue to fluoresce after the ultraviolet light source has been removed are referred to as phosphorescent.

**Lustre**, the reflection of light from mineral surfaces, is classified as metallic or nonmetallic. Various terms are used to describe nonmetallic lustre, including vitreous (glassy), adamantine (brilliant), resinous, waxy or oily, silky, pearly and earthy (dull). Lustre is generally more characteristic of a particular mineral than colour.

**Transparency and Opacity** depend upon the mineral's ability to transmit or absorb light. Metallic minerals, strong light absorbers, are opaque. Transparent minerals transmit most incident light; these minerals are potential GEMSTONES. Translucent minerals both absorb and transmit light; objects viewed through them appear blurred. Some mineral species vary from transparent to almost opaque, depending upon the degree of impurity and structural defects they contain.

**Specific Gravity** is the density or weight of a substance, compared to the weight of an equal volume of water (specific gravity, 1). Galena, an ore of lead, has a density of  $7\frac{1}{2}$ , ie, is  $7\frac{1}{2}$  times heavier than water. The atomic weight of elements forming the mineral and the packing arrangement (ie, whether atoms are close or far apart) affect specific gravity. In stream gravels, minerals are separated by their specific gravity, heavier ones settling to the bottom.

**Hardness**, the relative ability of a mineral to resist scratching or abrasion, is among the most useful diagnostic properties. The Mohs' mineral scale of relative hardness is used to assign an approximate hardness value to a mineral. The scale consists of 10 minerals in order of increasing hardness: talc, 1; gypsum, 2; calcite, 3; fluorite, 4; apatite, 5; orthoclase, 6; quartz, 7; topaz, 8; corundum, 9; diamond, 10. Each mineral will scratch those with lower hardness and be scratched by those higher on the scale. Zircon, which scratches quartz but not topaz, has a hardness of  $7\frac{1}{2}$ . The hardness of a mineral depends upon the strength of the bonds, or electrical force, holding atoms together; the scratch breaks those bonds.

**Breakage** Cleavage, a smooth, flat break produced between planes of atoms, results from weakness in the force binding parallel planes of atoms to each other. Minerals may cleave in one or more directions, or not at all. Cleavage is described according to the number and direction of cleavage planes and by the smoothness of the cleavage surface (perfect, good, fair, poor). Mica minerals have a perfect cleavage in one direction and can be split into sheets. Galena has 3 cleavage directions at right angles to each other; each cleavage surface is parallel to a cube face and the cleavage is referred to as cubic. Fracture, a break across planes of atoms resulting in an irregular, nonplanar surface, occurs in minerals having no distinct planes of weakness. All minerals show some type of fracture; minerals that cleave in one or more directions may fracture in others. Fracture is described as conchoidal or shell-like (quartz, glass), hackly or jagged (native copper), splintery (jade) or uneven (feldspar).

**Tenacity or Cohesiveness** is the breaking strength of minerals. "Tough" minerals (eg, jade) are so difficult to break that boulders are generally sawn. Brittle minerals shatter or crush

to a powder when struck; diamond, the hardest mineral known, and talc, the softest, are brittle. Other minerals are deformed more easily than broken: a malleable mineral (gold) can be hammered into sheets; a sectile mineral (silver) can be cut into shavings; a ductile mineral (copper) can be drawn into wire; flexible minerals (graphite) can be bent; and elastic minerals (mica) will spring back after being bent.

**Magnetism and Radioactivity**, properties shown by only a few common minerals, are easily detected. Magnetism refers to the reaction of a mineral in a magnetic field. Magnetite is strongly attracted to a hand magnet; pyrrhotite and ilmenite are less strongly attracted. Radioactive minerals (uraninite, thorite) contain unstable atoms (uranium, thorium) that emit radiation detectable by a scintillometer or a Geiger counter. In metamict minerals (betafite, allanite) radioactivity causes destruction of the internal atomic structure and the minerals become noncrystalline.

**Optical Properties** refer to the behaviour of light passing through a mineral. Light travels more slowly in minerals than in air and the amount of slowing varies from mineral to mineral. With the loss of speed, light changes its path, or is refracted. The degree of slowing, referred to as the index of refraction, may be expressed as the ratio of the speed of light in air to the speed in a given mineral. For example, light travels at 299 330 km per second in air (refractive index 1) but slows down to 123 916 km/s in diamond (ie, light travels 2.41 times as fast in air); hence, the refractive index of diamond is 2.41.

All minerals, except those in the cubic (isometric) system, split an incoming light ray into 2 rays when it travels along certain crystallographic directions. Each ray is slowed down to a different degree; hence, each ray will have its own index of refraction and the mineral will have 2 indices of refraction along certain directions. Such minerals are referred to as optically anisotropic; minerals with only one refractive index are described as isotropic. To determine the refractive index, mineralogists use the petrographic (polarizing) microscope; gemologists, the refractometer.

**X-Ray Powder Diffraction** is the most universal laboratory method of mineral identification. The technique uses an X-ray source, a cylindrical camera lined with a strip of photographic film, and a small amount of the mineral powder mounted on a rod inside the camera. A beam of X-rays strikes the mineral which reflects (diffracts) the X-rays from different sets of parallel planes of atoms; the reflected rays are recorded on the film as a series of concentric lines of varying intensities. The lines represent distances between atomic planes and the intensities are related to the kinds and distribution of atoms in the atomic plane. Since the distances and intensities of the lines (ie, the powder diffraction pattern) are characteristic for each mineral species, the film gives a "fingerprint" of that mineral. An unknown mineral is identified by matching its pattern with a standard pattern.

#### Classification of Minerals

Modern mineral classification is based on chemical composition. Each chemical class is subdivided into groups or families according to similarities in structure and, to a lesser degree, in chemistry. Minerals in each group have similar properties and were formed in similar geological environments.

**Native Elements** The 20 or so minerals formed of one element include metals (eg, gold, silver), semimetals (arsenic, bismuth, antimony) and nonmetals (sulphur, carbon as graphite or diamond).

**Sulphides, Sulphosalts** A sulphide mineral is composed of sulphur with one or more metallic

elements (eg, galena, chalcopyrite) or sulphur with a semimetallic element (realgar). A sulphosalt, or double sulphide, is composed of sulphur with both metallic and semimetallic elements (pyrrargyrite). Sulphides and sulphosalts are generally opaque, have metallic lustre and a hardness of 1–6, and occur commonly in veins. They include the important ore minerals.

**Oxides, Hydroxides** Oxide minerals are composed of oxygen with one or more metals or semimetals (eg, hematite). If hydrogen is also present, as in goethite, the mineral is classed as a hydroxide. Oxides generally have simple chemistry and structure.

**Halides** are minerals composed of the halogen elements (fluorine, chlorine, bromine, iodine) with a metal (eg, halite or table salt, fluorite). Halides are generally soft, brittle and light in colour; some are water soluble. The halides form an important group of industrial minerals, including halite, sylvite (a source of potash), chlorargyrite (ore of silver) and fluorite.

**Carbonates, Nitrates, Borates** Minerals in these classes have the same basic structural unit (ie, a radical) consisting of 3 oxygen atoms arranged in an equilateral triangle. In each class, a different type of atom is positioned in the centre of the triangle: the centre position in carbonates is occupied by a carbon atom and the radical is  $\text{CO}_3$ ; in nitrates by nitrogen (radical  $\text{NO}_3$ ); in borates by boron (radical  $\text{BO}_3$ ). Each triangular unit is held to similar ones by atoms of metallic elements. Carbonate minerals are most common; calcite and dolomite are the major constituents of limestone and marble. Carbonates are generally soft and soluble in acids; nitrates are water soluble and occur only in arid regions.

**Sulphates, Phosphates, Chromates, Arsenates, Vanadates** Minerals in these classes have the same type of basic building block (radical), a tetrahedron (pyramid shape) with one oxygen atom at each of its 4 corners and an atom characteristic of the class inside. In sulphates the inner atom is sulphur and the radical is  $\text{SO}_4$ ; the others are phosphorus in phosphates ( $\text{PO}_4$ ), chromium in chromates ( $\text{CrO}_4$ ), arsenic in arsenates ( $\text{AsO}_4$ ) and vanadium in vanadates ( $\text{VO}_4$ ). Atoms of metallic elements unite the tetrahedra to form minerals. Barite and gypsum are important sulphates; apatite is an important phosphate.

**Molybdates, Tungstates** The radical in minerals in these classes is the tetrahedron of 4 oxygen atoms surrounding an atom of molybdenum in molybdates ( $\text{MoO}_4$ ) or tungsten in tungstates ( $\text{WO}_4$ ). These tetrahedra are distorted by the large atoms inside.

**Silicates**, minerals containing silicon and oxygen, make up over 90% of Earth's crust and about one-quarter of known mineral species. The basic building block of silicates is the silicon-oxygen tetrahedron ( $\text{SiO}_4$ ). The silicates are classified into 6 groups according to ways in which the tetrahedra are joined to each other: in nesosilicates, the basic  $\text{SiO}_4$  tetrahedra are held together by atoms of other elements (eg, zirconium in zircon); in sorosilicates, pairs of tetrahedra share one corner atom and the "bow tie" shaped units formed are held together by atoms of other elements (eg, hemimorphite); in cyclosilicates, which have a ring structure, each tetrahedron shares a corner oxygen atom with the 2 adjoining tetrahedra (eg, beryl); in inosilicates, which have a chain structure, each tetrahedron shares an oxygen atom with the 2 adjoining tetrahedra and the chains are aligned and joined by atoms of other elements (eg, pyroxene); in phyllosilicates, which have a sheet structure, each tetrahedron shares 3 oxygen atoms with other tetrahedra (eg, mica minerals); in tectosilicates or framework silicates, all 4 oxygen atoms of each tetrahedron are shared (eg, quartz).

ANN P. SABINA

**Mineral and Mining Engineering** Mineral engineering is that branch of ENGINEERING concerned with the application of scientific and technical knowledge to the search for and production of valuable MINERALS from naturally occurring surface, underground or below-water deposits. Mining engineering, an essential part of mineral engineering, is also concerned with the construction of civil works such as tunnels, subways, power plants and shelters and, thus, is related to both CIVIL and MECHANICAL ENGINEERING. Minerals are inorganic substances but engineers and economists commonly include materials derived from organic matter (eg, COAL; OIL AND NATURAL GAS) in their classification. A mineral occurrence is called an ore deposit when its valuable minerals can be extracted at a profit.

#### History in Canada

The native people of Canada were known to have used minerals (eg, COPPER) before the arrival of Europeans. Early explorers of N America showed intense interest in the mineral potential of the New World. It was not however until the establishment of the GEOLOGICAL SURVEY OF CANADA (1842) that scientific principles were used to determine the extent of Canada's mineral wealth. The mid-1850s (especially the GOLD RUSH) saw the beginning of a series of major finds of economic minerals. To meet the need for qualified individuals to help exploit the new-found wealth, engineering schools were established to teach core courses in civil, mechanical and mining engineering. These included King's College, Fredericton, NB, in 1854; McGill, Montréal, in 1871; School of Practical Science, Toronto, in 1873; Ecole polytechnique, Montréal, in 1873; Royal Military College, Kingston, in 1876; and the School of Mining and Agriculture, Queen's University, Kingston, in 1893. The Canadian Institute of Mining and Metallurgy was established in 1898; its membership in 1982 was about 13 000.

Because Canada's ECONOMY has remained resource based, mineral and mining engineers and their colleagues who discover and exploit economic minerals (geologists, geophysicists, geochemists, and electrical, mechanical, chemical and metallurgical engineers) continue to play a vital role in Canada's economic well-being. Continuous improvements in mining technology have greatly reduced the hazards for mine employees (see MINING SAFETY). Canadian advances in dealing with the logistics of mineral extraction, such as floating a prebuilt processing factory to a remote site, have extended the range of usable resources. Considerable advances have also been made in technologies for extracting the required ore from the rock in which it is embedded.

#### Applications

The normal sequence of mineral engineering activities includes exploration (ie, PROSPECTING), evaluation, financing, development and extraction of the ore and, then, separation, concentration and refining of the desired minerals, using chemical, physical, electrical and metallurgical systems. The environmentally acceptable disposal of the resultant wastes is an integral part of the process. Exploration activities may still involve the traditional individual prospector looking for surface outcrops or other ready evidence of mineral deposition. Modern mineral exploration, however, makes increasing use of highly organized and specialized REMOTE SENSING methods. The benefits of surface geological mapping can be substantially extended by the use of aerial or satellite photography. Geophysics is concerned with the detection of anomalies related to gravitational, seismic, magnetic, electromagnetic, radioactivity and electrical conductivity measurements in Earth's crust. These changes may indicate the presence of valuable underground mineral occurrences.

**GEOCHEMISTRY** is used to identify unusual concentrations of chemicals in surface soils, water and vegetation, as clues to the proximity of an ore deposit.

The evaluation of mineral occurrences to determine their potential value and to establish proven, probable and possible quantities of ore requires detailed sampling from surface pits and diamond drill holes. Even after extensive drilling has outlined a potential ore body, it may be necessary to carry out bulk sampling from underground shafts, drifts, crosscuts and stopes before the true value of the deposit can be accurately calculated and MINING costs established. Pilot-plant studies may be carried out to confirm or modify mining methods and treatment systems. Because of the highly competitive nature of the mineral industries, the evaluation of relatively low-grade ore deposits is becoming increasingly rigorous. Methods for funding mineral production will depend on the level of risk and the total capital requirement for the recovery procedures involved. Normally, the establishment of a limited liability company and sale of equity shares is necessary. Alternatively, some or all of the funding may be obtained through loans guaranteed by the ore proven in the evaluation stage.

Some minerals (eg, **PETROLEUM**) may be extracted from the earth via drilled holes, using induced pressure and solvents. Dredging is used to mine unconsolidated materials from below the water. Recovery of mineral nodules from the deep-sea bed requires further development of the dredging method (see **OCEAN MINING**). Minerals may also be leached from surface or underground deposits by circulating solvents or microbial fluid, with later precipitation or other suitable disposal of the leached material. Surface and underground deposits may be exploited by open pit or underground mining methods.

The development phase of mining activity involves mining engineers in complex decisions on rate of ore extraction, methods of mining and treatment of broken ore. A critical path schedule is established and, based on this schedule, equipment is purchased and a work force mobilized. Because many of these decisions interrelate, the mine planner will be involved in selection of equipment for drilling, blasting, waste control, transportation, pumping, power supply, ventilation, ground support and personnel safety. Final mining and process plant design and erection, housing and all of the other complex infrastructure needs will depend on mine location and transport facilities available.

Most mining operations require some form of further processing of broken ore. This processing could be as simple as crushing and washing or may include further steps (eg, grinding, screening, flotation, gravity separation, cyanidation, leaching, precipitation, filtering, roasting), the ultimate purpose being to separate waste from valuable material and to concentrate the latter to meet customer requirements or to prepare for further processing, including smelting and electrical refining (see **METALLURGY**). Environmental considerations require that great attention be given to the disposal of waste products. Atmospheric emissions should be treated to remove unacceptable chemical constituents and solid particulate matter. Processed water should be recycled through the ore-treatment system and, when discharged, should be treated to avoid undesirable constituents reaching rivers or streams. Suspended solids are filtered or settled in restricted basins. When an ore body is completely mined, the site should be returned to an environmentally acceptable condition; eg, plant equipment is removed and access to underground workings sealed, building foundations are normally destroyed and buried, waste dumps are levelled and contoured to fit in with adjacent topography. T.W. KIERANS and W.G. WEGENAST

**Mineral Naming** Each MINERAL species is identified by its own appellation, and names have been assigned since antiquity. While there are only some 3000 valid mineral species, nearly 20 000 names occur in the literature. This discrepancy results because different names have been used to describe the same mineral by researchers working independently, or because distinct names have been applied to minerals that later proved to be varieties or mixtures of already known species. Today a much better control is exercised by the Commission on New Minerals and Mineral Names established in 1959 by the International Mineralogical Assn.

Two contrasting tendencies can be seen in mineralogical nomenclature. First, there are the names that convey useful information about the mineral itself and are based on the chemical composition, crystal form, colour, lustre or other

#### Minerals Named after Canadian Places

athabascaite	from Martin Lk mine near Uranium City, N of Lk ATHABASCA, Sask
bytownite	for Bytown, former name of city of OTTAWA, 1830-1857
carletonite	for Carleton College, now Carleton U, Ottawa, where mineral first recognized
falcondoite	after Falcondo, subsidiary of Falconbridge Nickel Ltd
froodite	for Frood mine, SUDBURY dist, Ont
gaspeite	from a site in Gaspé Ouest County, GASPÉ Peninsula, Qué
hastingsite	from a site in Hastings County, Ont
hedleyite	from a site near Hedley, SW of Penticton, BC
hilaireite	from the site at Mont St-Hilaire, Rouville County, Qué, one of the Monteregians, where about 125 mineral species have been recognized
labradorite	from Paul I, coast of Lab, official mineral of NFLd
langisite	from Langis mine, Timiskaming Dist, Ont
latrappite	from an area near La Trappe, Qué
madocite	from a marble quarry near Madoc, Ont
mattagamite	from a site at Matagami Lake, Qué, spelled Mattagami until 1962
mcgillite	after McGill University, Montréal, Qué
montbrayite	from a site in Montbray township, Abitibi, Qué
monteregianite	after the Monteregian Hills, Qué, 8 extinct volcanoes E of Montréal; see above, hilaireite
mordenite	from a site near Morden, NS
muskoxite	from the Muskox Intrusion (named by Charles H. Smith) located S of Coppermine, NWT
pellyite	site near the headwaters of Pelly R, YT
romarchite	from Royal Ontario Museum of Archaeology now Royal Ontario Museum, also hydromarchite
spionkopite	site on Spionkop Creek in SW Alta
sudburyite	for Sudbury, Ont
tancoite	site at Tanco mine near Bernic Lake, Man, Tantalum Mining Corp of Canada
semagamite	site near Lake TEMAGAMI in northern Ont
tintinaite	site near the Tintina silver mines, YT
tulameenite	site near Tulameen River, BC
wakefieldite	site near Wakefield, Qué
yarrowite	site near Yarrow Creek, SW Alta
yukonite	site near Tagish Lake, YT

properties. For example, caysichite, found near Poltmore, Qué, is named after its chemical composition (Ca, Y, Si, C, H). Secondly, there are minerals with names that communicate very little or no information about the composition or properties of the mineral. Such is the case when names of persons are used: some refer to the discoverer or first analyst of the mineral; others recall a famous person or a scientific institution. For example, steacyite was named for H.R. Steacy, a Canadian mineralogist. Moreover, there are names of minerals that convey information about the region where they have been found. Some are quite specific about the location, eg, sudburyite named for Sudbury, Ont; others refer to a much larger area, eg, labradorite. The suffix "ite" is derived from the Gk word *lithos*, meaning rock or stone. While the vast majority of mineral names end in "ite," some have the suffixes "ine" or "ide."

Some 86 new minerals, discovered, analysed or identified by Canadians, have been enshrined in the international nomenclature with Canadian names. Two branches of the Dept of Energy, Mines and Resources (EMR), the GEOLOGICAL SURVEY OF CANADA (GSC) and the Canada Centre for Mineral and Energy Technology (CANMET), rank very high among the leading institutions that identify and publish scientific studies on new minerals; at this time, they have at least half a dozen new species under examination.

A number of Canadian localities, regions and other geographical features are identified by names from the mineral kingdom. A famous example is Cap Diamant. While investigating the surroundings of the Indian settlement of Stadacona (near Québec City), Jacques CARTIER and his men noticed some sparkling, crystallized minerals attached to the rocks of the nearby cliff, which any modern geologist would describe as a formation of argillaceous limestones and bituminous schists dating back to the Middle Ordovician period (over 450 million years old). This formation forms part of the front of the Appalachians. Understandably, these hexagonal crystals provoked great interest among Cartier's sailors, particularly those specimens showing a range of colours caused by the presence of minute quantities of bitumen. Samples of the newly found "diamonds" were brought back to France, where an informed mineralogist instructed Cartier and his men about the great difference between rock crystal and the most precious stone known to man. It is probably this incident that is responsible for an old French saying, still heard in some parts of Normandy and Brittany: "Faux comme un diamant du Canada" [Fake as a Canadian diamond]. Samuel de CHAMPLAIN, founder of Québec (1608), made the same discovery some 70 years later, and the promontory was, accordingly, named Cap Diamant.

Many more Canadian geographical names have been derived from minerals. Dozens of lakes, creeks, points, inlets, hills and islands have names such as agate, amethyst, calcite, copper, emerald, garnet, gold, jasper, quartz, ruby, silver, sulphide, topaz and zircon, to name just a few of the minerals and precious and semiprecious stones currently used for this purpose across the country. JEAN-PAUL DROLET

**Mineral Resources** On a world map, Canada covers as much territory as Europe, rests firmly on a solid base (the US), extends to the North Pole, reaches from the Atlantic to the Pacific oceans and, as if greedy for more land and water, stretches to pull in the islands of Vancouver and Newfoundland and a few more along the coasts. On the E, W and N there are oceans; the land extends not only a *mari usque ad mare* but *ad mare* once more. Beyond its importance as one of the main suppliers of food (wheat) to the rest of the world, Canada is probably best known as

a storehouse for a host of MINERALS: metals, non-metals, structural materials and fuels.

**Mineral Endowment** Few countries can claim a mineral domain that covers nearly 10 million km<sup>2</sup> and embraces 5 main GEOLOGICAL REGIONS, each possessing its characteristic features. Dominating this territory is a massive central upland of Precambrian rocks known as the Canadian SHIELD, which underlies about half the total area of Canada (most of Qué, Ont and Man and large parts of Sask and the NWT, including the eastern parts of the ARCTIC ARCHIPELAGO). This vast expanse of ancient IGNEOUS and SEDIMENTARY rocks, bush and bog is one of the world's richest ore-bearing regions, and has been Canada's leading source of a great variety of precious and base metals and has large reserves of ferrous and uranium minerals. Because of its enormous size and favourable geological features, the Shield still has great potential for the discovery of additional mineral deposits. One geological region, the Superior Province of the Shield, has been the greatest source in Canada of copper, lead, zinc, gold, silver, nickel, iron, cobalt, platinum, magnesium, titanium and uranium.

Between the Shield and the Western Cordillera, and stretching from the US border to the Arctic Ocean, lie the Interior Plains (Interior Platform). Under the rich, fertile soil of the southern plains lies a vast storehouse of PETROLEUM, coal, potash and salt, contained in thick sequences of gently dipping sedimentary rocks. The northernmost part of the region holds

promise for further discoveries of fossil fuels. Exploration is being extended through most of the plains, including areas in the Arctic Archipelago. The central part contains the famous Athabasca rock formations, where accumulations of heavy-oil sands show reserves and resources equal to any in the world.

West of the Interior Plains is the Cordilleran Region composed of high mountains, lower plateaus and valleys, underlain by various sedimentary and volcanic rocks. It covers most of BC, the YT and part of the NWT, and has extensive and varied mineral wealth. Whereas the western and central parts are mainly sources of a great variety of metals, the Eastern Cordillera is noted chiefly for coal, gas, petroleum and some industrial minerals.

Eastern Canada, SE of the Shield, contains a broad belt of mountains and plains known as the Appalachian Region. It underlies all of NB, NS and PEI, parts of Newfoundland, and that part of Québec lying S of the St Lawrence R and E of a line between Lk Champlain (US) and Québec City. A great variety of minerals is found there, particularly asbestos (Eastern Townships, Qué) and coal (NS); important deposits of lead and zinc occur in NB and Newfoundland, and industrial minerals (salt, potash and gypsum) in NB and NS.

The Innuition Region, lying mainly in the Arctic Archipelago, is underlain mainly by folded sedimentary rocks and by gently dipping strata, which contain important petroleum re-

sources (eg, Sverdrup Basin). Older rocks of the Cornwallis Belt contain lead and zinc, including the rich Arvik deposit which supports Canada's most northerly mine, Polaris, on Little Cornwallis I. Other minerals, such as salt and gypsum, have also been identified in the region.

Of increasing importance are the continental shelves extending off the coasts of Canada and underlain mainly by seaward-dipping sedimentary and, in places, volcanic rocks. They include the Pacific, Atlantic and Arctic continental shelves, the last known to extend between the arctic islands, beneath the Beaufort Sea and along the coast of Baffin I. Canada has the second-largest continental margin — that vast submerged area that is the geological prolongation of Canada's landmass into the seas. Increased attention has been paid in recent years to exploration for petroleum and natural gas, particularly off the Atlantic coast where the shelf extends out more than 320 km.

**Minerals and Economic Development** In the course of its history, and more particularly since Confederation (1867), Canada has taken its place among the richest nations of the world. The people of Canada have discovered and brought into production a rich variety of minerals (metals, industrial minerals and ENERGY resources), making Canada one of the world's leading mineral producers (surpassed only by the USSR and the US for value and diversity of production).

QUARRYING and MINING are among the oldest industries in Canada. The record dates from the

#### Minerals Named after Canadian People

aplowite	Albert Peter LOW	gittinsite	John Gittins (b 1932), petrologist, U of Toronto	penikisite	Toronto, past president, Mineralogical Soc of America (1948)
barnesite	William Howard Barnes (b 1903), mineralogist NRC	gormanite	Donald G. Gorman (b 1922), mineralogist, U of Toronto	petarasite	Gunar Penikis (1936-1979), a discoverer of phosphate occurrence in northeastern YT
berryite	Leonard Gascoigne Berry (b 1914), mineralogist, Queen's U, past president of Mineralogical Soc of America (1964), editor of <i>The Canadian Mineralogist</i> (1957-75)	gunningite	Henry Cecil Gunning (b 1901), geologist, GSC	poitevinite	Peter Tarasoff (b 1934), amateur mineralogist, assistant director, Noranda Research Centre
boyleite	Robert William Boyle (b 1920), geologist, GSC	hawleyite	James Edwin Hawley (1897-1965), mineralogist, Queen's	poitevinite	Theophile Eugene Poitevin (1888-1978), mineralogist, GSC
cabriite	Louis John Cabri (b 1934), mineralogist, CANMET, EMR	haycockite	Maurice Hall Haycock (b 1900), former head mineralogy section, EMR	prosperite	Prosper John Williams (b 1910), South African mineral dealer, Ont and Alta
cernyite	Petr Cerny (b 1934), mineralogist U of Manitoba	howlite	Henry How (1828-1879), chemist, U of King's College, Windsor, NS, author of <i>The Mineralogy of Nova Scotia</i>	robinsonite	Stephen Clive Robinson (1911-1981), mineralogist, Queen's and GSC
chapmanite	Edward John Chapman (1821-1904), geologist and mineralogist, U of T	jagowerite	John Arthur Gower (1921-1972), mineralogist, UBC	rucklidgeite	John Christopher Rucklidge (b 1938), mineralogist, U of Toronto
collinsite	William Henry Collins (1878-1937), geologist, former director GSC	jamborite	John Leslie Jambor (b 1936), mineralogist, CANMET	sabinaite	Ann Phyllis Sabina (b 1930), geologist, GSC
dadsonite	Alexander Stewart Dadson (1906-1958), contributed to development of Yellowknife gold deposits	keithconnite	Herbert Keith Conn (b 1923), Manville Products Corp, provided samples for study	satterlyite	Jack Satterly (b 1906), geologist, Ont Dept of Mines and ROM
dawsonite	Sir John William DAWSON	kulanite	Alan Kulan (1921-1977), prospector, Ross River, YT	spencite	Hugh Swaine Spence (1885-1973), Dept of Mines, now called tritomite-(Y)
donnayite	Joseph Dérisé Hubert Donnay (b 1902), mineralogist-crystallographer, McGill and Laval universities; Gabrielle (Hamburger) Donnay, (b 1920) crystallographer-mineralogist, McGill	larosite	Frederick Alfred La Rose, prospector, discovered silver at Cobalt, Ont	sperryite	Francis Lewis Sperry (d 1906), chemist at Sudbury who first found the mineral
dresserite	John Alexander Dresser (1866-1954), geologist, author of <i>The Geology of Québec</i> , also strontiodresserite	lemoyneite	Charles Le Moyne, Baron de LONGUEUIL	spertiniite	Francesco Spertini (b 1937), chief geologist, Jeffrey mine, Asbestos, Qué
ferrierite	Walter Frederick Ferrier (1865-1950), geologist and mining engineer	mandarinoite	Joseph Anthony Mandarino (b 1929), mineralogist, curator, ROM	steacyite	Harold Robert Steacy (b 1923), mineralogist, GSC
frohbergite	Max Hans Frohberg (1901-1970), geologist	michenerite	Charles Edward Michener (b 1907), geologist, Canadian Nickel Co, Toronto	sterryite	Thomas Sterry HUNT
gaidonnayite	Gabrielle (Hamburger) Donnay, crystallographer-mineralogist, McGill	moorhouseite	Walter Wilson Moorhouse (1913-1969), geologist, U of Toronto	twinnite	Robert Mitchell Thompson (1918-1967), mineralogist, UBC; mineral name derived from Thompson, ie, "son of Thomas," Thomas based on Aramaic for "twin"; the mineral thomsonite existed already
gaitite	Robert Irwin Gait (b 1938), curator of mineralogy, ROM	neyite	Charles Stuart Ney (1918-1975), geologist in charge of early exploration of deposit where mineral discovered	tyrrellite	Joseph Burr TYRRELL
garyansellite	Harold Gary Ansell (b 1943), mineralogist, GSC	nuffieldite	Edward Wilfred Nuffield (b 1914), mineralogist, U of Toronto	weloganite	William Edmond LOGAN
		parsonsite	Arthur Leonard Parsons (1873-1957), mineralogist, U of Toronto, ROM	wicksite	Frederick John Wicks (b 1937), curator of mineralogy, ROM
		pavonite	Martin Alfred Peacock (1898-1950), [Lat <i>pavo</i> , "peacock"], professor, U of	yofortierite	Yves Oscar Fortier (b 1914), geologist, former director of GSC

Annual Values of Canadian Mineral Production

Year	Production (Millions\$)	Value per capita (\$)
1886	10.2	2.23
1890	16.8	3.50
1895	20.5	4.05
1900	64.4	12.15
1905	69.1	11.51
1910	106.8	15.29

1980	31 841.7	1 330.28

time of the early explorers Cartier, Frobisher and Champlain. In the 1850s, gold discoveries in BC, oil finds in Ontario and the expansion of Cape Breton coal production marked a turning point in mineral history from events of primarily local importance to developments destined to have wide-ranging impact. BC's entry into Confederation (1871) came about largely because of the rapid growth of the West Coast colony following the GOLD RUSHES. The discovery of petroleum at Oil Springs, Ont, in 1857, followed by gold finds in Québec in the 1860s, attracted increased attention to the mineral possibilities of eastern Canada. During the 1870s, the country emerged as a major phosphate supplier to the fertilizer industry, with the development of deposits throughout eastern Ontario and southwestern Québec. The mineral potential became more clearly evident with the discovery of asbestos in the Eastern Townships (1877) and the fabulous Sudbury nickel-copper discovery (1883). Cape Breton coal, the development of the Wabana iron mine in Newfoundland (1893), the Intercolonial Railway, industrial expansion of Ontario and Québec assisted by mineral development, and the start of an IRON AND STEEL INDUSTRY, all were important in the subsequent economic development of Canada.

In the years following Confederation through the 1890s, increasing exploration in southern BC led to many gold, silver and base-metal discoveries, including the Rossland copper-gold deposit (1889) and the famous lead-zinc deposit at Kimberley. The Athabasca oil sands of northern Alberta, which were to commence production only in recent years, received attention in a Senate committee report of 1887, following investigations made by the GEOLOGICAL SURVEY OF CANADA a few years earlier. In 1896 placer gold was found in the KLONDIKE, YT, giving rise to one of the world's most spectacular gold rushes. It is reported that between 1898 and 1905 more than \$100 million worth of gold was mined from the sands and gravels of creeks near Dawson. Even at this early stage, large deposits of coal, oil and gas were evident in that part of the North-West Territories later to become Alberta. Ontario's mineral potential inspired considerable optimism, especially since good progress was being made in finding the best ways of extracting metals from the Sudbury copper-nickel ore. Asbestos was the leading mineral in Québec at that time, followed by copper. In the Atlantic area, NS coal was the dominant mineral commodity, although Newfoundland's copper had gained world prominence.

Although economic policy, based on railways, immigration and tariffs, did not adversely affect the mineral sector, it was closely linked to the railway-building programs of the 1870s and 1880s. After 1896, a new period of ex-

pansion began, particularly in the PRAIRIE WEST. The resulting impetus to the production of capital goods increased demand for more minerals for the manufacturing sector. During WWI, the steel industry almost doubled in capacity. Diversification increased, changing the steel industry from a specialized industry serving the railway-building market to one equipped to supply a range of products to meet the needs of a new industrial economy. In the 1920s the mining and metallurgical base was broadened by the Noranda (Qué) copper-gold enterprise, the Flin Flon copper-zinc operation on the Man-Sask border, and the Britannia copper mine near Vancouver; by metallurgical expansion at Sudbury and the establishment of the Trail smelter in BC; and by many other developments, including the drilling of the first oil well at Fort Norman, NWT, and the discovery of a major deposit of natural gas in the Turner Valley field near Calgary (1914), followed by oil production (1924). Mineral development was slower in Saskatchewan. The first copper-zinc ore from the Man-Sask boundary area came from the Mandy mine in 1917. Not until the Flin Flon smelter was built (1930) did the Prairie provinces contribute to Canadian metal production. It was also in 1930 that Gilbert LABINE discovered silver-radium ores at Great Bear Lk, NWT.

In WWII, Canada became an important source of strategic materials. Expansion of production was particularly great in the steel and nonferrous-metals industries and in the electrical-apparatus, tool and chemical industries. Between 1939 and the peak of the war-materials output, steel production doubled and aluminum output increased fivefold. During the war years, production of nickel, copper, lead and zinc had a value of over \$1 billion. Following the war, the country quickly converted to peace-

Mineral Production by Province, 1983

	Millions\$	Percent
Alberta	22 218.0	61.7
Ontario	3 566.7	9.9
BC	2 826.0	7.9
Saskatchewan	2 736.1	7.6
Québec	1 916.6	5.3
Newfoundland	690.3	1.9
Manitoba	637.6	1.8
NWT	561.1	1.6
NB	513.7	1.4
NS	248.5	0.7
YT	59.4	0.2
PEI	1.5	0.004
Total	35 975.5	100.0%

time activities, and interest in mineral-resource development was renewed after the huge draw-down of resources of the war period, when there was little exploratory activity. The new discoveries, such as crude oil, iron ore, natural gas, potash, copper, zinc and uranium, not only launched the mineral industry on its greatest period of expansion but also provided an impetus to the capital goods industries.

Since 1945, total mineral output value has increased in every year except 1958, rising to the 1981 total of over \$30 billion. This era has been marked by many major finds: nickel-copper deposits in Manitoba, lead-zinc, molybdenite and copper in BC, base metals and asbestos in Qué, Ont, Man, Nfld, the YT and BC. The discovery of the famous Alberta LEDUC oil field (1947), was followed by great expansion of the fuels industry. In the early 1950s uranium was discovered in Ontario and Saskatchewan, making Canada the owner of the largest known reserves in the world. At this time, iron ore became one of the most important minerals in Canada as the huge deposits in Québec-Labrador were exploited and titanium was discovered on Québec's North Shore. Major base-metal mines were brought into production in NB and made possible an important smelter industry. The world's largest deposits of potash were discovered in Saskatchewan and N America's first tantalum mine was opened in Manitoba. The largest known reserves of zinc and silver in the world were discovered near Timmins, Ont.

The development of mining communities has helped to expand the frontiers of the nation and to provide economic activity in RESOURCE TOWNS across the country. Many of these towns are familiar: Labrador City and Wabush in Nfld; Bathurst in NB; Gagnon, Fermont, Sept-Îles, Schefferville, Chibougamau, Rouyn-Noranda, Val d'Or, Matagami, Murdochville, Black Lake in Qué; Wawa, Cobalt, Manitouwadge, Balmerton-Red Lake, Sudbury, Timmins, Temagami, Kirkland Lake, Elliot Lake in Ont; Leaf Rapids, Lynn Lake, Flin Flon and Thompson in Man; Esterhazy in Sask; Blairmore and Grande Cache in Alta; Ashcroft, Logan Lake, Cassiar, Kimberley, Peachland, Sparwood, Stewart and Trail in BC; Yellowknife and Pine Point in the NWT; Whitehorse and Faro in the YT. Canadians are also ushering in a new era to the Far North, mining gold on the fringe of the ARCTIC CIRCLE and developing the Arvik lead-zinc deposit on Little Cornwallis I., only 100 km from the North Magnetic Pole. Accompanying the development of metal and industrial mineral resources has been an equally significant development of petroleum and coal. Minerals, vital to a modern industrialized country and to the high standard of living of its people, have had an important impact on the social and economic development of Canada.

**The Mineral System** The mineral system comprises several components that are circumscribed by geography, economics, politics and the international context in which the system operates. An important element that transcends

Minerals and Metals Essential to Canada (excluding fuels)

Produced in Canada (surplus exported)	Radium*	Tin
Abrasives	Salt*	Titanium (metal)*
Aluminum (metal)*	Sand and gravel*	Tungsten (metal)*
Antimony (compounds)*	Selenium	
Arsenic (oxide)	Silicon metal	
Asbestos	Silver*	Not now produced in Canada (imports)
Bismuth	Sulphur*	
Cadmium*	Tellurium	
Calcium	Titanium (dioxide)*	Bauxite
Cement*	Tungsten (oxide)*	Beryllium
Clays and shales*	Uranium (oxide)*	Boron
Cobalt*	Zinc*	Bromine
Copper*		Chromium*
Ferrosilicon		Corundum and emery
Gold*	Produced in Canada but not in right form (or deficit imported)	Diamonds
Gypsum*	Antimony (metal)*	Fluorine (fluorspar)
Helium	Ball clay	Fuller's earth
Indium	Barite and celestine	Garnet
Iron ore*	Bentonite	Gemstones (high quality)
Lead*	Cesium (metal)	Germanium
Limestone and lime*	Columbium (metal)*	Hafnium
Magnesium	Fireclays	Iodine
Mica	Gallium	Kaolin
Molybdenum (compounds)*	Gemstones*	Kyanite
Nepheline	Granite (black)	Lithium
syenite* and feldspar	Graphite	Manganese

Rank Held in the World by Canada  
as Producer of Minerals  
(based on 1981 statistics)

Mineral	Rank
Nickel	1st
Zinc	1st
Asbestos	2nd
Gypsum	2nd
Potash	2nd
Elemental sulphur	2nd
Uranium concentrate	2nd
Molybdenum	2nd
Titanium concentrate	2nd
Gold	4th
Platinum group	3rd
Aluminum	3rd
Copper	4th
Lead	4th
Silver	4th
Cadmium	4th
Iron ore	6th
Antimony	7th

the whole mineral system is TRANSPORTATION. Mineral development depends on efficient and economical means of transportation (railways, highways, waterways and air), which link the resources to domestic and foreign markets. Crude minerals and products (excluding petroleum) account for over half of all revenue freight moved by Canadian railways; and half of all cargoes loaded at Canadian seaports for international markets are made up of minerals. In turn, materials for mineral development comprise a large portion of the tonnage moved by the transport industry.

From mining to marketing, the mineral industry provides much direct and indirect employment, stimulates a broad range of manufacturing and service industries and, through export sales, contributes substantially to Canada's balance of payments. Apart from large amounts of new investment, mineral development accounts also for much of the new railway construction, for several new ports and for many Canadian frontier communities. Mining

Facts About the Industry, 1983

Fuels . . . . .	\$24.96 billion	69.4%
Metals . . . . .	\$ 7.24 billion	20.1%
Nonmetals . . . . .	\$ 1.90 billion	5.3%
Structural materials . . . . .	\$ 1.70 billion	4.7%
Other minerals . . . . .	\$ 0.17 billion	0.5%
Total	\$35.98 billion	100.0%

The total value represents over 10% of Canada's GNP

Canada ranks third in the world (after the USSR and the US) for value and diversity of mineral production. For value of production for all minerals, including fuels, Canada ranks sixth, after the USSR, the US, Saudi Arabia, China and Iran. For nonfuels only, Canada's value of production ranks fourth, after the USSR, the US and South Africa. Per capita, Canada ranks first among major mineral-producing countries

About 45% of total crude production is exported to over 90 countries. In the case of nonfuel minerals, exports account for over 70% of sales

Minerals, crude and fabricated, represent about one-third of Canada's total commodity exports, and a much greater percentage of manufactured goods of mineral origin are included

For reasons of economics and geographical distribution of resources, Canada also imports large quantities of minerals, some of which are already being produced in this country: energy minerals (oil and coal) and iron ore are the most important. The energy minerals account for 80% of imports. Others include bauxite and alumina, which are smelted to produce aluminum, phosphate rock and metals such as chromium, manganese and tin

Canadian ownership in the nonfuel sector is over 60%, with a large percentage of the industry being managed by Canadians; in the fuels sector foreign ownership stood at 64% in 1984

In recent years, the estimated cost of finding a minable deposit in Canada has averaged about \$25 million. Over the past 30 years, the time from discovery to production has averaged about 6 years. Although very few of the many prospects located and investigated by exploration in Canada each year become producing mines, our overall record is enviable

has helped Canadians attain one of the highest standards of living in the world. But the mineral industries are dependent on the economic well-being of Canada's trading partners in the world economy: production is adversely affected by a severe slowdown of growth rates in the world economy and changing geographic patterns of industrial growth and mineral consumption. Both of these factors have affected the mineral sector in the early 1980s. A further problem is the capital expenditure necessary for the opening of new mines to replace depleted deposits. Studies estimate that 200-250 new mines will have to be developed in the 1980s and 1990s, if Canada is to hold its place in world markets.

**Present Status** The Canadian mining industry not only enjoys good distribution in every major region (from coast to coast and into the North) but is also highly diversified. Over 60 mineral commodities (metals, nonmetals, structural materials and fuels) are produced from nearly 300 mines and quarries and processed in hundreds of mills, smelters and refineries. In fact, Canada produces most of its mineral requirements and has substantial proven reserves and undeveloped resources to meet its growing domestic and export needs.

Growth of the mining industry is tied very closely to a number of factors: international demand for minerals, competitive prices in the world markets, climate for mineral development in Canada, availability of workers in remote areas and introduction of advanced technology. In 1983 confidence in a potential boom in the mineral industry, after the down cycle of recent years, has been demonstrated by the many new developments in several regions of Canada: coal in BC, potash and uranium in Saskatchewan, gold and silver in Ontario, several new gold mines in Québec, potash in NB and coal in NS. As one of the world's most diversified suppliers and largest exporters of mineral products, the Canadian mining industry will continue to meet future demand on the world markets. Canada's known economic mineral reserves and known undeveloped resources, coupled with technical expertise, a favourable energy environment and easy access to world markets (principally the huge US market), offer limitless opportunities. J.P. DROLET

**Mingan, Îles de**, Québec, are 15 islands and 40 or more islets stretching for 80 km in the Détroit de Jacques-Cartier between Ile d'ANTICOSTI and the N Shore of the ST LAWRENCE R, 175 km E of SEPT-ÎLES. They are a striking example of sedimentary rock formations left by retreating glaciers, and are noted for picturesque "flowerpot" rock formations and limestone cliffs. The islands are a sanctuary for migratory birds and seabirds, and a feeding area for blue finback and other whales. Naturalists have identified 256 species of WILDFLOWERS here. Indian burial grounds indicate they were inhabited before Jacques CARTIER first reported the islands in 1535. Surveys have also uncovered 16th-century Spanish coins and the remains of BASQUE habitations. Frontenac gave the islands to Louis JOLLIET 1679 for cod fishing and seal hunting, which remained the chief uses. The HBC gained title to the islands 1836 and sold them to Siebens Oil and Gas Co 1973. DOME PETROLEUM became the owner when Siebens's assets were taken over in 1979. Geological surveys identified industrial uses for the limestone deposits, but they were never commercially exploited. In 1983 Parks Canada bought the islands for \$5 million, securing them as a national wilderness park.

HENRY F. HEALD

**Minimum Wage**, lowest hourly wage that an employer is legally permitted to pay to employees. There are 2 sets of minimum-wage laws reflecting the division of powers between the federal and provincial governments. The federal minimum wage covers employees in designated

federal industries while the provincial minimum wage covers most other employees — farm labourers being a notable exception. The 1984 federal minimum wage was \$3.50 per hour, a level lower than that of most provinces. Minimum wages were initially legislated in Canada during the 1920s, but economists have for many years disagreed about their effectiveness, arguing that they may price low-skilled workers out of the market and cause unemployment. D.A. SMITH

**Mining** is the work of extracting rocks and solid MINERALS of economic value from the Earth. These products include metallic ores (eg, IRON, COPPER, LEAD, ZINC), industrial minerals (eg, LIMESTONE, ROCK SALT, POTASH, GYPSUM), native metals (principally GOLD and SILVER), COAL, oil sands, URANIUM ores and precious stones. Excavation of SAND AND GRAVEL is a mining activity; QUARRYING for building and monument stone is a special branch of mining. The creation of underground spaces, such as storage chambers or drainage tunnels, uses many mining techniques but is not generally considered to be mining, unless the solids removed also have some value. The production of liquids and gases, as in the PETROLEUM INDUSTRY, is not usually considered mining. Mining is a major primary industry, as are AGRICULTURE, FORESTRY AND FISHERIES, but differs in being a "one-crop" industry: minerals and rocks, once removed and used, cannot be replaced or regenerated. New mineral deposits must be found continually and new mines opened to replace exhausted ones. Most industrial activities require materials originally obtained by mining. A few mine products can be used in their natural state, but many must be processed by concentration, extraction, purification or fabrication.

**History** Mining has been practised since prehistoric times, when people began to dig for stones, weapons and pigments. In southern Africa, caves made to get iron-oxide pigments are at least 40 000 years old. In western Europe, pits dug for flints are several thousand years old. Prehistoric people collected loose pieces of native copper, gold, silver and gemstones from streams or the ground. Quarrying was widely practised when Stonehenge and the Pyramids were built. Advances in technology and civilization, indicated by the terms "Copper Age," "Bronze Age" and "Iron Age," required quantities of ore obtainable only by mining. Thus began the digging of trenches, caves and pits; operations later extended to excavation of shafts, tunnels and underground chambers. Ancient operations were restricted by limitations on TECHNOLOGY available and dependence on human labour as the main energy source. The difficulty of removing water prevented deep mining in wet places and hard ores could be broken only by hammering or wedging, or by heating and dousing with water. By the Middle Ages, advances had been made in mining and METALLURGY, although they remained dependent on manual labour. Two especially important improvements came later: the application of explosives and steam power. The use of explosives in mining, which began around 1627, eliminated much of the arduous work needed to break rocks. Steam was first applied for industrial power around 1700, in Cornwall, England, for working mine pumps. The invention of steam railway locomotives, mine hoists, etc, followed a few years later.

In the Western Hemisphere, no underground hard-rock mining was done before the arrival of the Spanish. Mining had been limited to placer work, chiefly for gold and silver, and to quarrying building stones and digging native copper, flints and obsidian from outcrops. The search for gold was a principal goal of the voyages of many explorers and of the campaigns of the conquistadors. Their plundering of the na-

Gold miners pose beside ore cars at a typical mining operation in the Yukon, c1900 (courtesy Yukon Archives, Government of Yukon).

tives' collections was followed by placer mining, then by mining of lode deposits of gold, silver, tin, lead, mercury and copper, often using forced labour.

In N America, British and French explorers were less successful in finding precious metals. In 1577 Martin FROBISHER took back to England, from Baffin I, some 200 t of rock; he believed it to contain gold, but it proved worthless. Raleigh, in 1584, had hoped to find gold but, failing in this, turned to colonization. Discoveries of silver and iron, in NS, were reported in 1604 by Master Simon, a mining engineer with Samuel de CHAMPLAIN, and the coal outcrops along the shores of Cape Breton I were known to early sailors and settlers. In 1643 a shipment of coal from NB to New England was reported, and in 1672 Nicolas DENYS prepared a report on the coal resources of the Maritimes for Louis XIV of France.

Mining and metallurgical operations were started in eastern N America as settlement proceeded. Small ore bodies of lead (for bullets) and of copper were opened; iron deposits were also mined. By the early 1700s, several iron foundries were in operation in the eastern states and at FORGES ST-MAURICE at Trois-Rivières, Qué. As the fur traders moved west, they noted that copper ornaments and small tools were widely traded by natives of the Lk Superior district. This copper was obtained from loose pieces and surface outcrops of native metal. Traders sought the sources of the metal but did not establish productive mines. Samuel HEARNE journeyed to the COPPERMINE R (1771) hoping to locate the source of copper carried by northern Indians, but found only small amounts of ore. The first mines of important size in northern N America were opened about 1845 to exploit the Michigan copper ore bodies near Lk Superior; Cornish miners working these brought their knowledge of mining and ore processing to the continent.

The discovery of placer gold near Sacramento (1848) triggered the California Gold Rush (1849). The flow of miners to the goldfields spilled over into other parts of the western US and N into Canada, leading to the discovery of many other mineral deposits. The Fraser R GOLD RUSH (1858) brought an influx of miners and traders into interior BC, prompting the formation of a British

colonial government. The KLONDIKE GOLD RUSH (1897-98) was an exciting but brief episode. Since then, placer mining has received less attention but is still carried out on a small scale in the YT and in northern and central BC.

When BC joined Confederation, a transcontinental railway connection was promised. As the CPR was being built, nickel-copper ore was discovered near SUDBURY, Ont (1883). Prospectors flocking to the district soon staked many of the deposits there. During the following half century, others ranged further into northern Ontario and northwestern Québec, finding the silver veins of the COBALT area, the gold veins of the TIMMINS and KIRKLAND LK areas and the copper and zinc ore bodies of northwestern Québec. PROSPECTING and the establishment of new mines has continued, and about 280 mines are now in operation in Canada.

Coal has been mined in NS and NB since the early days of settlement. In western Canada, coal was first noted at DRUMHELLER, Alta, in 1793,

The first mine in Ontario at Marmora, Ont, water-colour by Susanna Moodie, c1870 (courtesy Public Archives of Canada/C-174).

but coal mining began about 1835, when the Vancouver I coal seams were opened near NANAIMO to serve coastal trade. As railways brought settlers into the Prairies, plains coal seams were mined to provide fuel for local use and foothill and mountain seams were opened to serve both railways and settlers. Petroleum development (1947-60) caused severe losses of coal markets, forcing many western mines to close. However, recent growth in export markets, particularly in Japan, and in the use of coal for ELECTRIC-POWER GENERATION has revived the industry. It now comprises fewer but larger mines, with over 90% of production from surface operations.

**Canadian Mines** Mining has been carried out in all provinces and territories, except PEI. In BC, the Britannia Mine, N of Vancouver on Howe Sound, was a major producer of copper ores for many years. Its ore bodies have been depleted, but some parts of the mine are maintained as a museum. The LeRoi Mine, Rossland, which yielded rich copper ores in the early 1900s, is the site of a museum demonstrating how work was done some 75 years ago. Several large open-pit copper mines operate in the Highland Valley near KAMLOOPS. The largest, Lornex, has recently expanded its output to about 100 000 t per day. The famous Sullivan Mine, at KIMBERLEY, has been one of the world's largest producers of lead and zinc ores since the 1920s.

In 1932 the Eldorado Mine, beside Great Bear Lk, NWT, was opened for the radium and silver in its ores. Operations were suspended in 1940 but were resumed in 1942 to meet wartime demands for uranium. It was operated to produce uranium until 1960, then closed. It reopened in 1964 as a silver mine, finally closing in 1981.

The Flin Flon Mine, Man, began production in 1930, although the ore outcrops were discovered in 1915. The mine, noted for its unusual name, remains an important producer of copper, zinc and precious metals.

The Blind R district, Ont, is one of the world's major uranium-producing areas. Discovery of its ore bodies in 1953 and establishment of its first producing mine 2 years later were triumphs of geological reasoning and mine planning and administration. The Sudbury district, where the first ore bodies were located in 1883-85, is the world's most important nickel mining and smelting area. Large amounts of copper and other valuable metals are also produced. Methods of separating copper from nickel in the smelting and refining processes had to be found before the ores could be profitably exploited. The district boasts several of the largest underground mines in the world. The Creighton Mine

Cominco lead-zinc smelter at Trail, BC (photo by Doug Leighton).

has the deepest vertical shaft in the Western Hemisphere, extending 2175 m below the surface. Gold mines, notably in the Timmins and Kirkland Lk districts, have passed peak production but the important recent gold discoveries in the Hemlo district will more than make up the loss. The Kidd Creek Mine near Timmins, which produces principally copper and zinc, is now the largest mine in northern Ontario. The Cobalt area silver mines led to a staking rush. In the 60 years following the discovery of silver ores in 1903, over 500 000 oz (troy) of silver were taken from the mines. The area is quiet now.

Mines in northwestern Québec have been important contributors to the mineral wealth of the nation since 1926, when the Noranda copper-zinc mine came into production. Some of the earliest-worked ore bodies have been depleted but others have sustained production.

Coal mining in Cape Breton I has continued for over 200 years and, with the associated coking and iron and steel works, is the island's most important industry. Mining has followed the seams beyond the shoreline for over 8 km, and mining to greater distances is projected as drilling from ships has established the presence of coal seams far under the ocean floor (see OCEAN MINING). In a mining museum at GLACE BAY, visitors can descend into part of an old coal mine.

These are only a few of the mines and districts important in Canada's mining industry. Others include coal mines in BC, Alta and Sask; BITUMEN mines in northern Alta; uranium and potash mines in Sask; nickel mines in Man; iron mines in Ont, Qué and Lab; and asbestos mines in Qué.

**Mining Safety and Health** Mining has been considered, with some justification, a dangerous occupation. Disastrous mine fires and explosions receive much publicity, but single injuries and fatalities also occur, as they do in many other industries. Safety statistics for an industry can be expressed in several ways, eg, frequency of fatalities or injuries, number of working days lost through injuries. These differences in standards and methods mean that care must be taken when comparing statistics from different industries or countries, or from different mines. However, surface mining is generally about as safe as work in other heavy surface industries: most injuries result from work with machinery. Workers in underground mines face additional hazards because working space is usually more restricted, illumination and visibility are lower, and ventilation is more difficult. Most underground injuries result from rockfalls and from work around equipment; others from slips, falls and explosions. In coal mines, accidents and fatalities are often more frequent than in other mines because the rock strata are usually weaker and methane gas may be present. Fires and explosions of methane and coal dust have caused great losses of life, especially because of the carbon monoxide and carbon dioxide produced and the resulting depletion of oxygen.

The frequency of accidents and injuries has been much reduced by the efforts of miners' unions, employers, engineers and research workers. The development of better methane detectors, safety lamps, flameproof electric equipment and safer explosives has greatly reduced the frequency of mine fires and explosions. Shielded and remote-controlled equipment minimizes exposure of miners to dangerous areas; better knowledge of strata control and rock mechanics, and better supports (eg, rock bolts, hydraulic supports and cemented fill) have reduced the frequency of falls of rock. Increased use of personal protective equipment (eg, hard hats, goggles, respirators) has also diminished the number and severity of injuries.

Safety generally means freedom from injury or fatality; health is a state of well-being, the absence of disease or infirmity. Several occupational diseases may result from prolonged or excessive inhalation of mine dusts: silicosis from dust containing free SILICA; pneumoconiosis

(black lung) from coal dust; asbestosis and certain forms of cancer from ASBESTOS dusts. Radon gas, from URANIUM ores, may be related to a higher incidence of lung cancers in uranium miners, notably among smokers. In modern mines, because of increasing attention to dust suppression at source and dust reduction by improved ventilation, the incidence of dust-related diseases has been greatly reduced. Present ventilation standards are expected to prevent the occurrence of such diseases in future.

Hearing loss may develop in miners working in noisy places for prolonged periods. In mines, the noise hazard is often accentuated by the confined spaces. In recent years noise-abatement measures have been developed, eg, the muffling and enclosure of noisy equipment. Where these measures are not feasible, the wearing of hearing-protective devices is generally mandatory.

These improvements in TECHNOLOGY have been accompanied, sometimes forced, by laws, regulations and codes of practice controlling the conduct of mining operations. To ensure that SAFETY STANDARDS are met, mine inspectors are appointed by most governments and given authority to assess penalties for infraction of regulations or to stop work if conditions are unsafe. In coal mines, the qualifications of workers and supervisors must usually be approved by government boards. Regular safety inspections by supervisors are routine in well-managed mines, and frequently miners' representatives are also empowered to make inspections. Increasing emphasis is being placed on training new workers in safe work methods because most accidents are now caused by human error. Aside from human and legal considerations, strict attention to safety standards is warranted for purely economic reasons: as has often been shown, safety and profit are inseparable. Great improvements in safety have been made and some companies now claim that employees are safer at work than at home or on the highways.

In Canada, provincial governments are generally responsible for legislating and enforcing safety and health standards; the federal government is responsible for works in the YT and NWT and for certain mines in the provinces. The federal government tests and certifies equipment and materials, eg, diesel engines, explosives, electric devices and motors. Regulations differ among the various governments and are subject to revision as new information becomes available and as policies evolve. All

Dog miner at work in the 19th century (courtesy Public Archives of Canada/C-949).

governments carry out other functions related to worker safety and health, including maintaining records, administering WORKERS' COMPENSATION for injuries and conducting or supporting research programs. See DISASTERS. T.H. PATCHING

**Mining Work Force** Mining is estimated to support, directly or indirectly, about 6% of all Canadian employment. When at full strength, metal mines employ about 60 000 people; coal mines, 11 000; quarries, 3 000; and nonmetallic mines, 14 000. About 30 000 are employed in nonferrous smelting and refining plants. Many more are employed in associated industries, eg, IRON AND STEEL, MANUFACTURING, TRANSPORTATION, CONSTRUCTION, etc. In Canada mining pays the highest average wages of any major industry; straight wage, bonus, salary and contract schemes are in effect at various mines. Most operations are unionized. The higher costs of living in remote mining communities are often offset by subsidies or other benefits. Nevertheless, many small companies, especially those engaged in northern mining, have difficulty hiring and retaining a competent, steady work force during periods of full employment elsewhere.

Mining has been a predominantly male activity. Laws prohibit employment of juveniles; until recently, the engagement of females as mine workers was generally forbidden. In part, this was a reaction to conditions prevalent 150 years ago, when over half the underground workers in western Europe were women, and children under 12. In recent years, however, legislation has allowed hiring of women as underground labourers in some provinces. The proportion of women so employed is still small. Some are engaged in surface mining operations, as physical strength is not needed to operate most powered vehicles and machines. In most countries, very few are employed in underground work because, although the operation of some kinds of underground equipment does not require great effort, the environment is not considered attractive, customs are slow to change and some tasks still require considerable strength.

Until recently, mining was a labour-intensive industry. However, wages have increased rapidly in the last 3 decades, and the need to mine larger tonnages of lower-grade ores and to increase productivity has become more urgent. Improvements in equipment, resulting in mechanization of many tasks, have reduced the number of workers required. Consequently the industry has become capital intensive and, in many mines, investment in equipment now exceeds \$100 000 per miner. Concurrently the proportion of conventional miners has diminished, while that of mechanics, electricians, technicians, etc, has increased.

Certification of coal mine workers and supervisors is usually required, with minimum standards set by federal or provincial governments. This is to ensure that miners and officials are aware of hazards and will follow approved procedures where explosive gas and coal dust may be present. Government certification in other mining industries is not usually required but employers generally provide training programs. These programs range from simply assigning new employees to work with more experienced workers, to formal courses, sometimes with union and government participation. A recent development in some areas is the awarding of certificates of competence to miners who have achieved certain standards of experience and skill. Many companies also provide apprentice training programs for tradespeople (eg, mechanics, electricians). T.H. PATCHING

**Ministère de la Marine**, the section of the French government that administered Canada during its last 100 years as a French colony. The

Marine, variously described as a ministry, department, or secretariat of state, combined administration of the navy, the colonies and seaborne trade. It was an expression of the MERCANTILIST idea that colonies and the trade they produce are fundamental to the wealth and power of the state, which thus maintains a navy to protect them and to destroy the wealth and power of rival countries.

Cardinal Richelieu, Louis XIII's first minister, created the prototype of the Marine in 1624 and in 1626 became "grand master" of navigation and trade. This gave him authority without creating a permanent bureaucracy. It was left to Louis XIV's most trusted servant, Jean-Baptiste Colbert, to create a government department in the modern sense. An edict 7 Mar 1669 established the Marine, to be housed in offices at Versailles, where with a permanent staff Colbert established its policies and procedures. The Marine was divided into *bureaux* headed by *premiers commis* or "first clerks," the powerful civil service mandarins of their day. It was the Bureau du Ponant (from 1710, Bureau des Colonies) that administered Canada.

Under Colbert, France had the largest navy in Europe. But after 1690, even though the colonies were increasing in importance, the French became disenchanted with naval strategy and the fleet was allowed to deteriorate. In the 18th century hard-pressed controllers general kept the Marine chronically short of money. Protection for the colonies declined accordingly, and until the AMERICAN REVOLUTION France did not again attempt to equal Britain upon the seas. See also COLONIAL OFFICE. DALE MIQUELON

**Ministry of Overseas Military Forces**, est Nov 1916 to administer Canadian forces in the UK, especially in the training of reinforcements, and to act as the communications channel between the Militia Dept, the British War Office, and the Canadian Corps in France. When the CANADIAN EXPEDITIONARY FORCE went overseas, no provision had been made for its administration. Sir Sam HUGHES, minister of militia, George PERLEY, acting high commissioner in Britain, and Col Max AITKEN, Canadian military representative at the front, were involved in CEF affairs. To end confusion, PM Borden planned to establish a military council in England. Meanwhile, Hughes established an Acting Sub-Militia Council. Borden then appointed Perley minister of overseas military forces on 31 Oct 1916, and an angry Hughes, requested to resign, did so. Sir A.E. Kemp succeeded Perley in Oct 1917, and the office was abolished in July 1920.

RICHARD A. PRESTON

**Mink** The American mink (*Mustela vison*) is a small, amphibious WEASEL, inhabiting wetlands throughout Canada, excluding the tundra, and abundant on the BC seashore. They are dark brown with some white on the chest and abdomen. Although the feet are not webbed, mink swim and dive well. The fur is dense and lustrous and serves as insulation even in water. Males reach 1.8 kg in weight and 60 cm in length; females weigh less than 1 kg. Mink feed on a variety of fish, invertebrates (especially sea crabs), small mammals and amphibians. Except along the Pacific coast, they breed Feb-Mar and give birth in late Apr and May. On the coast they breed May-June and give birth in July. The litter size is usually 5 (range 1-10) and young reach adult weight in 4 or 10 months (females and males, respectively). The mink is the most valuable Canadian furbearer. Each year, 70 000-80 000 are trapped and up to one million are produced on ranches. See FUR FARMING; FUR TRAPPING. IAN McTAGGART COWAN

**Minnedosa**, Man, Town 2637 (1981c), inc 1883, is located 205 km NW of Winnipeg, on the E side of the Little Saskatchewan R. The area was popular for buffalo hunting. Settlement began

in 1870 near a trail to the NW. The site was first called Tanner's Crossing after John Tanner, who established a toll ferry and later a bridge across the river. Competitive communities sprang up nearby, but a gristmill and sawmill operation at Tanner's Crossing attracted trade and settlement. In the 1880s Minnedosa — a name of Sioux origin, meaning "swift water" — became the major supply and grain and livestock trading centre in NW Manitoba. Settlers included Hungarians, Scandinavians, and English "gentlemen's sons" sent to Canada to learn farming. When the boom ended, Minnedosa was financially overextended, and Neepawa and Dauphin soon surpassed it as regional centres. Today, Minnedosa serves the area's grain and livestock farms and has several industries — farm implement and prefabricated home manufacturers, a creamery, a feed mill, a gasohol plant and a ceramics company. D.M. LYON

**Minnow** Many people refer wrongly to any small fish as a minnow. Properly, minnows are small to large freshwater fish of class Osteichthyes, order Cypriniformes, family Cyprinidae. The largest fish family, with over 1500 species (including carp, squawfish, dace, bream, etc), it is found worldwide, excluding S America, Australia and the Far North. Forty-nine species occur in Canada. Some have restricted ranges (eg, redbelly dace, *Clinostomus elongatus*, of Lk Ontario drainages); others are found coast to coast. Carp (*Cyprinus carpio*) and goldfish (*Carassius auratus*) are familiar Asian minnows that have been introduced and become established in several provinces. Minnows inhabit waters from bogs to large lakes and rivers throughout Canada, except insular Newfoundland, and are often the most numerous fishes, as both species and individuals. Many are quite small, attaining lengths of only 60 mm as adults, eg, the northern redbelly dace (*Phoxinus eos*). The northern squawfish (*Ptychocheilus oregonensis*), unusually large for a minnow, may reach 120 cm in length. Minnows are characterized by toothless jaws (pharyngeal teeth are present); soft fin rays (carp and goldfish have stiffened rays in dorsal and anal fins); and cycloid (smooth) scales, often giving them a silvery sheen. A series of bones, the Weberian apparatus, connects the swimbladder to the ear. This makes their ability to detect sound exceptional and is probably important to their success. Injured minnows release "fright scents" into the water, which cause fear reactions in other members of the species.

Breeding males may be as brightly coloured as tropical aquarium species and may develop obvious tubercles (nodules) on the head, scales and fins. In the breeding season, some species (eg, hornyhead chub, *Nocomis biguttatus*) construct nests a metre in diameter by piling up pebbles with the mouth. Food varies with species. The chiselmouth (*Acrocheilus alutaceus*) of BC has a chisellike cutting edge to its lower jaw, used to scrape algae from rocks. Species with long, coiled intestines feed on algae and bottom ooze; those with short guts feed on insects, crustaceans and molluscs. The northern squawfish preys on other fishes. Minnows are not considered good to eat, and few are large enough to attract anglers. They are important as food for more valuable fish and as bait. Certain species, eg, pugnose minnow (*Notropis emiliae*), are sensitive to urbanization and to agricultural practices that increase the silt load in rivers. Abundance and distribution of such species serve as indicators of environmental conditions. BRIAN W. COAD

**Minority Government**, one that does not have a majority of MPs attending its caucus. A minority parliament (in which no party can claim a majority of MPs) need not result in a minority government if 2 or more parties are willing to form a coalition government, but since 1867 no peacetime coalition governments

and only one wartime coalition (1917) have existed. Since 1921 there have been 8 minority parliaments (1921, 1925, 1957, 1962, 1963, 1965, 1972 and 1979) and 9 minority governments (the 1925 parliaments had both Liberal and Conservative governments), 4 of them Conservative, 5 of them Liberal. Of the former (1926, 1957-58, 1962-63 and 1979-80), none endured for more than a few months and only one (1957-58) did not fall on a vote of confidence. Of the 5 Liberal governments, one (1925-26), under Mackenzie King, left office following the refusal of the governor general to grant a dissolution (see KING-BYNG AFFAIR). A second Liberal government (1972-1974) was defeated on its budget, but it is generally agreed that it sought defeat in the correct belief it could win a majority in an election. The remaining Liberal minority governments (1921-25, 1963-65 and 1965-68) were able to gain the support of the third parties. The balance of power in minority parliaments in Canada has been held by reformist parties of the broad left (Progressives, CCF, NDP) or, occasionally, by a regional French Canadian party (Créditistes) — parties that have feared and distrusted the intentions of the Conservative Party, which was, in any event, unable to compromise its policy positions to accommodate them. The Liberal Party, however, has always been willing to accommodate them, at least minimally. For example, the King government's ability to retain the confidence of the Commons from 1921 to 1925 depended partly on the strong antitariff policy favoured by the PROGRESSIVE PARTY. The Pearson minority governments of 1963-65 and 1965-68 and the Trudeau minority government of 1972-74 wooed the NDP by enacting, or by committing themselves to enact, the Canada Pension Plan, the Canada Assistance Plan, the Guaranteed Income Supplement for old-age pensioners, universal medicare, nonpartisan redistribution of seats in the House of Commons, regulation of election expenses and the establishment of Petro-Canada. Perhaps the Liberal governments would have enacted these measures anyway, but undoubtedly the possibility of being hanged within a fortnight concentrated their minds and imparted an urgency to their legislative programs. In contrast, immediately following the election of the Conservative minority government of 1979-80, PM Clark announced he would govern as if he had a majority. He tried, even to the extent of allying with the Liberal Party and NDP, to deprive the Créditistes of their standing as a recognized political party in the House of Commons, although his government depended for its existence upon the votes of those same Créditistes. D KWAVNICK

**Mint**, low-growing perennial HERB (genus *Mentha*, family Labiatae) with aromatic leaves and small blue flowers. It spreads rapidly in moist ground. Over 200 species have been described, but that number has been reduced to about 15 valid species: 7 Australian, 7 Eurasian and 1 circumboreal. Field or wild mint (*M. arvensis*) is the only species native to Canada. It was used by N American Indians as tonic for stomach disorders, heart ailments and chest pains. *M. spicata* (spearmint, garden or green mint), cultivated in Europe for centuries and probably introduced to N America by the Puritans, is now used primarily as a culinary herb. Strongly flavoured peppermint (*M. piperita*) is grown for commercial preparation of menthol. A powerful antiseptic with local anaesthetic properties, mint is widely used for toothache, headache, chest complaints and rheumatic pains. An antispasmodic, it is used for seasickness and to relieve stomach cramps. It makes a palatable tea, which is good for colds and insomnia. GILLIAN FORD

**Minting** From 1858 to 1907 most issues of Canadian coins were struck at the Royal Mint in London, Eng, with additional issues from the

Royal Canadian Mint in Winnipeg, Man (photo by Hans Blohm/Masterfile).

Heaton Mint of Birmingham. The Royal Mint in Ottawa was opened in 1908 as a branch of the Royal Mint in London, and operated as such until 1931. When the Dominions were made equal with Great Britain by the STATUTE OF WESTMINSTER, the Ottawa mint became independent and was renamed the Royal Canadian Mint. It operated as a branch of the Dept of Finance until 1969, when it became a CROWN CORPORATION. Today the Royal Canadian Mint strikes coins for foreign countries as well as for Canada. Since 1965 a branch mint at Hull, Qué, has produced special issues and sets for collectors. Since 1974 the mint that opened at Winnipeg, Man, has shared with Ottawa the production of the nation's coinage.

To make coins, metal ingots are rolled into sheets of the proper thickness, from which the blanks are cut. The blanks are cleaned, polished and sent to the coining room, where they are struck by dies. A die is developed by a lengthy and painstaking process. A master punch is first produced by means of a reducing machine. A model in hard plastic, about 20 cm in diameter, is scanned by a tracer at one end of the machine. At the other end, a cutter duplicates the movements of the tracer and cuts the design in reduced size on a steel block about 7.5 cm in diameter. A second reducing machine then scans the block and reproduces the design, in the intended size of the coin, onto another steel block. This final reduction, the master punch, is used to sink the master matrix. Details lacking in the master punch are punched into the matrix, which is used to produce the working punches. The working punches are then used to sink the working dies, which strike the coinage. Since 1945 all coinage dies have been chromium plated to give longer die life and a better finish to coins. R.C. WILLEY

**Minto, Gilbert John Murray Kynynmond Elliot, 4th Earl of**, soldier, governor general of Canada, 1898-1904, viceroy of India, 1905-10 (b at London, Eng 9 July 1845; d at Minto Castle, near Hawick, Scot 1 May 1914). Lord Melgund (his title before succeeding to the earldom) served as military secretary to Gov Gen Lord Lansdowne, 1883-85, and as F.D. MIDDLETON'S

chief of staff during the NORTH-WEST REBELLION. In 1898 he became governor general; his term was marked by controversy and political strife. He was inexperienced in government, distrustful of politicians and determined to play an active part in Canadian public life, and his criticism of his government's handling of the SOUTH AFRICAN WAR crisis, his interest in reforming the Canadian Militia and his support for Joseph Chamberlain's imperial preference campaign, all caused tension. More positively, he attempted to forge closer ties between French and English Canadians, preserve the written and material record of Canada's past, promote sports (the Minto Cup in lacrosse) and protect Canada's northern miners and native peoples from the neglect and mismanagement of government.

CARMAN MILLER

Reading: Carman Miller, *The Canadian Career of the Fourth Earl of Minto* (1980).

**Mirabel**, Qué, City, pop 14 080 (1981c), inc 1971, located some 55 km NW of MONTRÉAL, is one of Québec's youngest cities and also one of its most extended (covering some 750 km<sup>2</sup>). It was created in Jan 1979 through the arbitrary merger of 14 existing municipalities whose lands had been expropriated in Mar 1969 for the construction of the new international airport for Montréal, since named "Mirabel" in honour of a little hamlet that has now disappeared. The dismemberment of this ancient land and its new orientation has completely changed the regional structures and habits of its population. The airport, linked to Montréal by the Laurentian Autoroute, is in the centre of town. The region's economy still depends on agriculture.

GILLES BOILEAU

**Miramichi River**, 220 km long from Juniper, NB, to the Gulf of ST LAWRENCE, arises in central NB. Its 2 branches, the SW and NW Miramichi, join at Beaubears I, near NEWCASTLE, NB. Seaward from here, and throughout the open shallow Inner Bay, river water forms a fresh, less dense layer on top of saltier denser water. This is the picturesque Miramichi Estuary formed some 4000 years ago when currents and waves built a barrier of sand islands across the drowned, ice-deepened valley in the soft sandstones and shales of Pennsylvanian age. The effect of the sea is felt 65 km inland at Redbank as a regular rise and fall in the river flow.

Earl of Minto, governor general of Canada 1898-1904 (courtesy Public Archives of Canada/C-51950).

Early view of the Miramichi River from Beaubears I, where the 2 branches of the river meet. From the time of the settlement by the Acadians, the river has been the centre of fishing and forestry for NE New Brunswick (courtesy New Brunswick Museum).

Since their settlement by ACADIANS after the fall of LOUISBOURG and by English lumbermen, later turned shipbuilders, the scenic shores have been the focus of the dual economic life of fishing and forestry. Besides the legendary ATLANTIC SALMON run — the foremost in eastern N America before its devastation by overfishing, pollution and unknown causes — smelt, gaspereau, shad, eel, herring, mackerel and lobsters are exploited. Formerly, extensive log rafts plied the river's waters; now major forest industries at CHATHAM and Newcastle depend on the Miramichi for shipping and effluent disposal. The spirit and independence of the Miramichi inhabitants are characterized by their survival, sometimes immersed to their necks in river-water, of the Great Miramichi Fire (1825) in which 200 people died and almost one-quarter of NB's forests were burned. The obverse side of this individualism is the salmon poaching notorious along the length of the river. The origin of the name is unknown. KATE KRANCK

**Miron, Gaston**, poet, publisher (b at Ste-Agathe-des-Monts, Qué 8 Jan 1928). Miron spent the period 1947-53 discovering through everyday events the values of his province — its landscapes, people, heritage, social conditions and politics. In 1953 he and a few friends founded the Montréal publishing house L'Hexagone, and he continued his explorations of contemporary society. His poetry, for a long time oral, has been published in *L'Homme rapaillé* (1970) and *Courtepointes* (1975) and has captured an international audience. His poems are rooted in the here and now, but remain faithful to Québec's ancestral language, customs and usages, crystallizing isolated images: the man we meet on the street and whom we find in ourselves; the man committed to a political struggle; the collective and social individual caught up in a common destiny; and the land. Through these themes, his writing exalts and reconciles opposing elements in a time frame that is repetitive but that tends towards an ultimate transcendence. The poetry is dense and measured.

Miron was the first poet to show the Quebecer as he is. He had a definite influence on poetry of the 1960s and 1970s and he awakened the N American and European reader to a particular and universal anthropological reality.

EUGÈNE ROBERTO

**Miscou Island**, 64 km<sup>2</sup>, comprises the most eastern part of Gloucester County, NB, on the W side of the Gulf of St Lawrence and at the entrance to CHALEUR BAY. The island is characterized by white sandy beaches, spruce trees, deep-sea fishing, lakes and salt lagoons, and a lighthouse at the northern tip, Miscou Pt. Originally inhabited by the MICMAC, it was discovered by Jacques CARTIER in 1534. Populated by settlers from France and the Channel Islands (hence its unique "patois" of Old French), the island passed to Britain in 1763. Its name derives from the Micmac *Susqu* meaning "boggy marsh" or "low land".

DAVID EVANS

**Miss Canada** The representation of Canada as a sweet but coy young lady was a Victorian convention that was abandoned about the time of WWII. A popular depiction of Miss Canada was in winter garb — wearing skates, an overcoat, a toque and a sash. At other times she was shown royally resisting the blandishments of a conniving Uncle Sam, symbolic of the US, siding instead with a portly John Bull, representative of Great Britain. Miss Canada is also a title awarded annually since 1946, on the basis of beauty, talent, personality, etc, to contestants with regional titles by the Miss Canada Pageant.

JOHN ROBERT COLOMBO

**Mission**, BC, District Municipality, pop 20 056 (1981c), inc 1969, area 25 333 ha, is located on the N bank of the FRASER R, 70 km by road E of Vancouver. An Oblate priest, Father Fourquet, established a mission on the present site 1860-61. Large-scale development began after the CPR was completed (1885) and a bridge built across the Fraser (1891). A community known as Mission Junction sprang up. Renamed Mission City in 1922, it amalgamated with the old district of Mission to form the present municipality, which has 2 main communities, Mission and Hatzic, and 4 smaller ones: Steelhead, Stave Falls, Silverdale and Ruskin. Hatzic, to the E of Mission, is mainly residential and is separated from Mission by land owned by the province as part of the agricultural land reserve. Mission's economy is based on lumbering, manufacturing, dairying and fruit and vegetable growing. A major landmark is the Benedictine monastic complex, Westminster Abbey, moved to Mission from Burnaby in 1954. ALAN F.J. ARTIBISE

**Mistassini**, Qué, Town, pop 6682 (1981c), inc 1976, is located on the Rivière Mistassini, to the N of LAC SAINT-JEAN. Mistassini in Indian means "big rocks." Settlement dates from 1892, when the Trappist fathers from OKA came to found a

monastery in the forests N of Lac Saint-Jean. The monks also built a flour mill and a sawmill. Mistassini is a small service centre for surrounding parishes. Its population grew with the construction of the Dolbeau paper mill (1927) and power stations on the Péribonka R (1954-60). The town's growth forced the monastery to move to the nearby countryside (1979). Each Aug Mistassini holds its Blueberry Festival, honouring the small, blue fruit found in such abundance in the district. MARC ST-HILAIRE

**Mistassini, Lac**, 2336 km<sup>2</sup>, elev 372 m, max length 159 km, is located in central Québec, 360 km E of JAMES BAY and 220 km NW of LAC SAINT-JEAN. Fed by numerous small lakes and streams, it drains to the W, via Lakes Mesgouez and Némiscau, following the course of the Rivière de RUPERT. It is the largest natural lake in the province. A series of rocky island ridges virtually divide it into 2 separate lakes. It is surrounded by black and white spruce, white birch, poplar, larch, jackpine and balsam, which support a fairly extensive logging industry. The waters of the lake contain whitefish, pike, gray and lake trout, and freshwater seals have been reported. The caribou have been overhunted, but moose are still frequently seen. The area has also been overtrapped, and the population of fox, otter, lynx, marten, mink and beaver have been seriously reduced. The lake was discovered by Abbé Charles Albanel in 1672, and was long a centre of the FUR TRADE. It still has a trading post, a Church of England mission and a Cree reservation. Geologist Albert Peter Low wintered at the lake in 1884-85 and surveyed it June-July 1885. Today the area is famous for its production of blueberries, contributing greatly to the 13 million kg annual Canadian harvest. The name derives from the Cree word *mista-assini*, meaning "great stone."

DAVID EVANS

**Mistletoe** family, Loranthaceae, includes about 30 genera and over 1000 species. It is predominantly tropical but has members in temperate regions. Plants are mostly small shrubs, parasitic on gymnosperms and woody flowering plants. They are attached to hosts, drawing nutrients from them through modified roots (haustoria). Severe infestations may produce abnormal growth of branches, called "witches' brooms." Flowers are small, usually greenish and, in N American species, unisexual. Fruits, fleshy berries with shelled seeds, are eaten by birds, which wipe the seeds from their beaks onto trees or deposit them in droppings. The only Canadian genus, *Arceuthobium*, comprises about 10 species, 4 of which are native to Canada. Three tend to parasitize particular trees: *A. americanum*, pine; *A. douglasii*, Douglas fir; *A. pusillum*, spruce. Only *A. campylopodum* has several hosts. *A. pusillum* occurs in the East, the others in the West. Most mistletoes are leafy and often evergreen, but *Arceuthobium* species have leaves reduced to scales, thus appearing leafless. The genus is unique in the explosive discharge of seeds from fruits. Some western Indian groups ate boiled berries, and used "leaf tea" for contraception. Some species may be toxic to livestock. Familiar mistletoe, *Viscum album*, is native to Europe, Africa and Asia. It has long been associated with ancient Celtic religious ceremonies, and its modern use as a Christmas decoration may derive from this. See PLANTS, NATIVE USES.

**Mitchell, Charles Alexander**, scientist, veterinarian, medical historian (b at Clarksburg, Ont 9 Aug 1891; d at Ottawa 8 July 1979). After graduating from the Ontario Veterinary Coll, Toronto, in 1915, he worked for the Dominion Dept of Agriculture 1914-57 and was Dominion Animal Pathologist 1944-57. Author of numerous articles, he was internationally recognized for his secret work on animal diseases during WWII. A strong supporter of organized VETER-

**INARY MEDICINE**, Mitchell was closely involved in the formation of regional and national veterinary associations and local medical study groups. In addition he researched and reported on many aspects of Canadian veterinary and medical history. Late in life he became director of research 1958-72 at Ottawa Civic Hospital. From 1958 to 1970 he was also associate professor in the Faculty of Medicine at U of Ottawa.

J.F. FRANK

**Mitchell, Humphrey**, electrician, trade unionist, politician (b at Old Shoreham, Eng 9 Sept 1894; d at Ottawa 1 Aug 1950). After serving in the Royal Navy in WWI, Mitchell settled in Hamilton, Ont, to work as an electrician. He served 2 years as president and 22 as secretary of the Hamilton and District Trades and Labor Council and chaired the Ontario executive of the TRADES AND LABOR CONGRESS OF CANADA. He was elected city alderman (1929-31) and in a 1931 by-election won a seat in the House of Commons. Although an independent labourite, he refused to join the new CCF and eventually gravitated towards the Liberals. After his defeat in the 1935 general election, he entered the federal Department of Labour; he later headed a number of wartime commissions and boards on labour matters. From 1941, just before he regained a parliamentary seat, until his death he was minister of labour under KING and ST. LAURENT. The introduction of new compulsory collective-bargaining legislation during his tenure laid the basis for Canada's postwar industrial-relations system.

CRAIG HERON

**Mitchell, James**, lawyer, politician, premier of NB (b at Scotch Settlement, York County, NB 16 Mar 1843; d at St Stephen, NB 15 Dec 1897). Mitchell was a prominent lawyer in St Stephen and during the early years of his career was also inspector of schools for Charlotte County. An MLA from 1882 to 1897, he served as provincial surveyor general, commissioner of agriculture, receiver general and provincial secretary before becoming premier in 1896. Poor health forced him to retire after 15 uneventful months, and his administration accomplished little of lasting significance.

ARTHUR T. DOYLE

**Mitchell, Joni**, stage name of Roberta Joan Anderson, pop singer, songwriter (b at Fort Macleod, Alta 7 Nov 1943). Initially a folksinger in Calgary and Toronto, Mitchell moved to the US in 1966, eventually settling near Los Angeles. Widely influential as a lyric stylist, her songs "Urge for Going," "The Circle Game" and "Both Sides Now" were popular in recordings by other artists. Subsequently, through her own albums (*Blue, Court and Spark*, *Hejira*) she outstripped her folk beginnings and, with her collaboration in 1978 with Charles Mingus (*Mingus*), reached into jazz. Her album *Clouds* received a Grammy Award in 1969.

MARK MILLER

**Mitchell, Peter**, lawyer, politician (b at Newcastle, NB 4 Jan 1824; d at Montréal 25 Oct 1899). A colourful swashbuckler, Mitchell became a celebrity as Canada's first minister of fisheries but died bitter and unrewarded. In politics from 1856 and a strong supporter of Confederation, he became premier of NB in 1866 through a fluke. In the Senate 1867-72 and elected to the Commons in 1872, he was Sir John A. MACDONALD's minister of fisheries 1867-73 and proved himself both innovative and aggressive. He created an international incident when Canadian gunboats seized American fishermen in Canadian waters. The PACIFIC SCANDAL ended Mitchell's influence, though he remained in politics for several years and purchased the Montréal *Herald*. His self-esteem increased, as did his unreliability. He drifted to the Liberals, nursing grievances against Macdonald and others.

CARL M. WALLACE

**Mitchell, William Ormond**, novelist, dramatist (b at Weyburn, Sask 13 Mar 1914). In his treatment of prairie settings and language, W.O. Mitchell has depicted the West in fiction and influenced many later writers. He studied at U of Man and U of A. In 1944, after teaching 2 years, he settled in High River, Alta, where he remained until 1968 except for 3 years as fiction editor at MACLEAN'S (1948-51). After 1968 he was writer-in-residence at Banff School of Fine Arts, U of C, U of A and Massey Coll, Toronto. He has been at U Windsor since 1978, and lives there and in Calgary.

In 1947 Mitchell achieved instant recognition with the publication of his classic *Who Has Seen the Wind*. The novel examines the initiation of the boy Brian into the meaning of birth and death, life, freedom and justice. The children and the eccentrics, the ever-drunken Ben and the madman Saint Sammy, are the most vivid characters. Mitchell portrays the beauty and power of the prairie and the wind, symbolizing God. ALLAN KING directed the feature film based on the novel (1977). Mitchell's second novel *The Kite* (1962) is also concerned with life and mortality. Here Mitchell combines comic anecdotes with a more archetypal theme of the quest that ends in celebration and immortality. *The Vanishing Point* (1973) was a reworking of an early unpublished novel. Set on the Paradise Valley Reserve, its theme is the resolution of alienation; it is an affirmation of racial and personal interconnectedness. His novel *How I Spent My Summer Holidays* (1981) returns to the theme of initiation, but the vision is much darker. Hugh leaves childhood innocence to pass into a world of betrayal, guilt, repression and violence. In the end, the old man Hugh is left only with knowledge. His most recent novel, *Since Daisy Creek*, appeared in 1984.

Mitchell also wrote many plays for radio and TV. The popular *Jake and the Kid* (1961) originated in stories written for *Maclean's*; the series ran weekly on CBC Radio 1950-56. Around the hired man and the adolescent Kid, Mitchell wove the adventures of the community of Crocus, Sask. The eccentric characters, tall tales and local dialect added to the audience's enjoyment. The series was televised in 1961. The early radio plays *The Devil's Instrument* (1949) and *The Black Bonspiel of Wullie MacCrimmon* (1955) were later revised as full-length plays; the latter was staged in 1979 by Theatre Calgary as were *The Kite* (1981) and 2 plays written for the stage, *Back to Beulah* (which won the Chalmers Award, 1976) and *For Those in Peril on the Sea* (1982). Mitchell also experimented with a musical, *Wild Rose*, in 1967.

**Mite**, common name for some members of order Acari, a large, diverse group of tiny ARACHNIDS. Worldwide, about 30 000 species of mites have been described, of an estimated 250 000; in Canada, about 2000 of an estimated 10 000. Mites may exceed INSECTS in numbers of individuals: up to 1 million mites, representing some 100 species, may occur in one square metre of forest soil and litter in Canada. The earliest fossils are 380 million years old. Mite remains of present-day genera are commonly found in pieces of 80 to 100-million-year-old amber from Canada, Mexico and Europe. As their common name indicates, "mites" are unusually small; most range from 0.1 to 10 mm. Mites come in all colours; many are dull, but some, especially water mites, are bright red, blue or green. Like spiders, mites lack well-defined abdominal segments, but, unlike spiders, their abdomen is not separated from the rest of the body by a narrow waist. Mites grow by gradual metamorphosis: egg, six-legged larva, 1-3 eight-legged nymphal stages and eight-legged adult. Mites and ticks are the most ubiquitous single animal group, living in nearly every terrestrial and aquatic habitat, including the sea. Mites may disperse by air currents or by birds, mammals and flying insects. Many have developed nonpredacious feeding habits, eg, feeding on bacteria, yeasts, fungi, algae, mosses and higher plants. Others parasitize insects and vertebrates (except fish), some being found in secretive spots, eg, inside bird quills, under lizard scales, in lungs of seals, and in human facial pores. Mites are both destructive and useful. Herbivorous spider mites are pests of various crops, forest trees and ornamentals. Some eriophyid mites, also herbivorous, form galls or transmit plant viruses, including wheat streak mosaic in Canada. Mites cause great economic losses in stored grain, other food and organic products. House dust mites concentrate allergenic materials. Other mites, eg, chiggers, mange and scabies mites, are important parasites and sometimes transmit human and livestock diseases. Some species are beneficial as predators of herbivorous mites; others feed on weeds. The importance of oribatid mites in decomposing and recycling organic matter in soil is just beginning to be understood.

EVERT E. LINDQUIST

**Mitel Corporation**, see ELECTRONICS INDUSTRY.

**Mladenovic, Milos**, professor, editor (b S of Belgrade, Serbia 1903; d at Montréal 4 1984). With degrees in law and commerce from Belgrade and a doctorate from the Sorbonne, he joined McGill's history dept in June 1950. He introduced courses on eastern European, USSR and Byzantine history and also lectured on the Soviet legal system. He examined the history of war as part of "the general historical process," stressing above all the reciprocal influences of social structure and the forms taken by military conflict. Mladenovic devoted the greater part of his life to his graduate students, who published a festschrift in his honour in 1969, *Eastern Europe: Historical Essays*, and a symposium of essays on war and society in 1972, *War and Society in the 19th Century Russian Empire*. At one time in the 1970s, 7 departments of history, 2 of political science and one of Byzantine studies were chaired by his former students. From 1964 to 1974 he was editor of *The New Review*, the only scholarly journal in Canada devoted to eastern European history. He has published numerous books, articles and reviews in English, French, German and Serbian.

J.L. BLACK

**Moberly, Walter**, civil engineer (b at Steeple Aston, Eng 15 Aug 1832; d at Vancouver 14 May 1915). He came to Canada as a child and studied in Canada W, later moving to BC. In 1859 he was appointed superintendent of public works and in 1862 was involved in the construction of the Yale-Cariboo wagon road (see CARIBOO ROAD).

He was assistant surveyor general of BC 1864-66 and then spent 4 years in the US. In 1871 he was in charge of surveys for the route of the CPR through the Rocky Mts and BC. He published his reminiscences, *The Rocks and Rivers of British Columbia*, in 1885.

ERIC J. HOLMGREN

**Moccasin** Though they were of 2 major types, there were as many kinds of moccasins distributed throughout N America as there were tribes who manufactured them. Moccasins found in the Arctic and on the Plains are hard soled, consisting of a deerskin upper sole sewn to a heavier and stiffer bottom sole. Soft-soled moccasins, made from a single piece of hide, are characteristic of the Subarctic, the northern prairies and northeastern N America. The soft-soled variety have a wider distribution and are more efficient for use with snowshoes.

RENÉ R. GADACZ

**Mockingbird**, common name for some members of the THRASHER family (Mimidae). The northern mockingbird (*Mimus polyglottos*), the only mockingbird in Canada, is a rare, permanent resident across Canada and is slowly extending its range northward. Grey above, greyish white below, its white wing patches and white outer tail feathers are conspicuous in flight. Its loud, musical, repetitive song is often given at night and includes mimicked vocalizations of other birds. Northern mockingbirds inhabit dense thickets and woodland edge, maintaining territories year-round, defending food sources in winter. Breeding occurs May-July; clutches contain 4-5 eggs.

J. C. BARLOW

**Modern Dance**, see DANCE, MODERN.

**Moffat Communications Limited**, controlled by Randall L. Moffat, owns and operates radio stations in Vancouver, Calgary, Edmonton, Moose Jaw-Regina, Winnipeg and Hamilton. The company also owns CKY-TV, the CTV-network affiliate in Winnipeg, which extends service to 97% of Manitoba's population. Moffat's 80%-owned CABLE-TELEVISION company, Winnipeg Videon Inc., provides service to over 136 442 households. The company also owns 85.5% of 2 cable-television systems in the US. Total assets in 1983 were \$61 million, with revenues of \$50.3 million.

PETER S. ANDERSON

**Mohawk**, the most eastern member of the IROQUOIS Confederacy, resided in 3 principal villages ("castles") on the banks of the Mohawk R. In 1609 and 1610 they were defeated by their northern neighbours, assisted by CHAMPLAIN. Mohawk hostilities were then channelled eastward, where they drove the Mahicans out of the Mohawk Valley and gained access to the Dutch traders of Ft Orange (now Albany, NY). By 1640 they had exhausted beaver stocks in their own country and so they obtained this trade item by plundering fur fleets coming to trade with the French. A truce between NEW FRANCE and the Mohawk was arranged in 1645. Isaac JOGUES attempted to establish a Jesuit mission in their country, but was accused of witchcraft and executed. Shortly afterward the Mohawk and SENECA combined to drive the HURON from their homeland.

The French burned the Mohawk villages in the autumn of 1666 and then made peace. The Jesuits established a mission and encouraged their converts to move to the St Lawrence, away from English influence, where settlements were established in the 1670s. War again broke out, and the Mohawk towns were burned in 1693, with some of the Catholic Mohawk aiding the French against their kinsmen. The entire Iroquois Confederacy negotiated treaties of peace and neutrality with both the French and English in 1701.

In 1710, 3 Mohawk chiefs and a Mahican journeyed to London where they were presented to Queen Anne. To counteract French Jesuit in-

Huron moccasins (courtesy National Museums of Canada/National Museum of Man/S77-1857).

fluence, Anglican missionaries were promised to the Mohawk, and the queen presented communion silver for a chapel. Catholic Mohawk from the St Lawrence played an active role as French allies, participating in the destruction of Deerfield, Mass, in 1704 and Groton, Mass, in 1707.

During the 18th century the Mohawk, now living in 2 principal towns, became surrounded by white settlers. They adopted the housing styles of their neighbours and were closely tied to the British administration; the Indian superintendent, Sir William JOHNSON, married a Mohawk, Mary BRANT. Johnson used Mohawk warriors in the final French-English conflict for possession of the continent. Johnson died before the outbreak of the American Revolution. The Mohawk joined that struggle in 1777, under the leadership of Joseph BRANT who had just returned from England. Brant and his Mohawk frequently defeated the Americans, but were forced to flee their homes, which were confiscated and used by the rebel settlers.

After the war, Brant and his followers settled on the Grand R on a grant secured for them by Gov Frederick HALDIMAND (now the Six Nations Reserve). Other Mohawk, under John DESERONTYON, settled on the Bay of Quinte. The Mohawk were largely Anglican, and the Queen Anne communion silver was divided between the 2 reserves. The Mohawk settled in Ontario and those on the St Lawrence became increasingly incorporated in the white man's world. Mohawk from Caughnawaga outside Montréal established a reputation as boatmen and were recruited to ferry Gen Garnet WOLSELEY's army up the Nile in 1884-85 (see NILE EXPEDITION). In later years, men from this same reserve established a reputation as structural-steel workers.

Over 3000 Mohawk continue to speak their native language. Some of them returned to the HANDSOME LAKE RELIGION and established long-house congregations at Caughnawaga in the 1920s and St Regis (Akwasasne) in the 1930s. Residents of both these communities had been Roman Catholic for some 250 years. See also NATIVE PEOPLE: EASTERN WOODLANDS; IROQUOIS WARS; and general articles under NATIVE PEOPLE.

THOMAS S. ABLER

Reading: B.G. Trigger, ed, *Handbook of North American Indians*, vol 15; Northeast (1978).

**Moisie, Rivière**, 410 km long, rises in eastern Québec from Lac Opocopa and flows S to the St LAWRENCE R. With a DRAINAGE BASIN of 19 200 km<sup>2</sup>

and a mean discharge of 490 m<sup>3</sup>/s, it is the river of greatest volume along the middle N Shore of the St Lawrence. Its current is swift and rapids numerous. The deep, rugged valley is lined with spruce, fir, birch, aspen and pine. It is one of the best salmon and trout rivers in eastern N America. The HBC has a trading post at the village of Moisie at the river's mouth, some 20 km E of Sept-Îles. The name possibly derives from a Montagnais personal name.

JAMES MARSH

**Mold**, or mould, term for woolly or cottony growths produced by FUNGI, and for species causing these growths. Molds are numerous and common Canadian species have worldwide distributions. Maximum species numbers and growth rates occur under warm, humid conditions, but some molds grow slowly at -20°C, while others continue growing at +60°C. Mold consists of hyphae (filaments), masses of which are called mycelia. Vegetative mycelium develops in organic material or soil; visible mold consists of fertile hyphae and spore-producing structures. Materials in which hyphae grow are digested (decayed) and the fungus absorbs products as nutrients. Decay, an essential natural process, causes deterioration of foods, textiles and structural materials. In addition to causing spoilage, some molds produce poisonous substances (mycotoxins) that render foods unsafe. Mycotoxins may be carcinogenic. Mold infections cause skin diseases (eg, ringworm and athlete's foot). Severe systemic infections (mycoses) are common in some regions. Hay fever may be caused by airborne mold spores. Domesticated and wild animals and birds are subject to similar afflictions. Molds infect and kill insects and cause many plant diseases; some water molds cause fatal fish and crustacean infections. Common blue and green molds, which cause spoilage of fruits, vegetables and jams, are mostly species of *Penicillium* and *Aspergillus*. Some species of these genera are important in industrial production of antibiotics, citric and gluconic acids, etc. Blue cheeses owe their distinctive flavour to species of *Penicillium*. Molds related to black bread mold and *Aspergillus* species are used in production of some Asian foods (eg, tofu, tempeh, saki and soy sauce).

R. J. BANDONI

**Mole**, common name for 20-29 species of predominantly burrowing insectivores of family Talpidae, restricted to Eurasia and N America. Six species occur in Canada. Moles have cylindrical bodies; dense, velvetlike fur; pointed, mobile snouts (with fingerlike appendages in the star-nosed mole); minute eyes and external ears greatly reduced or lacking. The five-toed feet show varying degrees of adaptation for swimming (Old World water moles) or burrowing. Moles usually mate in spring; gestation lasts 4-6 weeks; litters average 2-5 young. They may live 3-4 years. Canadian species are largely subterranean, preying mainly on soil invertebrates. They may eat their own weight in food daily. Shrew, coast and Townsend's moles (*Neurotrichus gibbsii*, *Scapanus orarius*, *S. townsendii*, respectively) live in extreme southwestern BC; eastern mole (*S. aquaticus*), in Essex County, Ont; hairy-tailed mole (*Parascalops breweri*), in forests of Ont and Qué; and the somewhat aquatic star-nosed mole (*Condylura cristata*), from the Maritimes to Man and N into the boreal forest.

C.G. VAN ZYLL DE JONG

**Molecular Biology**, subdiscipline of BIOCHEMISTRY that studies the structure, synthesis and degradation of macromolecules (ie, very large molecules) found in living cells, their metabolic regulation (how they are interrelated and balanced during synthesis and degradation) and their expression (how the GENETIC code operates and is controlled through structural interrelationships). Macromolecules include the nucleic acids DNA (deoxyribonucleic acid) and RNA (ribonucleic acid), proteins (including enzymes),

carbohydrates, and complexes of carbohydrates and proteins and lipids (soluble cellular fats and waxes) and proteins. The term was first used by Oswald T. Avery in the late 1940s and was early equated with the study of nucleic acids. As a result of their work on bacteria, Canadian researchers Avery and Colin M. MacLeod and American Maclyn McCarty were the first to provide firm evidence that DNA was the genetic material in the cell (1944). Current interests also include the structure of collagen (cartilage) and keratin (a highly insoluble protein in skin).

The structure of DNA is a double helix, first described in 1953 by Nobel laureates (1962) J.D. Watson (an American who had been influenced by Avery's work) and British researcher Francis Crick. The double helix is composed of 2 antiparallel chains of sugar-phosphate "backbones" with complementary pairs of nucleic-acid bases in the centre. American biochemist Erwin Chargaff's observation of base pairing was important to Watson and Crick's discovery as were the X-ray diffraction studies of British biophysicist Rosalind Franklin. Just before the elucidation of the structure of DNA by Watson and Crick, G. Wyatt (now at Queen's University) described 5-methylcytosine, the first modified base found in DNA molecules, and confirmed base pairing and the base composition of a number of DNAs. DNA was postulated as the template for RNA synthesis by French biochemists Jacques Monod and François Jacob (Nobel Prize, 1965). RNA synthesis is called transcription; protein synthesis from the RNA transcript is called translation. Once the protein is translated, depending on the type of cell, it can then undergo a series of changes (eg, addition of carbohydrate or lipid) to make the complex proteins that are part of many cells.

A large part of research in molecular biology has been undertaken on viruses, the simplest of life forms, because they have no complex cellular structure or cell membrane. Some of the earliest basic studies on viral systems were made by Canadian researcher Felix d'Herelle, who independently discovered bacteriophages (bacterial viruses). Viruses are composed either of DNA or RNA with associated proteins, and thus can be used as model systems for examining replication (DNA synthesis), transcription (RNA synthesis) and translation (protein synthesis). Bacteriophages were the first to be examined in detail. DNA synthesis is best understood in these viruses mainly because of studies led by American biochemist A. Kornberg. More recently, eukaryotic viruses (ie, those that attack nucleated cells) have been used. The virus can be considered a microcosm of the cells and tissues of animals and its molecular biology is controlled by mechanisms analogous to those in cells. Viruses that have RNA as their genetic material are called retroviruses; some retroviruses have been implicated in human cancer. However, most viruses that attack eukaryotic cells are DNA viruses.

Molecular biology has expanded recently as a result of the application of recombinant DNA techniques (ie, GENETIC ENGINEERING), following the isolation of restriction enzymes in 1970 by American biochemist Hamilton Smith (Nobel Prize, 1978). Restriction enzymes cut DNA molecules at specific sites (base sequences). Joining enzymes can link together the DNA fragments. These enzymes were used to join different DNA molecules together in gene-splicing experiments to form recombinant molecules, first on bacterial cells and viruses. In 1977 the first recombinant molecules composed of mammalian DNA inserted into bacterial elements called plasmids were contracted. Plasmids are particles found in some bacterial cells that contain DNA, but are not part of the chromosomal apparatus of the bacterium. The next important discovery was of "split genes," ie, the RNA synthesized from the

DNA of eukaryotic cells can be much larger than the final messenger RNA product, because those segments of the RNA product that are not necessary to code for the protein message are cut out, and the remaining RNA spliced together.

This work was followed by the development of powerful, fast and relatively easy methods for determining the base sequence of DNA, ie, the order of the base components in DNA. Two laboratories, those of Walter Gilbert in Cambridge, Massachusetts, and Fred Sanger in Cambridge, England, developed different methods. Gilbert, Sanger and Californian Paul Berg (who performed the first cloning experiments) received a Nobel Prize in 1980. The advent of these technologies has led to a complete change in classical and molecular genetics. The ability to explain clinical observations at the level of the DNA molecule has led to a better understanding of many hereditary diseases. Changes in the DNA at the base sequence level cause differences in the messenger RNA sequence which, when translated into protein, result in the wrong protein being made or in an altered protein, leading to a dysfunction characteristic of the GENETIC DISEASE. Many genetic concepts have been revised; eg, multiple gene copies have been proven to exist for many proteins.

Canadians have played an important part in the development of molecular biology. Gobind Khorana, who received the Nobel Prize for the first chemical synthesis of a nucleic-acid molecule in 1968, started his work at the British Columbia Fisheries Research Laboratories, Vancouver. Khorana's many students include G. Tener (UBC), who developed a chromatographic column for separating nucleic acids over a range of sizes, an innovation that has had tremendous methodological impact on molecular biology; and M. Smith (UBC), who was a member of Sanger's laboratory when the first DNA virus molecule was sequenced in 1977. Groups are now undertaking research in molecular biology in all major Canadian universities (within laboratories in faculties of Medicine and Science), in the BIOTECHNOLOGY companies located in most provinces, and in many federal and provincial laboratories. See NATIONAL RESEARCH COUNCIL OF CANADA; RESEARCH, PROVINCIAL ORGANIZATIONS.

JOHN H. SPENCER

**Molecules in Interstellar Space** Atoms had been detected in the interstellar medium by 1921 and, between 1936 and 1942, C.S. BEALS, then at the Dominion Astrophysical Observatory (DAO), Victoria, and Adams and Dunham in the US, detected optical transitions of the molecules CH, CN and CH<sup>+</sup> in interstellar space. Andrew McKellar (DAO) found that the CN molecule showed evidence of an excitation of about 3 K. This temperature was not understood at the time, but is now known to result from microwave cosmic background radiation.

In 1963 the first detection of a molecule (the hydroxyl radical OH) at centimetre-wavelength radio frequencies was made by Weinreb, Barrett, Meeks and Henry of the Massachusetts Institute of Technology. The detection at millimetre wave lengths of the more complicated molecule ammonia (NH<sub>3</sub>), by Townes, Welch and their collaborators at Berkeley in 1968, led to a flurry of further discoveries. Using earth-satellite Copernicus, Lyman Spitzer Jr and his co-workers at Princeton detected molecules in the ultraviolet. About 53 molecules have been detected, many by US astronomers using the Kitt Peak (Arizona) millimetre-wave telescope. When fully explored, using SPACE TECHNOLOGY, the infrared region is expected to produce a rich yield of new molecules.

Spectra from interstellar molecules give a wide variety of information about the interstellar medium and have shown that a significant fraction of the medium is clumped into

molecular clouds, ranging from less than 100 times the mass of the sun to a million solar masses. Within these clouds the visible stars in the GALAXY are formed. Molecular radiation provides information about the temperature, density and velocities within the clouds, and the clouds themselves are being used to map the structure of our galaxy. Improvements in the sensitivity and angular resolving power of telescopes have allowed detection of radiation from molecular clouds in several nearby galaxies. When larger millimetre-wave telescopes, now being constructed, are operational, research opportunities will be even greater.

Radiation detected from interstellar molecules usually arises from changes in a molecule's state of rotation. Substitution of an isotopic species of one of the atoms in the molecule (which produces a significant change in the rotation speed) is therefore easy to detect. This technique allows measurement of isotope ratios of several common atoms (eg, hydrogen, carbon, oxygen, nitrogen, sulphur) in a number of clouds throughout the galaxy; these studies have indicated that, apart from anomalies in the region of the galactic centre, the isotopic composition of the rest of the galaxy (including our solar system) appears to be fairly uniform.

Canadians have made significant contributions to the search for new interstellar molecules. In the early 1970s the molecules HCN and HC<sub>3</sub>N were detected, the latter by UBC graduate Barry Turner working at the National Radio Astronomy Observatory in Virginia. This sequence was greatly extended by a group of Canadian radio astronomers from the Herzberg Institute of Astrophysics (named for Gerhard HERZBERG, 1971 recipient of the Nobel Prize in chemistry for his study of the spectra of molecules). Inspired by T. Oka, the principal investigators were Lorne Avery, Norm Broten and John MacLeod who, with the British spectroscopist Harry Kroto, used the 46 m telescope at ALGONQUIN PROVINCIAL PARK to discover successively the molecular sequence HC<sub>3</sub>N, HC<sub>4</sub>N, HC<sub>5</sub>N. Subsequently, another team at the same institute detected HC<sub>11</sub>N, at present the heaviest interstellar molecule detected. Scientists are now trying to establish the existence in interstellar space of the simplest amino acid, glycine, which is a building block of DNA and therefore of life forms.

WILLIAM SHUTER

**Molinari, Guido**, painter (b at Montréal 12 Oct 1933). He studied briefly at the School of Design at Montréal Museum of Fine Arts (1950-51), and began making drawings and paintings combining automatic methods with a disciplined approach. He was a leader in the development of a rigorous colour abstraction in Montréal. Characteristic of his paintings in the 1960s were vertical, hard-edged bands of colour. Pictorial space in these paintings was created by the spectator's perception of the shifting and mixing of the colours. More recently, colour in his work has been reduced to very dark values, and rather than narrow bands, the paintings are divided into 2 to 5 large vertical sections. In 1956 Molinari was a founding member of the Association des artistes non-figuratif de Montréal. He exhibited at the Biennale in Venice in 1968, where he was awarded the David E. Bright Foundation prize. In 1977 he participated in the Paris Biennale, and in 1980 he was awarded the Paul-Émile BORDUAS prize by the Québec government. Molinari teaches at Concordia U and has exerted a powerful influence on younger artists, through his teaching, his theoretical writing and his opinions, firmly held and strongly stated.

MARILYN BURNETT

**Mollusc**, soft-bodied, usually shelled INVERTEBRATE belonging to one of the largest animal phyla (Mollusca) with some 100 000 living and about 35 000 fossil species. Molluscs are found

on land and in salt and fresh water, and include SNAILS, ABALONE, CLAMS, MUSSELS, OCTOPUSES and SQUID. Molluscs range from some of the smallest invertebrates (snails and clams, measured in millimetres) to the largest (giant squid, up to 15-20 m long). The group is characterized by a muscular foot on which the animals creep; a calcareous shell secreted by the underlying fleshy mantle; and a feeding structure, the radula, consisting of a membrane, bearing sharp cusps, thrusting out from the mouth (found in all major groups except Bivalvia). Food particles (plant or animal tissue) are rasped on the inward or return stroke and are borne into the gullet and through the alimentary tract in grooves lined with cilia (hairlike projections). Bivalves feed mainly on waterborne food particles, captured by a mucus-filtering system formed from the gills. Mollusc shells consist of calcium carbonate crystals (sometimes with magnesium carbonate) interspersed in an organic framework. The mineralized shells have left a rich fossil history dating back to the earliest evidence of animal life. The ancestral mollusc is thought to have been a small, creeping, bilaterally symmetrical inhabitant of ocean shallows, bearing a shield-shaped shell. It ate fine algae scraped from rocks. Seven major classes of living molluscs evolved: Monoplacophora, Polyplacophora (chitons) and Gastropoda (snails) most closely resemble the primitive form; Aplacophora, Scaphopoda (tusk-shells), Bivalvia (clams) and Cephalopoda (octopuses) represent more radical divergences from the ancestral type. Molluscs, because of their diverse and often beautiful shell shapes, accessibility, and importance as food and disease vectors, have played important cultural and economic roles in human history. Malacology studies the diversity, classification and evolution of molluscs. A brief discussion of the 7 major molluscan classes follows.

THOMAS CAREFOOT

**Monoplacophora**, small class comprising some 7 species in genus *Neopilina*; no Canadian species are known. First discovered live in 1952 from deep-dredge collections off the Pacific coast of Costa Rica, these small (0.3-3 cm long) animals were hitherto known only from fossils of the Cambrian period (570-500 million years ago). Their primitive features, eg, single, shield-shaped shell (hence, name Monoplacophora), poorly developed head, and repetitive systems of paired kidneys, gills and foot retractor muscles, suggest that Monoplacophora represent one of the earliest molluscan groups. They are adapted for life at great depths and eat unicellular plants and animals and sponge material grazed from the sea bottom.

THOMAS CAREFOOT

**Polyplacophora**, the chitons, marine class comprising some 600 living species, ranging from a few centimetres or less to over 30 cm long. The name, meaning "bearer of many plates," refers to the 8 distinctive, overlapping shell-plates. The protective shell and broad, adhesive foot permit life on rocks in wave-disturbed intertidal zones. They eat unicellular algae, scrapings from seaweeds and occasionally animal matter. The poorly developed head, rudimentary nervous system, primitive larval form and multiple gills suggest that chitons diverged early from the main line of molluscan evolution. The gum-boat chiton (*Cryptochiton*) of the Canadian West Coast is one of the world's largest chitons.

THOMAS CAREFOOT

**Gastropoda**, the largest molluscan class, with 75 000 living and about 15 000 fossil species, includes some of the most common invertebrates: limpets, abalones, PERIWINKLES, CONCHS, WHELKS, SLUGS and snails. Gastropoda are harvested and cultured for food worldwide. Certain freshwater snails are important disease vectors, acting as intermediate hosts for liver and blood flukes that parasitize humans (eg, schistosomiasis). Snail shells are prized for their form and beauty. Gas-

tropods occupy more habitats and represent more species than any other molluscan class. This extensive adaptive radiation was made possible through 3 major changes from the molluscan ancestral plan: development of a complex head with elaborate receptors and nervous system; coiling of shell; and torsion, involving a 180° twisting of the shell and visceral mass over the lower body section. Coiling and torsion evolved independently. Coiling probably preceded torsion, converting the ancestral shell from a simple, flattened shield to a fully protective retreat. The earliest form of coiled shell (found only in extinct species) was planospiral, ie, each spiral lying outside of the preceding one in the same plane (eg, like a coiled rope). This large, unwieldy and probably unbalanced shell was improved by evolution of asymmetrical coiling about a central axis. The new shell had its centre of gravity squarely over the body midline. The outward projection of the largest whorl of the shell creates the mantle cavity (lined with the shell-secreting membrane), which houses gills and sensory equipment for testing water quality and receives discharge of kidneys, gonads and rectum.

Torsion, thought to have occurred after the evolution of a planospiral shell, formed the gut and nervous system into a U-shape and brought the mantle cavity from its posterior position to an anterior one. Torsion occurs in the larval stage of living gastropods. Its significance in gastropod evolution is disputed. Some argue its importance to larvae (protective withdrawal into mantle cavity); others, to adults (enhanced respiratory stream). An important consequence of the shifting of the mantle cavity to the front was the potential for fouling the head region with rectal and kidney wastes. The solution, involving redirection of water flow for respiration, resulted in considerable modifications of shell design. For example, the perforated shells of abalone and keyhole limpets allow a unidirectional flow of water through the mantle cavity: in over the head, past the gills, then past the rectal and kidney outlets, exiting via the shell holes.

Gastropods are separated into 3 subclasses. Prosobranchia, the largest, is mainly marine and includes gastropods having full torsion, eg, limpets, abalones, whelks, periwinkles and conchs. Among members of this subclass exploitation of habitats and food types has been extensive; some even live as parasites. Food-stuffs include dead organic material, microscopic phytoplankton, seaweeds and animal prey (including fish). In snails the food-procuring device is the radula, which in cone shells has evolved into poisonous barbs that can be thrust into prey. Therefore, certain cone shells can be highly toxic to humans. The second subclass, Opisthobranchia, is almost entirely marine, with some 1100 species including sea slugs, sea hares, sea butterflies and bubble shells. Opisthobranchs have undergone detorsion in their evolution, shifting the mantle cavity to the side. Associated with this has been a tendency towards reduction or loss of shell and mantle cavity, and a loss of gills. Shell loss may have led to evolution of defences characteristic of opisthobranchs, eg, ability to swim, acid secretion, protective internal spines (spicules), camouflage coloration, and secondhand use of stinging cells seized intact from coelenterate prey. The third subclass, Pulmonata [Lat, "lung"], probably evolved from the Prosobranchia. Pulmonates include some 20 000 species of land snails and slugs, freshwater snails, and a few marine snails, having in common a loss of gills and conversion of mantle cavity into a lung. This highly successful group includes numerous crop and garden pests.

THOMAS CAREFOOT

**Aplacophora**, obscure class of shell-less Mollusca (aplacophora means lacking shell) com-

prising some 250 living species. Aplacophorans live in marine bottom sediments or on hydroids and soft corals throughout the oceans. These small (up to 5 cm long), worm-shaped animals have a vestigial head and archaic nervous system; shell, mantle and foot are absent. Aplacophorans are largely predators or scavengers and use the radula to procure food. Their evolutionary position among molluscs is unclear, as the extent of their primitiveness or specialization is unknown. Aplacophorans superficially resemble polyplacophorans; therefore, the 2 groups are sometimes combined in a separate taxon, Amphineura.

THOMAS CAREFOOT

**Scaphopoda**, small class of burrowing marine molluscs, the tusk or tooth shells, comprising some 350 living species. The shell, ranging from less than 1 cm to 5-6 cm long, is cylindrical and resembles an elephant's tusk, open at both ends. The animal lies buried in sediment with the smaller, posterior end of shell near the surface of the substratum. A ventilating current circulates through the shell, exiting from the hole at the posterior tip. Scaphopods eat microscopic organisms collected by small tentacles. Tusk shells, specifically genus *Dentalium*, were prized as ornaments and were used as a medium of exchange by Northwest Coast Indians.

THOMAS CAREFOOT

**Bivalvia**, also called Pelecypoda ("hatchet-foot") or Lamellibranchia ("comb-shaped gills"). The class includes clams, mussels, SCALLOPS, OYSTERS and shipworms, and is exclusively aquatic. Approximately 12 000 species are known. In Canada there are 415 marine and about 200 freshwater species. Bivalves are used for food and were important to coastal native peoples. They now support fishing and AQUACULTURE on the Atlantic and Pacific coasts. Bivalves provide mother-of-pearls and freshwater and marine pearls. Most Canadian bivalves are 1-10 cm long, but species shorter than 1 mm and longer than 1 m are known. A hinged shell, consisting of 2 calcareous valves (half-shells) joined by a hinge ligament on the back, is characteristic of the group. The hinge region frequently has interlocking teeth that align the valves. Many bivalves have 1 or 2 protruding tubes (siphons) for entry and exit of water. The head is reduced as sensory functions are located on external body parts. Gills are small in groups that feed by sorting food from sediment, big in those that pump large volumes of water to trap suspended food particles. Gills may be minute or entirely replaced by a muscular flap used to catch small prey. The foot is used for locomotion and especially for digging, but may be absent in adults of sedentary forms. The sexes are usually separate, but some species are hermaphroditic. Alteration of sex, depending on age or external conditions, occurs in several groups. Fertilization is usually external and development occurs in the plankton. A number of species living in cold, boreal or deep water brood the young within the shell or in a specially constructed pouch. The nervous system is simple, consisting of 3 pairs of interconnected ganglia (nerve masses). Specialized sensory organs include statocysts that monitor position; complex eyes on the mantle margins or siphons in some groups; and other organs sensitive to vibration. The alimentary system includes a stomach with complex ciliary sorting mechanisms that communicate with complex digestive diverticula (glandular tubes or sacs). Many groups possess a crystalline style (secreted, translucent rod), in the midgut or in a separate pouch, that aids in digestion. The intestine may be short or coiled. The alimentary system may be reduced or entirely absent. Scallops and a few other groups can swim briefly to avoid enemies, but the enclosing shell enforces sedentary habits (eg, lying on or buried in sediment, attaching to solid objects or boring). This life mode has limited the adaptive potential to

minor structural changes; however, bivalves have been a successful group from earliest times. Frequently they occur in large numbers, and the filtering forms are an important link between the planktonic (drifting) and benthic (bottom-dwelling) communities. Their origin is unknown and their classification subject to change. Five living subclasses and 12 orders are recognized based on fossil, shell structure, anatomical and biochemical characteristics.

FRANK R. BERNARD

**Cephalopoda** ("head-foot") Extensive modification of the molluscan head-foot resulted in the cephalopod's characteristic parrotlike beak, surrounded by a ring of grasping appendages: 8 sucker-covered arms for the octopods, 8 arms and 2 tentacles with suckers or hooks for squid and CUTLEFISH, and 60-94 simple arms in the primitive chambered or pearly nautilus. Of the 650 living cephalopod species, only 3 species of genus *Nautilus* have external shells. These are the last living tetrabranchiates (4-gilled cephalopods), although thousands of shelled Nautiloidea and Ammonoidea from the Paleozoic (between 570 and 225 million years ago) and Mesozoic (between 225 and 65 million years ago) are known from fossils. The hollow shells provided buoyancy and protection, but modern dibranchiate (2-gilled) cephalopods have given them up, apparently for flexibility and speed. These predatory, marine carnivores have little in common, externally, with other molluscs. Their shell-less muscular mantles work as pumps to force water through a funnellike tube that can be aimed in any direction. This jet-propulsion system provides for high-speed swimming with rapid direction changes, comparable to that of fish. Their swimming manoeuvres, complex arm movements, rapid colour changes and sophisticated camera eyes (resembling human eyes) require the most complex nervous systems in the invertebrate world. Only birds and mammals have larger brains relative to body size. Octopuses, sometimes called devil fishes, are easily trained and have been studied as examples of how animals learn. Squid, too, are important for research; their giant nerve cells were a key to understanding the electrophysiological basis of nerve function.

Although most of the world's cephalopods are tropical or subtropical, 46 species occur along Canada's coasts. This limited variety is made up for by size and quantity. Specimens of the giant squid or kraken (*Architeuthis dux*) found in Newfoundland, have reached nearly 20 m long (including tentacles) and may weigh up to 454 kg. Giant squid are the largest invertebrates known. On the Pacific coast, *Octopus dofleini*, the world's largest octopod, may exceed 80 kg. This octopus is fished commercially, as are 3 species of squid: *Loligo opalescens* in the West, *Loligo pealei* and *Illex illecebrosus* in the East. The arrow squid, *I. illecebrosus*, is famed for its exploits on Newfoundland's "squid jigging grounds." It was originally caught as cod bait, but recent annual catches of up to 150 000 t make this a major fishery in its own right, and one of the world's largest cephalopod fisheries. Dried or frozen, this "fish bait" is considered a delicacy in Oriental and Mediterranean markets. When cooked quickly, it is tender and has a delicate flavour resembling that of shrimp and scallops. Cephalopods are one of the largest, under-used food resources. Deep-sea cephalopods are a major food for many whales. It has been estimated that sperm whales alone consume some 800 million t annually, over 10 times man's total annual fish catch. Cephalopod fisheries are particularly attractive because most cephalopods grow rapidly, spawning and dying after only 1-2 years.

R.K. O'DOR

Reading: R.D. Barnes, *Invertebrate Zoology* (1980); Arthur H. Clarke, *Freshwater Molluscs of Canada* (1981).

**Molluscan Resources** Although Canada's coastline is extensive and contains many diverse molluscan species, the resource is economically relatively small. In 1982 about 178 000 t valued at \$248 million were taken. SCALLOPS and SQUID from the Atlantic coast were the dominant species, accounting for 95% by weight and 97% by value of all molluscs from both coasts. There is no molluscan fishery in arctic waters. In Canada most molluscs are fished rather than cultured. For most species the short growing season results in growth rates too slow for profitable culture. The OYSTER is the only species now cultured in some quantity, although MUSSEL culture is beginning. Expanded production of both is possible but, in general, the potential for molluscan AQUACULTURE in Canada is not great. The occurrence of paralytic shellfish poison can limit the use of some species. The toxin derives from poisonous planktonic dinoflagellates on which bivalves feed. Although harmless to molluscs, it can be fatal to humans. Except for scallop and partially for squid, most species are fished for or cultured by individual fishermen or families. Native people fish certain species (eg, CLAMS) commercially and for food. Federal and provincial governments participate in regulation as well as controlling factors such as sanitation, pollution, lands and marketing. Jurisdictions differ from province to province as a result of agreements developed through the years. Scallops are fished by vessels 20-30 m long, pulling drags over the bottom in depths up to 100 m. The centre of the fishery is on GEORGES BANK, ownership of which was contested by Canada and the US until Oct 1984, when the International Court at The Hague awarded the easternmost one-sixth, rich in scallops and groundfish, to Canada. It is unlikely that production can be increased beyond the level of past catches. Only the adductor mussel is used, sold fresh or frozen. On the Atlantic coast, oysters are cultured in shallow waters below the low-tide mark. Oyster ground is leased from the federal government and planted with oyster seed collected by various means. Oysters are marketed in the shell, usually by the dozen, and are eaten raw. On the Pacific coast the oyster industry uses a Japanese species that normally grows in intertidal areas. These zones are leased from the provincial government. Oysters are shelled and sold by volume of meat. Clams occur in both intertidal and subtidal areas and are fished by hand and by mechanical harvesters. Some are sold fresh but most are canned. A number of commercial species occur on both coasts and the fishery is regulated by season, quota or size. ABALONE live in rocky subtidal areas of the Pacific coast and are fished by divers. The catch is regulated by size and area quota. Most abalone are sold frozen to Japan. The centre of squid production is Newfoundland where they are fished by jigs and nets. Squid are used locally for bait and exported to Japan for food.

**Molson, Eric Herbert**, industrial capitalist (b at Montréal 16 Sept 1937). Molson was educated at Bishop's, Princeton and McGill. In 1959 he entered the family company, Molson Breweries of Canada, as an apprentice brewer, became assistant brewmaster 1961, brewmaster 1966, VP 1970 and president 1973. In June 1982 he

John Molson, brewer and banker, in a postcard reproduction portrait, c1860 (courtesy Public Archives of Canada /PA-125770).

bought 10% of the voting shares of MOLSON COMPANIES from D.G. Willmot to become the largest shareholder and VP of the parent corporation.

JORGE NIOSI

**Molson, John**, brewer, banker, steamship builder (b at Spalding, Eng 28 Dec 1763; d at Île Ste-Marguerite, Qué 11 Jan 1836). Orphaned as a child, he attended private boarding schools, immigrated to Canada at age 18, and in 1786 used his parents' legacy to become sole owner of a small brewery in Montréal. He had the business sense to exploit Montréal's growth as entrepôt in the fur trade and commercial base for developing the hinterland of Upper Canada. In 1816 he took his 3 sons into partnership as John Molson and Sons. He used cash payments from brewing to finance banking activities and build a steamboat line operating between Montréal and Québec City. He also built hotels and a distillery and financed the CHAMPLAIN AND ST LAWRENCE RAILROAD. Molson introduced the early steam engine to Montréal industry and became a close friend of James Watt. He sat in the House of Assembly of Lower Canada 1816-20, became president of the Bank of Montreal in 1826, and in 1832 was appointed a member of the Legislative Council of Lower Canada, where he upheld the interests of English-speaking businessmen amid the emerging discontent of French Canadians. Molson must be counted among the most prominent entrepreneurs in Canada during the first third of the 19th century.

ALBERT TUCKER

Reading: M. Denison, *The Barley and the Stream* (1955).

**Molson Companies Limited**, with head offices in Montréal, is one of Canada's larger breweries. Incorporated in 1930 as Molson's Brewery Limited (est 1786), the company became Molson Breweries Limited in 1962 and Molson Industries Limited in 1968, and it adopted its present name in 1973. These name changes reflect the changing nature of the company. From 1967 to 1980 the company acquired

interests in everything from furniture products to hardware stores and warehousing, and it is now a diversified Canadian corporation. Today, its principal businesses are brewing, retail merchandising and marketing special chemicals. It owns 10 breweries in 7 provinces and leases or franchises over 300 retail, plant and warehouse facilities across Canada. As of 1983, the company had annual sales or operating revenue of \$1.5 billion (ranking 59th in Canada), assets of \$935 million (ranking 90th) and 11 100 employees. The Molson family and estate own 38%.

DEBORAH C. SAWYER

**Molson Prize**, annual awards funded by Molson's "to encourage Canadians of outstanding achievement in the fields of the Arts, the Humanities or the Social Sciences to make further contributions to the cultural or intellectual heritage of Canada." The laureates are chosen by the chairman and president of the CANADA COUNCIL in consultation with a jury chosen from across Canada. The selectors have attempted to choose laureates who are close to the peak of an outstanding career and the terms provide that no individual may be awarded the prize more than once. Between 2 and 4 awards, accompanied by payments of \$50 000 each, are made each year.

#### Molson Prize Recipients

1970	Jean-Paul Audet (scholar) Morley Callaghan (writer) Arnold Spohr (artistic director, Royal Winnipeg Ballet)
1971	Northrop Frye (literary scholar) Duncan MacPherson (cartoonist) Yves Thériault (writer)
1972	Maureen Forrester (contralto) Rina Lasnier (poet) Norman McLaren (filmmaker)
1973	John James Deutsch (economist) Alfred Pellan (painter) George Woodcock (writer)
1974	Celia Franca (dancer, choreographer, artistic director of National Ballet) W.A.C.H. Dobson (scholar) Jean-Paul Lemieux (painter)
1975	Alex Colville (painter) Pierre Dansereau (ecologist) Margaret Laurence (writer)
1976	Denise Pelletier (actress) Jon Vickers (tenor) Orford String Quartet
1977	John Hirsch (theatre director) Bill Reid (sculptor and carver) Jean-Louis Roux (actor and theatre director)
1978	Gabrielle Roy (novelist) George Story (lexicographer) Jack Shadbolt (painter)
1979	Jean Duceppe (actor) Betty Oliphant (principal and director of National Ballet School) Michael Snow (painter)
1980	Michel Brault (filmmaker) Lois Marshall (singer) Robert Weaver (editor and radio producer)
1981	Margaret Atwood (writer) Marcel Trudel (historian) John Weinzwieg (composer)
1982	Gilles Vigneault (singer) Louis Edmond Hamelin (geographer) Jack McClelland (publisher) Allan Cairns (political scientist)
1983	Brian Macdonald (choreographer) Franses Halpenny (professor)
1984	James Eayrs (professor) Marcel Dubé (dramatist)

**Molybdenum** (Mo), silver-grey metallic element with an unusually high melting point (2610°C). It is an important alloying element in

iron, steels and specialty alloys and is used frequently in combination with other ferrous additives. The molybdenum content in these products ranges from a fraction of 1% to as much as 20%. A commonly used refractory (heat-resistant) metal, molybdenum is also used in catalysts, dyes and pigments. In IRON AND STEEL manufacture, the addition of molybdenum imparts hardness, strength and corrosion resistance and improves weldability. The principal mineral source of molybdenum, molybdenite (molybdenum disulphide, MoS<sub>2</sub>), may be used as a solid lubricant and as an additive to greases and oils. About 58% of world output comes from primary molybdenum mines; the balance is a by-product of copper mining. Canada, the world's second-largest producer (after the US), produces about 16 000 t annually. About 95% of Canada's output is produced in BC, the remainder in Québec. Canada consumes 6-10% of this output and exports the balance, mostly to the European Economic Community and Japan. Molybdenum contributed about 0.09% of the GNP in 1981. It is second only to copper in value among minerals in BC. *See MINERAL RESOURCES.*

**Monarchism** is based on ancient principles favouring a symbolic leader, state traditions, nonpartisan public relations and modern principles of parliamentary democracy. Canada, an autocratic monarchy before RESPONSIBLE GOVERNMENT was established, has become a constitutional monarchy in which the sovereign, GOVERNORS GENERAL, and LIEUTENANT-GOVERNORS act on ministerial advice. Constitutional monarchy helps resolve the problem of ensuring that politicians can be elected, criticized, defeated and held responsible and accountable, a difficult feat if symbolism and administration are combined in one person. Executive functions are divided among the sovereign, governors general and lieutenant-governors, who exercise symbolic and decorative duties relating to public relations for the state, formal powers (eg, assenting to legislation) used on ministerial advice, and emergency powers for unusually serious constitutional crises such as electoral deadlock. The PRIME MINISTER, as partisan government leader, is not given formal powers of his own by the Constitution Acts; he advises on the use of the CROWN'S powers as first minister responsible to Parliament. This combination, at federal and provincial levels, of reigning without governing and governing without reigning has worked comparatively well in Canada. With both levels of government sovereign in exercising their allotted powers (*see DISTRIBUTION OF POWERS AND CONSTITUTIONAL LAW*), the queen is the only official associated with all the state's powers and is therefore the focus of authority at a modest cost to Canada, which contributes nothing towards the queen's maintenance and comparatively little to that of her representatives.

The Atlantic provinces, Ontario and BC have traditionally supported the Crown. Attitudes on the Prairies towards the Crown have been recently affected by Prairie discontent with Ottawa, by the influence of American preference for a congressional as opposed to a parliamentary system and by a long series of partisan patronage appointments to governorships by one party during 50 of the last 60 years. Québec enthusiastically supported the monarchy until about 1955 when the Crown became a factor in arguments about nationalist symbolism. Nevertheless, the Crown was strongly entrenched in the Constitution in 1982 by a formula requiring the support of Parliament and all 10 provincial legislatures before its status could be altered.

Monarchism concerns ways of governing as well as forms of government. Canada's monarch and governors, monarchical in theory for constitutional reasons, are democratic in their ways of governing, while many presidents elsewhere have become, in practice, absolute mon-

archs. Ironically, even Canadian premiers may be said to have acted occasionally as absolute monarchs. The governments of premiers W. ABERHART (Alta), M. DUPLESSIS (Qué), M. HEPBURN (Ont) and J. SMALLWOOD (Nfld) were one-man enterprises. The misunderstanding about monarchism has resulted largely from the troublesome Canadian weakness of maintaining high-profile premiers in office for excessively long periods and of one-party dominance and patronage overshadowing the Crown and submerging the Opposition. Indeed, monarchism as a way of governing is inevitable in some form in every political system; the main questions concern its type — absolute or constitutional.

FRANK MACKINNON

**Monashee Mountains** are a 400 km long ridge in southern BC. To the W they merge with the Okanagan and Shuswap highlands; their eastern boundary is the S-flowing COLUMBIA R. The name, meaning peaceful mountain, was given by a Scottish prospector. The border area around ROSSLAND, Grand Forks and Greenwood was settled in the 1890s and has had prosperous periods of copper mining and smelting.

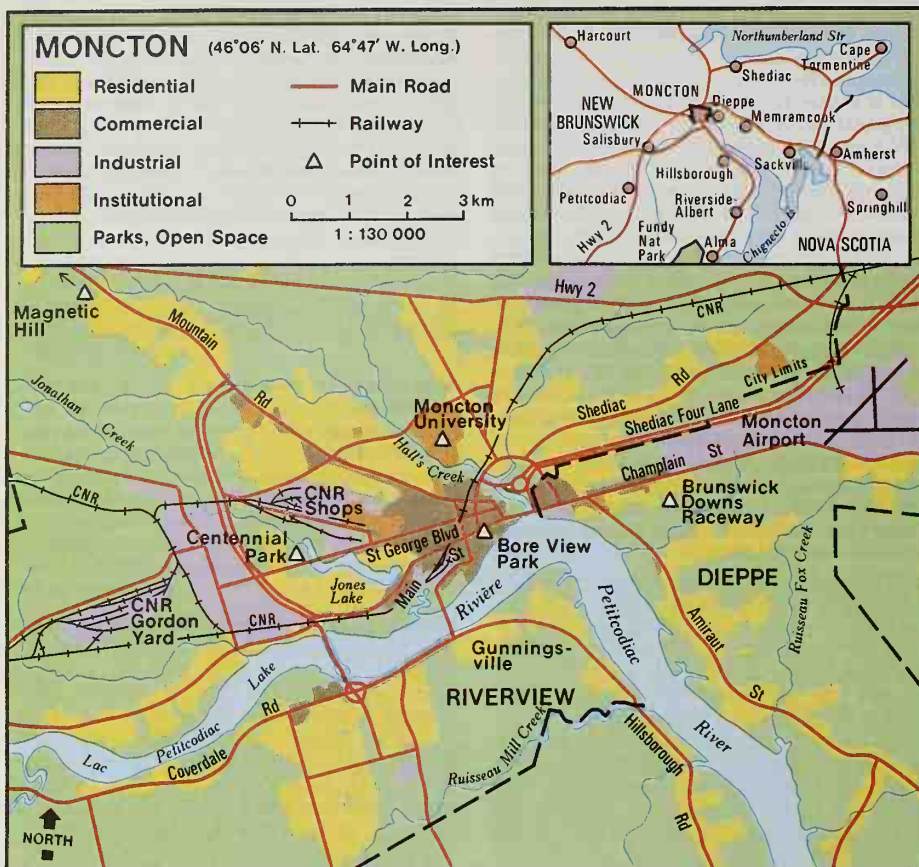

PETER GRANT

**Monck, Charles Stanley, 4th Viscount** in the Irish peerage and 1st Baron in the UK peerage, governor general of BNA, 1861-67, governor general of Canada and PEI, 1867-68 (b in Templemore, Tipperary, Ire 10 Oct 1819; d in Ire 29 Nov 1894). Monck was educated at Trinity Coll, Dublin, and then called to the Irish Bar at King's Inn in 1841. An Irish peer from 1849, he represented Portsmouth as a Liberal in the House of Commons and served as a lord of the Treasury. Appointed governor general of BNA in 1861, Monck displayed considerable diplomatic skill in dealing with the serious Canadian-American tensions of the day. A keen advocate of the defence and political consolidation of BNA, Monck was one of the architects of the GREAT COALITION, devised to carry CONFEDERATION, and he worked assiduously to overcome opposition to Confederation in NS and NB. As a mark of favour, the British government extended his term so that he might become the first governor general of Canada. Rideau Hall was purchased during his term to serve as official vice-regal residence. From 1874 to 1892 he served as lord lieutenant of Dublin County, Ire. *CARMAN MILLER*

**Monckton, Robert**, British army officer (b at Yorkshire, Eng 24 June 1726; d at London, Eng 21 May 1782). Monckton arrived in Nova Scotia in 1752 and took part in the establishment of LUNenburg in 1753. Two years later he engineered the first British success of the SEVEN YEARS' WAR when he captured Ft Beauséjour (NB) in June, and that fall he supervised the deportation of the ACADIANS. Lieutenant-governor of NS from Dec 1755, in 1758 Monckton raided Acadian settlements on the Saint John R. The following year he took part in the siege of Québec as second in command to James WOLFE. Wounded on the Plains of Abraham, he left Québec in Oct for further service in the southern colonies and the West Indies, where he stayed until 1763. A competent and humane soldier, Monckton was briefly considered for the command in N America, but never returned. By the time of his death he had become a lieutenant-general. *STUART SUTHERLAND*

**Moncton**, NB, City, pop 54 743 (1981c), inc 1890, is situated in eastern NB on a bend of the Petitcodiac R. Its first settlers, who were of German origin, called their community The Bend. The modern name, first used in the 1860s, honours Robert MONCKTON, a British commander who became lieutenant-governor of Nova Scotia. Today, almost one-third of the population claims French as a mother tongue; the remainder is English speaking.

**History** Moncton's early prosperity was intimately linked to shipbuilding. The turning point in its economic history was the establishment of a shipyard by George and Joseph Salter in 1849. By 1850 the shipping trade had become important enough that Moncton was made a port of entry. The town was incorporated in 1855 and that same year the first bank, the Westmorland Bank, was established. The decline of wooden ships wreaked disaster on Moncton. The bank collapsed and Moncton lost its status as an incorporated town in 1862. The beginnings of a new era, however, came with the railway, especially in the post-Confederation period when Moncton became the headquarters of the shops for the INTERCOLONIAL RY and a railway centre.

**Economy** It is the railway industry for which the city is best known today. Moncton is often referred to as "The Hub of the Maritimes" because all railway lines in and out of the Maritimes must pass through it. The CNR is the city's largest nongovernment employer and has played a vital part in the well-being of Moncton.

**Townscape** Moncton is home of UNIVERSITÉ DE MONCTON, a French-language university established in 1963, the only such university in Canada outside Québec. It also has the distinction of having the first law school in the world teaching COMMON LAW in the French language. Sites of interest in Moncton include Magnetic Hill, where cars appear to coast uphill, and the tidal bore, which features some of the highest tides in the world.

SHEVA MEDJUCK

**Monetarism**, an economic theory identified with American economist Milton Friedman, which argues that the growth of income is principally determined by the growth rate of the money supply, and that the control of inflation depends entirely on MONETARY POLICY. Governments have 2 major macroeconomic policy levers at their disposal — monetary policy, which determines the amount of money in circulation, and FISCAL POLICY, which determines

the level of government taxation and spending. Government attempts to manipulate and coordinate these policies to try to achieve full employment with stable prices while hoping to eliminate sharp swings in the level of economic activity. Monetarists reject the Keynesian position that fiscal policy can and should be used to stabilize the economy, claiming that larger government spending to increase employment and economic growth has only short-term results (see KEYNESIAN ECONOMICS). To monetarists the economy is self-stabilizing because market forces will eventually establish an appropriate growth rate for the economy, and therefore the manipulation of fiscal policy is destabilizing. Keynesians, on the other hand, argue that the economy needs to be stabilized because cyclical fluctuations are not self-correcting; they believe that monetarist policy aimed at reducing inflation is just as likely to reduce the overall growth of the economy and increase unemployment.

Monetarists and Keynesians basically agree that stable prices in theory require growth in the money supply equal to the growth of output. They disagree on the advisability of government intervention in the form of fiscal policy to stabilize the economy. Because monetarist policy limits the growth of the money supply, interest rates may swing up and down sharply. Monetarism also reflects political conservatism, based on a belief in a small, inactive government.

The BANK OF CANADA is charged with the authority to regulate Canada's money supply. In Nov 1975 the governor of the Bank of Canada, G. Bouey, announced a historic change in national monetary policy. In reaction to concern over inflation, the bank established a target for annual growth of the money supply. The target would be gradually lowered over a period of several years, a policy that came to be known as "gradualism." This approach was based on monetarist tenets, eg, that the existing inflation was too high and therefore a threat to long-term economic stability and that inflation could be lowered by lowering the growth of the money

supply. Critics of monetarism in Canada have charged that the bank's monetarist policies have had a high social cost in causing slower economic growth and higher unemployment. Some monetarists, on the other hand, have accused the bank of proceeding too gradually in bringing down the growth of the money supply.

W.F. FORWARD

**Monetary Policy** refers to any of a number of government measures undertaken to affect financial markets and credit conditions with the ultimate objective of influencing the overall behaviour of the economy. In Canada, monetary policy is the responsibility of the BANK OF CANADA, a federal crown corporation that implements its policy decisions largely through its ability to alter the Canadian money supply. The money supply is that portion of the financial wealth of Canadian households which has sufficient liquidity to be considered money. At the least it includes coin, currency, and chequing-account deposits in chartered banks, all of which have perfect liquidity in that they represent, at face value, an immediate means of payment for purchases made. Some economists broaden the money-supply definition by including additional chartered-bank deposits (eg, savings accounts) or deposits in other financial institutions such as trust companies or credit unions.

The Bank of Canada is not able to control the money supply directly, because the deposit portion of the money supply results from decisions made within the private BANKING system. By taking deposits from individual Canadian households and firms and then lending these funds, the commercial banks, in essence, "create" money because, in theory, the new funds will be redeposited in the banking system. However, the money-creation powers of the commercial banks are constrained by 2 factors. First, if INTEREST yields on other financial assets rise, Canadians will probably choose to hold a relatively smaller portion of their wealth as coin, currency and (largely low-yield) money deposits. Second, the banks are limited in loan expansion by the need to retain reserves (basically cash in the vault, and deposits of the individual banks at the Bank of Canada) to meet possible withdrawal needs. By altering interest rates and the level of banking reserves, or both, the Bank of Canada can manipulate the money supply indirectly with a high degree of precision (particularly over periods of 3 to 6 months or longer).

One method of manipulating the money supply, termed open-market operations, involves the trading of Canadian government securities in the secondary bond and treasury bill markets. A purchase of government bonds by the Bank of Canada represents an immediate increase in the stock of money held by the general public, raises banking system reserves, and therefore has a multiplied indirect effect on the total money supply. The added demand for bonds also puts downward pressure on bond yields and hence on the overall level of interest rates. Through a sequence of opposite effects, a sale of bonds will decrease the money supply and raise interest rates. The Bank of Canada can also affect interest rates and banking-system reserves by altering the BANK RATE (ie, the interest rate paid by the chartered banks on loans made to them by the Bank of Canada). However, since March 1980, the Bank of Canada has abandoned the bank rate as a formal policy tool and instead has allowed it to float passively one-quarter of 1% above the rate paid on 90-day treasury bills.

Control of the money supply is a powerful tool for influencing the general behaviour of the Canadian economy. For example, stimulative monetary policy (ie, a higher rate of money-supply expansion) will put downward pressure on interest rates, strengthen business investment

and housing demand, and hence raise the overall level of demand in the economy. During a cyclical downturn, when there is heavy unemployment and idle plant capacity, this stronger demand should in theory lead to a rise in output and increased jobs. Reduced money growth, on the other hand, acts as a restraining force on the economy — causing upward pressure on interest rates and reducing both investment and total demand. At a time of high INFLATION, such restraint will help reduce price and wage increases.

Because of the strong links between Canadian and American financial markets, monetary policy also has a major impact on the Canadian-US dollar EXCHANGE RATE. If Canadian monetary policy is significantly more expansionary than US policy, the value of the Canadian dollar will tend to depreciate in relation to the US dollar. A more contractible Canadian policy will result in the reverse effect.

Yet, despite its important effects, monetary policy also has limitations. It cannot, for example, simultaneously stimulate economic demand to reduce unemployment and restrain demand to combat inflation. Nor can the Bank of Canada increase money growth rates to reduce interest rates below US levels while at the same time successfully stabilizing the Canadian-US exchange rate. Therefore, monetary policy decisions often require painful choices ("trade-offs"). Sometimes these trade-offs involve conflicts between the short-term and long-term effects of a particular policy. For example, a sustained rise in money-supply growth may cause an initial increase in both jobs and production, but eventually it will lead to a correspondingly higher inflation rate with little or no permanent effect on employment or output. Similarly a major reduction in the rate of money-supply expansion ultimately will reduce even strongly entrenched inflation, but this accomplishment may take several years during which output and employment both fall. These intertemporal conflicts can be complicated by a third limitation — ignorance — for there are still many unresolved questions concerning the mechanisms whereby changes in monetary policy affect the economy, the nature of the interrelations between real and financial variables, and the exact determinants of wage- and price-setting decisions. Finally, monetary policy is restricted by the impact of other government actions, especially FISCAL POLICY, i.e., decisions about government expenditures and taxation. Fiscal policy also influences overall economic demand, and if fiscal and monetary policy are not co-ordinated, they can work at cross-purposes. In Canada the minister of finance and the governor of the Bank of Canada consult regularly. Furthermore, since 1961 there has been an explicit agreement that if any irreconcilable conflict between the 2 arises, the governor must either follow the written (and publicly released) directive of the minister or resign his office. Nonetheless, there is also a strong tradition that, except in such acute circumstances, the Bank should be able to set an independent monetary policy, free from political pressures. Therefore the potential for conflicting policies does exist.

The creation of monetary policy is often a highly contentious issue. Disagreements sometimes occur because of differing factual judgements about current economic circumstances (eg, whether or not a recession has started), or because of conflicting value judgements (eg, whether it is more unfair to have inflation erode the value of fixed pensions or to have recession cause the loss of jobs). Frequently, however, debate reflects broad conceptual differences about the appropriate strategy for monetary policy. Although there are many alternative (and intermediate) viewpoints, 2 general approaches can be distinguished.

**Keynesianism** Although considerably modified and refined by his followers, English economist John Maynard Keynes's concepts of the use of monetary and fiscal policy, developed during the GREAT DEPRESSION, remain highly influential (see KEYNESIAN ECONOMICS). Keynesians place considerable stress on the many influences that tend to destabilize the economy, including shifts in business and consumer confidence, dynamic investment cycles, and international trade, financial and price shocks. Keynesian policy, therefore, tends to be highly activist or discretionary, in the sense that the nature of monetary (and fiscal) actions alters significantly in response to perceived or anticipated shifts in overall economic circumstances. Carried to its logical limit such continual policy shifts are sometimes referred to as "fine tuning."

Keynesians recognize the risk that the policy chosen may sometimes worsen rather than improve economic performance. Some Keynesians, therefore, cautiously argue that while major cyclical swings should be countered by an appropriate policy change, minor fluctuations should be largely ignored. As a group, however, Keynesians are especially concerned that complete failure to react to economic downturns could lead to episodes of prolonged and severe economic stagnation — characterized by falling output and high unemployment — which can and should be avoided.

In his original analysis, Keynes argued principally for discretionary fiscal rather than monetary policy. His followers now generally believe that both tools are powerful and both should be actively used.

**Monetarism** The most important distinguishing characteristic of monetarists is their strong scepticism about the use of discretionary monetary policy to offset business-cycle fluctuations. Instead they advocate a neutral policy in which money-supply growth rates would be set and maintained at low levels, regardless of economic circumstances. Monetarists dispute the claim that the economy is inherently unstable, arguing that steady money growth coupled with automatic stabilizing influences in the private sector (and possibly automatic fiscal-policy stabilizers) will keep fluctuations to modest proportions. Secondly, they maintain that changes in monetary policy are unlikely to be effective in reducing output and employment oscillations and may actually accentuate them. The existence of potentially long and uncertain lags between the implementation and impact of a policy change is one important element in this argument. Finally, monetarists are concerned about the effect political pressures may have on the choice of a monetary policy. They assert that in practice Keynesian monetary policy will be too stimulative, aiming at immediate employment and output gains and ignoring the potential for higher inflation in the long run.

In the 1960s and early 1970s, the Keynesian approach was dominant, and the generally strong economic performance of the Canadian economy and many other economies was attributed, in part, to the implementation of Keynesian monetary and fiscal policy. However, the frequent bouts of double-digit inflation from the mid-1970s through the early 1980s, coupled with new theoretical analysis by a number of monetarists, greatly increased the influence of monetarist ideas on both academic economists and central bankers, including the Bank of Canada. Currently, many economists would accept elements of both Keynesian and monetarist analysis, while at the same time acknowledging that considerable further research needs to be done on both the nature and impact of monetary policy.

R.G. WIRICK

Reading: D. Bond, R. Shearer and J. Chant, *The Economics of the Canadian Financial System* (4th ed, 1983).

**Money** consists of anything that is generally accepted for the settlement of debts or purchase of goods or services. The evolution of money as a system for regulating society's economic transactions represented a significant advancement over earlier forms of exchange based on BARTER, a transaction in which goods and services are exchanged for other goods or services rather than money (today, barter is sometimes used as a form of tax evasion and in trade between nations). Money has at least 3 functions: it serves as a medium of exchange; a measure by which prices, debts and wages are expressed; and a store of value. These functions are interdependent, although some theorists (eg, Keynesians, Marxists) stress that money must have intrinsic value (eg, GOLD or SILVER) that represents labour, while others (eg, MONETARISTS) emphasize that the most important characteristic of money is its acceptability as a means of exchange.

In many ancient societies gold and silver served as money. They had intrinsic value, were easily portable and divisible, and were indestructible. Gold and silver coins were minted by the STATE (see COINAGE). The 17th century development of goldsmith BANKING in Europe marked the transition to paper money. Goldsmiths issued paper bills backed by the gold in their vaults. During the 18th and 19th centuries European states established central banks to regulate their monetary systems; by the turn of this century most states had taken over the issuance of paper money backed by bullion. Today, however, none of the major state currencies is officially backed by bullion (see GOLD STANDARD).

Canada's first paper money was playing cards, specially cut and signed by the governor and issued in 1685 to supplement the chronically short supply of French and Spanish silver coins then used as the main medium of exchange in New France (see PLAYING CARD MONEY). The playing cards had no intrinsic value but their inscribed value was supposedly guaranteed by the colonial government. In an attempt to pay for the Seven Years' War the government then issued vast amounts of paper money, the worth of which it could not guarantee. The result was rampant INFLATION.

After the Conquest (1763), the British introduced sterling and for almost a century, pounds, shillings and pence were official money in Canada. In practice this meant setting a sterling value for the various kinds of money in existence. The Spanish dollar was rated at 5 shillings, which meant there were 4 to the pound, a value first established by Halifax merchants. Dollar banknotes were printed, including a \$4 denomination to conform to official value of the pound, a value which made it different from the British pound. British money never became dominant, however, and a hodgepodge of money circulated in Canada in the first half of the 19th century, including Nova Scotia provincial money, American dollars, Spanish dollars, American gold coins and "army bills" used by the British forces to buy supplies in the War of 1812. The use of the army money accustomed Canadians to the idea of reliable paper money.

The decision to reject British money and adopt a decimal system like that in the US was made in the 20 years before Confederation. In 1858 a law required that accounts of the government of the Province of Canada be kept in dollars instead of pounds. At the same time, the government began to issue its own money to circulate alongside the bills issued by the BANK OF MONTREAL and other banks. In the first decades after Confederation, most Canadians simply assumed that a dollar was a dollar, whether it was issued by the government in Washington or Ottawa or by a bank. Canada's monetary system always paralleled that of the US, with some notable differences. In 1870 the Dominion government issued

SHINPLASTERS (25¢ government notes) to counteract the effect of an overabundance of American silver coinage in Canada that was worth only 80¢ against the Canadian dollar at that time. The American and Canadian dollars first diverged seriously in the period of high inflation that followed WWI (see EXCHANGE RATES). The Canadian dollar dropped to 84¢ US in 1920, but quickly recovered and was steady at about 100 cents in the last half of the 1920s. With the Great Depression, the Canadian dollar dropped to about 80¢ US, a record low until recent times, but the dollar recovered before the economy and was as high as \$1.04 US in the mid-1930s. During WWII, the value of the Canadian dollar was fixed at about 91¢ US. From 1952 to 1962, when the Canadian dollar was allowed to "float" rather than having a fixed value in American dollars, it was often worth more than the US dollar because of the flood of American investment in Canada. A dollar crisis hit Canada in the midst of the 1962 federal election campaign and the dollar was pegged at 92.5¢ US. In 1970 the Canadian dollar was again set free to float and quickly rose to be worth more than the US dollar, but this strength was deceptive and the 1976 election of the Parti Québécois in Québec triggered a fall which took it to 75¢ US by late 1984 (see CANADIAN-AMERICAN RELATIONS).

The 1970s revived interest in the old idea that inflation was essentially caused by too much money and attempts were made to try and limit the money supply in the economy (see MONETARY POLICY). The money supply (total amount of money) includes cash, bank deposits, deposits in financial institutions, certain kinds of short-term notes and sometimes credit cards. The Bank of Canada has several operational definitions of the money supply. M-1 (currency in circulation outside of the chartered banks, i.e. the actual cash in people's pockets and bank deposits that can be withdrawn without notice) is the most narrow definition. However, it does not correspond to the US definition of M-1 (in Canada, M-1B, which equals the Canadian M-1 plus chequable savings deposits, is the equivalent of the US M-1). The Bank of Canada had tried prior to 1982 to regulate the supply of M-1 (which amounted at that time to about \$30 billion, \$13 billion of which was currency) to restrain the money supply in an attempt to lower inflation, but the introduction of computer banking made it difficult to determine if M-1 could accurately measure the existing money supply. The next widest definition of money supply, M-2, includes M-1B, nonchequing personal term and savings deposits and some corporate chequable and nonchequable notice deposits. Canadian M-2, which was close to \$140 billion in the mid-1980s, corresponds to the American M-2. The broadest definition of money supply is M-3; it consists of M-2 and nonpersonal term deposits, including certificates of deposit held by business corporations. M-3 amounted to \$186 billion in the mid-1980s. The total money supply consists of M-3 plus Government of Canada deposits in chartered banks.

Canada's monetary system is of course linked to the international monetary system, which underwent a serious crisis in the early 1980s. This crisis was manifested in high rates of inflation, even hyperinflation in many countries, high interest rates, erratic gold and silver prices and a Third World debt problem of unmanageable proportions.

The process of monetary evolution which began several thousand years ago is still underway. The exact direction it will take is impossible to predict, but some elements of the functions of money as a store of value, measure of value and medium of exchange will be retained.

D. MCGILLIVRAY

**Monroe, Walter Stanley**, businessman, politician (b at Dublin, Ire 14 May 1871; d at St John's 6 Oct 1952). He was Newfoundland's eighteenth prime minister, June 1924-Aug 1928; his newly constituted party swept to power, ending Albert HICKMAN's brief prime ministership. A well-established and successful businessman, Monroe had served for a short time in William WARREN's Cabinet before that administration was replaced by Hickman's. In May 1924 Monroe was chosen as leader of a new alliance, the Liberal-Conservatives, which defeated Hickman in the June election. During Monroe's term, in spite of deepening financial difficulties, there was some industrial expansion and the long-fought LABRADOR BOUNDARY DISPUTE was settled in Newfoundland's favour. In Aug 1928 he passed the leadership to his cousin Frederick ALDERDICE and returned to his business concerns.

ROBERT D. PITT

**Mont-Joli**, Qué, Town, pop 6359 (1981c), inc 1945, is located 30 km NE of RIMOUSKI at the entrance to the Matapédia Valley. The development of a transportation infrastructure was the most important factor in the area's urbanization, beginning with the construction of the INTERCOLONIAL RY (1870-73). Further growth resulted from the establishment of train-repair yards. The headquarters of the Canada and Gulf Terminal Ry (linking Mont-Joli and Matane) located in the village in 1910. These developments led to the opening of a foundry that produced railway equipment. WWII saw the arrival of a military airport, firing range and bombing school; this centre has become the present regional airport. The government of Maurice Duplessis built a sanitarium here. One of the first radio stations in Québec opened here in 1922. Today, Mont-Joli has become a service town, and transportation plays a lesser role.

ANTONIO LECHASSEUR

**Mont Ste-Anne**, Qué, provincial park created in 1969, is located 40 km E of QUÉBEC CITY. Part of the LAURENTIAN HIGHLANDS, its flattened summit (815 m) dominates the N shore of the St Lawrence R. Mont Ste-Anne is internationally known for its SKIING facilities, and World Cup races have been held there since 1971. Downhill skiers enjoy over 50 km of both gentle and steep runs. The area is superbly equipped, with ski jumps, 90 km of illuminated and patrolled ski trails, and a 10 km snowshoe trail. A year-round chair lift takes people to the summit and its outstanding view of the river, its islands and the S shore. The park is a pleasant summer recreation spot with walking trails, bicycle and jogging paths, an 18-hole golf course and camping facilities.

CLAUDINE PIERRE-DESCHÊNES

**Mont St-Hilaire Nature Conservation Centre**, administered by MCGILL UNIVERSITY, comprises Mont St-Hilaire (one of the 10 Monteregian Hills located 35 km E of Montréal), which rises 400 m above the Richelieu R and covers 11 km<sup>2</sup>. The mountain was formed by the intrusion, some 100 million years ago, of IGNEOUS ROCK into sedimentary layers that have since been removed by erosion processes, including GLACIATION. The mountain's several peaks surround Lac Hertel (0.3 km<sup>2</sup>), which is drained by a small stream. Variations in altitude and climate produce a pattern of vegetation dominated by forests of pine, oak, maple, beech and birch. Animal species include 41 species of mammal (eg, skunk, fox, raccoon, porcupine, muskrat, squirrel, deer) and some 178 species of bird (eg, pileated woodpecker, warbler, hawk, Canada goose). Indians used the mountain until the 1700s, when French settlers began exploiting its timber and waterpower resources. After 1844, the Campbell family developed it as a tourist resort until 1913, when it was bought by Brig A.H. GAULT. He protected its natural qualities

and in 1958 bequeathed it to McGill. Since then it has been managed for conservation, scientific research, education and recreation. In 1960 it became a migratory BIRD SANCTUARY and in 1978 was recognized by UNESCO as Canada's first Biosphere Reserve. The public has year-round access to the western, 6 km<sup>2</sup> nature-centre zone which includes 24 km of trails. JOHN S. MARSH

**Mont Sorrel**, an important feature on the S shoulder of the Ypres Salient, captured by German forces on 2 June 1916 from the 3rd Division of the Canadian Corps. Maj-Gen M.S. Mercer, commanding the division, was killed and Brig-Gen V.A.S. Williams, commanding the 8th Brigade, was taken prisoner, the highest-ranking Canadians to be killed and captured during WORLD WAR I. An immediate counterattack that night failed but stemmed any further German advance. A more deliberate counterattack recaptured Mont Sorrel on June 12. Between June 2 and 14 the Canadians lost some 8000 men and the Germans lost 6000. BRERETON GREENHOUS

**Mont-Tremblant**, Qué, 968 m, located 140 km N of Montréal, is the highest peak in the LAURENTIAN HIGHLANDS. The Indians called it *manitonga soutana*, meaning "mountains of the spirits." The present name echoes the Indian legend that climbers feel the mountain tremble beneath their feet. In 1894 the Québec government established the Parc de la Montagne-Tremblante, today Mont-Tremblant. This 2564 km<sup>2</sup> recreational park, S of the Canadian SHIELD, contains a major hydrographic network of 965 lakes, 7 rivers and various streams and small waterfalls. Fishing is one of the park's main activities. The Mont-Tremblant tourist area bordering Lac Mercier, which has an extensive artificial-snow system, attracts skiers from across N America. In 1983 the Promodev Society invested \$25 million in the development and modernization of the area, notably in hotel and condominium construction.

CLAUDINE PIERRE-DESCHÊNES

**Montagnais-Naskapi** live in the eastern and northern portions of the Québec-Labrador Peninsula. They call themselves, and in Labrador are called, Innu ("person"), and are divided into many regional groups (eg, *Uashau Innuts* — the Sept Îles band). The terms "Montagnais" (French for "mountain people") and "Naskapi" (origin uncertain) both appeared in French 17th-century missionary sources. These terms have been used to refer to different groups over time. By the late 19th century "Naskapi" had acquired the connotation of the far northern "unchristianized" group (the native term is *Mushuau Innuts* — "Barren Land People"), while the group known as "Montagnais" primarily inhabited the forest. The total population is now approximately 8000.

The Montagnais-Naskapi are descended from populations that came to Québec-Labrador thousands of years ago. Although they briefly fought the INUIT, the IROQUOIS, the MICMAC and the ABENAKI, they were not a warlike group, and at least some hostility was a side effect of European contact. In the TADOUSSAC region they played an important role in early Canadian history, as military allies of the French, in wars with the British and their Indian allies (see IROQUOIS WARS); CHAMPLAIN formed an alliance with one group in 1608. They also established one of the first known game preserves, and for some years attempted to keep both Europeans and other Indians away from their grounds.

For 2 centuries the FUR TRADE was the focus of their relations with Europeans. Trade at the Gulf of St Lawrence posts was a monopoly of the Crown, first of France and later of Britain, and was leased to private traders. By the mid-1800s most areas were overtrapped, and the Montagnais needed assistance from missions and the government to survive. Soon commercial for-

estry increased their difficulties, and they were excluded from salmon rivers which were leased by clubs and individuals.

Prior to the 1800s most contacts between the Barren Ground subgroup and Europeans were indirect, by trade through neighbouring CREE and Montagnais intermediaries. Life depended on the movements of the Barren Ground CARIBOU. There was a special caribou hunt leader (*Arik Utshimau*) but his authority lasted only for the hunt. Starting in 1830, the HUDSON'S BAY COMPANY opened posts in this northern region, supplied first from Fort Chimo and later from North West River, Labrador. The fur trade had disastrous results, because trapping did not fit with nomadic caribou hunting. Large numbers of people died, some of starvation and others from disease. By the 1950s a still unsettled Barren Ground group was trading at Fort Chimo; sick and starving, they were finally persuaded by the government to settle at the new mining town of SCHEFFERVILLE, Quê.

Although there are strong pressures to abandon the nomadic life, some Montagnais-Naskapi spend part of the winter hunting. Game animals are caribou (for the eastern and northern area), moose (for the west), beaver, bear, lake fish and salmon. The people depend on their ability to travel, using the CANOE in summer, and SNOWSHOES and TOBOGGANS in winter. European items, such as flour, guns and even SNOWMOBILES, are fitted into an essentially native way of life.

The Montagnais-Naskapi developed an intellectually rich tradition on a modest material base. Every part of the caribou was used; the skin was decorated with painted or quill designs to make clothing of many kinds. Drums accompanied sacred singing. A caribou shoulder-blade, burned in a prehunt ritual, was believed to foretell the location of game. This belief in animal spirits played a major role in the hunt. Status was gained mainly through the ability to make gifts of meat to others. After the hunt a ceremonial feast of bone fat, *makushan*, was held. Much of the ancestral religion is recorded in legends. The language is part of the Algonquian family, and was one of the first in N America into which Christian texts were translated.

In the early 1970s the Montagnais-Naskapi organized themselves politically, with the Conseil Attikameg-Montagnais in Québec, the Naskapi Montagnais Innu Assn in Labrador, and the Naskapi of Schefferville. In 1975 this last group was excluded from the Agreement in Principle leading to the JAMES BAY AGREEMENT but negotiated a separate agreement, which provides them with a new village N of Schefferville. The other groups are pressing the government for settlement of their LAND CLAIMS. New creative expressions, such as the books of the first Montagnais author, An Antane Kapeshe, and recordings by singers such as Phillip MacKenzie, have recently appeared, showing that the culture continues to adapt. See also NATIVE PEOPLE SUBARCTIC and general articles under NATIVE PEOPLE.

**Montague**, PEI, Town, pop 1957 (1981c), inc 1917, located 45 km SE of Charlottetown, is a picturesque community divided by the Montague R. Until incorporation, the town was known as Montague Bridge. While the original settlement date is unknown, in 1840 the townsite was occupied by 4 partially cleared farms. Situated on a navigable river that flows into the NORTHUMBERLAND STR, Montague began developing around the mid-19th century as a commer-

cial and shipbuilding centre. Economic ties with the surrounding fertile agricultural region sustained Montague when the shipbuilding industry died later in that century. While it still lacks an industrial base, the town has experienced renewed prosperity with the agricultural revitalization that began in the area in the 1960s. Out-of-province investment has started tobacco farms and rejuvenated the mixed- and dairy-farming industries. Because of its central location, Montague is the commercial centre of southeastern Kings County.

W.S. KEIZER

**Montcalm, Louis-Joseph de, Marquis de Montcalm**, military officer (b at Candiac, France 28 Feb 1712; d at Québec City 14 Sept 1759). Montcalm entered the army at age 9 and served with distinction. In 1756 he was promoted *maréchal de camp* and replaced Baron Dieskau as commander of French troops in N America. He arrived in Québec 13 May 1756 under orders that he was subordinate to VAUDREUIL, the governor general of NEW FRANCE. Vain and contemptuous of colonial authorities and their preference for guerrilla tactics, he developed open hostility to Vaudreuil and labelled the whole administration corrupt. He captured Ft William Henry (Aug 1757), and in July 1758 he conducted a successful defence against a British attack on Ft Carillon. His dispatches to France showed his own efforts to best effect and were critical of Vaudreuil. He was appointed 20 Oct 1758 lieutenant-general — the second-highest rank in the French army. In May 1759 WOLFE and SAUNDERS appeared before Québec. In Sept a series of errors by the French allowed Wolfe to scale the riverbank and land some 4500 men on the Plains of Abraham, less than 2 km from the city. Wolfe's position was threatening but precarious and Montcalm chose the one course of action that could have brought defeat: on the morning of Sept 13 he hastily rushed his troops into battle. The French were routed and Montcalm received a mortal wound from which he died the next morning. Historians have long been at odds with the assessment on the plaque on the Plains of Abraham, of the "gallant, good and great" man. He won some notable victories but suffered the greatest defeat in Canadian military history. See also BATTLE OF THE PLAINS OF ABRAHAM, SEVEN YEARS' WAR.

Marquis de Montcalm, commander of the French forces during the Seven Years' War (courtesy Public Archives of Canada/C-27665).

**Montcalm Construction Case (1979)** *Montcalm Construction Inc v Minimum Wage Commission et al* was concerned with whether or not provincial labour laws applied to the employees of a construction company that had a contract with the federal government to build the landing strips at Mirabel Airport on land belonging to the Crown in right of Canada. The Supreme Court of Canada decided that while aeronautics fell within federal jurisdiction (see AERONAUTICS REFERENCE), the salaries paid by an independent business are so far removed from aerial navigation and use of an airport that the power to regulate the matter could not form an integral part of the primary jurisdiction of Parliament over aeronautics or be tied to the development of a federal operation. The court also ruled that federal lands are not extraterritorial enclaves within provincial boundaries and that valid and generally relevant provincial laws apply to them.

GÉRALD-A. BEAUDOIN

**Montferrand, Jos**, French Canadian of legendary strength who lived in the Ottawa-Montréal region in the early 19th century. He fought many famous boxers of his day, but was particularly active in protecting local Frenchmen from English aggression, once taking on 20 English troublemakers single-handedly. Exploits of extraordinary strength attributed to him include pointing with the plough to give someone directions and leaping so high in a dance that he left the print of his heel on the hotel ballroom ceiling.

NANCY SCHMITZ

Lucy Maud Montgomery, author of *Anne of Green Gables* (courtesy Public Archives of PEI).

**Montgomery, Lucy Maud**, writer, diarist (b at Clifton, PEI 30 Nov 1874; d at Toronto 24 Apr 1942). Raised in Cavendish, PEI, and educated at Prince of Wales Coll (PEI) and Dalhousie, Montgomery was earning money from her pen by the late 1890s. In 1908 her first novel, *ANNE OF GREEN GABLES*, became an instant best-seller. In 1911 Montgomery married Rev Ewan Macdonald and moved permanently to Ontario. She published 7 sequels to *Anne*, the autobiographical *Emily* trilogy and 2 well-received novels for adults. During her lifetime, she published 22 books of fiction, a serialized version of her life, a book of poetry, and approximately 450 poems and 500 short stories. At her death, she left 10 volumes (over 5000 pages) of unpublished personal diaries (1889-1942) — an outstanding record of social history and of a remarkable woman's life.

Writing for a popular market that demanded "happy endings," Montgomery nevertheless managed to depict an infinite number of human frailties, but she softened these with her natural wit, her benevolent view of mankind and her use of the romance structure. Her ear for dialogue, together with her insight into human nature and her choice of universal themes, has made her Canada's most enduring literary export, and red-haired "Anne" has become a world-famous mythic character. **MARY RUBIO**

**Montizambert, Frederick**, physician, public-health official (b at Québec, Canada E 3 Feb 1843; d at Ottawa 2 Nov 1929). Montizambert practised in Québec before entering the Canadian public-health service in 1866. In 1899 he became director general of public health and sanitary adviser to the Government of Canada. He supervised the federal government's disorganized and dispersed health services, published articles on sanitation and studied the use of chaulmoogra oil in the treatment of leprosy. He was a member of many health and medical organizations in Canada, Britain, the US and France. **JANICE DICKIN MCGINNIS**

**Montmagny, Charles Huault de**, called Onontio by the Indians, governor of NEW FRANCE (b in France c1583; d on Île St-Christophe, W Indies c1653). Montmagny succeeded CHAMPLAIN in 1636. His primary concern as governor was defence of the tiny colony; he worked to lay out and fortify Québec C and give some protection to Trois-Rivières. In 1641 the IROQUOIS WARS broke out, and Montmagny built Ft Richelieu (at Sorel, Qué) to counter the threat. In 1747 the establishment of a council (forerunner of the SOVEREIGN

COUNCIL), placed some curbs on the exercise of his powers as governor. **MARY McDUGALL MAUDE**

**Montmorency, Qué**, a village located 12 km E of QUÉBEC CITY, is now part of the municipality of Beauport (pop 60 447, 1981c). The famous 84 m MONTMORENCY FALLS were named in 1603 by Samuel de CHAMPLAIN in honour of the duc de Montmorency, later the viceroy of New France. Gen James WOLFE's troops were defeated on 31 July 1759 on the cliffs of the falls near Courville. The manor, built in 1781 by Frederick HALDIMAND, governor general in chief of Canada 1778-86, known as "Kent House," was inhabited 1791-94 by the duke of Kent, father of Queen Victoria. By the late 19th century, a large textile factory founded in 1889, Montmorency Cotton, located near the falls and served by the CPR, employed most of the local population. It became Dominion Textile in 1905 and still operates. In recent years, after its fusion with Beauport, the area has been turning into a residential suburb of Québec City.

**CLAUDINE PIERRE-DESCHÊNES**

**Montmorency Falls**, located 10 km E of Québec City at the mouth of the Rivière Montmorency, where it empties into the St Lawrence R, is the highest waterfall in the province of Québec and the ninth highest in Canada. The Rivière Montmorency rises in the provincial Parc des Laurentides N of Québec City and courses 100 km before reaching the St Lawrence. The 84 m cataract (30 m higher than Niagara Falls) forms a spectacular cascade as it joins the waters N of the ÎLE D'ORLÉANS. Whether seen from the base or the crest, or from the 1737 m suspension bridge that joins the N shore of the St Lawrence to the Île d'Orléans, the waterfall has captivated visitors since the days of Samuel de CHAMPLAIN. In wintertime the spray from the waterfall creates a "sugarloaf" cone of ice, often 30 m or more high. Tobogganing down the cone was a popular 19th-century pastime. The nearby community of MONTMORENCY (1869) takes its name from the waterfall. The town's industries are fueled by the hydroelectric power developments at the waterfall, and Québec City is provided with power and light from the same source.

The waterfall was first noted by Jean Fonteneau dit Alfonse (who served as pilot in the 1542 expedition of Sieur de Roberval) in his *Cosmographie*. In 1603 Champlain named the waterfall after Henri II, duc de Montmorency, governor of Languedoc and admiral of France, who served as viceroy of New France 1620-25. In July 1759, during the campaign to take all French possessions in Canada, British forces landed near the base of the waterfall and established a fortified camp on the heights to the E. The ensuing Battle of Montmorency (31 July 1759) saw the British, under General James WOLFE, repulsed and forced to evacuate their positions by French forces sent from Québec City. A plaque commemorating this historic event is at the Montmorency church. An enduring tourist attraction over the years, the waterfall has observation points and picnic areas at both its base and crest. **DAVID EVANS**

**Montréal**, located in southwestern Québec, is the metropolis of the province and was the most populous city in Canada for a century and a half. Situated on Île de Montréal, the largest in the Hochelaga Archipelago, at the confluence of the ST LAWRENCE and OTTAWA rivers, it occupies a strategic location on one of the world's greatest rivers, at the heart of a hydrographical system covering all of eastern N America. A major industrial centre, commercial and financial metropolis, railway and maritime bridgehead, and home of francophone culture in N America, Montréal is one of the world's great cities and enjoys international acclaim.

Population: 980 354 (1981c); 2 828 349 (CMA)

Rate of Increase (1971-81): (City) -19.3%; (CMA) 3.1%

Rank in Canada: Second (by CMA)

Date of Incorporation: 1832

Land Area: City 158 km<sup>2</sup>; 2814 km<sup>2</sup> (CMA)

Elevation: 200 m (Mount Royal)

Climate: Average daily temp, July 21.6°C, Jan -8.9°C; Yearly precip 999 mm; Hours of sunshine 1959 per year

Since 1870 the urbanized area has been steadily overflowing the limits of the city proper, despite numerous annexations of suburban municipalities. In 1981 the census metropolitan area included approximately 100 different municipalities, the largest being Montréal-Nord (94 914); Saint-Léonard (79 429); La Salle (76 299) and Saint-Laurent (65 900) on Île de Montréal; Laval (268 335) and Repentigny (34 419) N of Île de Montréal; and Longueuil (124 320) and Saint-Hubert (60 573) on the S shore.

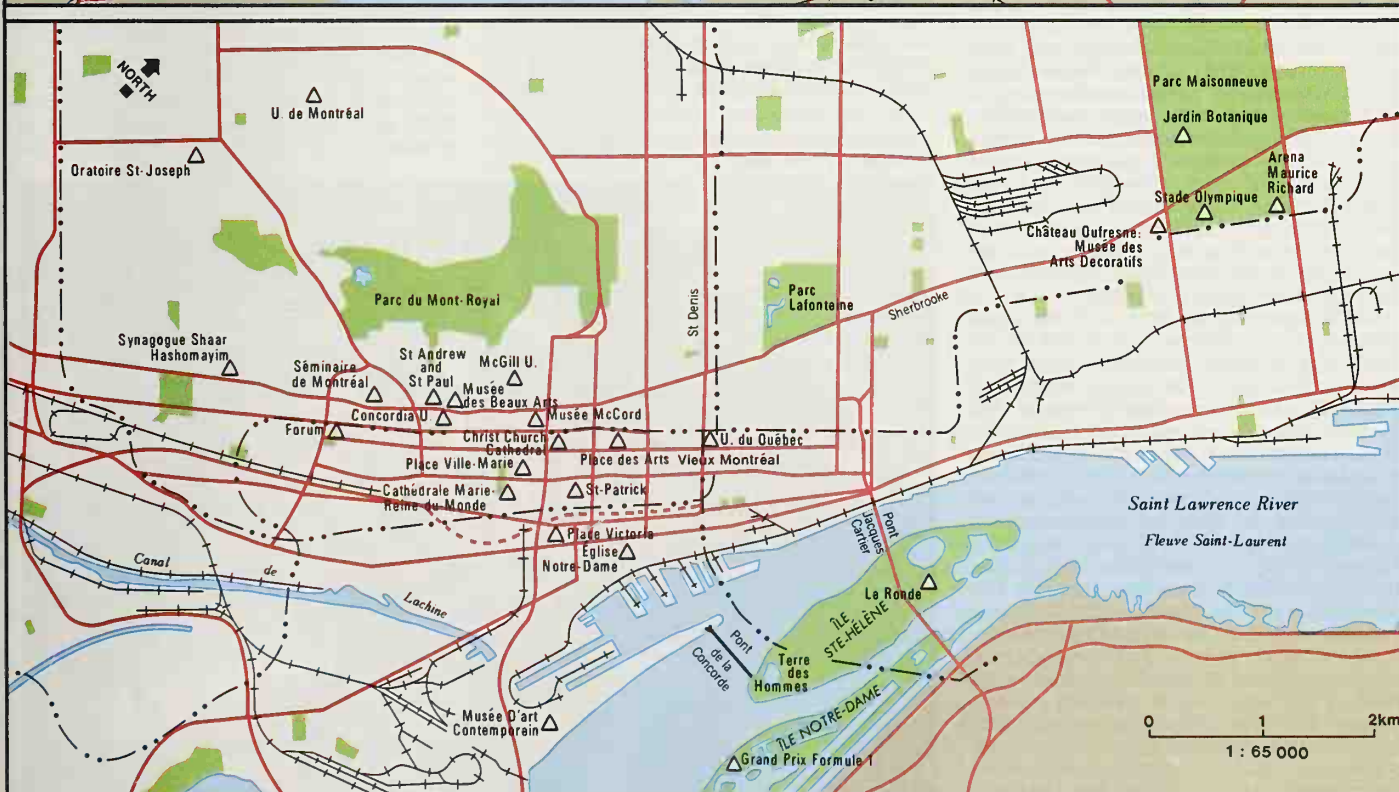

**Settlement** Montréal had difficult beginnings. The initial objective of evangelizing and settling the Indians proved utopian and had to be abandoned. In settling on Île de Montréal, Maisonneuve and his tiny group of colonists were caught in a storm of conflict between Indian tribes for control of the fur supply. A permanent state of war with the Iroquois marked the early decades of the colony's existence (see IROQUOIS WARS). The French military intervention of 1665-66 eased tensions in Montréal somewhat, but it was not until the conclusion of the peace treaty with the Iroquois in 1701 that the climate became more relaxed.

**Development** While QUÉBEC CITY was the administrative capital and the main port where exchanges took place with France, Montréal was a city of the interior, soon to become the great centre of the FUR TRADE, from which the COUREURS DE BOIS and the famous explorers, such as LA SALLE, DULHUT, D'IBERVILLE and LA VÉRENDRYE, set out. They established a network of trading posts to secure furs for Montréal and methodically explored the N American continent from the Gulf of Mexico to the Rockies. Relying upon the labour of the Indians, the fur trade did not provide much employment in Montréal itself. Strong dependence on this single activity and the weakness of the region's agriculture explain why population growth in Montréal was slow. At the end of the 17th century, the city had just over 1000 inhabitants, rising to approximately 5500 in 1789. In addition to the merchants and the coureurs de bois, religious institutions made their presence felt in the life of the community. Among these was the Seminary of Saint-Sulpice, which held Île de Montréal *en seigneurie* for close to 200 years, providing it with priests for the parish church (see SEIGNEURIAL SYSTEM).

After the British conquest (the city surrendered 1760), Montréal's economy continued to depend entirely on the fur trade for several decades. Scottish merchants — Alexander MACKENZIE, the FROBISHER brothers, Simon MCTAVISH, Duncan, Simon and William MCGILLIVRAY, to name only the best known — took the place of francophone merchants. They combined their interests to create the NORTH WEST CO to compete more effectively with the HUDSON'S BAY CO for control of the fur trade of the Northwest. Despite the disadvantage of distance, the Montréal-based firm prospered until it was assimilated by its rival in 1821. The fur trade had played an important role in establishing Montréal's hegemony over the interior. From the end of the 18th century, the city's growth depended increasingly on the settlement of the rural hinterland, both on the plain outside Montréal and in Ontario. The large influx of immigrants from the British Isles, which began in 1815, accelerated the settlement process. By the 1820s its popu-

# MONTRÉAL (45°30' N. Lat. 73°36' W. Long.)

Montréal skyline seen from Mount Royal (photo by G.J. Harris).

lation outnumbered that of Québec City and it had clearly asserted itself as the metropolis. In 1825 Montréal already had 22 540 inhabitants; there were 44 591 in 1844. A dynamic merchant class, engaged in the import and export trade, succeeded the fur-trade magnates. This group created the BANK OF MONTREAL in 1817 and the Committee of Trade in 1822, invested in maritime shipping and, in 1836, began to invest in railways.

Large-scale immigration enabled the residents of British origin to become the majority in the city. Conflict between French and English and struggles for political power marked the 1830s and resulted in the REBELLIONS OF 1837. The defeat of the PATRIOTES gave a political victory to the new anglophone middle class, and after 1840 the francophone leaders had no choice but to agree to co-operate with them. During the following years, fundamental changes took place in transportation and industry. Expansion of the St Lawrence canal system and deepening of the channel to Québec City made Montréal the principal seaport. Railway construction, particularly of the GRAND TRUNK RY, made the city the hub of the railway system. Finally the process of INDUSTRIALIZATION, begun around the middle of the century, was to alter completely the city's face. After depending for generations on trade and commerce for its livelihood, Montréal was becoming a major industrial centre.

Montréal grew rapidly 1850-1914. The population increased to 467 986 in 1911 (828 397 including the suburbs). The city proper overflowed its boundaries and quickly reached the cities in the suburbs, annexing 22 between 1883 and 1918. Industrial growth attracted those in search of employment. French Canadians living in rural areas poured into the city to join the urban proletariat and from 1867 Francophones were again in the majority. Immigration increased dramatically at the turn of the century and Montréal became a more cosmopolitan city. The settlement of the Canadian West was also important for the city's development. The CANADIAN PACIFIC RY established its head office here in the 1880s. Much western grain was shipped through the port of Montréal, considerably enlarged at the beginning of the 20th century. Montréal was then indisputably the metropolis of Canada, and St-Jacques Street was the country's financial centre. Toronto, however, was a powerful rival, and in the long run benefitted

more from western settlement; eventually (around 1970) it took Montréal's place as Canada's centre of economic activity.

After WWI, Montréal saw another period of growth, based on industry, trade, finance and transportation. In 1931 the population of the city and suburbs reached over one million. But the GREAT DEPRESSION brought this period of expansion to a halt and caused grave social hardship. At the Depression's height, in Feb 1934, there were 62 000 unemployed in the city, with 240 000 receiving government assistance. The city administration could no longer pay its expenses and Montréal was placed under trusteeship.

WWII stimulated production and employment and helped restore prosperity. The 1950s and 1960s saw strong growth, supported by a new wave of immigrants and a large exodus of inhabitants from rural areas. This growth was especially apparent in the suburbs, where many new cities sprang up. The downtown area was completely transformed, and in the process the working classes, longtime residents of the area,

had to move elsewhere. Under the leadership of Mayor Jean DRAPEAU, Montréal embarked upon great projects, several on an international scale: the Métro (inaugurated 1966), the International World Exposition (EXPO 67), the 1976 Summer Olympic Games and the Florallies Internationales (1980). These projects were undertaken during a period of relative economic decline, which became more pronounced in the 1970s. Slow growth, combined with the decision of many large firms to move their corporate headquarters to Toronto, caused the city to lose its prominent position, and it was relegated to the level of a regional metropolis. Montréal is nevertheless a great city and its vitality remains as strong as ever.

**Cityscape** Mount Royal, a small mountain of volcanic origin (elev about 200 m), dominates Montréal's landscape. Its graduated terraces mark the city's elevations and also determined its settlement pattern for many years. After a trial period at Point-à-Callière, Montréal's founder, Maisonneuve, moved to the elevated site (25 m) he had chosen along the river on the slopes of the Saint-Louis hill. This was to be the site of Vieux ("Old") Montréal, enclosed for many years by a stockade erected at the beginning of the 18th century. Few visible traces of the early French settlement remain. With few exceptions, the old buildings still in existence date from the 19th century; the area's middle-class residents have made way for warehouses, stores and office buildings. For a long time, downtown Montréal was confined to this area, centered around Notre-Dame and St-Jacques streets. Since 1960, however, the downtown has expanded considerably, and a second pole of activity, to the NW, has grown up along Dorchester St, which is lined with skyscrapers. The most famous is the cruciform Place Ville-Marie (43 stories), inaugurated 1962. This expansion led to the destruction of the city as it had been known. Buildings with great historical value were demolished, ancient residential areas were radically altered and thousands of low-income residents were displaced.

Around this downtown core are residential districts with the highest density of dwellings in the city, dating from the beginning of the century. The houses, built in rows, generally have 2 or 3 stories and much-celebrated outdoor stairways, a trademark of Montréal architecture of this period. On the higher slopes of Mount Royal nestle the well-to-do areas, the cities of Westmount and Outremont in particular. At the

Characteristic outside stairs on houses, Montréal (photo by Harold V. Green/Valan).

mountain's summit are a park and 2 cemeteries. Farther away are the newer districts built just after the war, such as Ahuntsic on the Rivière des Prairies. The density of dwellings is not as high here as in the older sectors. Finally, the vast suburban areas developed in the late 1950s are characterized by the N American-style single-family residence. They cover the western and eastern ends of the island and overflow northward on to the Ile Jésus (Laval) and the N shore, as well as southward onto the vast S shore, the home of over half a million people.

The Montréal landscape is circumscribed by the majestic St Lawrence to the S and the Rivière des Prairies, skirting the N side of the island. Numerous bridges connect the different areas; 15 have been built for automobiles and 5 for railways. In the middle of the St Lawrence is Ile Ste-Hélène, a park for many years, which was enlarged as the site for Expo 67, where the annual exhibition Man and His World is now held. Farther east the imposing shape of the Olympic Stadium (1976) dominates the district of Maisonneuve.

**Population** Since the mid-19th century, Montréal has had 3 distinct decades of rapid growth: 1851-61, 1901-11 and 1951-61. Since 1966 the number of city inhabitants has declined while the population in the suburbs has increased. In 1931, 80% of the metropolitan area population lived in Montréal proper; in 1976 this figure was 39%. The early city limits, established 1792, remained the same for almost a century. After 1883 the annexation of suburban municipalities began. From 1883 to 1918, 22 were annexed; since 1963, 4 more have been added.

Demographic growth has stemmed largely from an influx of people rather than natural

View of Montréal harbour from the Customs House, 1878-80 (courtesy Notman Photographic Archives).

growth. The periods of most rapid growth coincided with the arrival of large numbers of immigrants. The most significant growth, however, was a result of internal migration. British living in Québec rural areas returned to the city, as did an even more significant number of French Canadians. After the war, natural growth was also a major contributing factor. In 1971 natives of other countries accounted for less than 19% of the city's population and only 15% of the metropolitan area population. Most Montréalers are natives of the province (77% born in the city itself). After Paris, Montréal is the largest French-speaking city in the world.

During the greater part of the 19th century, 98% of Montréal's population was of French or British descent. The British were in the majority 1831-67; the French Canadians then regained first place and have since held this position. At the turn of the century, contingents of JEWS from eastern Europe began to arrive, commencing the process of ethnic diversification which accelerated during the 20th century. In 1971 French Canadians formed 64% of the population (city and CMA); the British formed 11% (16% in the CMA); and ethnic groups formed 25 and 20%, respectively. Half this category consisted of ITALIAN or Jewish groups; the remainder was formed of many different ethnic groups. Some of them (GERMANS, POLES, UKRAINIANS, DUTCH) have been in Montréal longer than others. Groups from Southern Europe (GREEKS and PORTUGUESE), Asia and the West Indies arrived afterwards.

**Economy and Labour** After being a city whose economy was based on the fur trade for 150 years, Montréal evolved into a diversified commercial metropolis, focusing on both international trade in basic products and the distribution of manufactured goods. From the mid-19th century, industry played a growing role, and in the 20th century the services sector expanded with the rise of financial institutions, universities, engineering firms, etc. Today, trade, industry and services constitute the main poles of economic activity.

During the last 2 decades, some industrial decentralization has helped a few cities in the suburbs, but the industrial sector remains largely concentrated in Montréal. The principal manu-

facturing industries include food and beverages, clothing, metal products, transportation materials and equipment, and chemical products. Automation brought a drop in manufacturing employment. In 1971 only 15.7% of employable workers in the metropolitan area were directly involved in manufacturing. Administrative work and management functions employed almost 26%, the services sector almost 24%.

**Transportation** Montréal has long been a key seaport in eastern N America. Before the opening of the ST LAWRENCE SEAWAY in 1958, all goods destined for or coming from the Great Lakes had to be transhipped at Montréal. The improvement of navigation above and below the city became a constant preoccupation, beginning with the construction of the Lachine Canal (1825) and the deepening of the channel between Montréal and Québec (1851). Port facilities now extend over 24 km and include 117 berths, which accommodated 4479 ships in 1980. Long a major Canadian grain-exporting centre, Montréal's port has 4 grain elevators with a total capacity of 550 000 t. In recent years the handling of containers has played an increasing role, and 5 terminals have been equipped for this purpose.

Montréal is also closely associated with the history of Canadian railways. The hub of the great transcontinental systems, it is at the head of major lines running S into the US. Canada's main railway companies, CN and CP, have their headquarters here, as does Air Canada. Montréal's 2 international airports are Dorval for Canadian and American domestic flights, and Mirabel for international flights. Saint-Hubert airport is used mainly by private aircraft. Interconnecting expressways, built mostly in the 1960s, crisscross the city and connect with numerous intercity highways. The public bus and subway systems are under the jurisdiction of the Commission de transport de la communauté urbaine de Montréal. The Montréal Métro, inaugurated in 1966, glides quietly underground on rubber tires. Successive extensions brought its length in 1980 to 45.3 km and the number of stations to 52. Another 21.5 km and 22 stations will be added by 1985.

**Government and Politics** Montréal was first granted its charter in 1832. From 1796 municipal affairs had been administered by magistrates not accountable to citizens for their actions. In 1836, with the provincial legislature out of session because of political unrest in

#### Distribution of Industrial Activity\* by Industry Grouping within Census Metropolitan Areas, 1980

#### Industry groupings

1. Food and beverage and tobacco products industries
2. Leather, textile, knitting mills and clothing industries
3. Wood, furniture and fixtures, paper and allied and printing, publishing and allied industries
4. Machinery, transportation equipment and electrical products industries
5. Primary metal and metal fabricating industries
6. Rubber and plastic products, petroleum and coal products and chemical products industries
7. Non-metallic mineral products and miscellaneous manufacturing industries.

\* Industry activity based on the average of percentage shares of the value shipments of goods of own manufacture, total value added and total number of employees for each of the selected metropolitan areas.

Lower Canada, the city charter was not renewed, and the magistrates resumed their role. The city was granted a new charter in 1840. In 1851 election of the mayor was extended to the people, though only property owners and certain tenants had this privilege. In its first decades the council resembled a private club for important Montréal businessmen. After Confederation, 1867, members of the liberal professions (doctors, notaries, etc) settled in the city in increasing numbers.

In the late 19th century, poor administration and corruption at city hall led some businessmen to form reformist groups. After a public inquiry, the provincial government created the "Bureau des commissaires" (4 elected members), limiting councilors' responsibilities to general administration. Financial difficulties led the Québec government to set up a 5-member administrative commission, with full powers to put the city back on its feet. In 1921 city council regained its powers, and in 1940 it was reformed along corporate lines: one-third of the 33 councilors were elected by property owners, another one-third by property owners and tenants, and one-third were appointed by organizations such as the Chamber of Commerce and the universities. The last category was abolished in 1960, and it was not until 1970 that the councilors and mayor were elected by universal suffrage.

In the 20th century, Montréal politics has been dominated by populist mayors who have held office for several terms: Médéric Martin (1914-24, 1926-28); Camilien HOUE (1928-32, 1934-36, 1938-40, 1944-54), nicknamed "Mr Montréal," and Jean Drapeau (1954-57 and 1960 to the present). Drapeau's Parti civique de Montréal (fd 1960) transformed civic political customs, until then practised by somewhat lax interest groups and numerous independent councilors. Since 1960 the Parti civique has held the majority of seats on council, lending cohesion and continuity to the city administration. During the 1970s citizens' committees, trade-union militants and progressive associations combined forces in opposition, winning their greatest number of seats in the 1974 election.

Mayor Drapeau is known for his grandiose projects. A veritable commercial traveller, he promotes the image of Montréal throughout the world. The soaring cost of the 1976 Olympic facilities tarnished his image and brought a halt to lavish spending. During the last few years, the city administration has concentrated more on the quality of urban life and the environment.

Montréal and the suburban cities have long disputed the sharing of costs and responsibilities for urban development. Since 1970 all municipalities on the island have been represented in the Montréal Urban Community, an association with island-wide responsibilities, including police protection, water and sewage services, and antipollution activities. Representatives of Montréal proper have a majority of seats on council and on the Urban Community executive.

**Cultural Life** The presence of a strong francophone population gives Montréal a distinctive character among large N American cities. It is the main centre of expression and diffusion of the French Canadian culture, as well as the meeting place between the French and American cultures. The anglophone minority also has its particular cultural institutions here.

Montréal is an important university centre, with 2 French-speaking universities — UNIVERSITÉ DE MONTRÉAL and UNIVERSITÉ DU QUÉBEC à Montréal — and 2 English-speaking universities — MCGILL and CONCORDIA. The Québec National Library, located here, has copies of all works published in the province. The municipal library has an important collection of Canadiana (Salle Gagnon). The Montreal Musée des Beaux Arts, established over a century ago, contains a general collection; the Musée d'Art Con-

Place Ville Marie, Montréal (photo by Michel Gagné/Reflexion)

temporain collects the works of 20th-century artists. The McCord Museum specializes in ethnology and the history of Canada. The centre for performing arts is Place des Arts (with 3 concert halls), where the Montreal Symphony Orchestra performs. There are also a number of theatre companies in the city.

Montréal has teams in numerous professional sports. The MONTREAL CANADIENS have won the STANLEY CUP more often than any other team and were one of sport's most enduring dynasties. The MONTREAL EXPOS play in the National Baseball League and the MONTREAL CONCORDS in the CFL. The city hosts the annual Canadian Grand Prix, Formula 1, automobile race. Montréal is also a centre for international competitions in amateur sports, the most famous held so far being the 1976 Summer Olympics. The Île de Montréal International Marathon is run annually in Sept.

PAUL-ANDRÉ LINTEAU

**Montreal and Lachine Railroad** began operations 19 Nov 1847 between Bonaventure Station in Montréal and the St Lawrence R. Built to bypass the LACHINE rapids, it was 12 km long. The railway merged with the Lake St Louis and Province Railway in 1850, taking the name Montreal and New York Railroad. In 1857 it amalgamated with the CHAMPLAIN AND ST LAWRENCE RAILROAD under the name Montréal and Champlain Railroad. It was eventually absorbed by the GRAND TRUNK RAILWAY. JAMES MARSH

**Montreal Canadiens**, one of the 4 teams that formed the NATIONAL HOCKEY LEAGUE in 1917. The original franchise was granted to J. Ambrose O'Brien in 1909 and the team played its first game 5 Jan 1910. The team was officially named Le Club athlétique Canadien in 1911 and was composed entirely of French-speaking players until the 1912-13 season. Led by Newsy LALONDE, Jack Laviolette and goalie Georges VEZINA the Canadiens won their first STANLEY CUP 1915-16. The team early on established its reputation for flair, speed and offensive power; in addition to Joe MALONE and Aurél Joliot, it had in Howie MORENZ the most exciting player of the 1920s and 1930s. The Canadiens won the Stanley Cup 1923-24, 1929-30 and 1930-31, but not again until 1943-44 and 1945-46 when the

explosive Maurice RICHARD, goalie Bill DURNAN, Toe BLAKE and Elmer Lach joined the team. The victory in 1952-53 marked the seventh in the Canadiens history to that point, but in 1955-56 the team initiated an era of success unmatched, perhaps, in the history of professional sports. The team won 5 straight Stanley Cups to 1959-60, 4 out of 5 from 1964-65 to 1968-69, again in 1970-71 and 1972-73, and another 4 straight 1975-76 to 1978-79 — an amazing record of 14 Stanley Cups in 24 years. In the same 24-year span, the team finished first in its division 17 times. Individual stars of the period, including Jacques PLANTE, Doug HARVEY, Jean BELIVEAU, Bernie GEOFFRION, Ken Dryden, Larry ROBINSON, Jacques Lemaire, Guy Lapointe, Serge Savard and Guy LAFLEUR, amassed an impressive array of individual awards, including the VEZINA TROPHY (14 times), JAMES NORRIS TROPHY (9 times), ART ROSS TROPHY (8 times) and HART TROPHY (6 times).

The Canadiens moved into the Montreal Forum in 1924 (rebuilt in 1968 at a cost of \$10 million) and are currently owned by Brasserie Molson du Canada Ltée. Throughout its history the Canadiens have been a symbol of pride and excellence for the sporting public of Québec, although they have had less success since their last Stanley Cup in 1979-80 and now share the avid hockey fans of Québec with QUEBEC NORDIQUES.

JAMES MARSH

**Montreal Concordes**, FOOTBALL team. Founded in 1868, the Montreal Football Club was Canada's first organized football team. A later merger with the Montreal Amateur Athletic Association produced the MAAA Winged Wheelers, who competed in the Big Four (Inter-provincial Rugby Union) until 1936 — defeating Regina in the 1931 GREY CUP. In 1946 Lew Hayman established the Montreal Alouettes. They won the 1949 Grey Cup (defeating the CALGARY STAMPEDERS) and, led by quarterback Sam Etcheverry, made 3 successive Grey Cup appearances (all losses to the EDMONTON ESKIMOS) from 1954 to 1956. Etcheverry finally won his Grey Cup in the 1970 game, coaching the Alouettes to victory over Calgary. They faced Edmonton in the final in 1974, 1975 and 1977-1979, winning Grey Cups in 1974 and 1977 under Marv Levy. In 1977 the Alouettes moved

into Montréal's Olympic Stadium (58 367 seats) and, through change of ownership, they were renamed the Concordes in 1982. DEREK DRAGER

**Montreal Expos** The first Canadian team admitted to BASEBALL's National League, the Expos began play in 1969 at Jarry Park in Montréal's north end. The team's principal owner, Charles Bronfman, hired John McHale to oversee the club's operation. The Expos moved to Olympic Stadium in 1977, and in 1979 achieved their first winning season with a record of 96-65, finishing 2 games behind the Pittsburgh Pirates. Memorable moments in the team's history include Bill Stoneman's "no-hitters" in 1969 and 1972, the Expos winning the National League's Eastern division pennant in 1981, and the selection of Gary Carter, Andre Dawson, Al Oliver, Tim Lincecum and Steve Rogers to play in both the 1982 and 1983 All-Star games. Between 1979 and 1983 the Expos attracted over 2 million fans annually, except for the strike-shortened 1981 season, and in that 5-year period earned the best overall winning percentage (.548) in the National League. WILLIAM HUMBER

**Montréal Riots**, the most spectacular moment of which was the burning of the Parliament building on 25 Apr 1849, occurred during a serious economic and political crisis in the PROVINCE OF CANADA. After 1848 the Reformers had formed the government; relegated to the Opposition, the Tories, who were largely anglophone and supported British rule and economic links with Britain, felt threatened by the French Canadian influence in government. Resentment was felt most keenly in Montréal, the capital city, where the population was half English speaking, half French speaking.

In Feb and Mar 1849 when the LaFontaine-Baldwin ministry passed the REBELLION LOSSES BILL, the opposition violently denounced the Act. On Apr 25, at the Tories' instigation, crowds of protesters opposed Gov Elgin's sanction of this law; they threw stones and rotten eggs at his carriage. That evening, public protest turned into a riot: the mob invaded Parliament and set fire to the building. The riots involved thousands of people, lasted 2 days and included attacks on the private property of several Reform leaders, including LAFONTAINE and Hincks. But Gov Elgin's endorsement of the majority decision in Parliament — in effect an affirmation of RESPONSIBLE GOVERNMENT — won the approval of most of the people and of the British government. Less than a month after the riots, however, it was decided that the seat of government should no longer be Montréal, which was considered too susceptible to ethnic tensions. JEAN-PAUL BERNARD

**Montreal Standard** began as a Saturday newspaper in 1905, an attempt to create a Canadian version of the *London Illustrated News*. The initial object was to provide a serious yet lively look at the week's events through photographs and news stories. During WWI, in particular, and to a lesser extent during WWII, this format was both popular and successful. Over time, the *Standard* became less news-oriented and more a feature-filled weekly with comics, recipes and fiction jostling for space with advertising and illustrations. The original broadsheet format changed to tabloid size, but, by the beginning of the 1950s, *Montreal Standard* seemed out of date. In 1951 its publishers conceived the idea of WEEKEND MAGAZINE, and the *Standard's* staff was absorbed into the new periodical. See also MAGAZINES, NEWSPAPERS. J.L. GRANATSTEIN

**Montreal International Competition/Concours international de Montréal**, annual MUSIC COMPETITION held in Montréal for outstanding young musicians from around the world. The organization was incorporated in 1963 with Wilfrid PELLETIER as honorary president and the first competition was held in 1965. Alternating among piano, violin and voice, each competition is restricted to performers 16-30 years of age (piano and violin) and 20-35 (voice). There are 2 preliminary rounds and a final round in which the ORCHESTRE SYMPHONIQUE DE MONTRÉAL often takes part. The rigorous admission standards and the high quality of its juries have made the competition one of the most prestigious in the world. The prize money (\$10 000 first prize) and opportunities for performances with leading Canadian orchestras have attracted superb young musicians. Among contestants who have gone on to highly successful careers are Ghidón Kremer (2nd, violin, 1969) and Ivo Pogorelic (1st, piano, 1980). A special prize is awarded to the best interpreter of a new work by a Canadian composer, especially commissioned for the competition.

**Monts, Pierre Du Gua de**, explorer, trader, colonizer (b at Saintonge, France c1558; d in France 1628). A founder of the earliest permanent French settlements in N America and a close associate of Samuel de CHAMPLAIN, de Monts exerted great influence during the first 2 decades of the 17th century. His first visit to Canada was probably made in 1600 with Pierre Chauvin de Tonnetuit, and in 1603 he received royal patents for the colonization, commercial exploitation and government of Acadia. In 1604 he established a settlement on the Ile Ste-Croix (Dochet I). Forced by climate and disease to move to PORT-ROYAL in 1605, the colony survived and prospered until the revocation of de Monts's fur-trading monopoly in 1607 forced its temporary abandonment. By then de Monts had returned to France and turned his attention to the St Lawrence Valley. Although he never visited N America again, he sent Champlain to found a trading post at Québec in 1608, thus playing a leading role in establishing it as a continuing French settlement. De Monts pursued his commercial interests in Canada until 1617, when he retired to the Ardennes. JOHN G REID

**Moodie, Susanna**, née Strickland, author, settler (b at Bungay, Eng 6 Dec 1803; d at Toronto 8 Apr 1885). Susanna was the youngest in a literary family of whom Catharine Parr TRAILL and

Susanna Moodie (courtesy Public Archives of Canada/C-7043).

Samuel Strickland are best known in Canada. Her struggles as a settler, progressive ideas, attachment to the "best" of contemporary British values, suspicion of "yankee" influence in Canada, and her increasingly highly regarded book, *ROUGHING IT IN THE BUSH*, have made her a legendary figure in Canada.

From comfortable beginnings Susanna and her sisters became precociously engaged in writing, partly for economic reasons, after their father's death in 1818. They produced work for children, for gift books and for ladies' periodicals. Susanna wrote sketches of Suffolk life for *La Belle Assemblée* 1827-28, prefiguring the style and method of her later, best-known book. She moved to London in 1831, where she continued an association begun earlier with the Anti-Slavery Soc, meeting her future husband, John Wedderburn Dunbar Moodie, at the home of the society's secretary. For the society she wrote 2 antislavery tracts, *The History of Mary Prince, a West Indian Slave* (1831) and *Negro Slavery Described by a Negro* (1831), establishing her humanitarianism and sensitivity to the range of character and moral outlook among "respect-

*The Burning of Parliament (1849)*, painting attributed to Joseph Légaré. It is thought that rioters, furious at the passing of the Rebellion Losses Bill, broke the gas mains and that the resulting leak led to the flames (courtesy McCord Museum/McGill University).

able" people. *Enthusiasm: and Other Poems* (1831) also reveals a writer engaged in serious ideas.

After her marriage in 1831, she and her husband emigrated with their first child (of 6) in July 1832 largely for financial reasons — Dunbar Moodie being a half-pay officer and Mrs Moodie being without wealth. Arriving in the Cobourg area of Upper Canada, they attempted to farm in 2 different locations over the next 7 years. Unsuccessful, they removed to Belleville in 1840 after Dunbar was appointed sheriff of Victoria Dist. Emigration and the pioneering years, however, provided Mrs Moodie with material for the *Literary Garland* (Montréal) — material later incorporated in *Roughing It* and drawn upon for her novel *Flora Lyndsay*.

In Belleville Mrs Moodie wrote and published a good deal, much of her output romantic fiction set outside Canada. During 1847-48 she and her husband edited and wrote for the *Victoria Magazine*, intending to supply good literature for the mechanic class — skilled and semiskilled workers. She published *Roughing It in the Bush* in 1852, *Life in the Clearings* in 1853 and *Flora Lyndsay* in 1854 — all 3 concerned with Canada. It is often (incorrectly) remarked that she wrote documentary realism for the British market and romantic adventure for the Canadian market. In fact, she published both in both countries and in the US, but England provided her with more opportunity to publish than Canada did.

*Roughing It in the Bush* is her best-known and best work. It combines her steadfast moral vision, her fascination with differences in character, a willingness to reveal personal weakness and inexperience, considerable psychological insight and a generous measure of wit and playfulness. Together with its sequel, *Life in the Clearings*, it has formed the basis of her reputation.

Mrs Moodie lived in or near Belleville until the death of her husband in 1869, from which time she lived chiefly in Toronto until her own death. R.D. MATHEWS

**Moon**, natural satellite of Earth, with a mean diameter of 3476 km and a mass of  $7.28 \times 10^{22}$  kg (1.23% of Earth's mass). Three moons of Jupiter and one of Saturn are larger; the planet Pluto is smaller. The moon's mean distance from Earth is 384 500 km in an orbit that requires 29.5306 days from one New Moon to the next. The moon shines only by reflected sunlight, appearing as a crescent when it is within 90° of the sun. Except near New Moon, it is second only to the sun in brightness. Tidal effects of Earth have forced the moon's rotation to match Earth's orbital period; hence, one side of the moon always faces Earth and only 59% of its surface is visible. Because it is so close, the moon's influence exceeds the sun's as the cause of tides on Earth. The moon has been important in religion and art from earliest times and was the basis of the lunar calendar (see TIME).

The dark grey lunar surface reflects only 7% of the sunlight it receives (comparable to the reflectivity of black soil). The moon is dominated by thousands of craters, ranging from microscopic pits to gigantic Clavius, diameter 230 km. Water appears to be absent from the moon and the maria (lunar seas) are large lava-flooded craters. Maria, large craters, and almost all small craters are now known to have been formed by the impact of meteorites (or comets) and the mountain chains surrounding some maria are parts of the craters' rim structures. Other surface features include rilles, long cracks or valleys which are typically 100 km long, 1-3 km wide and several hundred metres deep. Rilles are interpreted as tension cracks resulting from the cooling of surface layers. Crater chains consist of small craters (normally along a rille) caused by venting of gas from the interior.

For most people the highlight of the space program was the landing of Apollo 11 ASTRO-

NAUTS on the moon on 20 July 1969. The landing followed a series of unmanned missions by the US and the USSR which provided close-ups of the moon's surface, including pictures of the far side, which is also covered with craters but is deficient in maria. Six American landings and several Soviet probes returned lunar soil and rocks for intensive study. The landings confirmed the absence of both a lunar atmosphere and a magnetic field; chemical studies of the rocks showed that the moon contains less metal than Earth and is deficient in volatile material. The formation ages of the rocks are between 3.1 and 4.42 billion years, which accord with current estimates of the age of the solar system (nearly 4.6 billion years). The maria were flooded 3.1-3.8 billion years ago, filling pre-existing impact basins with younger rocks. Records from seismic instruments left on the moon indicate a small core with an outer fluid layer, surrounded by a mantle and crust.

There are 3 main theories of the moon's origin: it was split off from Earth, shortly after Earth's formation (fission theory); it resulted from the capture by Earth of one or more bodies that had formed elsewhere in the solar system; Earth and moon were assembled in the same region as a double planet. Moon rocks have not resolved the question of origin, although explanations have tended towards some version of the double-planet theory.

Although lunar research has not been a major activity of Canadian scientists, several important contributions have occurred. An extensive program of impact-crater studies initiated by C.S. BEALS at the Dominion Observatory, Ottawa, involved analysis of both lunar and terrestrial craters. In his later years, Beals studied the relative ages of some lava surfaces by counting the frequencies of small craters on photographs obtained from lunar orbit. Geological studies of moon rocks were conducted in government laboratories in Ottawa and the evidence for ancient lunar magnetic fields was found by David W. Strangway (currently at University of Toronto) while working in the US. Lunar craters are normally named after deceased scientists and 10 Canadians are among those honoured in this fashion: Oswald T. Avery, Sir Frederick BANTING, C.S. BEALS, C.A. CHANT, Reginald Alworth Daly, J.S. FOSTER, F.S. HOGG, Andrew MCKELLAR, R.M. PETRIE and J.S. PLASKETT. IAN HALLIDAY

**Moore, Brian**, writer, journalist (b at Belfast, N Ire 25 Aug 1921). Twice winner of the Gov Gen's Award for fiction, he is one of the most accomplished and innovative of 20th-century novelists, giving a painstaking, ironically humorous portrayal of characters at the point of change. In the earlier, "Irish" novels, eg, *The Lonely Passion of Judith Hearne* (1955) and *The Feast of Lupercal* (1957), his forlorn characters struggle in vain to break from their environments. Each of his novels explores the confrontation of past and present on different terms and from the perspective of individually realized characters and examines the consciousness of characters who conjure into fictional reality apparitions from the past. His later works include *The Luck of Ginger Coffey* (1960), *Catholics* (1972), *The Great Victorian Collection* (1975) and *The Mangan Inheritance* (1979). He also wrote *The Revolution Script* (on the kidnapping of James Cross by the FLQ in Oct 1970) and the film script of Alfred Hitchcock's *Torn Curtain*. He lived in Canada 1948-58 and now resides in California, maintaining his Canadian citizenship. GERALD LYNCH

**Moore, Dora Mavor**, actress, teacher (b at Glasgow, Scot 8 Apr 1888; d at Toronto 15 May 1979). After studying elocution at Toronto's Margaret Eaton School of Expression, she became the first Canadian to graduate from London's Royal Academy of Dramatic Art. She

made her professional debut in 1912 in Ottawa, with the Colonial Stock Co, and then joined Ben Greet's Pastoral Players in New York, performing Shakespeare on their CHAUTAUQUA tours. She was with Greet again in 1918, playing Viola in *Twelfth Night* at London's "Old Vic." Returning to Toronto to raise 3 sons, she plunged into teaching and directing amateurs. In 1938 she founded the Village Players which toured Shakespeare to schools. It was the prototype for her non-profit, professional New Play Society which played 10 seasons (1946-56) and produced 72 plays, 47 of which were original. As well as its annual satiric revue *Spring Thaw*, which delighted audiences for 25 years (1948-73), the NPS ran a theatre school (1950-68) which survived the demise of the producing company. Moore was instrumental in bringing Tyrone Guthrie to the STRATFORD FESTIVAL. Toronto's annual theatre awards have been named in her honour.

DAVID GARDNER

**Moore, Keith Leon**, anatomist (b at Brantford, Ont 5 Oct 1925). Educated at Western (PhD, 1954), he joined the staff at U of Man in 1956. In 1965 he became professor of anatomy and head of the department there and in 1976 assumed the same positions at U of T. Internationally recognized for his research in genetics, embryology and teratology, he has served as president of the Canadian Assn of Anatomists and as chairman of the board of the Canadian Federation of Biological Societies. Among the textbooks he has written are *The Developing Human* (1973, rev 1982), *Before We Are Born* (1974) and *Clinically Oriented Anatomy* (1980). A fellow of the International Academy of Cytology and of the Royal Soc of Medicine, he has received awards both for his publications and teaching. T.V.N. PERSAUD

**Moore, Mavor**, actor, playwright, producer, professor, public servant (b at Toronto 8 Mar 1919), son of Dora Mavor MOORE. An artistic polymath, Mavor Moore was born into a distinguished academic and theatrical family. Educated at the U of T Schools and U of T, he served in intelligence during WWII and for the CBC's International Service. After the war, he worked for the UN and UNESCO and in 1950 became chief producer of television for the CBC, a post he held until 1954, all the while continuing his own theatrical writing and composing. He is perhaps best known for the annual revue *Spring Thaw* (est 1948), which he produced to 1966, and for collaborating on Harry SOMERS' opera *Louis Riel*. Moore began to teach at York in 1970 and served the Canada Council as chairman through difficult financial and political times from 1979 to 1983, when he was succeeded by Maureen FORRESTER. J.L. GRANATSTEIN

**Moore, Thomas Albert**, Methodist minister, moderator of United Church of Canada (b at Acton, Canada W 29 June 1860; d at Toronto 31 Mar 1940). After his ordination in 1884, Moore served several Ontario congregations before becoming secretary of the General Conference of the Methodist Church 1906-25 and secretary of the General Council of the United Church 1925-36. A member of the Methodist Church's union committee, he was elected moderator of the UNITED CHURCH OF CANADA in 1932. Moore's managerial skills and evangelistic enthusiasm made him a leader in the fight for social improvement. An honoured and respected spokesman for religious and secular institutions, he toured and preached for religious renewal and moral reform. NEIL SEMPLE

**Moore, Tom**, carpenter, trade-union leader (b at Leeds, Eng 1878; d at Ottawa 6 July 1943). Arriving in Canada in 1909, Moore practised his trade in Niagara Falls, Ont, and served in the carpenters' union as both local official and general organizer for eastern Canada 1911-18. In 1918 he was elected president of the Trades and

Moose (photo by Stephen J. Krasemann/DRK Photo)

Labor Congress of Canada at the head of a slate that opposed radical tendencies in the Canadian labour movement, especially those in western Canada that would form the ONE BIG UNION the next year. He held that office until 1935 and again 1938-43. He served on royal commissions on industrial relations in 1919 and on employment and social insurance in the 1930s. His position also won him a seat at the Int Labour Organization in the 1920s and at other international labour conferences.

CRAIG HERON

**Moore, Frank Duff**, merchant, politician, 2nd premier of Newfoundland 1972-79 (b at Carbonear, Nfld 18 Feb 1933). In 1968 Moores won the federal seat of Bonavista-Trinity-Conception for the Progressive Conservative Party and in 1970 became the leader of the Newfoundland PC Party. The Oct 1971 election ended in a near tie between the Liberals and Conservatives. In Jan 1972, when Liberal Prem SMALLWOOD resigned, Moores was asked to form a new government. He went on to win the 1972 and 1975 elections. In contrast to Premier Smallwood, who followed policies of centralization and industrialization, Moores emphasized rural development and resource control. In 1979 he retired from politics to re-enter private business. In 1983 he was a prominent organizer of the successful PC leadership campaign of Brian MULRONEY.

MELVIN BAKER

**Moose** (*Alces alces*), largest living member of the DEER family (Cervidae). Cows may weigh up to 490 kg and, in Alaska, bulls may reach 600 kg. More commonly, females weigh about 350 kg, bulls about 400 kg. Moose have a black coat; long, stiltlike legs, for wading through deep snow; a humped back; a long face with an overhanging upper lip, large ears and a dewlap of skin (bell) hanging from the throat. Their distribution extends from Nfld (introduced), through NS and NB, W to BC and N to Alaska. Called elk in Europe, they range across the USSR and Scandinavia. Bulls have long, horizontally spreading, palmate antlers, which begin to grow in Apr. Antlers, which remain velvet-covered until Aug and early Sept when they are used for fighting during the breeding season, Sept-Oct, are shed Dec-Feb. In breeding season, cows are vocal; hunters can attract bulls by imitating the female call. Females can breed at 16-18 months and reproduce until 18-20 years old. Calves, often twins, are born in late May and early June. Newborns are an unspotted, light red to reddish

brown colour. Cows will defend young calves against both wolves and humans. Moose inhabit deciduous-coniferous forests across Canada; recently, they have extended their range beyond the TREELINE. In winter moose occupy forests where snow levels are reduced. They browse birch, aspen and willow twigs and, in summer, frequent lakes to eat aquatic vegetation, at times submerging completely. After forest fires moose seek new deciduous growth in regenerating forests. They may damage young conifers by trampling saplings and browsing the growing ends. The moose population is limited by wolf predation, HUNTING and starvation of calves in deep-snow winters. Moose are considered worthy prizes by hunters and naturalist photographers.

A T. BERGERUD

**Moose Factory**, Ont, UP, pop 1452 (1981c), located on an island in the Moose R, 24 km from JAMES BAY and opposite MOOSENEE. Founded (1672-73) by Charles Bayly, it was the HBC's second post and the first English settlement in what is now Ontario. Originally called Moose Fort, it was captured (1686) by the French in a daring overland attack led by de TROYES. It was returned to the HBC 1713 and trading activities resumed 1730. Among the restored buildings at this historic site is the blacksmith's shop (1740), likely the oldest wooden building in Ontario. The altar cloth and liturgical vestments at St Thomas's Anglican Church (1864) are of moosehide. The island is home to a Cree band.

JAMES MARSH

**Moose Jaw**, Sask, City, pop 33 941 (1981c), inc 1903, is located 160 km N of the US border. The city lies in a sheltered valley at the confluence of the Moose Jaw R and Thunder Cr. The city's colourful name is likely based on Indian sources and was first applied to a local creek that supposedly resembled the outline of a moose's jawbone. An agricultural service centre, it is the province's third-largest city. Moose Jaw is governed by a mayor and 10 aldermen elected at large. A provincial agency, the Local Govern-

ment Board, oversees municipal financing. The city's growth was closely tied to the expansion of cereal agriculture. Though it became an important retail, wholesale and industrial centre, Moose Jaw never rivalled nearby REGINA (65 km to the E), which shared the same tributary area. Its greatest periods of growth were from 1911 to 1921 when the population increased 40%, the 1940s with an increase of 17%, and the 1950s with an increase of 36%. For decades the sprawling CPR shops and marshalling yards dominated the urban landscape and remained the lifeblood of Moose Jaw's economy. The conversion to diesel locomotives in the mid-1950s diminished the CPR's presence, however. CFB Moose Jaw, first established as a training facility in 1941, now holds the distinction of being the city's largest employer. The majority of the population is native-born and British in origin. People of German, Scandinavian and Ukrainian origin form the largest non-British elements. The 5 largest religious denominations are United Church, Roman Catholic, Anglican, Lutheran and Presbyterian.

CFB Moose Jaw, the largest jet-training base in Canada, has a military population of 5000, including dependents, and 350 civilian personnel. Moose Jaw is located on the Trans-Canada Hwy, the CPR main line and a branch line of the CNR, and is served by 2 bus lines. Crescent Park, in the heart of the city, is 11 ha in extent and includes the Public Library, the Art Museum and a swimming pool and other recreational facilities. Moose Jaw's educational facilities include the Saskatchewan Technical Institute. The city is served by one English-language TV station, a radio station and a daily newspaper, the Moose Jaw *Times-Herald*.

J. WILLIAM BRENNAN

**Moose River**, 80 km long, is formed by the confluence of the Mattagami and the Missinaibi rivers. About 55 km downstream, it is joined by the Abitibi R, then by the N French R, and flows NE to discharge into the bottom of JAMES BAY in northern Ontario. With its tributaries it drains most of the northeastern part of the province. Once well travelled by fur traders, the river valley today is the site of mining, pulp and paper, and hydroelectric developments. MOOSE FACTORY, Ontario's oldest trading post (est 1673), is located on an island in the river's mouth, opposite the mainland village of MOOSENEE, Ontario's only saltwater port. The Ontario Northland Ry links these settlements to the S.

DANIEL FRANCIS

**Moosonee**, Ont, UP, pop 1433 (1981c), located on the Moose R, 25 km from JAMES BAY. The old fur-trade post, MOOSE FACTORY, lies on an island nearby. The site was chosen as the N terminus of the Ontario Northland Ry, which follows an old Indian canoe route along the Abitibi and Moose rivers. The name was derived from the Cree *moosoneek*, "at the Moose." Moosonee is Ontario's only saltwater port, but high hopes for its prosperity were never realized. Many of the local Indian population are employed as guides for the tourists and hunters who ride the "Polar Bear Express" from COCHRANE.

JAMES MARSH

**Moraine**, landform composed of an accumulation of sediment deposited by or from a GLACIER and possessing a form independent of the terrain beneath it. Moraines are composed primarily of till, an unsorted mixture of clay, silt, sand, pebbles, cobbles and boulders deposited directly from a glacier. Moraines are classified according to their form, origin and position (see GLACIATION). End (terminal), lateral, medial and recessional moraines, composed of ridges of till, are commonly associated with valley glaciers in mountainous areas. Well-developed examples are present on or near the Athabasca Glacier in JASPER NATIONAL PARK. The ice sheets that covered much of Canada during the ICE AGE produced end, recessional, interlobate, hummocky (knob

and kettle) and cross-valley moraines in many parts of the country. Interlobate moraines, such as the Oak Ridges moraine N of Toronto, form between 2 advancing tongues of an ice sheet. Hummocky moraines, composed of irregularly spaced knobs and mounds of till formed by melting glaciers, cover much of the Canadian prairie. Cross-valley moraines form at or very near the margin of a glacier terminating in a lake or ocean. Good examples are present along the shores of Hudson Bay and in Labrador.

N.W. RUTTER

**Moraviantown, Ont.**, a small UP on the Thames R, 75 km SW of London. It was established in the spring of 1792 by a group of Moravian missionaries leading about 150 Delaware Indian converts from the US. Also known as Fairfield, this mission in the backwoods developed peacefully until the WAR of 1812 when it was destroyed during the Battle of Moraviantown (5 Oct 1813), in which the famous Indian leader TECUMSEH was killed. The Indians returned to the site in 1815 and reestablished their village, calling it New Fairfield. During the 19th century, Moravian influence waned and in 1903 the Methodist Church took over the mission; it remains today, carried on by the United Church.

DANIEL FRANCIS

**Morawetz, Oskar**, composer (b at Svetla, Czechoslovakia 17 Jan 1917). Recognized as a leading composer from the mid-1940s when his *String Quartet No. 1* (1944) and *Sonata Tragica* (piano, 1945) won national awards, Morawetz remains one of Canada's most frequently performed composers. He came to Canada in 1940 and studied at U of T; in composition, however, he is self-taught. Romantic by temperament, he has always avoided writing music that "cannot be felt but needs explanation consisting of mathematical formulas." Lyrical melody, lively rhythm, secure polyphony and innovative exploitation of instrumental colour are hallmarks of his style. Graceful works in a happy vein, such as *Carnival Overture* (1946) and *Overture to a Fairy Tale* (1956), are typical of Morawetz's early music. More serious emotional content, as in *Memorial to Martin Luther King* (cello and orchestra, 1968) and *From the Diary of Anne Frank* (soprano and orchestra, 1970), is characteristic of his later work.

BARCLAY MCMILLAN

**Morden, Man, Town**, pop 4579 (1981c), inc 1903, is located 105 km SW of Winnipeg and 20 km N of the international boundary. The area contains fossils of prehistoric wildlife and the ancient sites of Mound Builders, and has received European and Métis explorers, traders and buffalo hunters. Ontarians homesteaded here 1874; Jewish and Mennonite settlers followed. The Morden townsite — named for Alvey Morden, an early settler — was established by the CPR 1881-82, and by 1885 had a thriving business community. The region is well suited to agriculture. A federal research station at Morden is the main prairie centre for horticultural and special crops research. Morden is the major service centre for the region. It has several industries, including farm implement, clothing and kitchen products manufacturers and an epoxy plant. It is the only Canadian site of commercial production of bentonite clay (used in the clarification of vegetable and mineral oils).

D.M. LYON

**Morel, François**, composer, pianist, professor, conductor (b at Montréal 14 Mar 1926). He was one of the few composers to have received his education entirely in Québec, and studied with, among others, Claude CHAMPAGNE and Jean PAPINEAU-COUTURE. His composing career began with *Antiphonie* (1953). With other musicians, including Serge GARANT, he presented groundbreaking concerts of contemporary music during the mid-1950s. He worked for several years

for Radio-Canada as a composer of scores for plays, musical adviser, researcher and program host. In all his work he paid particular attention to rhythmic pulse and orchestration. In 1980 the *Concours international de musique de Montréal* commissioned *Melisma* from him. His other works include *L'Étoile noire*, *Radiance*, *Aux marges du silence* and *L'Oiseau-demain*. In the early 1980s he stopped writing musical scores to devote himself increasingly to conducting. He is chairman of Editions Québec-musique and founder and artistic director of the group Bois et cuivres du Québec.

HÉLÈNE PLOUFFE

**Morenz, Howarth William**, Howie, hockey player (b at Mitchell, Ont 21 Sept 1902; d at Montréal, Qué 8 Mar 1937). He played junior hockey in Stratford, Ont, and joined MONTREAL CANADIENS in 1923. A swift skater, deft stick-handler and prolific scorer, he was a popular idol in Montréal. He helped stir interest in hockey in the US and was traded to Chicago Black Hawks (1934) and then New York Rangers before returning to Montréal (1936). He died as a result of injuries suffered in a game on 28 Jan 1937. His death was mourned across Canada, and thousands filed past his bier, placed dramatically at centre ice in the Montréal Forum. Morenz scored 270 goals and 467 points in 14 seasons, led the National Hockey League in scoring in 1928 and 1931 and was judged most valuable player in 1928, 1931 and 1932.

JAMES MARSH

**Morgan, Henry**, merchant, founder of Canada's oldest department store (b at Saline, Scot 1819; d at Montréal 12 Dec 1893). After apprenticing in a Scottish wholesale house, Morgan came to Canada 1845 and opened a dry-goods store with David Starke Smith on St Joseph Street (now Notre Dame) in Montréal. When Smith retired in 1852 Morgan was joined by his brother James and the firm became Henry Morgan & Co. By 1874 the store employed 150 clerks with each department responsible for its own management, buying and overhead expenses. The business moved several times until in 1891 it found its final location in a large new building at the top of Beaver Hall Hill on St Catherine Street — a move regarded by the Montréal mercantile community as a commercial catastrophe and an unwelcome invasion of a select residential neighbourhood. Convinced that Montréal would expand northward from the waterfront, Morgan was vindicated when his competitors followed him to what would become Montréal's main shopping area. In the 1950s branches of Morgan & Co were opened in many large centres in Ontario and Québec, and a Morgan continued to head the company until it merged with the HBC in 1960.

JOY L. SANTINK

Reading: J.W. Ferry, *A History of the Department Store* (1960).

**Morgentaler, Henry**, physician, abortion advocate (b at Lodz, Poland 19 Mar 1923). The son of Jewish socialist activists killed in the Holocaust, Morgentaler survived Auschwitz and Dachau, arriving in Canada in 1950. He began a general practice in medicine in Montréal in 1955 but by 1969 was devoting all his energies to family planning. He was one of the first Canadian doctors to perform vasectomies, insert IUDs and provide contraceptive pills to the unmarried. As president of the Montréal Humanist Fellowship he urged the Commons Health and Welfare Committee in 1967 to repeal the law against ABORTION.

To draw attention to the safety and efficacy of clinical abortions, Morgentaler in 1973 publicized the fact that he had successfully carried out over 5000 abortions. When a jury nevertheless found him not guilty of violating article 251 of the Criminal Code the Québec Court of Appeal (in Feb 1974) in an unprecedented action

squashed the jury finding and ordered Morgentaler imprisoned. Though this ruling was upheld by the Supreme Court a second jury acquittal led Ron Basford, minister of justice, to have passed a Criminal Code amendment taking away the power of appellate judges to strike down acquittals and order imprisonments. After a third jury trial led to yet another acquittal all further charges were dropped. In Nov 1984 Morgentaler and 2 associates were acquitted of conspiring to procure a miscarriage at the Toronto clinic. A month later the Ontario government announced its intention to appeal the decision made by a Supreme Court of Ontario jury. The treatment of Morgentaler has focused attention on legal procedures as well as the issue of abortion.

ANGUS MCLAREN

**Morin, Augustin-Norbert**, lawyer, politician, judge (b at St-Michel-de-Bellechasse, LC 13 Oct 1803; d at Ste-Adèle, Canada E 27 July 1865). Morin was without oratorical talent, and seemed dimmed by his associates, the brilliant speakers L.J. PAPINEAU and L.H. LAFONTAINE, but it was he who assured the continuity of French Canadian political claims for a quarter century as a member of the Assembly of Lower Canada from 1830 and of the Province of Canada in 1841 and 1842-55. He formed a ministry with Francis HINCKS 1851-54 and with Sir Allan MACNAB in 1855. Morin drafted the 92 Resolutions adopted in 1834 by the Assembly, presenting the members' grievances and arguing for an elected Legislative Council (achieved in 1856) and RESPONSIBLE GOVERNMENT (achieved 1848). In 1852 Morin became the first dean of the faculty of law of the new UNIVERSITÉ LAVAL, which he had helped found. In 1854 he managed to achieve abolition of the seigneurial regime. He sat as judge of the Superior Court 1855-59 when he became a member of the commission that drafted the first CIVIL CODE of Lower Canada. Morin also founded the newspaper *La Minerve* in 1826 and contributed to it for 10 years. He acquired land N of Montréal where he experimented with several crops, notably potatoes.

JEAN-MARC PARADIS

**Morin, Claude**, professor, politician (bat Montmorency, Qué 16 May 1929). A Laval professor 1956-63, he became after 1960 one of the most influential advisers to Jean LESAGE's administration. He was considered one of the prime thinkers behind the QUIET REVOLUTION and held the positions of economic adviser (1960-63), deputy minister of federal-provincial affairs (1963-67) and deputy minister of intergovernmental affairs (1967-71). He resigned after political disagreements with Robert BOURASSA's government to become professor at the Ecole nationale d'administration publique, UQ, and in 1972 joined the Parti Québécois. He was defeated in the riding of Louis-Hébert in 1973 but elected in 1976. As minister of intergovernmental affairs for the PQ government (Nov 1976 to Jan 1982) Morin was a principal architect of the electoral strategy that brought the party to power and of its strategy for the referendum on SOVEREIGNTY-ASSOCIATION and for constitutional negotiations with the federal government (1976-81). He resigned in Jan 1982, returning to his academic career.

DANIEL LATOUCHE

**Morin, Léo-Pol**, pianist, music critic, teacher, composer (as James Callihou) (b at Cap-St-Ignace, Qué 13 July 1892; d in an accident near Lac Marois, N of Montréal 29 May 1941). An ambassador for the French music of his era, he also contributed to the growth of Canadian music. After studying in Québec C and Montréal, he won the Prix d'Europe (1912) and continued his training in Paris. He returned to Canada in 1914 and devoted himself to teaching and concert performances. In 1918 he was one of the founders of Le NIGOG, a music, literature and

fine-arts review. During a second stay in Europe (1919-25) he toured with Ravel (1923); in 1928 he played in a concert given by Ravel in Montréal. Morin first wrote on music for *La Patrie* (1926-29), then made weekly contributions to *La Presse* (1929-31) and *Le Canada* (1933-41). He wrote several harmonizations for folk songs.

HÉLÈNE PLOUFFE

**Morin, Paul**, lawyer, poet and translator (b at Montréal 6 Apr 1889; d at Beloeil, Qué Sept 1963). Admitted to the Québec Bar in 1910, Morin decided to study COMPARATIVE LITERATURE at the Sorbonne, Paris. His doctoral thesis on Henry Wadsworth Longfellow was published in 1913. After briefly teaching literature at McGill (1914-15) and in the US (1915-18) Morin went on to become secretary at the École des beaux-arts, Montréal (1922-30) and, after 1930, a court translator. His translation of Longfellow's *Evangeline* appeared in 1924. In Morin's first collection of poems, *Le Paon d'email* (1911), he most closely followed the Parnassian school, emphasizing the description of scenes and works of art, full of mythological and literary allusions. In his second collection, *Poèmes de cendre et d'or* (1922), for which he won the Prix David, he achieved greater technical perfection and displayed a more personal style. He brought out a last collection, *Gérone et son miroir*, in 1960. His poetry, in sparkling images, was witness to his great concern for form and his lasting fascination with other places, real or imaginary.

NICOLE BOURBONNAIS

**Morine, Sir Alfred Bishop**, lawyer, public figure (b at Port Medway, NS 31 Mar 1857; d at Toronto 18 Dec 1944). Morine's first career was editing newspapers, first in NS and after 1883 at St John's. Journalism launched him into Newfoundland politics, and politics into law. Beginning in 1886, he represented Bonavista in the Assembly for 20 years; he held several portfolios in the late 1890s and became a paid advocate for the Reid Newfoundland Co. In 1898 he was publicly embarrassed and forced to resign because of blatant conflict of interest. From 1906 to 1912 Morine established a Toronto law practice, lost his second mainland bid for election, and chaired the Public Service Commission of Canada (1911-12). He again became MHA for Bonavista 1914-19 and was also minister of justice 1919 and government leader in the legislative council 1924-28. From 1928 he resided in Toronto, writing on Newfoundland affairs and occasionally giving causes such as Confederation his elder statesman's support. He was a leading spokesman for Newfoundland on the FRENCH SHORE question, exemplified the toleration that the public showed to corrupt politicians and wielded great talents with equal persistence. He was knighted in 1928. M. MACLEOD

**Moriyama, Raymond**, architect, planner (b at Vancouver 11 Oct 1929). Educated at U of T and McGill, Moriyama began to practise architecture in Toronto in 1958; in 1969 he went into partnership with Ted Teshima. Moriyama is noted

Scarborough Civic Centre (1973) designed by Raymond Moriyama (courtesy Moriyama & Teshima/Landscape Inc.).

as a designer of monumental civic buildings in which the space pleases the public for whom the buildings are intended, an achievement not always realized in architecture today. His buildings include the ONTARIO SCIENCE CENTRE (1969), Scarborough Civic Centre (1973) and the Metropolitan Toronto Library (1977). His projects, however, have ranged from the design of a Japanese ceremonial bell, the Goh Ohn bell (awarded the Gov Gen's Medal for Architecture, 1982), to a vast planning project in Saskatchewan's Meewasin Valley.

SUSAN FORD

**Mormon Church**, fd 1830 in upstate New York. The Church of Jesus Christ of Latter-day Saints, by far the largest Mormon denomination, is the only one of significance in Canada. Its members regard it as the ancient church of Christ, destroyed through apostasy but restored by divine revelation. Unlike Catholics and Protestants, Latter-day Saints accord sacred value to a continuing record of revelations received through church leaders, as well as to the Bible; and they accept the *Book of Mormon* as the inspired translation of accounts concerning immigrant descendants of the House of Israel in America. They reject the notion of original sin and see men as gods in potential. Within their temples are performed rituals for the living and, by proxy, for the dead. In their concern for relations between the living and the dead, they have developed an immense collection of genealogical records.

Growing rapidly, the original Mormon religious community moved westward. After the 1844 assassination of founder Joseph Smith Jr, its main body was forced by religious persecution to make an arduous journey from Illinois to Utah under Brigham Young. In Utah the doctrine of polygamy, openly adopted, brought Mormons into conflict with American authorities until the practice was officially abandoned in 1890.

From its earliest years the LDS Church had sought converts in British North America. Smith undertook his only foreign missionary work in Upper Canada, and Young was among the first missionaries to go there. Most Canadian converts journeyed S and W to join other Mormons in Illinois, and then in Utah. By the 1880s, church leaders had come to see the Canadian West as suitable for colonization and as a refuge, at least for fugitive polygamists. In 1887 the first Mormon settlers, led by Charles Ora Card, arrived in the North-West Territories [Alberta] and established Cardston. After polygamy ceased to be an issue, the LDS Church sent other immigrants to southern Alberta. They developed the region's first major irrigation system and established the sugar beet industry there. By 1910, when Mormon immigration to Canada had almost ceased, Latter-day Saints formed a majority of the rural population S and SW of Lethbridge, as they do now. Today, while the greater number of Canada's 90 000 Mormons (1981c) reside in cities, CARDSTON retains its significance as the site of Canada's only Mormon temple, although plans were announced in 1984 for a new temple to be built in the Toronto area.

KEITH PARRY

Reading: *A History of the Mormon Church in Canada* (1968); Thomas F. O'Dea, *The Mormons* (1957).

**Morning Glory** family (Convolvulaceae), containing 1200 species of herbaceous PLANTS, is represented in Canada by cultivated common morning glory (*Ipomoea purpurea*) and 3 related species; 11 species of climbing, parasitic dodders (genus *Cuscuta*); and 5 species of bindweed (*Convolvulus*). Common morning glory, less popular as a garden ORNAMENTAL than formerly, persists as a WEED or in waste places. Native to tropical America, it is closely related to the sweet potato. Dodders are leafless, vinelike annuals without chlorophyll. They have orange or reddish threadlike stems that encircle stems of herbs and

shrubs and attach themselves by suckers that tap the host plant for water and nutrients. Once suckers are operational, dodders' roots disappear. Two bindweeds are important weeds in Canada. Field bindweed (*C. arvensis*), a European perennial found across Canada (except possibly Newfoundland and PEI), twines counterclockwise around crop and other plants, and spreads by seeds and underground roots. The white or slightly pink flowers are about 2.5 cm across. Hedge bindweed (*C. sepium*), similar in appearance, has flowers up to 5 cm across.

PAUL B. CAVERS

**Moroni, David Lee**, dancer, teacher, director (b at Ottawa 14 Mar 1938). As founding principal of the Royal Winnipeg Ballet School's professional division, Moroni has made a significant contribution to the quality of dance education in Canada and has helped raise the technical standard of the company itself, into which many of his students have graduated. Moroni trained in Ottawa with Nesta Toumine and danced in her local company before joining the ROYAL WINNIPEG BALLET in 1964 where he became a principal dancer in 1966 and associate artistic director in 1976. In 1970 he retired from dancing to head the company school's newly established professional program. Under the particular tutelage of the great Russian teacher Vera Volkova, Moroni was able to develop a successful academic regime of which celebrated ballerina Evelyn HART is the most distinguished product.

MICHAEL CRABB

**Morrice, James Wilson**, painter (b at Montréal, 10 Aug 1865; d at Tunis, Tunisia 23 Jan 1924). Morrice was one of the earliest Canadian modernist painters and the first Canadian to achieve widespread acceptance abroad. Born of a wealthy and strictly Presbyterian merchant family, he showed an early interest in painting. His father wanted him to enter law and, after studying at U of T and Osgoode Hall, he was called to the Ontario bar in 1889, but never practised. Montréal dealer William Stewart advised him to study abroad and Sir William VAN HORNE, recognizing his talent, persuaded his father to finance his art studies in Europe. He began his studies at the Académie Julian in Paris in 1890 but soon sought individual masters, first the Barbizon painter Henri Harpignies, then the American painter James McNeill Whistler. But it was in Venice, which he visited with Maurice CULLEN in 1896, that the peculiar light effects changed his perception and set him on his course as a painter.

Morrice never returned to live in Canada but each year until his father died in 1914 he visited and painted the extraordinary winter sketches and pictures of Québec City and its environs that represent the Canadian side of his work. Paris remained for many years the centre of his world. He became one of the Left Bank expatriate painters and writers, and frequented cafés such as the Chat Blanc in Montparnasse, where he associated with Whistler and Charles Conder and English writers Arnold Bennett and Somerset Maugham, who portrayed him as a minor character in their books. They record his wit, his bibulous geniality, and his habit of making quick oil studies on small wood panels. These sketches were always the start of Morrice's paintings. He made hundreds, some later worked up into canvases. At first he was influenced by the late Impressionists, notably Bonnard and Vuillard, but from about 1909, when he met Henri Matisse, he moved towards the Fauves, with their more violent colouring and their stronger and more rhythmical composition. At the same time he visited N Africa. There, and in the Caribbean, to which he first travelled in 1915, he encountered the clear, strong tones of his later palette. Yet even at its most opulent, his painting was never strident in

J.W. Morrice, *The Ferry, Québec* (c.1909), oil on canvas. Morrice's winter paintings of Québec are distinctively Canadian in their cold light and stark forms (courtesy National Gallery of Canada).

colour; it never lost his special delicacy and translucency.

The years of WWI were particularly disruptive. The Paris café life dwindled away; he went to London but found the climate difficult. He spent a period as a Canadian war artist and in this role painted a most uncharacteristic work — a mural of an endless line of soldiers marching through the mud of a battlefield. When the war ended, he spent more of his time in countries where the warmth was kind to his health and the colours and light inspired him as a painter. He was critically ill at Montreux, Switzerland, in 1922; when he went on to N Africa the rumour reached Paris that he was dead, and in 1923 some friends organized a retrospective exhibition. He died in reality a few months later.

Morrice's fame in his native country was almost entirely posthumous. Though he was a member of the short-lived Canadian Art Club, 1907-15, and was elected to the Royal Canadian Academy in 1913, he was mainly appreciated by a few fellow painters, and it was not until after his death that the first major exhibitions of his work were held in Canada. In Europe, however, he began to gain recognition in the early 1900s. In Paris, he exhibited regularly at the modernist Salon d'Automne, of which he became a vice-president. The more advanced French painters accepted him, and before Canadian galleries were acquiring his paintings on any scale, his work was moving into the great European public collections.

Morrice was a painter who bestrode 2 worlds. His work finds a place in the European modernist tradition and his tropical paintings have an exoticism of colour and spirit that few Canadian painters paralleled until recently. Yet his winter paintings of Québec, which include some of his most famous canvases, such as *The Ferry, Québec*, and *The Ice Bridge*, are so distinctive in their cold light and stark forms that one cannot think of them as anything but Canadian. They are among the first truly great Canadian paintings.

GEORGE WOODCOCK

**Morris, Man, Town**, pop 1570 (1981c), inc 1883, is located at the confluence of the Red and Morris rivers, 55 km S of Winnipeg. First called Scratching River and later named after Alexander, Morris, Manitoba's second lieutenant-governor, it was the site of fur-trade rivalries in the early 1800s and later a landmark for cart brigades moving between St Paul, Minn, and the RED RIVER COLONY. By the early 1870s Ontarians were homesteading in the area. Morris soon became a busy stagecoach stop between Fargo, N Dak, and Fort Garry. Like other Manitoba towns, it was caught up in the competition for a rail line, offering a substantial bonus to attract the CPR 1882-83. By 1884-85 the town had collapsed under its debt load; it only recovered in the mid-1890s.

The Red and Morris rivers have greatly affected the town, especially during floods in 1950, 1966 and 1979. Morris is a trade centre for a prosperous grain-growing region and has several industries (manufacture of buses, agricultural implements and grain storage bins). Tourism has become important with development of the "Big M" — the Manitoba Stampede and Agricultural Exhibition held in July.

D.M. LYON

**Morris, Alwyn**, canoeist (b at Montréal 22 Nov 1957). He won the K-1 1000 m and K-1 500 m junior national championships in 1977 and was the 1977 recipient of the Tom Longboat Award for top N American Indian athlete. With Hugh FISHER he won a gold medal in the K-2 1000 m (time 3:24.22) and bronze in the K-2 500 m (1:35.41) at the 1984 Los Angeles Olympics. He was in 1984 an outdoor recreation management student at Capilano Coll, N Vancouver.

JAMES MARSH

**Morris, Clara**, stage name of Clara Morrison, née La Montagne, actress, author (b at Toronto 17 Mar 1848; d at New Canaan, Conn 20 Nov 1925), dubbed "the Queen of Melodrama" for her ability to move an audience to tears. Taken to Cleveland as a child, she was a "ballet-girl" in 1860. By 1869 she was a leading lady in Cincinnati and she played Halifax in 1870 before being discovered that Sept in New York by Augustin Daly. She was an overnight triumph in Wilkie Collins's *Man and Wife* and a sensational success as Camille and mad Cora in *L'Article 47*. Even-

tually ill-health curtailed her appearances. She wrote 3 vols of reminiscences, *Life on the Stage* (1901), *Stage Confidences* (1902) and *Life of a Star* (1906), as well as several novels and volumes of stories.

DAVID GARDNER

**Morris, Edward Patrick, 1st Baron Morris**, politician (b at St John's 8 May 1859; d in London, Eng 24 Oct 1935). Morris was elected to the Newfoundland Assembly in 1885. In 1889 he joined Sir William WHITEWAY's Liberal Cabinet. He was especially important to the party as a senior Roman Catholic politician with immense influence in St John's. His relationship with Robert BOND, who succeeded to the Liberal leadership in 1897, was uneasy. They split in 1898 but united in 1900 to take power from the Tories. Morris became minister of justice in Bond's Cabinet but, urged on by Bond's opponents, resigned in 1907 and in 1908 formed the People's Party, which won the 1909 election. Morris had no clear policy other than to keep himself in power, and his government was tainted by accusations of conflict of interest. His popularity waned during WWI as the Opposition capitalized on discontent caused by profiteering and mismanagement. Having formed the first National Government in 1917, Morris retired early 1918 to England, where he was raised to the peerage.

J.K. HILLER

**Morris, Joseph**, labour organizer (b in Lancashire, Eng 14 June 1913). He immigrated to Vancouver 1 where he worked as a woodcutter. He organized for the International Woodworkers of America and rose through the ranks to become president of Local 1-80 (1948) and regional president (1953-62). He was then elected executive VP of the CANADIAN LABOUR CONGRESS until in 1974 he became the congress's president. Morris viewed work in the labour movement as a battle for small gains. Under his leadership, the CLC in 1976 issued a "manifesto" favouring tripartite decision making, and opposed wage controls in a "national day of protest" — the largest organized demonstration in Canadian history. In 1977 Morris was elected chairman of the International Labor Organization. He retired from the congress presidency in 1978.

LAUREL SEFTON MACDOWELL

**Morrison, Donald**, outlaw (b near Megantic [Lac-Mégantic], Canada E c1858; d at Montréal 19 June 1894). He was the son of Scottish settlers, grew up near Lk Mégantic and spent several years working as a cowboy in western Canada and the US. In 1886 he became involved in a financial dispute which resulted in the loss of the family farm to Maj Malcolm McAulay. Believing he had been cheated by the wealthy and influential McAulay, he harassed the new owners, and a special constable, Lucius (Jack) Warren, was engaged to arrest him. On 22 June 1888 Morrison shot and killed Warren in Megantic. After evading capture for some months, largely through the assistance of sympathetic Scottish farmers, he was apprehended on 21 Apr 1889, tried and sentenced to 18 years hard labour. Broken by prison life, he refused food and medication, and died of consumption within 5 years. He became a legendary figure in the Scottish settlements of eastern Québec. His story is romanticized in a poem by Oscar Dhu [Angus Mackay], *Donald Morrison, the Canadian Outlaw* (1892), and is the subject of fictional account by Bernard Epps, *The Outlaw of Megantic* (1973).

EDWARD BUTTS

Reading: M. Robin, *The Bad and the Lonely* (1976); C. Wallace, *Wanted: Donald Morrison* (1977).

**Morrison, James**, "J.J.," salesman, farmer, farm leader (b near Arthur, Canada W, 25 July 1861; d at Toronto 17 Mar 1936). He attended business college in Toronto during 1885 and worked as a salesman until 1900 when he returned to the family farm. He became active in

local educational and farm issues, as a member of the Patrons of Industry and joined the Ontario Grange in 1907. In 1914 he helped plan the development of the United Farmers of Ontario (secretary 1914-33) and the United Farmers Co-operative Company (secretary 1914-35). Morrison organized the delegation of 3000 Ontario farmers that marched on Ottawa in 1918 to protest the government's CONSCRIPTION policy. He also played a crucial role in the Progressive victory in Ontario in 1919, although he declined the premiership in favour of E.C. DRURY. Because he thought the Progressive movement should remain exclusively a farmers' movement, Morrison soon disagreed vigorously with Drury's approach; his obstructionism contributed significantly to the Drury government's defeat in 1923.

IAN MACPHERSON

**Morrison, Mary Louise**, soprano (b at Winnipeg 9 Nov 1926). Studies at the Royal Conservatory of Music brought Morrison to Toronto, where she began her career as an opera singer, appearing with the Canadian Opera Co and on the CBC. She also appeared frequently as soloist with choirs and orchestras in works of the standard repertoire. Morrison is best known, however, as a dedicated interpreter of 20th-century music. She has sung in numerous premieres of Canadian works, many of which, in recognition of her exceptional ability to make avant-garde music enjoyable to audiences, have been specially written for her. Much of her contemporary music performance in Canada and abroad has been undertaken as a member of the Lyric Arts Trio.

BARCLAY McMILLAN

**Morrisseau, Norval**, artist (b at Sand Point Reserve, near Beardmore, Ont 14 Mar 1932). He is a self-taught artist of Ojibwa ancestry (his Ojibwa name means "Copper Thunderbird") and he originated the pictographic style, or what is referred as "Woodland Indian art," "legend painting" or "x-ray art." This style is a fusion of European easel painting with Ojibwa Midewiwin Society scrolls and pictography of rock paintings. Introduced to the Canadian public at the Pollock Gallery, Toronto, in 1962, Morrisseau was the first Indian to break through the Canadian professional white-art barrier. Throughout the 1960s Morrisseau's pictographic style grew in popularity and was often per-

ceived by other Cree, Ojibwa and Ottawa artists as a tribal style, to be adapted for their own cultural needs. By the 1970s younger artists painted exclusively in his genre. For Morrisseau, the 1970s saw him struggling to reconcile native and Christian religions in his art and personal life. The period did enrich his colour palette and saw the introduction of his "stained-glass" icons, variations of his earlier works. It was not until his mid-1970s discovery of the religion Eckankar, which has Eastern and Christian elements, that Morrisseau ceased trying to Christianize his imagery. He created instead a world of non-sectarian, universal consciousness. Morrisseau's brilliance lies in his ability to move away from his own conventions to renew his artistic vision. He constantly returned to his Ojibwa heritage, instilled in him by his maternal grandfather, Moses Nanakonagos.

TOM HILL

*Reading:* Elizabeth McLuhan and Tom Hill, *Norval Morrisseau and the Emergence of the Image Makers* (1984).

**Mortality**, see POPULATION.

**Mortgage**, a legal paper in which borrowers agree to surrender their property to a lender if they do not pay back the money they owe, with INTEREST. If the property is easily movable, eg, a car or a boat, the deal is called a chattel mortgage, but most mortgages involve real estate and are called collateral mortgages. The ordinary way to buy a house in Canada is to raise most of the money by a mortgage loan on the house itself because if the borrowers fail to make their mortgage payments the lender can foreclose the mortgage and take the house and sell it (see BANKING). Lenders try not to write a mortgage for more than the property will bring when sold. Sometimes there is more than one mortgage on the same property, in which case, if the borrower fails to repay, the holder of the first mortgage recovers all his money before the holder of a second mortgage recovers any. As a result, interest rates on second and third mortgages are high. Under the National Housing Act, first passed in 1938 and much amended since, the federal government insures mortgages on moderately priced new houses, cutting the risk and so lowering the interest rate. Mortgages not guaranteed under the NHA — which includes most mortgages on the resale of older homes — are called conventional mortgages. In the 1950s and 1960s, most mortgages lasted 20 or 30 years. Lenders ceased offering such long-term mortgages in the 1970s when interest rates rose rapidly. Most mortgages are now due in one, 3 or 5 years, although even the 5-year mortgages were rare in the early 1980s when interest rates climbed to more than 21%. Banks, forbidden to lend mortgage money before 1954, had written about 33% of the more than \$100 billion worth of mortgages that were outstanding in the mid-1980s.

DON MCGILLIVRAY

**Morton, William Lewis**, historian, professor (b at Gladstone, Man 13 Dec 1908; d at Medicine Hat, Alta 7 Dec 1980). Educated at U of Man and Oxford, Morton combined a lengthy career as a professor of history at U of Man and Trent U with a record of distinguished publications. By the 1950s he had become one of Canada's best-known and most accomplished historians. In his writings he consistently sought to combine his commitment to regional distinctiveness with his concern for elucidating the nature of the Canadian identity, particularly as it was shaped and structured by imperial links with France and England. Among his many books, conservative in tone and interpretation, are *The Progressive Party in Canada* (1950), winner of the Gov Gen's Award for nonfiction; *Manitoba: A History* (1957) and *The Canadian Identity* (1961). *The Critical Years* (1964) was one volume in the Canadian Centenary Series, of which Morton was executive editor. "History is not an academ-

ic mystery," he once wrote. "It's what the community thinks about itself, how it sorts out ideas."

A B. MCKILLOP

**Mosaic** (1967- ), a quarterly magazine devoted to "the comparative study of literature and ideas," founded at U of Manitoba under the editorship of Kenneth McRobbie. It publishes only critical and interpretive essays. Each issue is now devoted to a single scholarly theme, eg, "From an Ancient to a Modern Theatre"; "The Novel and Its Changing Forms"; "The Eastern European Imagination in Literature." An unusual feature of *Mosaic* is that many issues are republished in book form.

GEORGE WOODCOCK

**Mosher, Aaron Roland**, trade unionist (b in Halifax County, NS 10 May 1881; d at Ottawa 26 Sept 1959). In 1907 Mosher led Halifax freight-shed employees on strike. In 1908, when the Canadian Brotherhood of Railway Employees (CBRE) was founded, Mosher was elected its first president, a position he held until 1952. Under his leadership CBRE became the largest Canadian transport-workers' union. As a national industrial union, it embraced employees who were outside the jurisdiction of the craft railway brotherhoods. CBRE briefly affiliated with the Trades and Labor Congress but was expelled at the insistence of a competing international union. Mosher became Canada's foremost exponent of national unionism. In 1927 he became president of the new All-Canadian Congress of Labour. When it was succeeded by the CANADIAN CONGRESS OF LABOUR (1940), Mosher retained the presidency. During WWII, as a labour representative on several government committees, he favoured collective-bargaining legislation and opposed wartime wage controls.

LAUREL SEFTON MACDOWELL

**Mosquito** [Sp, "little fly"], long-legged, fragile FLY of order Diptera, family Culicidae. About 3000 species are known worldwide, at least 74 in Canada. Only females seek blood meals; both sexes feed on nectar. All mosquitoes have a long, slender proboscis (beak), a pair of slender, fifteen-segmented antennae, and densely scaled wing veins. The female proboscis has 6 long, pointed stylets that enter the victim's skin in rapid succession. The female may take 3 times her own weight in blood, using it for egg production. Eggs are laid on water or moist soil. Those laid on soil may hatch after flooding or

About 3000 species of mosquito are known worldwide, at least 74 are found in Canada (artwork by Shirley Stacey).

Norval Morrisseau, *Indian Vision, Man* (nd), tempera on paper. He was the first Indian artist to break the professional white-art barrier (courtesy Glenbow Museum).

remain dormant until the next spring. Eggs deposited in water habitats subject to drying, eg, shallow pools or water-filled containers, can resist desiccation for weeks or months. All larvae are aquatic and, except for a few predaceous species, feed on detritus and microorganisms. Pupae are active, but nonfeeding. Adult life averages 3 weeks in summer, but Canadian species that overwinter as adults in protected places may live 8-9 months. One species may overwinter as larvae in water-filled leaves of purple PITCHER PLANT. In some areas of Canada, these larvae may be ice-bound for 6-7 months. Most species are tropical. They are feared as transmitters of malaria, filariasis and dengue fever (affecting about 0.5 billion people annually). In Canada, mosquitoes transmit human and equine encephalitis viruses and the NEMATODE causing dog heartworm. In northern boreal forests, mosquitoes are serious INSECT PESTS of people and animals. Their bites cause considerable irritation and result in significant blood loss. Mosquitoes present a barrier to northern development by reducing hours spent outdoors for industrial and recreational purposes.

R.A. BRUST

Reading: J.D. Gillett, *Mosquitoes* (1971).

**Moss**, small terrestrial PLANT, usually less than 10 cm tall, that lacks true conducting tissues (xylem, phloem) and has a dominant gametophyte (sexual) generation. Mosses are the largest and most highly developed group of division Bryophyta (which also includes LIVERWORTS and hornworts). Bryophytes are sometimes known as the "amphibians of the plant world" because of their dependence on water for sexual reproduction. Mosses show alternation of generations, ie, have 2 phases in the life cycle. These are the free-living, perennial gametophyte (the typical green moss plant), and the short-lived sporophyte (asexual generation), which remains dependent on the gametophyte. The sporophyte produces spores that are wind-dispersed. Some spores germinate into new gametophyte plants. Gametophyte plants produce sex cells (eggs, sperm) that undergo fertilization to produce another sporophyte. The gametophyte has rhizoids (rootlike structures that attach the plant to its substrate), a simple or branched stem, and small leaves (mostly only one cell thick). The sporophyte has a foot embedding it into the gametophyte and a spore capsule usually borne on a stalk (seta). Some mosses reproduce asexually by gemmae (small groups of cells produced on the gametophyte tissues) or by bulbils (small, deciduous shoots) found in leaf axils. Most mosses can also reproduce by fragmentation, ie, the breaking off of almost any plant part, which then grows into a new plant. Lacking true conducting tissues, mosses mostly absorb water directly through the stem and leaves. Many botanists believe that mosses evolved from primitive vascular plants (ie, those having true conducting tissues). Others argue that they developed from some green algal ancestor. Mosses are thought to be a reduced group, which lost much evolutionary potential by having a dominant gametophyte generation and by lacking specialized conducting tissues (a factor limiting size).

Mosses occur in several growth forms, the more common being turfs, cushions, mats and wefts. Individual plants are usually closely associated and several hundreds may be found in a single turf or cushion. Mosses grow in many places but prefer moist, shady habitats. A few are aquatic (especially water mosses, genus *Fontinalis*); some grow in very dry places (especially granite mosses, *Andreaea*). Common growth surfaces include rocks, trees, rotten wood, humus and soil. The presence of copper mosses may indicate high levels of heavy metals in the substrates. Dung mosses grow only on dung or other nitrogen-rich substrates. PEAT mosses (ge-

nus *sphagnum*) accumulate into deposits that may be several hundred metres thick. Peat is used in horticulture and as fuel. Mosses, an important part of the ground cover in the boreal coniferous forests, are also a conspicuous part of arctic TUNDRA or mountain vegetation. Some mosses are good pioneer colonizers and quickly invade bare or disturbed soil, consolidating it by their dense, turflike growth. There are over 10 000 species worldwide of which about 1250 occur in N America. Individual parts of Canada have fewer species (eg, 466 species in Alberta, 445 in Newfoundland, 430 in Ontario). Mosses thrive in humid climates, and coastal parts of Canada have a greater diversity than do the interior parts.

GUY R. BRASSARD

**Moth**, common name for INSECTS that, with BUTTERFLIES, constitute the order Lepidoptera. Probably over 100 000 species of moths exist worldwide, several thousand in Canada. Moths are distinguished from butterflies by having threadlike or feathery antennae. Most are nocturnal. They vary in size from adults of some leaf miners, with wings spreading little more than 3 mm, to the Asian atlas moth, spreading 20 cm. The related cecropia moth, spreading 12 cm, is Canada's largest. Most moths have mouthparts modified into a coiled proboscis (tongue) for extracting nectar from blossoms.

Moths have 4 developmental stages: egg, larva, pupa and adult. Moth larvae, called caterpillars, are usually plant feeders. Most consume leaves; others feed on roots (eg, ghost moth larvae), bore into tree trunks (carpenter worms), feed beneath surface of leaves, stems or bark thus forming tunnels (leaf, stem or bark miners), or bore into fruits or seeds (codling moth larvae). In many species, larvae live in shelters formed by rolling and tying leaves together (leaf rollers); others build portable cases in which to live (bagworms). Pupae are usually contained in a cocoon, or in a cell in the soil. Although most moth larvae are solitary, some live in colonies, eg, webworms and tent caterpillars. The American tent caterpillar is a periodic pest in fruit-growing areas of eastern Canada. Larvae spin a silken nest in which they congregate when not feeding. Forest tent caterpillars, which feed on broad-leaved trees, do not form an actual nest, but gather in a mass in crotches of tree branches.

The cecropia moth, Canada's largest, has a wingspan of 12 cm (photo by Mary W. Ferguson).

In some years, forest tent caterpillars are numerous enough to damage large tracts of broad-leaved trees.

One family (Sphingidae) of large moths attracts popular interest. It includes hawk or sphinx moths, distinguished by long, narrow wings and rapid flight. Although primarily nocturnal, they often fly at dusk and greatly resemble hummingbirds as they hover, feeding. Larvae of 2 species, tobacco and tomato hornworms, are occasional crop pests. Another family (Tortricidae) of much smaller moths includes economically important species. The codling moth, a pest of apples, bores into fruit, making it inedible. Spruce budworm, the primary problem of Canada's FOREST industry, sometimes destroys vast acreages of conifers. One of the largest families (Noctuidae) includes the owl moths (millers) and many economically important larvae (eg, cutworms). Cutworms hide in the surface layer of soil in daytime and feed on young plants at night, often severing stems at the surface. Several pest species occur in Canada, pale western, red-backed and black cutworms being among the most important. The armyworm, another chronic pest, derives its name from larvae that march en masse from one stand of grain to another. Another group of Noctuidae contains species that bore into flowers and fruits (eg, corn earworm, tobacco budworm). Larvae of another large family (Geometridae) are called geometers or inchworms, from their form of locomotion. This family includes pest species responsible for defoliation of trees (eg, spring and fall cankerworms). Clothes moths, which occur worldwide, are carried from house to house on clothing or other articles of animal origin. Their natural food is hair, wool, feathers, etc.

D.F. HARDWICK

**Motherwell, William Richard**, agrarian activist, politician (b at Perth, Canada W 6 Jan 1860; d at Regina 23 May 1943). An early homesteader in Saskatchewan, he was a cofounder in 1901 of the Territorial Grain Growers' Assn, which under his leadership exacted legislation to curb monopolistic practices by line elevator companies and the CPR. Appointed Saskatchewan's first minister of agriculture in 1905, he was a tireless advocate of techniques that enabled the dry belt to be cultivated effectively; he also helped establish the College of Agriculture. A LAURIER Liberal, he resigned in 1918, largely in opposition to the provincial party's

Motherwell Homestead, near Abernethy, Sask, for 60 years the home of William Motherwell, agrarian activist and politician (photo by John deVisser).

support of CONSCRIPTION. Between 1921 and 1930 he served twice as federal minister of agriculture under Mackenzie KING and initiated important national measures to increase farm production. See MOTHERWELL HOMESTEAD. LYLE DICK

**Motherwell Homestead**, near Abernethy, Sask, for over 60 years the residence of William MOTHERWELL. He homesteaded in what is now Saskatchewan in 1882. The HOMESTEAD is an excellent example of the Ontario settlers' approach to farmstead design and scientific agriculture in the PRAIRIE WEST. To separate the principal functional elements, Motherwell divided the farmstead into 4 quadrants — domestic, garden, water supply and barnyard. To provide protection from the elements, an attractive landscape and a means for trapping snow for spring meltwater, he designed an elaborate shelterbelt system. By building an Ontario-style house and barn, and landscaping a lawn-tennis court and ornamental plantings, Motherwell recreated the feeling of a rural Ontario estate. In 1966 the Canadian government designated the homestead a national HISTORIC SITE, and by 1983 had restored it to commemorate Motherwell's career and the history of scientific agriculture in western Canada. LYLE DICK

**Motorcycle Racing** takes a variety of forms, each with its own rules and specialized equipment. The best known is road racing, in which cyclists race in categories, usually related to engine size, over special circuits or on public highways closed for the occasion. Motocross is conducted on a closed circuit over rough, cross-country terrains and natural obstacles. Dirt-track races are run at speedway tracks. Other forms include time trials, hill climbing, sprints, endurance runs and ice racing. The Canadian Motorcycle Assn was formed in 1946 to organize competition when motorcycling became a popular competitive sport. In 1967 Canada hosted a World Championship Road Race for the first time and a Canadian team participated in the international Six-Day Trials, the "Olympics of Motorcycling." Mike Duff was world-champion Grand Prix driver in the 1960s. In 1972 John Williams, of Markham, Ont, won the World B Division Hill-Climbing Championship. BARBARA SCHRÖDT

**Mount Allison University**, Sackville, NB, was established in 1839 by a local merchant, Charles Frederick Allison. Mount Allison was a boys' academy owned and operated by the METHODIST Church but open to all denominations. It opened in 1843, and a branch institution for girls was added in 1854. Teaching at the college

level began in 1862. In 1875 the university conferred on Grace Annie Lockhart a bachelor's degree in science and English literature, the first baccalaureate awarded to a woman in the British Empire. In 1882 Mount Allison granted to Harriet Starr Stewart the first bachelor of arts degree awarded to a woman in Canada.

Mount Allison is primarily an undergraduate university, awarding degrees in arts, science, music, fine arts, commerce and education, and certificates in engineering and secretarial studies. Although the university is no longer church controlled, it retains close ties with the UNITED CHURCH. Over the years it has preserved the character of a compact scholarly community: by combining a manageable size with excellent facilities (many of the buildings have been constructed since 1960) Mount Allison seeks to provide the best in undergraduate instruction to a largely residential student body. Forty Rhodes Scholars have graduated from Mount Allison since 1900. Admission is highly selective, since the university receives some 2500 applications annually for an average of 500 openings.

Enrolment: Mount Allison University, 1982-83

**Mount Assiniboine Provincial Park** (est 1922, 386 km<sup>2</sup>), area of mountain peaks, alpine meadows and lakes dominated by 3561 m Mt ASSINIBOINE (about 25 km S of BANFF, Alta). Geologically, the area consists mainly of folded limestone rocks sculpted by GLACIATION. The park, which is mainly above 1500 m, has a score of peaks exceeding 2700 m, numerous small lakes (notably Lk Magog), and some underground streams in KARST areas. Climate and vegetation vary with altitude and aspect: near peaks, summer is short and cool and vegetation sparse (eg, mountain avens, saxifrage, arctic willows); lower down, alpine meadows feature numerous wildflowers; between 2100 m and 2400 m, alpine larch, alpine fir and Engelmann spruce occur; below 2000 m, spruce, alpine fir and lodgepole pine are dominant, and open areas feature berries, rhododendron and false azalea. Mammals include wapiti, moose, mule deer, mountain goats, bighorn sheep, bear, wolf, ground squirrel, coyote, porcupine; 66 bird species have been observed (eg, Canada jay, ptarmigan, waterfowl, golden eagles). The area was explored in the early 1800s and brought to public attention in the 1880s by G.M. DAWSON, who named Mt Assiniboine after the Indians who had hunted the area for generations. The Alpine Club of Canada promoted recreation in the area and was instrumental in establishing the park, which was expanded in 1973. Today the park is used mainly for hiking, climbing, horseback riding and cross-country skiing. There are few facilities other than a lodge and cabins at Lk Magog, primitive campsites and trails. Access is mainly on foot or horseback from the Sunshine Village ski area, Spray Reservoir or Highway 93. JOHN S. MARSH

**Mount Carleton Provincial Park** (est 1962, 174 km<sup>2</sup>), comprising part of the Central Highlands of NB, is located 43 km by road ESE of St Quentin. The highlands are complex geologically. Mt Carleton, focus of the park and the highest peak (820 m) in the Atlantic provinces, is a monadnock of resistant rock left after EROSION (including GLACIATION) produced the surrounding valleys and lakes. The varied habitat is dominated by conifers and deciduous species (eg, beech, maple, birch, ash). Mammals include moose, deer and beaver; fish are abundant. Canoe routes of the Indians and French missionaries traversed the area, which was initially

exploited for lumber. Tourists subsequently established fish and game clubs. The area has continued to be popular for canoeing, fishing, camping, hiking and, in winter, cross-country skiing and snowmobiling. Two roads provide access but are sometimes impassable because of adverse weather conditions. JOHN S. MARSH

**Mount Edziza Provincial Park** (est 1972, 2300 km<sup>2</sup>) comprises part of the Tahltan Highlands, between the Stikine and Iskut rivers in BC. The nearest community is Telegraph Creek, 20 km NW of the PARK. The area is a volcanic wilderness that, according to Indian legend and scientific research, has been geologically active within the last few hundred years. Some 30 cinder cones dominate the park landscape, the highest of which, Mt Edziza, rises to 2787 m. Around it is a 640 km<sup>2</sup> lava plateau. To the S are the older, brilliantly coloured and glacially eroded Spectrum Mts. The area experiences great temperature variations, and snow may persist on the peaks throughout summer. Wildlife includes mountain goats, stone sheep and, at lower elevations, mountain caribou, grizzly bear and moose. In the late 1800s, a trail was built across the southern part of what is now the park, through Raspberry Pass, to allow construction of a telegraph line that would link N America, Asia and Europe. Abandoned poles and derelict cabins can still be found along this route. All access to this wilderness is by rough trails that require visitors to be experienced and fully self-sufficient. JOHN S. MARSH

**Mount Everest Expedition** The highest mountain in the world at 8848 m, Mt Everest lies on the border between Nepal and Tibet. It was first climbed in 1953 by New Zealander Edmund Hillary and Sherpa Tenzing Norgay. Since that time, Everest has been attempted by mountaineers from many nations. In 1982 the Canadian Mt Everest Expedition took up the challenge, under the sponsorship of Air Canada. The team consisted of 20 Canadians and 39 Nepalese Sherpas.

Preparations for the climb took 5 years and involved over 100 Canadian companies, who provided nearly 20 tonnes of equipment and food. Special equipment had to be designed and manufactured, including tents made of "bullet-proof" nylon. Over 6000 man-days of food was packed in Canada into daily ration boxes for carrying up the mountain. In addition, preparations were made to send TV signals back to Canada using 3 satellites. (This was the first "live" TV coverage of an Everest expedition.) After a 240 km hike from Katmandu, capital city of Nepal, the expedition arrived at the base of Everest on 15 Aug 1982. Over the next 2 weeks rapid progress was made through the terrifying Icefall and into the Western Cwm ("valley"). By the end of Aug the route had been pioneered to Camp 2 at 6545 m. However, on Aug 31 tragedy struck when a huge avalanche fell across the route in the Icefall, killing 3 Sherpas. Two days later a collapsing ice tower killed cameraman Blair Griffiths.

This double blow stopped the expedition and it was 2 weeks before the climb could proceed. On Sept 22 the climbers established Camp 2 and started work on the upper mountain. Camp 3 was established at 7155 m, and on 4 Oct the final Camp 4 was occupied on the South Col at 7980 m. On Oct 5 the first summit team of 32-year-old Laurie Skreslet of Calgary and Sherpas Sungdare and Lhakpa Dorje left the South Col camp at 4 AM and reached the summit at 9:15 AM after a rapid ascent. Two days later, the summit was reached a second time by 30-year-old Pat Morrow of Kimberley, BC, and Sherpas Pema Dorje and Lhakpa Tshering. The Canadian expedition thus placed 2 Canadians and 4 Sherpas on the summit of Everest on its first attempt in a year marked by very bad weather. JOHN AMATT

**Mount Orford Park**, Qué, est 1938, is a provincial park located near MAGOG. The 57 km<sup>2</sup> park runs along the base of Mounts Orford (881 m) and Chauve (599 m), which lie on the lower Appalachian plateau and are separated from each other by the Rivière-aux-Cerises as it cuts diagonally across the park. The escarpments of the 2 main massifs have made possible the development of a celebrated downhill ski area and the park's huge hydrographic network is ideal for water sports, especially on Stukely and Fraser lakes. The abundant and varied vegetation is part of the Laurentian maple groves. The fauna include a major deer ground and an impressive beaver colony. The Jeunesses musicales du Canada established the Orford Art Centre, a music camp and cultural centre, in 1951. The centre's concert hall, a 500-seat amphitheatre, opened in 1960, and 2 modern residences were added in 1970. The ORFORD STRING QUARTET was formed by 4 students in 1965. CLAUDINE PIERRE-DESCHÊNES

**Mount Pearl**, Nfld, Town, pop 11 543 (1981c), inc 1955, is situated just SW of ST JOHN'S. Originally known as Mount Cochrane, it was an estate awarded to British naval officer James Pearl in 1834 by Gov Cochrane. The estate was subdivided at Pearl's death in 1840. In this century Mount Pearl was the site of Marconi's first experiment in transoceanic wireless telegraphy. Glendenning's Farm, part of the original estate and a government demonstration farm in the 1930s, was the site of an airfield used by aviation pioneers. A popular summer resort in the 1930s, Mount Pearl was developed as an urban centre by the 1950s. A number of large subdivisions were built in the 1960s and the town grew as a dormitory community, which eventually included in its boundaries Newtown and Donovans, a large industrial park. Apart from local services, Mount Pearl depends on the industrial park and the neighbouring city of St John's for most of its commerce and employment.

JANET E.M. PITT AND ROBERT D. PITT

**Mount Revelstoke National Park** (est 1914) is a place of contrasting landscape, varying from rain forests and lush alpine meadows to barren, rocky ridges and GLACIERS. The jagged spires of the Selkirk Range are the backdrop for this 263 km<sup>2</sup> PARK. Grizzly bear and caribou range throughout, while mountain goats frequent the rocky bluffs. Alpine meadows feature pika, hoary marmot and golden-mantled ground squirrel, often under the gaze of the golden eagle. Between Oct and June the park is covered in a thick blanket of snow, but in the brief summer, meadows glow with the blossoms of lupine, aster and Indian paintbrush. The park offers primitive backcountry campsites. Private campgrounds are located nearby on the TRANS-CANADA HIGHWAY. LILLIAN STEWART

**Mount Saint Vincent University**, Halifax, was founded in 1873 as a women's academy. After 1914 post-secondary education was provided by affiliation with DALHOUSIE UNIVERSITY. Mount St Vincent achieved degree-granting status in 1925, becoming the first independent college for women in the Commonwealth. It was totally burnt in 1951, but reconstruction was immediate. It is now a coeducational liberal arts and science facility directed by the Sisters of Charity. Emphasis is on preparing women for decision-making careers through a personalized education within the Roman CATHOLIC tradition. Specialized disciplines include public relations, business administration and child study.

LOIS KERNAGHAN

**Mount Tremblant Provincial Park**, the first in Québec, was established in 1894 and occupies 1248 km<sup>2</sup> of the LAURENTIAN HIGHLANDS about 125 km NW of Montréal. Geologically, the park includes the very old IGNEOUS ROCKS of the Canadian SHIELD and, in the S, the younger SEDIMENTARY

ROCKS of the ST LAWRENCE LOWLANDS, all of which have been glaciated. Two regions can be identified, the massif in the S, rising to Mt Tremblant (968 m), and the northern Great Lakes area, averaging 500 m in elevation. The park includes the watersheds of the rivers St Maurice, Matawin and L'Assomption. The rich vegetation varies with altitude but includes maples, birches and conifers. The abundant fauna includes moose, bear, fox, hare, beaver, many amphibians, 193 species of birds and 36 species of fish (notably trout). The area was used for logging and gradually became popular for summer and winter recreation. The park was reorganized in 1981 into 4 recreation zones accessible by highway, and 3 roadless nature preservation zones. Mount Tremblant is noted for its ski resort but there are other activities in the park. JOHN S. MARSH

**Mount Uniacke**, UP, pop 1145 (1981c), is located in central NS 35 km W of HALIFAX, on the highest point between YARMOUTH and Halifax. Rivers flow from here S to the Atlantic and N into MINAS BASIN. In 1784 Richard John UNIACKE, attorney general of NS, 1797-1830, was granted 400 ha on the Windsor road. He named the home that he built on that land Uniacke House after the home of his Irish grandfather. It was frequented by Halifax high society and visited by the elite of England, such as Edward, duke of Kent, father of Queen Victoria. Now owned by the NS government, it is considered perhaps the most interesting example of colonial architecture in Canada. In 1865 gold was discovered at Mount Uniacke and from 1866 to 1910 the mines were worked. Other industries of this village are lumbering and limited farming. In the past 20 years its population has grown considerably owing to its low tax base and easy commuting distance to Halifax. JEANNIE PETERSON

**Mountain**, native group living on the Mackenzie Mt slopes down to the MACKENZIE R. Historically, various small groups using the eastern slopes of the mountain range have been called Mountain Indians and have traded at all the posts between Ft Liard and Ft Good Hope. Those Mountain trading into Ft Norman since the 1820s have maintained their identity while most others have gradually merged with the native populations using other trading posts along the Mackenzie R. The Mountain are Athapaskan speakers and their language is closely related to HARE and BEARLAK. Historically, the name was probably appropriate for all natives in this region, including the Goat and NAHANI. Most information comes from those who continue to trade and live at Ft Norman.

Although the Mountain have exploited a large expanse of the Mackenzie Mts, from the Redstone R north to the Mountain R, their estimated population (1827-1971) has been less than 150. During the 19th century and aboriginally (according to their own accounts), the Mountain were fearful of and sometimes hostile to all native groups on the western slopes of the mountains. After the KLONDIKE GOLD RUSH (1898), increased contact with Yukon natives gradually reduced apprehensions and some settled and married into Yukon native groups. There is no evidence in oral tradition of hostile encounters with the Indians of the eastern region although contact was infrequent before the FUR TRADE.

The Mountain were almost totally dependent on moose, woodland caribou, mountain goats and Dall sheep. Population cycles or variations in migratory routes sometimes made it necessary to survive on the previous season's caches. This environment was often abundant, but during a bad winter, entire family bands could starve. The area is not rich in fur-bearing animals valuable in the fur trade. Most trade was in dried meat, grease and hides. In the late 19th century the Mountain developed the mooseskin

boat — framed with green spruce wood and covered with raw moosehides sewn together. The boats were usually 12-18 m long and greatly increased the amount of trade goods that could be transported, although they were only functional for the trip down the rivers; people and dogs had to ascend the mountains by foot. This was often done in both spring and fall until the 1940s when dry meat and grease were no longer acceptable trade items. By mid-20th century the Mountain had made Ft Norman their permanent location. They now share their hunting, trapping and fishing areas with other native peoples in the Ft Norman area. BERYL C. GILLESPIE *Reading: Handbook of North American Indians*, vol 6; Subarctic (1981).

**Mountain**, landform with steep sides and narrow summit area that rises prominently above adjacent land. A mountain is higher than a hill and smaller in area than a plateau, but the distinction is relative, depending more on relief (vertical distance from summits to valleys) than on size or elevation (vertical distance above mean sea level). Volcanic mountains or VOLCANOES are built by the accumulation of lava and solid ejecta from a volcanic vent. Erosional mountains are remnants of once larger uplands that have been dissected by streams or glaciers (see GLACIATION). Tectonic mountains have been elevated by crustal disturbances such as folding, faulting or plutonic activity (see PLATE TECTONICS). Most mountains are the product of several processes and their form depends on age, rock type and climate, which influence the type, extent and rate of EROSION. Mt Everest (elevation 8847.7 m), in the Himalayas, is the highest point on the Earth. The highest mountain in Canada is Mt LOGAN (elevation 5949.7 m) in the ST ELIAS MOUNTAINS of the YT. The mountains having the greatest relief on the Earth are the volcanoes of oceanic islands, which rise from the deep ocean floor, eg, Mauna Kea, the highest mountain in Hawaii, which extends 9752 m from the ocean floor. See GEOLOGICAL REGIONS. J.G. SOUTHER

**Mountain, Jacob**, first Anglican bishop of Québec (b at Thwaite Hall, Norfolk, Eng 1 Dec 1749; d at Québec City 16 June 1825). After graduation from Cambridge and 7 years of parish work, Mountain was appointed bishop of the new diocese of Québec in 1793. His episcopate coincided with the Napoleonic struggle and, largely because of the British government's preoccupation with it, Mountain was unable either to persuade those in authority to organize an effective church establishment in Québec or to subject the Roman Catholic Church to a form of government control, policies that he understood had been formulated and pursued after the cession of 1763. Yet Mountain accomplished much. In his episcopate 60 churches were built, including a stone cathedral in Québec City. He defended vigorously his church's claim to the clergy reserves. Between 1815 and 1825, a period of heavy immigration, he opened 35 missions. His clergy increased from 9 to 60, and he was able to augment their scanty stipends. He encouraged a new school system in Lower Canada and obtained a charter for McGill. Under pioneer conditions he made 8 laborious tours of the Canadas, going as far as Sandwich [Windsor].

A splendid preacher, Mountain was respected by colleagues in the Executive and Legislative councils of Lower Canada, with whom he was not always in agreement. He was not without his critics. The Roman Catholic hierarchy was apprehensive of his efforts to elevate the status of his church. Several governors and British colonial secretaries found his repeated demands difficult and even some of his clergy considered him more fitted for an English rather than a colonial see. But, aided by clergy and laity and with assistance from government and especially from the Society for the Propagation of the Gos-

pel, he laid strong church foundations on which his successors, including his son George, later bishop of Montréal and third bishop of Québec, were able to build.

T.R. MILLMAN

**Mountain Ash** (*Sorbus*), genus of small TREES or shrubs of the rose family (Rosaceae), consisting of perhaps 100 species distributed in temperate Eurasia and N America. Plants are deciduous, lack thorns, and have simple or pinnate (featherlike) leaves with 9-11 leaflets. Creamy white flowers form large, flat-topped clusters. Small, red, applelike fruits are much sought after by birds. There are 4 species native to Canada, usually found in moist woods: 2 eastern (*S. americana*, *S. decora*) and 2 western (*S. scopulina*, *S. sitchensis*). The introduced European mountain ash or rowan (*S. aucuparia*) is grown as an ORNAMENTAL from the Queen Charlotte Is to Newfoundland, and often escapes, appearing native. In some reference works, *Sorbus* is included in the genus *Pyrus* (pear). Berries and bark were used as medicine by N American Indians. The wood is easily bent and was used for CANOE frames and snowshoes. Mountain ash is not a true ASH.

Showy mountain ash (*Sorbus decora*), with flowers and fruit. The small red fruits are much sought after by birds (artwork by Claire Tremblay).

**Mountain Avens**, common name for dwarf, trailing or mat-forming shrubs in genus *Dryas* of the rose family (Rosaceae). The genus includes about 4 species found mainly in higher altitudes of the Northern Hemisphere. Three are native to Canada. Furry, evergreen leaves, single, decorative flower and mat-forming ability make mountain avens popular for rock gardens. They may be grown from cuttings, tuft division and from seed, particularly in sandy soil. The very hardy species *D. integrifolia* was chosen (1957) as

Three species of mountain avens are found in Canada, including the hardy species *Dryas integrifolia*, the floral emblem of the NWT (photo by Mary W. Ferguson).

the floral emblem of the NWT, where it is abundant and blooms June-July. It grows on rocky, barren slopes in the mountains of BC and Alberta, and throughout the Territories and the Arctic Archipelago. This species has a corolla of white petals with a yellow centre. See PROVINCIAL FLORAL EMBLEMS.

CÉLINE ARSENEAULT

**Mountain Beaver** (*Aplodontia rufa*), most primitive living member of order RODENTIA. Unlike true BEAVER, mountain beaver has no close living relative. It resembles a tailless muskrat and has a thick-set, heavy body, small ears and eyes, forefeet equipped with long, strong, curved claws for digging, and dense, short, grizzled brown fur. Adult males average 850 g in weight, females 775 g. Mountain beavers breed once annually (Feb-Mar), have a gestation period of 28-30 days and bear 2-3 young. They inhabit moist coniferous forests of the Cascade Mts from southwestern BC to central California. The mountain beaver digs a burrow system in damp, porous soil near streams. Burrow tunnels are 10-25 cm in diameter and 25-150 cm underground. Although several burrow systems may be adjacent, giving the appearance of a colony, the animals are by nature solitary. They do not hibernate and, in winter, eat conifer needles, leaves, tender twigs and bark, often climbing 2.5 m up shrubs and trees to clip branches. In summer they prefer sword ferns, bracken, leaves and various herbaceous plants. They can cause extensive damage by girdling young conifers and shrubs and by eating vegetable crops in gardens.

R. BOONSTRA

**Mountain Goat** (*Oreamnos americanus*), even-toed, hooved MAMMAL of the cattle family (Bovidae), derived during the ICE AGES from the primitive Asiatic goat-antelopes. It is not a true goat but belongs to a tribe ancestral to sheep and goats. The mountain goat, largest and most cold-hardy species of its tribe, is widely distributed in the Canadian western mountains. Adapted to life on steep cliffs where footholds are often covered by snow or ice, it is a slow, methodical climber and compensates for a narrow habitat with wide food habits. Males may exceed 125 kg; females weigh about 15% less. Adult females with kids dominate all other goats, including the largest males. In hard winters such females evict other goats from choice habitat; in mild winters goats remain gregarious. Both sexes have short, curved horns that can inflict severe damage in rare but vicious fights. Male goats are protected by an exceptionally thick hide that, during mating season, swells on the haunches to a thickness exceeding 2 cm. Goats have thin, fragile skulls and do not clash head on. Adult males avoid combat if possible, relying on elaborate dominance displays. They normally withdraw from aggressive females. Males are dominant only at the peak of the mating season. Afterwards, they leave the female ranges or are evicted. One, rarely 2, kids are born in June and are carefully guarded by females. Mountain goats are adversely affected by disturbances and can be easily over hunted, but are rarely preyed on by natural predators.

VALERIUS GEIST

**Mountain Range**, a linear arrangement of mountain peaks and ridges surrounded by adjacent lower land or clearly separated from adjacent ranges by intervening valleys. The mountains of a range are commonly related to a single geological structure or rock formation. A group of related peaks with a circular rather than linear arrangement is called a massif. An array of mountain ranges, massifs and other topographic elements of related origin comprise a mountain system, and several systems a CORDILLERA. The Cordillera of western N America extends from Mexico to Alaska and includes about 20 mountain systems each composed of many mountain ranges. The Earth's major

Mountain goat (*Oreamnos americanus*), the largest and most cold-hardy species of its tribe, is widely distributed in the mountains of western Canada (photo by Wayne Lankinen/DRK Photo).

mountain systems lie along the margins of crustal plates where concentrated tectonic forces have caused uplift, deformation and igneous activity (see PLATE TECTONICS). Individual mountain ranges may be formed by volcanic eruptions or, more commonly, by differential erosion of an uplifted terrane. When rapid uplift is accompanied by slow erosion, a plateau results. If erosion keeps pace with uplift, streams and GLACIERS erode away less competent rock, leaving more resistant rock standing as mountain ranges between the valleys. The long, narrow ranges of the ROCKY MOUNTAIN system of western Canada reflect the structure of resistant beds of folded and faulted sedimentary strata; the broader ranges and massifs of the Coast Range of BC were etched by water and glacier ice from an uplifted, granitic terrane of more uniform resistance to erosion. The relief and ruggedness of a mountain range depends on its age. The precipitous, very young ranges of the ST ELIAS MOUNTAINS in the southwestern YT, where rapid uplift is still proceeding, include the highest individual peaks in Canada. Uplift of the somewhat less rugged Rocky Mts began to decline after an episode of deformation about 70 million years ago. The subdued topography of the ancient Appalachian Mts is the result of erosion during the 150 million years since the last major uplift and deformation in eastern Canada. Submarine mountain ranges, which rise from the ocean floor along mid-ocean ridges, such as the mid-Atlantic Ridge and East Pacific Rise, are of

Marmolata, Pigeon and Snowpatch spires, left to right, in the Purcell Mts, BC (photo by Pat Morrow).

volcanic origin. On the moon and planets that have little atmosphere, such as Mercury and Mars, circular or crescent-shaped mountain ranges around impact craters have survived for hundreds of millions of years without being destroyed by erosion. See GEOLOGICAL REGIONS; VOLCANO.

J. G. SOUTHER

**Mountain Sheep**, highly successful, medium-sized, even-toed MAMMALS of the cattle family (Bovidae), genus *Ovis*, comprising some 37 races in Eurasia and southern N America. SHEEP colonized N America during the last GLACIATION but remained rare until after the extinction of many large American mammals, about 11 000 years ago. In Canada, 2 species, each with 2 races, are recognized. Bighorns (*O. canadensis*) include the California bighorn in the arid ranges of south-central BC and the larger Rocky Mountain bighorn in the Canadian Rockies. Thinhorn or Dall sheep (*O. dalli*) occur in the territories and northern BC. One race, black Stone sheep (*O. d. stonei*), is confined to Canada. Many sheep are glacier followers, doing best in cool, dry, sunny mountains within sight of snowfields. They vary greatly in size, reflecting the quality of their habitat. Large bighorn males (6 years or older) weigh about 110-120 kg in autumn; large females, 60-70 kg. Thinhorns weigh about 20% less. Fully grown males carry the largest horns relative to body size of horned mammals. These may measure over 115 cm, and weigh 10-12 kg. Horns are used like sledge hammers in fighting, as shields, and as symbols of rank among older males. A single lamb is born in late May or early June. In Canada, sheep are not endangered and respond well to wildlife management.

VALERIUS GEIST

**Mountaineering** is the practice of climbing in mountainous terrain for pleasure or research. Although it is usually associated with dangerous assaults of formidable summits, there are several elements to the activity, each often pursued for its own sake. Many people restrict their mountaineering to hikes in the lower regions of the mountains; others specialize in steep rock climbing, whether it be a 5 m boulder or a 1000 m cliff; others prefer climbing snow and ice; and yet others combine all 3 elements to stand atop the great alpine peaks of the world.

People have climbed mountains for centuries, either for religious reasons or simply to see better the surrounding land, but mountaineering as recreation is less than 150 years old. Towards the middle of the 18th century, European naturalists turned their attention to the glaciers of the Chamonix Valley of France, and their studies, combined with the Victorian era's interest in natural phenomena, gave birth to a general fascination with mountains. The earliest climbs in the mid-European Alps, such as Mont Blanc in 1786, were undertaken in the name of science, but by the early decades of the 19th century the Germans, French and Swiss were pursuing summits simply for pleasure. It remained for the British, however, to popularize the sport. During mountaineering's golden age — the years between 1854, when Alfred Wills climbed Switzerland's Wetterhorn, and 1865, when the combined teams of Edward Whymper and Rev Charles Hudson conquered the Matterhorn — more than 60 of the most difficult, spectacular climbs in the Alps were made for the first time, primarily by British climbers.

Within 15 years of the Matterhorn ascent, all the Alps of consequence had been scaled, and mountaineers began to look for new challenges. Some tackled more difficult routes up mountains previously ascended, and others explored new mountain ranges — the Andes of S America, the Caucasus of Russia, the Himalayas, the mountains of Africa and the western mountains of N America. The completion of the CPR in 1885 opened the SELKIRK MTS and the ROCKY

The thinhorn, or Dall, sheep (*Ovis dalli*), found in the territories and northern BC (photo by Stephen J. Krasemann/DRK Photo).

MTS of Canada, and they became the first ranges on the continent to be systematically explored for their mountaineering potential. Glacier House, below ROGERS PASS in the Selkirks, was an internationally recognized meeting place for climbers in the late 1880s and early 1890s, but its popularity was soon overshadowed by Lk Louise in the Rockies. To promote mountaineering in the western ranges, the CPR employed Swiss climbing guides for its clientele from 1899 to 1912. The Alpine Club of Canada, modeled after Britain's prestigious Alpine Club (1850), was formed 1906 and published its first journal the next year.

Most of the early climbing in the Selkirks and Rockies was done by British members of the

Towards the summit of the Bugaboo Spire in the Purcell Mts, BC (photo by Pat Morrow).

Alpine Club or by American members of the Appalachian Mountaineering Club of Boston. Phillop Abbot, a young lawyer, was climbing with a party from the AMC in 1895 when he fell from the icy flanks of Mt Lefroy above Lk Louise to become N America's first mountaineering casualty. Landmark climbs of the early years include Mt Sir Donald in 1890, Mt Temple in 1894, Mt Lefroy in 1897 and Mt ASSINIBOINE in 1901. Mt ROBSON, at 3954 m the loftiest of the Rockies, was not successfully climbed until 1913, after attempts by 5 separate parties dating from 1908.

Although the Rockies have remained internationally popular with climbers to the present day, the quest for new terrain carried climbers throughout Canada's North and West in the 1920s. In 1924, inspired by a daring British attempt on Mt Everest, the Alpine Club of Canada sponsored a climb of 5949.7 m Mt LOGAN, the highest elevation of Canada and second highest of the continent. In May 1925 a team of climbers under Albert McCarthy entered the ST ELIAS MTS on the boundary between Alaska and the Yukon Territory. After 2 months among the highest, most glaciated mountains in N America, the men emerged to say they had reached the summit on the afternoon of June 23. Two years later, a first attempt was made on Mt WADINGTON, at 3994 m the most impressive peak of the COAST MTS of BC. Despite repeated assaults, however, the summit remained untouched until 1936, when 2 Americans inched their way up the S face, at that time the hardest rock climb in N America.

Although Canada's mountains have been internationally famous for decades, Canada has produced few international mountaineers. During the late 1950s and early 1960s, however, many fine British- and European-born climbers settled in Canada, and under their tutelage a core of excellent Canadian climbers has emerged. Using refined climbing techniques and modern technological aids, the new generation has been quick to attempt increasingly difficult climbs on well-known mountains — winter ascents of the great N walls of the Rockies, or the knife-edge ridges and soaring buttresses of Mt Logan, for example — or untried peaks in places as far-flung as BAFFIN and ELLESMERE islands. Canadian centres of mountaineering activity include Montréal, Calgary, Banff and Vancouver, and climbers from those locations are rapidly extending the limits of both rock and waterfall ice climbing.

Canadians are also beginning to make their presence felt abroad. In 1977 the First Canadian Himalayan Expedition successfully negotiated Mt Pumori (7131 m), and in 1981 another team struggled to the summit of Dhaulagiri to become the first Canadians to stand atop an 8000 m peak. The most ambitious undertaking of the early 1980s, however, came in late Aug 1982, when a team of 16 climbers, under Bill March of Calgary, left Katmandu, Nepal, bound for Mt Everest. More than a month later, on Oct 5, Laurie Skreslet of Calgary became the first Canadian to stand on top of the world's highest mountain, followed 2 days later by Pat Morrow of Kimberley, BC. See MOUNT EVEREST EXPEDITION.

BART ROBINSON

Reading: R.W. Clark, *Men, Myths and Mountains* (1976); Chris Jones, *Climbing in North America* (1976).

**Mouse**, common name for several RODENTS of suborder Myomorpha, 11 species of which are found in Canada. Six are New World mice of the Cricetidae family: western harvest mouse, *Reithrodontomys megalotis*; DEER MOUSE, *Peromyscus maniculatus*; Cascade deer mouse, *P. oreas*; Sitka mouse, *P. sitkensis*; white-footed mouse, *P. leucopus*; and northern grasshopper mouse, *Onychomys leucogaster*. Four belong to the Dipodidae family: Pacific, western, meadow and wood-

land jumping mice (*Zapus trinotatus*, *Z. princeps*, *Z. hudsonius*, and *Napaeozapus insignis*, respectively). One species of the Old World Muridae family, the house mouse (*Mus musculus*), was introduced by the first colonists. The familiar field mouse is actually the meadow vole. The western harvest mouse is the smallest, only 13 cm long including the tail. The largest, the western jumping mouse, measures 25 cm. Meadow jumping mice, deer mice and house mice are common throughout Canada. Sika mice occur on the smaller Queen Charlotte Is. Cascade deer mice are limited to southern interior BC. Other species inhabit larger areas but are also limited to specific regions. Mice occur in forest and field but habitat varies with species. Most mice are primarily granivorous; in contrast, northern grasshopper mice are insectivorous. All mice are nocturnal. Some species remain active throughout winter, while others hibernate. House mice reproduce throughout the year, but most species are sexually active only from spring to autumn, generally producing several litters during the period. Mice are prey for various birds, mammals and snakes. Although certain species do not affect the economy, other granivorous species damage crops and reforestation projects. JEAN FERRON

By the time his 25th book appeared in 1979, Farley Mowat was reputedly Canada's most widely read author (photo by Ron Watts/First Light).

tract popular support for a cause. Mowat defines his approach as "subjective nonfiction," countering critics who point to factual errors and biases with the rejoinder that he "will never let facts interfere with truth." His influence has been enormous: his books on the Arctic and N Atlantic regions have dispelled myths about native peoples, animals and survival under hostile conditions; he has raised public awareness of the hazards of upsetting natural ecosystems with technology.

Mowat is praised as "a natural storyteller" but his work displays more stylistic variety than the epithet implies. His fast-paced narratives and anecdotes are framed by prose that is graceful, personal, near conversational. His commitments to causes inspire verbal fireworks: enthusiasms produce poetic descriptions and images; antipathies evoke ridicule, lampoons, and, at times, evangelical condemnation. Although he has never written a novel, his books are essentially autobiographical or dominated by his authorial presence. His best children's books, *The Dog Who Wouldn't Be* (1957) and *Owls in the Family* (1961), recall his youth in Saskatoon; *The Regiment* (1955) and his acclaimed *And No Birds Sang* (1979) recount his WWII military experiences. His range is perhaps best epitomized in his 3 books related to his 8-year residency in Burgeo, Nfld. *The Rock Within the Sea* (1968) presents his seafaring neighbours as exemplars of uncorrupted (by technology) modern man; his comic *The Boat Who Wouldn't Float* (1969) transforms his disillusion at Burgeo into laughter; *A Whale for the Killing* (1972) views the wanton shooting of a trapped whale as a symbolic tragedy. *Sea of Slaughter* (1984), Mowat's first book after a 5-year hiatus, chronicles the destruction of endangered species. GERALD J RUBIO

**Mowat, Sir Oliver**, politician, premier of Ontario (b at Kingston, Upper Canada 22 July 1820; d at Toronto 19 Apr 1903). Mowat was privately educated in Kingston before becoming John A. MACDONALD's first articulated law student. He was admitted to the bar in 1841 and quickly became a successful equity lawyer in Toronto. Mowat was brought up a Conservative, but as an adult opted for the Reform Party. After a brief interlude in Toronto municipal politics he sat in the Assembly of the Province of Canada

1858-64 where he was a prominent Reform leader. He served as provincial secretary in the brief administration of George BROWN and A.A. DORION in 1858, was postmaster general in the Sandfield MACDONALD-Dorion regime in 1863-64, and returned to that portfolio during the GREAT COALITION of 1864. Mowat, as an active participant in the QUEBEC CONFERENCE, was a FATHER OF CONFEDERATION. In Nov 1864 he was appointed chancellor of Ontario, a post he held until 1872 when he succeeded Edward BLAKE as premier. He served as premier and attorney general until 1896 when he was appointed to the Senate and became federal minister of justice. Knighted in 1892, he left Ottawa in 1897 to become Lt-gov of Ontario.

Mowat's greatest contribution was made as premier. A skilful electoral politician, he built a pragmatic and moderate Liberal Party, representative of all Ontario — Protestant and Catholic, rural and urban. Under Mowat's leadership, Ontario came of age economically, socially and politically. Agriculture was modernized, the importance of industry recognized, educational and scientific areas cultivated, urban problems addressed and trade unions accepted as part of the society. Substantial government regulation became part of Ontario life and numerous social programs were introduced. Mowat and his government also contributed to the definition of Canadian FEDERALISM. He was Canada's first important provincial-rights advocate and, through a series of successful legal and political battles with John A. Macdonald and the federal Conservative government, altered Macdonald's concept of Canada as a highly centralized state with the provinces weak and dependent. Moreover, Mowat and his colleagues established Ontario as the dominant province within Confederation. Ontario's resources were increased by expansion into northern territories and its boundaries substantially enlarged after a protracted dispute with the federal government. Good management of the key economic sectors of agriculture, industry and resources made it the richest province and it is fair to describe Mowat's tenure of office as the era of the emergence of modern Ontario. DONALD SWAINSON

Reading: Donald Swainson, ed, *Oliver Mowat's Ontario* (1972).

**MP**, see MEMBER OF PARLIAMENT.

Oliver Mowat, shown in 1869, was Ontario's premier (1872-96) during the emergence of modern Ontario. He was an early advocate of provincial rights (courtesy Public Archives of Canada/PA-28973).

**Mousseau, Jean-Paul-Armand**, artist (b at Montréal 1 Jan 1927). After studying painting and interior decoration (1941-46), he studied under Paul-Émile BORDUAS (1946-51). In 1946 he joined Borduas and 5 students in the first group exhibition of abstract art held in Montréal. He was one of 16 to sign the REFUS GLOBAL (1948) and participated in all AUTOMATISTE exhibitions. During the mid-1950s he became interested in experimental work having elements in common with what the PLASTICIEN group was doing. By the mid-1960s, however, he had abandoned painting. His long-held belief that art must not be isolated from daily life led him into designing costumes, jewellery and posters, as well as into theatrical and interior design, sculpture and mural designs. In his 1961-62 murals for Hydro-Québec (Montréal) he used such nontraditional media as fibreglass, plastic resin and neon lighting. Mousseau being one of the most daring exploiters of new media and techniques during the early 1960s. He has concentrated on collaborating with architects, and his courses at the École des beaux-arts in Montréal and at Laval have explored the integration of colours, textures, materials and lighting into architecture. BRIAN FOSS

**Mousseau, Joseph-Alfred**, lawyer, journalist, writer, politician, judge (b at Berthier-en-haut, LC 18 July 1838; d at Montréal 30 Mar 1886). Mousseau was admitted to the bar in 1860 and practised civil and criminal law for 20 years, becoming QC in 1873. Co-founder of both *Le Colonisateur* in 1867 and *L'Opinion publique* in 1870 and a supporter of CONFEDERATION in 1867, he won the federal riding of Bagot for the Conservative Party in 1874. He was re-elected in 1878 and became head of the Executive Council on 8 Nov 1880 and, on May 20, secretary of state. In July 1882 he agreed to exchange positions with J.A. CHAPLEAU, thus becoming premier of Québec. After 2 years of division and strife within the Conservative Party, he resigned at the request of the federal leaders and became a puisne judge of the superior court for the district of Rimouski. ANDRÉE DESILETS

**Mowat, Farley**, author (b at Belleville, Ont 12 May 1921). Mowat's controversial first book, *People of the Deer* (1952) — a denunciation of Canada's treatment of the Inuit — made him an instant celebrity. By the time his twenty-fifth book appeared in 1979, he was reputedly Canada's most widely read author: he is translated into 23 languages and published in over 40 countries. Many of his books are designed to at-

**Mufferaw, Joe**, the traditional strong man of the Ottawa Valley, was based on the early 19th-century French Canadian, Joseph MONTERRAND, a noted and natural pugilist. People in the lumbering woods tell tales, often like Paul BUNYAN yarns, of his great feats of power and skill, yet emphasize his gentleness and kindness. Anonymous assistance or inexplicable events are often attributed to "Who else but Joe Mufferaw?"

CAROLE H. CARPENTER

**Muhlstock, Louis**, painter (b at Narajow, Poland 23 Apr 1904), best known as a painter of the Depression. Muhlstock came to Montréal in 1911 and worked for his family's fruit-importing firm. He took art lessons at night and from 1928 to 1931 studied in France. After 1931 he taught drawing at his Montréal studio and also drew unemployed men in nearby Fletcher's Field, capturing the spirit of the times in sensitive drawings in chalk or charcoal often done on wrapping paper. He evoked his east-end neighbourhood in vibrant street scenes from the market on St Lawrence-Main or shadowed yards. During WWII he sketched riveters at the Montréal shipyards, shown as *War Workers*, 1945. Muhlstock received recognition in 1937 from Douglas DUNCAN of the Picture Loan Soc, Toronto, and has long ranked as one of Canada's finest and most widely collected draftsmen.

ANNE MCDUGALL

**Mukluk**, a watertight boot of INUIT manufacture, suitable for walking on the TUNDRA. The sole is made of sealskin and is sewn to tops of caribou skin. The sealskin has to be scraped of all hair, stretched and dried, then chewed to make it pliable for use. Sinew thread, used in a blind stitch passing only halfway through the skin, makes watertight seams. A running stitch attaches the soles to the upper boot. In winter and in cold weather several pairs are worn simultaneously.

RENÉ R. GADACZ

**Mullock, John Thomas**, Roman Catholic bishop (b at Limerick, Ire 27 Sept 1807; d at St John's 29 Mar 1869). Consecrated bishop in 1847, Mullock came to Newfoundland as co-adjutor in 1848. Two years later he became bishop of Newfoundland and directed the affairs of the church energetically for 20 years. He completed the cathedral, founded a new palace episcopal library, established St Bonaventure's College and 2 convents for the Presentation and Mercy Sisters, increased the number of priests and in 1856 divided the island into 2 dioceses. Involved in early attempts to develop steam, sail and cable communications in Newfoundland, he originated the idea of a transatlantic telegraph cable link from N America to Europe. His political support of the Liberals under P.F. LITTLE and John KENT was controversial, and his intervention in the 1861 election ultimately led to the decline of his influence. A scholar of wit and eloquence, he wrote many lectures and pamphlets.

J. ROGERS

**Mulock, Sir William**, lawyer, educator, Cabinet minister, provincial court justice (b at Bond Head, Canada W 19 Jan 1844; d at Toronto 1 Oct 1944). In Parliament from 1882 to 1905, Mulock was postmaster general (1896-1905) under LAURIER. He organized the federal Dept of Labour, becoming its first minister (1900-05) and bringing W.L. Mackenzie KING into public life as deputy minister. He negotiated an inter-governmental agreement to establish a telecommunications cable linking Canada, Australia and New Zealand and was instrumental in joining Canada and the UK through radio (1903). Advocating government ownership of Bell Telephone, he chaired the 1905 parliamentary inquiry into telephones until he was appointed chief justice of the Exchequer Division of the Supreme Court of Ontario (1905); he was chief justice of Ontario 1923-36. As vice-

chancellor of U of T (1881-1900), he was the primary force in federating denominational and professional colleges into the expanded, co-operative university. He served as chancellor 1924-44.

Reading: W.J. Loudon, *Sir William Mulock: A Short Biography* (1932).

**Mulroney, Martin Brian**, lawyer, politician, prime minister of Canada (b at Baie-Comeau, Qué 20 Mar 1939). The son of Irish immigrants, Mulroney's father was an electrician, anxious that his children escape the paper mill that dominated BAIE-COMEAU. Brian attended the private St Thomas High School in Chatham, NB, and then St Francis Xavier U in Antigonish, NS, where he studied political science, joined the campus Conservative club, and was Prime Minister in the Combined Atlantic Universities Parliament. He worked for John Diefenbaker in his successful leadership campaign in 1956. Smooth beyond his years, fluently bilingual and gregarious, Mulroney returned to Québec in 1961, receiving a law degree at Laval. He joined a major Montréal law firm (now Ogilvy-Renault) in 1964, soon specializing in labour negotiations for concerns such as Iron Ore Company of Canada and POWER CORPORATION. His father died in 1965, and Mulroney took on heavy family responsibilities. Later, in 1973, he married Mila Pivnicki. In 1974-75 he won public attention as an articulate and hard-hitting member of the Cliche Commission on violence and corruption in the construction industry in Québec. By now he was the leading Conservative organizer and fund raiser in the province. Despite never having run for office, he was a strong candidate for the leadership of the federal party in 1976, finally being eliminated on the third ballot. He became VP of Iron Ore Company in 1976; as president 1977-83 he emphasized management-labour relations and was able, at the end of his term, to close the company's operation in SCHEFFERVILLE, Qué, without serious political repercussions. Mulroney again ran for the PC leadership in 1983, a low-key effort in response to charges that his 1976 campaign had been too slick and showy. He beat Joe CLARK on the final ballot: 1584 votes to 1325. As leader of the Opposition and MP for Central Nova in 1983-84, he proved a skillful manager, concentrating on healing party wounds and building a solid electoral machine. Moderate and conciliatory by nature, he called for a strengthened private sector and less government intervention in the economy, minority French-language rights, and closer Canadian-American and federal-provincial relations. In the general election of 1984 he ran an almost

flawless campaign against PM John TURNER's Liberals and won 211 seats, the largest number in Canadian history. Mulroney, who had always emphasized the importance of Québec to the Conservatives, captured the seat for Manicouagan, his home riding. The party took 58 of its seats in the province, the breakthrough that Mulroney had promised would take place under his leadership. He was sworn in as the 18th prime minister on 17 Sept 1984.

NORMAN HILLMER

**Multiculturalism**, as a term, first came into vogue in the 1960s to counter "biculturalism," a term popularized by the Royal Commission on BILINGUALISM AND BICULTURALISM. It has to a considerable extent replaced the term "cultural pluralism," although that term is still favoured in Québec. Its use has spread from Canada to many countries, notably Australia. The term is used in at least 3 senses: to refer to a society that is characterized by ethnic or cultural heterogeneity; to refer to an ideal of equality and mutual respect among a population's ethnic or cultural groups; and to refer to government policy proclaimed by the federal government in 1971 and subsequently by a number of provinces.

It was with the advent of the British in the 18th century, the gold rushes of the 19th century, and the settlement of the West in the late 19th and early 20th century that Canada became one of the world's main immigrant-receiving societies, a position it retained through the 1920s and after WWII (see IMMIGRATION; IMMIGRATION POLICY). Except in French Canada, ethnic and cultural groups were, ideally, to be assimilated by the English majority. This ideal was replaced first by the ideal of the "melting-pot," ie, the creation of a new ethnic or cultural group out of the combined elements in the population, and then by the ideal of the "mosaic," ie, the collaboration of all ethnic and cultural groups, which would nevertheless retain their distinctive characteristics. The mosaic was the precursor of multiculturalism.

It was only after the turbulent 1960s that the provincial and federal governments adopted explicit policies of multiculturalism, although, in the first decade, the federal government allotted these policies far less money than the policy of French-English bilingualism, which had been formalized 2 years earlier. Federally, there has been a minister responsible for multiculturalism since 1972, and since 1973 there has been a Canadian Consultative Council of Multiculturalism and a Multiculturalism Directorate within the Dept of the Secretary of State.

Government policies of multiculturalism have been viewed with hostility and suspicion by many. French Canadians and others have regarded them as injurious to the French Canadian position as one of the 2 linguistic communities of which Canada is composed; some scholars have decried them as a means of buttressing Anglo-Saxon dominance, by diverting the efforts of the non-French and the non-English from political and economic affairs into cultural activities and excluding other ethnic groups from power and influence; some spokesmen from ethnic groups have viewed government multiculturalism policies as unacceptable substitutes for substantial aid; many have considered them bribes for "the ethnic vote."

The hostility and suspicion against multiculturalism have resulted from ambiguities in policy statements and in the term multiculturalism (it has been pointed out that a curious presumption of "multiculturalism" is that ethnic groups are outside the mainstream of society, whereas they can be more accurately described as cultural fractions that integrate unequally to form Canadian society). Social scientists have not adequately classified and communicated to politicians, bureaucrats and the

Brian Mulroney, speaking at the 1983 Tory Convention, Ottawa (photo by Ron Watts/First Light).

public the subtle but necessary distinctions between cultural and structural assimilation, culture and ethnic group, etc.

Multicultural policies in the 1970s may not have met the needs of immigrants, especially the growing numbers belonging to "visible minorities," designed as they were for long-established ethnic groups of European background. Nonetheless, the introduction of the term and what has been called the multicultural movement have been important in calling attention to an important type of diversity within Canadian society and in engendering political recognition of it.

JEAN BURNET

**Multinational Corporation**, business entity under common ownership or management control that operates in different countries. The parent and each of the subsidiaries are established under the laws and practices of the countries where they are located. The corporations are multinational in their geographic scope, but not in the sense that there is some multinational authority which permits them to operate. Of the top 100 industrial multinationals in the world, almost half have US parent companies, and about a third are in the PETROLEUM INDUSTRY; 8 of the 10 largest are in the oil industry and 2 are in the AUTOMOBILE INDUSTRY. The largest Canadian multinational, ALCAN, would rank in the second 100 largest world firms.

Multinationals have come under scrutiny in Canada and elsewhere for their economic, political, social and cultural impact on host countries. Less developed countries argue that they have traded political independence for economic dependence. Politically, there is concern over the extent to which multinational corporations are used as instruments of foreign policy by the governments of countries where parent companies are located. Foreign multinationals have set up subsidiaries in Canada, but Canadian multinationals have also established subsidiaries abroad. The FOREIGN INVESTMENT REVIEW AGENCY was created by the Trudeau government to screen new foreign investments, but although government policies can alter the way multinational corporations behave, their presence will persist because of their flexibility in adapting to changing circumstances. (See FOREIGN OWNERSHIP).

**Mumming**, a performance by actors (mummers) in disguise, forms part of a worldwide cultural phenomenon of great complexity. The immediate origin of, and the closest analogies to, the principal Newfoundland mumming practices are found in Ireland and the UK. Many mummers' plays were in the hero-combat tradition of English folk plays and presented variations on a typical fourfold action: the presentation of the characters (eg, St George, the Doctor, Alexander, Sir Guy, the Turkish Knight and others); the combat between one or more antagonists; the cure or resurrection of a slain champion; and the collection of money by performers.

Two practices associated with mumming, the house visit with the performance of a play and the formal outdoor procession or parade, are richly documented from 19th-century sources. After WWI, however, these performances were discontinued, though not forgotten, until their revival by professional actors in the early 1970s, following scholarly research on the tradition. The parade had been a familiar event of the Christmas season as early as 1812, especially in St John's, with elaborately costumed and disguised figures making their way through the streets, flanked by agile fools and "ownshooks"

("female" fools) armed with inflated bladders with which to thrash spectators. A type of performance (a combat or dialogue) was sometimes included at some point in the procession. This public form of mumming, even the wearing of disguise outdoors, was banned under an Act of the Legislative Assembly in 1861 because of the occasional disturbance and violence, but the ban was not effective.

The house visit during the Twelve Days of Christmas by mummers, or "jannies," is particularly common in Newfoundland and is similar to activities by "guisers" in northern England and Scotland, "skaklers" in Shetland, "belsnickles" in the German tradition in both NS and Virginia, and "naluyuks" in Labrador. When small groups of people appear at neighbourhood houses and seek admission, there is a reversal of normal modes of behaviour: reversal of sex (through costume disguise); of speech (the mummers' characteristic ingressive speech); of social role (the host is on the defensive); and of behavioural norms (the visitors are boisterous, uninhibited). At the centre of this form of mumming is the attempt by the host(s) to identify the disguised figures; the unveiling of the identified visitors; and the offering of refreshment. This less formal mumming tradition is still widespread in Newfoundland; it has been documented by folklorists and studied by anthropologists.

*Reading: H. Halpert and George M. Story, eds, Christmas Mumming in Newfoundland (1969).*

**Municipal Administration** The activities of locally elected municipal councils are administered by officials and employees organized into municipal public-service departments (see MUNICIPAL GOVERNMENTS). The link between policymaking and administration is often supplied through committees of council, each of which reviews the activities of the department related to it and makes recommendations to council. Each department head is usually accountable to at least one committee. Other municipal administrative structures include boards of control, in some Ontario cities; boards of commissioners, in some western cities, under which each commissioner is responsible for a group of departments and all are collectively responsible to the municipal council for the entire municipal administration; and chief administrative officers accountable to the municipal council for the co-ordination of all municipal departments. Variations of these structures exist across Canada. Another structure is an executive committee selected by and from within the municipal council to exercise responsibilities similar to a board of control.

All Canadian municipalities elect, on an at-large basis, a mayor (or reeve in the case of some rural municipalities) who presides at council meetings and who can also make recommendations to council. In Canada, any leadership role that a mayor may exercise is dependent largely on the power of personality and not on powers assigned to this office.

Because most municipalities are organized departmentally by function (eg, public works, finance, personnel, parks) there may be a proliferation of 15 or more departments, which does not facilitate planning and co-ordination. Departments are therefore sometimes grouped together, ie, departments responsible for activities such as social services, parks, recreation, might constitute a community-services group, while those responsible for providing support services, eg, finance, personnel, information processing, might be grouped under management services. Where such groupings are established, each department reports to a general director or commissioner responsible for the group.

Municipal governments have a major responsibility in the area of collective bargaining, be-

cause most municipal employees are organized. Major bargaining units include white collar and technical employees, skilled and unskilled labour, police, fire and transit workers.

Municipal budget preparation differs from that of other governments in that a balanced budget must be prepared annually. A deficit budget is not permissible; while municipal governments may borrow for capital works, provision must be made annually for the repayment of capital and interest. When expenditure estimates have been determined all revenues other than those derived from property taxation are then calculated; the difference between this total and the expenditure estimates must then be made up by property TAXATION. The scale of expenditures therefore has a direct impact on the property-tax rate established annually.

The most difficult and controversial of municipal responsibilities involves the planning and regulation of land use. While most of this is undertaken by the municipal planning department, many other departments are also involved in the planning process, much of which must be conducted in accordance with procedures established in provincial planning legislation.

TJ PLUNKETT

**Municipal Finance** is concerned with the revenues and expenditures of municipalities. Revenues are secured from local taxes (see TAXATION) and other local revenues and from provincial and federal grants. Property taxes include taxes for both general municipal purposes and schools, which in some provinces are levied directly by SCHOOL BOARDS and in others by the municipalities. Likewise, government grants include grants for education as well as for general municipal purposes. Taxes levied on "real property" (land and buildings) are the traditional and principal source of municipal tax revenue. The accuracy of the assessment of the value of real property is of paramount importance, especially in ensuring the equitable treatment of taxpayers in each municipality and, because many provincial grants are related to assessment, in ensuring equitable treatment of citizens in different municipalities. The principal basis of assessment is market value of property. Because of the importance and difficulty of establishing accurate and uniform assessments, all provinces have in recent years either assumed complete responsibility for assessment or imposed careful supervision over municipal assessment.

Most provinces provide either for a "homestead" provincial rebate to property taxpayers or for a property tax credit linked to provincial personal income tax, the former to reduce the burden, the latter to reduce the regressiveness of the property tax. Property tax exemptions are commonly granted for churches and other char-

itable organizations and in some provinces partial exemptions are granted for widows and the aged. Special assessment taxes are levied as supplementary charges for local improvements, eg, sidewalks, usually based on frontage of lots. Business taxes, calculated on such bases as rental value, floor space and real property assessment, are levied on occupants of business properties. Provincial and federal grants in lieu of taxes are paid on provincial and federal real property. Local nontax revenue derives from sales of services, eg, water, and from licences and fees, fines and penalties. Taxes on personal property and poll taxes, once quite general, have been abolished in most provinces, although the poll tax is still used in Newfoundland and is authorized in Saskatchewan municipalities but not applied. Ninety percent of the transfers (grants) from provincial and federal governments are special purpose (conditional) grants for such activities as education and social services; the remaining 10% are general purpose (unconditional), although these proportions differ widely from province to province. These transfers are meant principally to ease the property tax burden and to equalize it among municipalities.

Borrowing is typically for capital assets and the debt is amortized approximately over the life of the asset. Municipalities are not generally allowed to run deficits in their operating budgets. Although many municipalities still borrow in their own right, there is a trend towards consolidated borrowing by a provincial agency on their behalf to ensure more favourable interest rates and better debt management. While elementary and secondary education is still the principal local expenditure, provincial governments are increasingly assuming these costs, either by grants or, as in NB and PEI, by accepting complete responsibility for education.

Municipalities have long agitated for access to income and sales tax bases to reduce their dependence on the property tax, but because of the difficulties of administering these other taxes at the local level, the uneven yields per capita they would produce for the municipalities and the reluctance of the provinces to add another layer of such levies, the provinces have preferred to share revenues from these sources by means of grants. Manitoba and BC, however, now earmark a small part of their receipts from personal and corporate income taxes for their municipalities.

**Municipal Government**, local government created by the provinces to provide services that can be more effectively handled under local control. It is responsible for the administration of cities, towns and municipalities. Municipal governments make policy, raise revenue and ensure the implementation or administration of policy. The first 2 tasks are the responsibility of the municipal council, elected locally, which is expected to act as a local legislature. Under the CONSTITUTION ACT, 1982 the powers of municipal governments are determined by provincial governments, but their performance is assessed by the electorate in regular elections. The administration is handled by the municipal public service, made up of officials and employees appointed by the council and organized into departments. The necessary link between policy-making and administration is supplied in most municipal governments by a council or committee system, in which a municipal council establishes a series of committees to direct and control the municipal public service. The number of committees created by municipal governments depends on local circumstances and priorities. Each committee, made up of a specified number of council members, reviews the activities of the departments related to it and makes recommendations to the municipal council. The head of each municipal department is usually accountable to one committee and perhaps several, depending upon departmental responsibilities. Committees can sometimes recommend actions in one area that might conflict with another area of municipal responsibility; they also tend to fragment municipal decision-making and administration. Many municipal governments, particularly in the larger cities, have either abandoned or modified this system. At least 4 other structures have evolved, for example the council-board of control and the council-executive committee co-ordinate arrangements at the political level, ie, the municipal council, while the council-chief administrative officer and the council-board of commissioners are responsible for similar arrangements at the administrative level. The board of control structure derived from experiments by US municipal reformers in the latter part of the 19th century. Adopted by the city of Toronto, it was made mandatory under The Municipal Act of Ontario for all cities in that province over 100 000 in population, although an amendment now permits municipal council to abandon it. Several large cities, notably Toronto, Ottawa, Hamilton and Windsor, have given up this structure after several decades. The board of control comprises the mayor as chairman and a number of controllers, elected city-wide, who are also full members of the municipal council. Other members of council are usually elected to represent wards. Under The Municipal Act a board of control is assigned executive powers, including preparation of the annual estimates, amendment of contracts, and nomination and dismissal of officials and employees. Boards of control have been criticized for their tendency to create 2 categories of council member: controllers elected at large and aldermen elected on a ward basis. Moreover, it was difficult for council to overturn a financial recommendation of the board except by a two-thirds majority vote of council. In the city of Toronto the board of control was eventually replaced by an executive committee selected from within the council. While this committee exercises powers similar to that of the former board of control, it is more directly accountable to the council, which controls its membership. Boards of control have existed in Ontario for most of this century but have not been adopted elsewhere in Canada. Council-executive committees have long existed in Montréal and Québec City, and a variant of them was established recently in Winnipeg.

The council-chief administrative officer (CAO) may also be known as city or municipal manager, city administrator or city commissioner. Largely a modified version of the council-manager system popular in the US, the CAO system is based on business organization. The municipal council, like a corporate board of directors, is concerned only with policy, while the city manager, appointed by the council, has exclusive responsibility for and is accountable to the council for administration. Although some municipal governments in Canada now have managers, many have appointed an official as CAO with general responsibility for directing and co-ordinating the work of the municipal public service. As a result, municipal councils have often abolished committees, or council acts as a committee of the whole to receive reports from the CAO and other officials. Alternatively, councils have reduced the number of committees to which the CAO reports.

The council-board of commissioners arrangement evolved in western Canada, particularly in Edmonton, Calgary and Winnipeg. Instead of a single chief administrator, a management group of commissioners is appointed, one of whom is the chief commissioner. Each commissioner is responsible for a broad range of interrelated responsibilities. Heads of departments are accountable to the commissioners who as a board are collectively responsible to the municipal council for the entire municipal public service. Variants of these structures and combinations of them also exist. Winnipeg has an executive committee with a board of commissioners responsible to it; Québec City has an executive committee with a city manager accountable to it; and London employs a board of control with a CAO responsible to it.

Municipal structures also include a number of special purpose bodies usually established as local boards or commissions by provincial governments, although the extent of their use varies considerably, including, among others, library boards, utility commissions, transit authorities, parks and police commissions. Provincial statutes outline the procedures for the appointment of members. Most of these groups enjoy varying degrees of independence from municipal jurisdiction, although municipalities must provide a considerable proportion of their funds. Because these bodies fall under the control of both the provincial and municipal governments, it is difficult for the public to know just who is responsible and for what.

In contrast to the practice in some US cities in which duties such as budget formation and appointment of certain administration officers are the responsibility of the mayor, the significance of this office in Canada stems more from its high profile, although a mayor with a forceful personality may also be a strong leader. Various described as "the chief officer," "the chief executive officer" or "the head of council" in provincial statutes, the mayor has little power independent of the municipal council. All provinces provide that the mayor shall be elected at large, and Canadian mayors generally are expected to preside at all council meetings, are ex officio members of all committees and can make recommendations to the municipal council.

**Intergovernmental Relations** The relationship between a province and its municipalities is one of superior and subordinates. Provincial governments legislate the duties of municipal governments and are responsible for their well-being. Some of the responsibilities assigned to municipal governments, such as the exercise of planning powers and MUNICIPAL FINANCE, are regulated by the provinces. The relationship between municipalities and the federal government is relatively unimportant. Federal programs that affect municipalities are generally handled through federal-provincial agreements.

**Annexation and Amalgamation** The extension of municipal boundaries by the annexation of peripheral rural areas is usually justified on the grounds that urban physical services such as water, sewerage facilities and roads can be provided more readily by the urban municipality than the rural area. When a major city is encircled by several smaller municipalities, or when 2 municipalities have developed side by side and share a common boundary, separate municipal jurisdictions complicate the provision of necessary services over the entire area and the need to secure orderly and planned development. This problem is sometimes solved by amalgamation, the consolidation of municipalities into a single municipal entity. Decisions about annexation or amalgamation can only be made by the provincial government. Because both usually provoke controversy, most provinces have established a procedure of hearings held by ADMINISTRATIVE TRIBUNALS such as the Ont. Municipal Board, the Local Authorities Board in Alta or the Municipal Commission in Qué. In some circumstances a province may establish a special investigating commission to study the matter and make a recommendation. In large metropolitan areas where several municipal governments operate and outright amalgamation is almost impossible, some provinces have established METROPOLITAN GOVERNMENTS or REGIONAL GOVERNMENTS or districts.

T.J. PLUNKETT

**Municipal Loan Fund**, Canada West, est 10 Nov 1852, created largely by Francis HINCKS, co-premier of the PROVINCE OF CANADA, whose government's central policy was railway development. Hincks permitted municipalities to borrow on the province's credit to invest in important works; the fund itself would be created by anticipated municipal repayments to the province. By 1855, encouraged by promoters who predicted that railway-inspired development would generate the extra wealth needed to repay loans, 47 communities in Canada W, some mere villages, had borrowed over \$7 million, at least 80% for investment in local and branch line railways. Only a few railways proved economically viable. Laws passed late in 1854 cut off new borrowing, provided for repayment of some of the province's outlay from delinquent municipalities' shares in revenues from the secularized CLERGY RESERVES, and gave Lower Canadian municipalities access to a "fund" of equal value (of which only about \$1.8 million had actually been borrowed when the whole scheme was terminated in 1859). Rates of repayment, never high, plummeted in the 1857-58 depression, and by 1862 arrears of interest had added another \$3 million to the deficit. Thereafter the history of the fund merges with that of the Canadian PUBLIC DEBT.

DOUGLAS MCCALLA

**Municipal-Provincial Relations** Municipalities in Canada are similar to provincial governments in a number of important respects. Their governing bodies are democratically elected; they have the power to tax and to legislate (by-laws, ordinances); they provide a wide range of public services and facilities; and they make public policy (eg, land-use planning).

Municipalities are unlike provincial governments as far as important aspects of constitutional status are concerned. The provinces derive their powers from the Constitution and hence their permanence and autonomous jurisdiction are guaranteed. Municipalities, on the other hand, draw their powers from provincial law, which can be changed simply by a majority vote of the legislature. These powers are usually set out in a Municipal Act which applies to all municipalities within one province. Some cities (eg, Vancouver, Saint John, Halifax) have a city charter, which is a separate Act of the legislature

applying only to one city and providing powers that may differ in some respects from those contained in a Municipal Act.

Municipalities can usually exercise only those powers delegated to them by a provincial government. The province retains the right to change municipal boundaries, to abolish individual municipalities (as New Brunswick and Ontario have done), to alter municipal financial resources and to withdraw old powers or grant new ones. The province makes some powers mandatory and some permissive.

The autonomy of municipalities is severely restricted. For example, many municipal by-laws require provincial approval to become effective; municipal borrowings for capital projects are strictly controlled by the province's Ministry of Municipal Affairs or by a provincially appointed municipal board; many local planning decisions can be appealed to a provincial agency; and many local powers apply only to a shared provincial-municipal jurisdiction (eg, the environment). The limited autonomy of municipal governments raises questions about the democratic accountability of LOCAL GOVERNMENTS. They are accountable both to their own electorates and to provincial authorities, but in degrees that vary among provinces and even within some of them.

The relationship between municipalities and their respective provincial governments is not an easy one. Many municipal politicians are resentful about their lack of autonomy, and many provincial ministers and bureaucrats think of municipalities as just another interest group seeking to pressure the province into particular policy decisions. The special status of municipalities as governments elected on a universal franchise is well understood by ministers and officials of Municipal Affairs departments, but their colleagues in other departments or in Cabinet have their own vested interests in budgetary and jurisdictional decisions, which lead them to minimize the importance of municipal affairs.

Municipalities have come together in voluntary associations in their attempt to support the municipal interest in provincial policy-making. There is one such association for BC, Nova Scotia, PEI, Newfoundland and, as of 1982, Ontario. Québec and the Prairie provinces each have 2 such associations. New Brunswick has one association for cities, one for towns and one for villages. A national association, the Federation of Canadian Municipalities, exists to relate to the federal government.

A major concern of these associations is to secure a better financial arrangement for municipalities. Local revenue is mainly derived from property taxes and grants from the provinces. These grants are on average 80% conditional. The conditions sometimes induce municipalities to make choices that meet provincial policy goals at the expense of local goals. The property tax, is generally seen as the most regressive of all the major tax fields in the country. Further it does not grow with the economy or inflation as do sales and income taxes. Hence municipal leaders resent being limited to this particular tax field.

In several provinces, regular consultative meetings are held between the responsible minister and representatives of municipal associations. However, although the minister often uses the language of partnership, it is a very unequal partnership indeed. Sometimes there are promises of consultation before any provincial action affecting municipalities is taken, but when an election looms or the economy declines, such promises may well be forgotten. Because of the inferior constitutional position of municipalities, their most important powers are those of organization and persuasion. The powers of law and money, however, are on the provincial side.

ALLAN O'BRIEN

**Munitions and Supply, Department of**, Canada's principal agency for co-ordinating domestic industry during WORLD WAR II. It was decided that a civilian department should control the production of munitions for Canada and its allies, and accordingly Parliament passed the Munitions and Supply Act in Sept 1939 and brought it into force on 9 Apr 1940. The department's only minister was C.D. HOWE, who furnished dynamic, aggressive leadership, as well as significant political clout. Besides producing ARMAMENTS (tanks, guns, ships) through its production branches, the department regulated scarce supplies held to be essential to war production, such as gasoline, most building materials and silk (used for parachutes). To regulate the economy without creating a big bureaucracy, the department established crown corporations such as Victory Aircraft (bombers), Polymer (artificial rubber) and Research Enterprises (high technology). The department was dissolved at the end of WWII with a highly successful record.

ROBERT BOTHWELL

**Munk, Jens Eriksen**, explorer (b at Barbo, Norway 3 June 1579; d at Copenhagen, Denmark 3 or 24 June 1628). Instructed by King Christian IV of Denmark to search for a NORTH-WEST PASSAGE, he set out with 2 ships May 1619. After detours into Frobisher Bay and Ungava Bay he entered Hudson Bay 25 Aug. He was forced to winter at the estuary of the CHURCHILL R. and by spring 61 of his men had succumbed to scurvy. Munk and 2 other survivors struggled home, reaching Norway 21 Sept 1620. He published an account of his voyage in 1624. Relics of his stay have been found at Pt Churchill.

JAMES MARSH

**Munro, Alice**, short-story writer (b at Wingham, Ont 10 July 1931). Twice winner of the Governor General's Award, she is one of the most gifted writers of SHORT FICTION IN ENGLISH in Canada. The strength of her fiction arises partially from its vivid sense of regional focus, most of her stories being set in Huron County, Ont, as well as from her sense of the narrator as the intelligence through which the world is articulated. Her theme has often been the dilemmas of the adolescent girl coming to terms with family and small town. Her more recent work has addressed the problems of middle age, of women alone and of the elderly. Characteristic of her style is the search for some revelatory gesture by which an event is illuminated and given personal significance. In *Lives of Girls and Women* each story is organized around a metaphor whose function is to draw all the elements of the various fictional sequences into a radiant centre. Thus the death of the protagonist's Uncle Craig that occurs in "Heirs of the Living Body" is related to other deaths and envisioned as part of natural process, such that the protagonist's mother can announce that "Uncle Craig doesn't have to be Uncle Craig! Uncle Craig is flowers!" He, like all of Munro's characters, shares one living body, although the connections might not always be perfectly clear. The implicit connection that does not always lead to epiphanic discovery is more apparent in *The Moons of Jupiter*. Here relationships are suggested but the threads of attachment are not always unraveled.

It is sometimes remarked that Munro's fiction is nearer to autobiography than fiction. In defence of *Lives of Girls and Women*, which is most frequently identified as being modelled on the author's life, Munro has asserted it is "autobiographical in form but not in fact." The distinction is perhaps not persuasive, but the charge is difficult to evade, for Munro's ear for the local speech has an absolute pitch and her narrators as filters of past and present possess an intelligence that makes one feel that if it is not her life being told, then it is ours. E.D. BLODGETT

**Munsinger Affair** Between 1958 and 1961 Pierre SÉVIGNY, John Diefenbaker's associate minister of national defence, had an affair with Gerda Munsinger, a German immigrant. Acting on information from American sources, the RCMP warned Justice Minister Davie FULTON that Munsinger was a prostitute and a security risk. Fulton told Diefenbaker, who reprimanded Sévigny. Munsinger returned to Germany while Sévigny remained in the Cabinet. The affair meant nothing to anyone except the principals until Liberal Justice Minister Lucien Cardin, angered by Conservative taunts about security leaks, raised Munsinger's name 4 Mar 1966 in the Commons. The press revelled in Canada's first major parliamentary sex scandal. A royal commission criticized Diefenbaker's leniency but found no security breach. JOHN ENGLISH

**Murder and Manslaughter**, see HOMICIDE.

**Murdoch, James Young**, lawyer, mining executive (b at Toronto 29 July 1890; d there 18 Apr 1962). A graduate of Osgoode Hall, Murdoch practised mining law in the Toronto firm Holden and Murdoch 1913-62; he was created KC in 1929. He drafted the incorporation of Noranda Mines Ltd and served as its first president 1923 to 1956, when he became chairman. Murdoch expanded and diversified Noranda's original copper-mining interest in Québec through various investments. In WWII he held senior positions in 2 wartime crown corporations, was president of the National War Services Funds Advisory Board, chairman of the National War Services Committee of the YMCA and was awarded an OBE. Murdochville, Qué, was named after him in 1952, and for his contribution to the mining industry in Canada he received the Canadian Institute of Mining and Metallurgy's Blaylock Medal. JOSEPH LINDSEY

**Murdoch Case**, Supreme Court of Canada case (1975) involving matrimonial property law. Historically, wives could only own property by having it placed in their names or by providing all or part of its purchase price. No allowance was made for indirect contributions by them towards property acquisition or for their role in nurturing the family. In *Murdoch* the court decided that a wife who had helped run the family ranch had done "just about what the ordinary rancher's wife does" and had no right to a share in it. The outcry from women's groups produced reforms in provincial matrimonial property laws across Canada. Mrs Murdoch did obtain a lump sum of secured maintenance under the Federal Divorce Act. A. BISSETT-JOHNSON

**Murdochville Strike** On 10 Mar 1957 the 1000 workers of Gaspé Copper Mines, Murdochville, Qué, struck for the right to unionize. The conflict lasted 7 months and ended in defeat for the miners. Moreover, a 15-year judicial battle finally awarded the company \$1.5 million in damages from the United Steelworkers of America ("Métallos" in Québec). Murdochville was a COMPANY TOWN belonging to Gaspé Copper Mines, a subsidiary of the Noranda Mines empire. The company refused to recognize the miners' union (Métallos were affiliated with the Québec Federation of Labour, est Feb 1957) and used strikebreakers, along with provincial police dispatched by Prem Maurice DUPLESSIS, to subdue the strikers. This intervention by the state precipitated considerable violence. The strike led to joint action by the QFL and the Canadian Catholic Federation of Labour (see CONFEDERATION OF NATIONAL TRADE UNIONS), yet this common front, despite its immense potential, was seriously hampered by dissent within the QFL. The strike has often been called a turning point in QFL history; in fact it was the most dramatic episode in 12 years of effort leading to the 1965 unionization of Murdochville miners. GUY BELANGER

Emily Murphy was prominent in the suffrage movement and in 1916 became the first woman magistrate in the British Empire (courtesy Glenbow Archives).

**Murphy, Emily Gowan**, née Ferguson, pen name Janey Canuck, writer, journalist, magistrate, political and legal reformer (b at Cookstown, Ont 14 Mar 1868; d at Edmonton 27 Oct 1933). Born into a prominent Ontario legal family, Murphy moved W in 1903 with her husband Arthur Murphy, an Anglican minister and entrepreneur, and their 2 daughters. A prolific contributor of book reviews and articles to Canadian magazines and newspapers, she adopted the pen name Janey Canuck and published 4 very popular books of personal sketches: *The Impressions of Janey Canuck Abroad* (1901), *Janey Canuck in the West* (1910), *Open Trails* (1912) and *Seeds of Pine* (1914).

First in Swan R, Man, and then in Edmonton, where she lived from 1907, Murphy combined family life, writing and a multitude of reform activities in the interests of women and children. In 1911, responding to persistent public pressure organized by Murphy, the Alberta legislature passed a Dower Act protecting a wife's right to a one-third share in her husband's property. Murphy was also prominent in the suffrage movement, as well as a longtime executive member of the Canadian Women's Press Club (president 1913-20), the National Council of Women, the Federated Women's Institutes (first national president) and over 20 other professional and volunteer organizations.

A self-taught legal expert, in 1916 she was appointed police magistrate for Edmonton and then Alberta, the first woman magistrate in the British Empire. Exposed to a succession of cases involving prostitution and juvenile offenders, she became an implacable enemy of narcotics, which she blamed for much organized crime and for victimizing the defenceless. *The Black Candle* (1922) by "Judge Murphy" was an expansion of articles published in *Maclean's* magazine describing in lurid detail the evils of the drug trade; her exposé led to laws governing narcotics that remained unaltered until the late 1960s.

Challenged on her first day on the bench by a lawyer who asserted that as a woman she was not a person in the eyes of British law, Murphy soon embarked on a decade-long campaign to have women declared legal "persons" and therefore eligible for appointive positions, including

the Senate. With the support of 4 other Alberta women, Henrietta EDWARDS, Louise MCKINNEY, Nellie MCLUNG and Irene PARLBY, she carried the PERSONS CASE to the Privy Council in Britain, which ruled in a celebrated judgement in 1929 that women were indeed persons under the BNA Act. The long-sought Senate appointment eluded Murphy, however, and she died in Edmonton of diabetes in 1933. SUSAN JACKEL

**Murray, Alexander**, geologist, explorer (b at Crieff, Scot 2 June 1810; d there 18 Dec 1884). Murray served in the Royal Navy 1824-35, and then in 1837 immigrated with his young bride to Woodstock, Upper Canada. Their arrival coincided with an economic depression and the 1837 Rebellion; he served in the naval brigade that destroyed US steamer *CAROLINE*. The Murrays returned to England in 1841, the same year the Canadian Parliament authorized a geological survey of the United Provinces. Learning of this, Murray studied geology. He received an appointment in 1842-43 to the Geological Survey of Great Britain. When William LOGAN was appointed director of the GEOLOGICAL SURVEY OF CANADA, he selected Murray as an assistant. In May 1843 the Murrays returned to Canada. In 1851 he discovered the petroleum seepages near Black Creek, Canada West, which later became the location of the world's first drilled oil well; in 1856 he identified the first known nickel mineralization in the Sudbury Basin. Murray practically single-handedly mapped the geology of Canada West as recorded in *Geology of Canada* (1863). In 1864 he became first director of the Geological Survey of Newfoundland, at a time when the Island was virtually unexplored. Despite being crippled by an injury, within 10 years Murray had completed a topographical and geological map of the Island and co-published a report entitled *Geological Survey of Newfoundland* (1881), which showed that mineral, timber and agricultural resources were present in the interior. RICHARD DAVID HUGHES

**Murray, Anne**, (married name Langstroth), pop singer (b at Springhill, NS 20 June 1945). Canada's most successful pop performer of the 1970s, Murray was noticed first for her recording "Snowbird" (1970) after minor exposure on CBC TV in Halifax. With her personable alto, wholesome presence and stylistic versatility, she enjoyed great record success ("Danny's Song," "You Needed Me," "I Just Fall in Love Again," etc) and expanded her concert and TV itinerary to include pop and country music audiences. She has received many Juno Awards and several (US) Grammy Awards. MARK MILLER

**Murray, George Henry**, lawyer, politician, premier of NS (b at Grand Narrows, NS 7 June 1861; d at Montréal 6 Jan 1929). Murray's unbroken 27 years in power (1896-1923) is a British Empire and Commonwealth record. Leadership of the NS Liberal Party fell to Murray when W.S. FIELDING entered the LAURIER Cabinet in 1896. Always cautious, Murray practised a form of brokerage politics, trying both to avoid controversy and to appeal to every constituency. His government continued Fielding's commitment to railway consolidation and road and bridge construction, encouraged agricultural and technical education, took some initial steps in improving the public health system, and co-operated with the federal government in prosecuting the war. His administration's more significant accomplishments included the introduction of worker's compensation in 1916, the extension of the vote to women in 1917, the development of the NS Power Commission in 1920, and the legislation of PROHIBITION in 1921. Faced with postwar economic dislocation, industrial collapse and the continuing mistrust of the province's working class, Murray retired in Jan 1923. COLIN D. HOWELL

**Murray, James**, military officer, colonial administrator, first British governor of Québec (b at Ballencreeff, Scot 21 Jan 1721/22; d at Beaufort House, near Battle, Eng 18 June 1794). Murray commanded a battalion in the siege of LOUISBOURG in 1758, and was one of James Wolfe's 3 brigadiers at Québec. After the BATTLE OF THE PLAINS OF ABRAHAM, he remained in command of the city, facing undefeated French forces up the St Lawrence R. In Apr 1760 the Duc de Lévis advanced on Québec. Murray's garrison, weakened by disease, attacked near Ste-Foy, but was driven back into the city and besieged until British warships arrived (see BATTLE OF STE-FOY). In Oct 1760 Murray was appointed military governor of the District of Québec and in Nov 1763 civil governor of the province. A member of the landed gentry, he supported the agrarian, French-speaking inhabitants over the newly arrived, English-speaking merchants. He was reluctant to call a legislative assembly, promised in the PROCLAMATION OF 1763, because he feared that Canadians would be barred from it on religious grounds. His willingness to allow French law and custom in the courts further alienated the merchants and led to his recall in 1766. Nevertheless, his administrative arrangements for government were institutionalized in the QUEBEC ACT and were a factor in preventing Québec from becoming the 14th rebellious colony. From 1774 to 1782 Murray was lt-gov and later governor of Minorca, where he directed a spirited, though unsuccessful, defence against a Franco-Spanish besieging force. O A. COOKE

**Murray, James Alexander**, businessman, politician, premier of NB (b at Moncton, NB 9 Nov 1864; d at Sussex, NB 16 Feb 1960). A respected politician and forceful speaker, Murray represented Kings County 1908-20. He was a member and president of the Executive Council of NB and minister of agriculture, before becoming premier in 1917 for the shortest term in provincial history. His government was defeated at the polls less than a month later. ARTHUR T. DOYLE

**Murray, Sir John**, oceanographer (b at Cobourg, Canada W 3 Mar 1841; d at Kirkliston, Scot 16 Mar 1914). At 17, Murray moved to Scotland, the ocean voyage inspiring him in his lifelong career. After attending U of Edinburgh, he became naturalist to the CHALLENGER EXPEDITION (1872-76), during which he mapped much of the ocean floor of the world and became expert at classifying sediments and determining their origins. Other expeditions included one to Spitzbergen in 1868 and a survey of freshwater lochs in Scotland, published in 6 vols. After the death of *Challenger* expedition leader C.W. Thompson, Murray edited most of the resulting 50 vols (1882-95), and wrote the 2-vol summary (1895). Other contributions included a theory on the origin of coral reefs, a textbook on OCEANOGRAPHY with Johan Hjort (1912) used for about 30 years, and a popular account (1913). His 1888 estimates of proportions of various depths of ocean floor still generally hold. He was knighted in 1898. MARTIN K. MCHNICOLL

**Murray, John Clark**, philosopher (b at Thread and Tannahill, Scot 19 Mar 1836; d at Montréal 20 Nov 1917). Murray's career as a philosopher began in 1862 at Queen's in Kingston, Ont. His commitment to the PHILOSOPHY of Sir William Hamilton shifted radically after a time in Canada, and his Hegelian inclinations resulted in 2 works on philosophical psychology: *A Handbook of Psychology* (1885) and *Introduction to Psychology* (1904). All things exhibited a rational unity for Murray and reason was the crucial factor in his theory of human nature. In 1887 he wrote a manuscript, unpublished until 1982, entitled *The Industrial Kingdom of God*, which made a plea for social and economic reform and proposed a co-operative society based on Christian prin-

ciples of freedom, equality and justice for all people.

Murray was scholarly, but not a recluse. He fought a long battle for women's political and educational rights. His public lectures, newspaper articles and contributions to popular journals made him widely known. Murray's Scottish determination and sense of public duty had an impact, not only on his students, among whom were author and poet William D. LIGHTHALL and Stephen LEACOCK, but also on the developing Canadian culture. His books *A Handbook of Christian Ethics* (1908) and *An Introduction to Ethics* (1891) and his social-gospel novel *He That Had Received the Five Talents* (1904) spell out his moral theory. He was a fellow of the Royal Soc of Canada and a Canadian philosopher who truly practised what he preached.

ELIZABETH A. TROTT

**Murray, Leonard Warren**, naval officer (b at Granton, NS 22 June 1896; d at Derbyshire, Eng 25 Nov 1971). Murray joined the navy in 1911, served in WWI and by 1939 was deputy chief of the naval staff. In WWII he held a series of important operational commands culminating in that of commander in chief, Canadian North-west Atlantic, in Apr 1943. The only Canadian to command a theatre of war, Murray was forced into early retirement (formally Mar 1946) by his supposed failure to curb the excesses of his sailors during the VE-Day riots in Halifax. In Sept 1945 he left for England, where he was called to the bar in 1949.

MARC MILNER

**Murray, Robert**, sculptor (b at Vancouver 2 Mar 1936). His abstract metal SCULPTURE, constructed of simple geometric forms using industrial materials and methods, shares important stylistic characteristics with the work of British sculptor Anthony Caro, but it was influenced chiefly by N American artists David Smith and Barnett Newman. In 1959 Murray met Newman at U of Sask's summer school at Emma Lake, and in 1960 he moved to New York, having been offered an assistantship by Newman. Beginning in the 1960s with a fountain sculpture for Saskatoon's city hall, Murray has produced public sculptures for sites throughout Canada and the US. His early work was noted for its clear, open relationships with characteristics of contemporary minimalism, but since the mid-1970s he has developed a more lyrical vocabulary of curved, folded and twisted forms. His sculptures are unified throughout by a smooth painted finish, often in saturated colours.

ROALD NASGAARD

Robert Murray, *Saginaw* (1979), aluminum painted red (courtesy Gallery One).

**Murray, Walter Charles**, educator (b at Studholm, NB 12 May 1866; d at Saskatoon, 24 Mar 1945). A philosophy professor at UNB and Dalhousie, Murray became president of UNIVERSITY OF SASKATCHEWAN in 1908, a position he held for 29 years. He advocated nondenominationalism and centralization in higher education, along with political neutrality and practical service to the community. At a time of controversy over agricultural education, Murray successfully steered U of Sask towards integrating agriculture with other fields of study. He encouraged the affiliation of religious and junior arts colleges with the provincial university, developed agriculture and extension departments, and established university control over instruction and examinations in the professional fields of law, pharmacy, engineering, accounting, education and medicine. Murray served on a number of government commissions on education.

MAUREEN AYTENFISU

**Murre**, medium-sized member of the AUK family. Murres weigh 900-1000 g and are up to 46 cm long. Plumage is dark brown to black above, pure white below. Like all auks, murres come to land only to breed. Murres occur in cooler waters of the N Pacific and N Atlantic oceans and adjacent parts of the Arctic Ocean. There are 2 species: common murre (*Uria aalge*) breeds primarily in boreal and low arctic waters; thick-billed murre (*U. lomvia*) breeds further N in arctic waters. Murres often breed in dense colonies on coastal cliffs and islands, laying a single, large egg on bare rock ledges on the cliff face or surface. They first breed when 5 years old. Incubation, shared by both parents, takes 32-34 days. In Canada, both species are most abundant on the Atlantic coast. Small numbers of common murres breed in BC; thick-bills in the western Arctic. Almost 90% of eastern N American common murres breed in Newfoundland with about 75% (400 000 pairs) at FUNK 1. Breeding distribution of thick-bills is also restricted; most breed at 11 sites in the eastern Arctic. The thick-billed murre population in eastern Canada totals 1 283 000 pairs, representing the entire population in eastern N America and 55% of all thick-bills breeding in the western N Atlantic. Numbers of both species have been seriously reduced over the last century because of habitat disturbance, hunting, oil pollution and probably fisheries development. D.N. NETTLESHIP

**Mushroom and Puffball**, fleshy, spore-bearing fruitbodies produced by many club FUNGI (Basidiomycetes) and a few sac fungi (Ascomycetes). Such fungi may be saprophytes, living on and causing decay of organic matter; symbionts, living in association with tree roots to their mutual advantage; or occasionally PLANT parasites. In soil-inhabiting species, mycelium (mass of filaments forming the vegetative body of the fungus) grows indefinitely; fruitbodies are produced when conditions are favourable. Rings of fruitbodies (eg, fairy rings) mark the location of buried mycelium. Rings expand annually and ages can be estimated from annual diameter increase. Some rings are over 500 years old. Mushroom species in Canada may exceed 2000; of these many also occur on other continents.

Mycologists (biologists studying fungi) do not distinguish mushrooms from toadstools, although the latter term is popularly used for poisonous types. Related species may differ markedly in edibility and no simple tests exist for identifying edible types. Identifying features are macroscopic or microscopic. For specialists, microscopic features are most significant, eg, shape of spore-bearing cells, size and other features of spores and microscopic fruitbody structure. Macroscopic characteristics include fruitbody shape and colour, presence or absence of ring (annulus) and cup (volva), form of spore-

Bear's head hydnum (photo by Mary W. Ferguson).

Oyster mushroom (photo by Mary W. Ferguson).

Chantarelle, an edible wild mushroom (photo by Tim Fitzharris).

producing layer (hymenium) and spore-print colour.

**Annulus and Volva** In the button stage, the cap and stalk of a mushroom are joined by a membrane (veil) that ruptures as growth occurs, preparatory to spore dispersal. As the destroying angel (common in eastern Canada) develops, remnants of 2 membranous veils are left as a ring on the stalk and a cup at the stalk base. Fly agaric or fly amanita has a bright red cap with warts (also veil remnants) and a ring; its cup consists of irregular ridges around the swollen stalk base. Mushrooms may have only the ring or only the cup; many have neither.

**Hymenium** Gill fungi, such as market mushrooms and amanitas, produce spore-bearing cells on surfaces of structures called gills. Pore fungi (eg. boletes) have pores (tubules) instead of gills. The hymenium of hedgehog mushrooms is borne on teeth; that of crested coral mushroom covers branch surfaces. The morels and potentially poisonous false morels produce spores in sacs (asci) on the outer cap surface. All of these have exposed spores, but puffball spores are enclosed in the fruitbody. Gemmed puffballs become dry at maturity, a pore develops at the top and the fruitbody functions as a bellows when struck (eg. by water drops).

**Spore-Print Colour** Spore masses, shown in spore prints, are white in amanitas and fairy-ring mushroom; chocolate brown in market mushrooms; yellowish, pinkish, rusty brown or black in other species.

Fly amanita fungus, with its bright red cap and warts (photo by Stephen J. Krasemann/DRK Photo).

Mushroom poisonings are caused by several toxins. Amanitas and some galerinas produce heat-stable amatoxins and phallotoxins, which induce symptoms felt only after 4-48 hours. Also potentially fatal, with a delay of up to 2 weeks before symptoms appear, are the orellanins produced by some Cortinarii. False morels produce a potent toxin (monomethylhydrazine) which is lost if the mushrooms are thoroughly cooked. Muscarine, present in small quantities in fly amanita, is abundant in some inocybes and clitocybes, poisoning by which may cause death; appropriate treatment neutralizes poison. Mild poisoning (diarrhea, etc) occurs with ingestion of numerous other mushrooms.

Commercial exploitation of wild mushrooms is not extensive in Canada, but a few are harvested and sold. Pine mushrooms (Canadian matsutake) and chanterelles are exported. See MUSHROOM CULTIVATION.

R.J. BANDONI

Reading: O. Miller, *Mushrooms of North America* (1980).

**Mushroom Cultivation** The mushroom cultivated on a large scale in Canada is *Agaricus bisporus* (also called *A. brunneescens*). The most commonly grown strains have white caps, less common strains are cream and brown. Small quantities of *A. bitorquis* (a related white species) are also grown. *Agaricus*, first cultivated in France in the 17th century, was grown by E. Cauchois in 1877 in Québec.

Nutrients for *Agaricus* are usually provided by horse-manure composted with straw and nitrogen-rich additives (eg. chicken manure, brewer's grains, ammonium nitrate, etc). Gypsum is added for texture. Composting is initiated by watering horse-manure mixture stacked in long piles (2.0-2.4 m high, 1.8-2.2 m wide) on a concrete floor outdoors. Piles are turned mechanically 4 times during a 2-week period. Water may be added at each turn or less often, depending on the season. The temperature inside the piles rises to 70-75°C through action of bacteria and fungi, which decompose plant and animal matter and convert inorganic to organic nitrogen compounds, providing nutrients for the mushrooms. Trays (1.2x1.8 m) or long shelves, arranged in tiers in dark mushroom houses, are filled with a layer (20 cm) of cooled compost. During the subsequent "cook-out" process, continuing microbial activity raises the temperature to about 45°C and, after 1-3 days, steam is let

into the houses for several hours allowing pasteurization to occur (60°C), thus killing parasites. The compost is left for 5-12 days (at about 50°C), during which "conditioning period" microorganisms produce more nutrients. The compost is then cooled to about 25°C. Mushroom spawn, prepared under sterile conditions by allowing vegetative mushroom mycelium to grow into cereal grains, is inserted into the compost and spread over the surface. The mycelium penetrates the compost in about 2 weeks. Compost is then covered (cased) with a 2-3 cm layer of pasteurized loam topsoil, or a deeper layer of sphagnum moss or peat mixed with soil (acid peat is neutralized with hydrated lime or limestone). The casing layer is watered and the mycelium grows through it. Beds are cooled by ventilation to about 20°C, stimulating formation of young mushrooms (pinheads) in about 4 days. They are harvested when caps are about 2-8 cm. At 7-11-day intervals new crops ("flushes" or "breaks") appear, one batch of compost yielding up to 7 crops. Strict sanitation is maintained and pesticides used because *Agaricus* is susceptible to attack by viruses, bacteria, microscopic fungi, nematodes and mushroom fly larvae.

Mushrooms are the third most valuable Canadian vegetable crop. In 1980 Canadian production of *Agaricus* was 29 071 t (\$65.7 million), of which 21 183 t were sold fresh (most of the remainder being canned). Ontario produced about half; BC almost 28%; Québec, Alberta, the Maritimes, and Manitoba, the remainder. In 1979 per-capita consumption was 2.5 kg. On a small scale, 2 edible mushrooms are cultivated commercially on wood: *Lentinus edodes*, known by Japanese name Shiitake, in Ontario and BC, and the oyster mushroom, *Pleurotus ostreatus*, in Ontario and, at least experimentally, in Québec.

HANS E. GRUEN

Reading: F.J. Ingrassia and T.J. Blom, *Commercial Mushroom Growing* (1980); N.W. Tape, *How to Grow Mushrooms* (1980).

**Music, Profession of** Professional musicians are those who through their skill, training and commitment are able to earn a living as musicians. They may be teachers, performers or non-performers, and their specialty may be popular, classical, military or religious music. Musicians are often active in more than one occupation at a time, particularly in teaching combined with other musical activities. The largest group of professional musicians is teachers working in schools, conservatories and universities, as music therapists and as coaches of singing and instrumental groups. Teaching, especially if associated with an institution, provides the most stable income and working conditions for a musician, though schoolteachers usually require a college degree or diploma. At the conservatory and university level, exceptionally talented musicians may not need certification.

Competition is greatest among performers, whether ensemble or solo instrumentalists and vocalists or conductors. Artists perform only a few hours each week as far more time is spent in practice, rehearsal and, if on tour, travel. Experience in performance is included in all music training at the post-secondary level for popular or classical music. While it is possible to obtain good training in Canada (see MUSIC EDUCATION), most musicians seeking a virtuoso career will study abroad. Canada does not have a national school of music similar to those in ballet and theatre. Nonperforming professional musicians include composers, musicologists, ethnomusicologists, music librarians and archivists; journalists and editors; instrument builders, repair craftsmen and tuners; and music producers for radio, TV and recordings. Certain administrators in music schools, unions, performing rights societies, artist management and record companies, as well as technicians such as engineers in recording studios, may be trained musicians.

The cost of preparing for a career in music can be high, involving lessons, instruments and equipment, travel, promotion and management. Most musicians begin music study in their preteen years, though a talented person can make a later start. Income for the independent performer is often irregular and unpredictable. There are few fringe benefits and a musician in poor health cannot work. Musicians can be subject to arbitrary and unfair decisions by employers and as a group are poorly represented politically. Some areas of performance are highly stressful. Many of these unfavourable working conditions have been improved through the efforts of music unions and professional organizations for teachers, organists and composers. The American Federation of Musicians of the US and Canada (AF of M) negotiates union agreements with the CBC, CTV, NFB, the recording industry and companies producing commercials in which music is used, and its local branches negotiate with individual symphony orchestras and concert halls. The Union des artistes (UDA, French-language) and the Assn of Canadian Television and Radio Artists (ACTRA, English-language) protect members' rights and fees on radio, TV and the recording industry; and Canadian Actors' Equity Assn protects live-stage performers.

Before the early 1800s most musicians for whom there is documentation in Canada were connected to the church. During the 19th century, the church, the military, private teaching studios, instrument building and the music trade were the main sources of income, though most musicians combined 2 or more of these activities. Not until the mid-20th century was it possible for musicians to earn a living in one specialized field, as careers opened up in CBC broadcasting, symphony orchestras and school teaching. Opportunities for professional musicians expanded following the establishment of the CANADA COUNCIL and various provincial arts councils, although the amount of government funding is diminishing.

Women have been active in the profession since at least the middle of the 19th century. It is likely that they were the bulwark of private teaching in the years after Confederation, and women appeared early as instrumentalists in orchestras in Canada. In spite of its disadvantages, the profession of music continues to attract participants. It is a challenging, creative career with scope for personal growth and satisfaction. See also CHAMBER MUSIC; COUNTRY AND WESTERN MUSIC; FOLK MUSIC; JAZZ; MUSIC BROADCASTING; MUSIC CRITICISM; MUSICAL INSTRUMENTS; MUSICOLOGY; OPERA; ORCHESTRAL MUSIC; POPULAR MUSIC; RECORDING INDUSTRY; RELIGIOUS MUSIC; SONGS AND SONG WRITING; and individual entries for organizations and groups.

CHRISTOPHER WEAIT

**Music Awards and Competitions** Music awards are given on a noncompetitive basis or are won in competition. Noncompetitive music awards recognize outstanding accomplishment, merit, leadership or generosity. Recipients may be part of a larger group honoured by government institutions (the Order of Canada, the Alberta Achievement Awards); they may be winners of prizes or trophies given specifically to members of the music community by musical clubs, professional organizations or businesses associated with music (the Canadian Music Council Medal or the Juno Awards); or they may be the object of salutatory awards made by schools (honorary degrees). Winners are usually chosen by a specially appointed jury or awards committee. Noncompetitive music awards can also take the form of scholarships, bursaries, fellowships or study grants, as established by individuals, businesses, foundations, music clubs, educational institutions or professional music organizations.

Competitive music awards can be divided into several categories: those given at competitive festivals, or in performance, conducting or composition competitions. Some provide honours only and others give monetary awards. Competitive festivals provide opportunities for young musicians to compete against their peers and profit from the experience of public performance and the advice of the judges. Some competitive festivals award medals and trophies to prizewinners.

Performance competitions usually involve participation at the advanced-student or young professional level. Winners are chosen by an appointed jury. In addition to a monetary prize, there are rewards such as national recognition by press coverage of the competition, possible offers of recording contracts and invitations to perform for radio or TV or with major orchestras, choirs or concert groups. These competitions are sometimes held publicly in concert halls (the Montréal International Competition) or on radio (the CBC Radio Talent Competition, formerly the CBC Talent Festival and successor to "Opportunity Knocks"). Conducting competitions are recent in Canada. They are sponsored by foundations, schools or conservatories to honour a well-known conductor who has shown particular interest in young musicians wishing to perform as conductors (the Heinz Unger Award). As well as offering a prize, usually money, these competitions provide a showcase for conductors to demonstrate their skills before representatives of community orchestras needing energetic and ambitious conductors. Composition competitions have increased greatly during the last 30 years. Sponsored by both the CBC and various corporations, as well as by musical organizations across Canada, composition competitions usually offer a cash prize for the winning composer, and the public performance and sometimes the recording of the successful composition, usually by a major orchestra, choir, ensemble or soloist. In recent years an increasing number of music prizes and awards have been established by corporations. To facilitate this, the Council for Business and the Arts was established (1974). Also, corporations offer cash prizes and awards for specific accomplishments such as orchestras performing the most Canadian works in a season. For a listing of music awards and competitions consult the *ENCYCLOPEDIA OF MUSIC IN CANADA*. See *MONTREAL INTERNATIONAL COMPETITION*.

MABEL H. LAINE

**Music Broadcasting** is the transmission of music via AM and FM radio and television networks and stations and by satellite. All transmission modes have French and English services and operate through privately and publicly owned systems. The FM stereo network is one of the world's largest high-quality music networks. In general, radio has been more important than TV for music broadcasting. The development of music broadcasting in Canada falls into 4 well-defined periods: pre-1936 (to the establishment of CBC); 1936-52 (to the introduction of TV); 1952-75 (to the pan-Canada FM stereo network); 1975 to the present.

Canada's contribution to BROADCASTING is noteworthy. Montréal's XWA (now CFCF) was one of the first stations in the world (May 1920) to offer regular, scheduled broadcasts. On 1 July 1927, the Diamond Jubilee of Canada's Confederation, a transcontinental network was inaugurated with a daylong broadcast, mostly music. In the early 1920s the Canadian National Railway, under its president Sir Henry THORNTON, built radio studios in several centres across the land. In the mid-1920s complete Gilbert and Sullivan operas were studio broadcast, as was an ambitious series, "The Music Makers." In 1927 the famed HART HOUSE STRING QUARTET travelled

coast to coast for (and on) the CNR, broadcasting recitals of Beethoven quartets. In 1929 the new network began N America's first series of radio symphony concerts, by members of the TORONTO SYMPHONY under Luigi von Kunits. The CPR had also begun to broadcast concerts, but the Depression in the 1930s ended the railways' involvement in national broadcasting. Between 1932 and 1936 Canadian public radio was developed by the Canadian Radio Broadcasting Commission under the Toronto critic Hector CHARLESWORTH. It was hastily organized and not well supported by the federal government.

In 1936 the CANADIAN BROADCASTING CORPORATION was founded and by the 1940-41 season CBC radio, operating nationally, regionally and locally, and in 2 language services, had presented some 600 symphonic broadcasts (many from the US), 2000 broadcasts of chamber music and 45 full-opera broadcasts (including the Metropolitan Opera, still broadcasting today). In 1942 the CBC commissioned from Healey WILLAN and John COULTER the radio opera *Transit Through Fire*, and 3 years later, the major opera *Deirdre of the Sorrows*.

In this period Canadian programs were heard over the US Mutual, NBC and CBS networks. This was a time of much original live broadcasting, including the talent hunts ("Singing Stars of Tomorrow" from 1943, "Opportunity Knocks" from 1947) and many amateur-hour programs. Between 1944 and 1962 the CBC operated an alternative English-language network, the Dominion. Toronto's CJBC was owned by the CBC, but all other stations were privately owned affiliates. Alternative programming was mostly lighter than that of the trans-Canada network, though the Toronto and Montréal Symphony orchestras performed on Dominion on Tuesday nights followed by "CBC Concert Hall." In that period the CBC maintained studio orchestras in Halifax, Québec, Montréal, Toronto, Winnipeg and Vancouver, providing welcome employment for local musicians. By the late 1940s the CBC was the largest single employer of musicians in N America. Music broadcasting ranged from symphonic and opera to light and popular. Private stations gave broadcasts of local musicians and many pop singers and instrumentalists owed their first encouragement to radio broadcasts. In general, the most intensive music broadcasting was from the CBC.

In Sept 1952 the CBC inaugurated its television broadcasting. In those first years CBC TV was inventive and adventurous. Major opera and dance productions were mounted by Franz Kraemer, Vincent Tovell and Norman CAMPBELL in Toronto, and Pierre MERCURE in Montréal (whose French-network series "L'Heure du concert" was among the most remarkable ever produced on this continent). As costs mounted and the CBC was forced to economize by buying imported programs, Canadian TV production dwindled, especially in music programs, though the occasional special made its mark, such as Norman Campbell's 1966 National Ballet production of Prokofiev's *Cinderella*, or Harry SOMERS opera *Louis Riel* produced by Franz Kraemer in 1969.

Although large audiences enjoyed the TV medium and private radio narrowed its perspectives, music on CBC Radio continued to flourish in the period from 1952 to 1975. The jazz and popular stylings of Phil NIMMONS (Toronto), Neil CHOTEM (Montréal) and Lance Harrison (Vancouver) were widely appreciated. Chamber music broadcasts also abounded. The CBC Symphony Orchestra, N America's only radio symphony orchestra, was active from 1952 to 1964 and featured many modern works, with special attention to Canadian composers. The Orchestra's growing reputation drew Igor Stravinsky to Toronto in the early 1960s for his 80th

birthday celebration. This was a period of exceptional support for Canadian composers, through performances of their works, commissions and the engagement of John BECKWITH, Somers, Norma BEECROFT, Mercure and François MOREL as commentators. The English network began to produce its own series of stereo discs, first for broadcast use but later for public sale.

After 1975 the increasing use of disc and tape wrought profound changes in the pattern of music broadcasting. The live or studio broadcast gave way to the varied program package, held together by a program host. The radio networks were reorganized in the mid-1970s and for the first time a fully national FM stereo network of high technical quality was inaugurated. AM retained its policy of providing programming for a general audience and FM was mostly music, largely non-pop though with some serious jazz. At first the schedule was perhaps 75% records, rarely Canadian. By the 1980s, however, CBC radio programmers had begun once more to diversify their formats, reviving "live-to-air" techniques for special events and in other ways projecting music as an art.

There was much live broadcasting of local origin, but after the early 1950s private radio settled comfortably into the "top 40" and foreign records, effectively preventing it from contributing to the development of music in Canada. One private-sector initiative of special note was the Canadian Talent Library, initiated and developed by Lyman Potts for the Standard Broadcasting syndicate. The Library recorded discs for broadcast only, featuring Canadian performers and much original Canadian composition.

By the early 1970s the regulatory CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC) had laid down new rules governing community service and Canadian content, which stimulated Canadian recordings and pop groups. New Canadian stars emerged (Anne MURRAY, Bruce COCKBURN, Burton Cummings, the GUESS WHO) retracing a similar development already far advanced in Québec, where chansonniers (Gilles VIGNEAULT, Pauline JULIEN and Robert CHARLEBOIS) had for years been accorded star status (see POPULAR MUSIC).

During WWII the federal government established its International Service (mostly short-wave radio), supervised by the Dept of External Affairs but operated by the CBC. In 1968 the service came under full CBC responsibility and was renamed Radio Canada International in 1972. The IS/RCI made and distributed internationally hundreds of recordings. By 1977 RCI had begun its Anthology series, each a package of several discs of the music of a particular Canadian composer.

Music broadcasting has been crucial to the vitality of music in Canada. New technologies and changing tastes will affect form and style, but broadcasting will still play a leading role in bringing music to the public. KEITH MACMILLAN

**Music Criticism** Serious music criticism in Canada has existed only since the late 19th century. It takes the form of concert and record reviews written for publications and, in a few instances, longer articles in books. Prior to 1867, few commentaries about concerts were judgemental. Instead, articles simply reported on a social event, briefly commenting upon the performers, the staging and audience. Because concerts were so rare, any performance was appreciated and treasured. In the 1870s a limited critical awareness began to emerge as touring companies regularly made circuits through Canada and audiences could now compare the standards of local and visiting musicians. When choral societies and symphony orchestras were formed in major cities, regular concert seasons set the stage for critical assessments. Unfortu-

nately, criticism was generally delegated to a local music teacher or amateur musician who avoided writing anything critical about concerts in the community. Newspaper reporters assigned the task often had little musical knowledge. Notable exceptions in French Canada were Guillaume COUTURE (*La Minerve, Revue de Montréal, La Patrie, Montréal Star*) and in the early 20th century Léo-Pol MORIN (*La Patrie, La Presse, Le Canada*), both of whom demanded higher performance standards and changes in repertoire. Their English Canada counterparts, Hector CHARLESWORTH (*Saturday Night*) and Augustus Bridle (*Toronto Daily Star*), also wrote critical reviews and assessed, for the first time, Canada's composers. J.D. LOGAN in 1917 attempted the first examination of the foundations of criticism in Canada in an essay on the aims, methods and status of aesthetic criticism. Such philosophical considerations of music criticism have been rare and in more recent times have usually been part of symposia or annual conferences.

Musical reporting now appears regularly in newspapers and some magazines in most major cities and large towns. With the growth of interest in POPULAR MUSIC and JAZZ, the media have created entertainment sections that include regular reviews and feature articles about the music scene and recordings, although discussions of new compositions and newly published scores are rare. Among many writers active across Canada in the 20th century are Thomas Archer, Claude Gingras, Eric McLean and Gilles Potvin in Montréal; Léo Roy in Québec; Jacob Siskind in Montréal and Ottawa; Augustus Bridle, Hector Charlesworth, John BECKWITH, William Littler, John Kraglund and Kenneth Winters in Toronto; Lorne Betts in Hamilton; Loretta Thistle in Ottawa; A.A. Aldrick and S.R. Maley in Winnipeg; Stanley Bligh, Max Wyman and Ida Halpern in Vancouver. Writers on jazz and popular music include Ritchie York, Bob Smith, Peter Goddard, Mark Miller, John Norris and Gilles Archambault. FREDERICK HALL

**Music Education** in Canada has progressed from rustic beginnings in the colonial period to the present time when music training is available both for amateurs and professionals, and, indeed, as an increasingly important facet of general education. Historically he main branches of music education can be identified as private teaching, school instruction (public and private), and music in higher education. However, music education in the 1980s has evolved into a sophisticated complex of activities involving institutions, professional organizations, government agencies and cultural groups within the Canadian community.

**Colonial Period to 1918** Missionaries and military personnel furnished early forms of musical activity. As permanent settlements developed, church choirs and bands, however informal and unsophisticated, became the wellsprings from which a vigorous musical life emerged. Religious orders provided most of the instruction in French Canada, with the result that music was closely associated with convent schools and other church institutions. Their contribution in English-speaking regions should also be recognized, particularly that of the Irish orders in Newfoundland. French and English origins of Canadian culture account for much of the diversity in music education. For example, solfège in Québec was based on the fixed doh system of continental Europe whereas the movable doh tradition in English Canada had its roots in Britain. Early American influences can be seen in the singing schools of Upper Canada where Protestant churches were prevalent.

Egerton RYERSON listed vocal music as a subject in the common schools of Upper Canada in 1846, and has been considered the champion of

school music ever since. As chief superintendent of education, he formulated his educational plan after extensive travel to Britain, Europe and the US, where school systems had introduced singing on the strength of Pestalozzi's educational theories.

The question of "who should teach school music" and what training they should receive was never resolved satisfactorily. Ryerson attempted to provide such training within his Normal School but the most successful results in the schools were achieved in cities such as Hamilton and London, Ont, and Ottawa where trained musicians were hired. As the population increased, these special music teachers assumed the role of supervisors and were expected to conduct in-service programs for the regular teachers. Generally, rote singing was the main activity although more competent teachers also taught sight reading and voice culture; written examinations suggest a certain preoccupation with the rudiments. Achievement in music was dependent upon the expertise and interest of the individual teachers, consequently the outcome was uneven from school to school. By the late 1880s enthusiasm for John Curwen's Tonic Solfa system had been transplanted to Canada by British immigrants such as A.T. Cringan who taught in the Toronto schools. Their missionary spirit was heightened in a controversy over a proposal to sanction a rival American method. Music in the rural schools was neglected or often nonexistent, but in the cities music supervisors mounted massed concerts and demonstrations to display their accomplishments, especially on the occasions of royal visits or Empire Days. These events were characterized by the singing of patriotic airs and a certain amount of flag waving. In the Prairie provinces where there was an influx of European peoples, school officials encouraged the use of national songs in their zeal to Canadianize the population. Too often music in the schools relied upon these utilitarian benefits rather than a sound educational philosophy.

In the late 19th century, music was an important subject in ladies' colleges and finishing schools, but the general curriculum for boys was tailored to university entrance and professional careers and usually did not include music. Later on, when girls attended regular high schools, the curriculum retained its commitment to the interests of the university and, consequently, music did not achieve any major status in secondary education.

A colourful array of private teachers in the 19th century free-lanced as organists, band conductors and music dealers; teaching was just one facet of their endeavours in a society which revelled in amateur artistic pursuits. The appellation "Professor" was common among these versatile entrepreneurs, some of whom left a trail of bad debts or were otherwise involved in social scandal. The more pretentious female teachers advertised themselves as "Madame" and, flaunting their superior European training, often claimed to be schooled in foreign languages. Such idiosyncrasies aside, even though much of the teaching was of a dubious standard, there were some outstanding individuals, most of whom gravitated to the cities.

Apart from degrees awarded to James Paton CLARKE and George William Strathy, BMus and DMus degrees were not granted in Canadian universities until the 1880s. In the British tradition, they were extramural programs administered through syllabi and examinations in theoretical subjects without regular instruction being given. These early beginnings did not establish music as a discipline in higher education.

The turn of the century brought a profusion of conservatories, although many were merely glorified studios and relatively few enjoyed any

permanence or prestige. The major conservatories affiliated with universities in an arrangement whereby the former gave instruction and the latter conducted examinations. By the early years of the 20th century the Associated Boards of the Royal Schools of Music (England), the McGill Conservatorium and the Toronto Conservatory had established their examinations on a national scale. They served private teachers well through their graded syllabi and examination standards. The competitive festival movement, which had its origin in Edmonton (1908), also stimulated private instruction. After 1890, women's musical clubs became the patrons of music by sponsoring recitals and providing scholarships.

**1919-45** The Toronto Conservatory became a Canadian mecca for musicians during the principalship of Sir Ernest Macmillan, 1926-42 (see ROYAL CONSERVATORY OF MUSIC OF TORONTO). The number of local conservatories decreased but several remained as centres of musical life in their respective regions: Halifax Conservatory, Mount Allison Conservatory, McGill Conservatorium, Regina College Conservatory, Alberta College Music Centre (Edmonton) and Mount Royal College Conservatory (Calgary). Although teachers from overseas dominated the scene, gradually more Canadians came to the fore — yet most of them still went abroad for advanced study.

The player piano and phonograph enhanced the place of music in the home, and in a striking way the growth of radio broadcasting increased the potential for American influence on Canadian society. Therefore, the establishment of CBC radio in 1936 was as vital to the cultural unity of the nation as railways had been for economic development in the 1880s (see BROADCASTING, RADIO AND TELEVISION).

In order to improve professional standards, private teachers formed organizations, first in the cities and then province wide. In 1935 the 4 western provinces took the initial step towards a national organization at a conference in Vancouver; Ontario joined in 1942 and others followed in due course. Another example of western initiative was the founding of the Western Board of Music (1936), a co-operative venture involving the universities and provincial departments of education in the 3 Prairie provinces.

Significant changes in general education owe their existence to the child development movement in the US and the focus in educational psychology on the growth of the individual. The specific changes in music were related to the "song method," with less emphasis on reading skills and the paramount importance of music appreciation. Teachers could obtain learning materials from the Victor Talking Machine Co or tune in to radio programs prepared especially for schools (see EDUCATIONAL BROADCASTING). In practice, "progressive education" was not accomplished in the way it was idealized. Many classroom teachers dabbled in the "new," while the old generation of music specialists continued to stress basic skills. Inconsistent results in elementary grades reflected the inadequate training in normal schools, but, in several provinces, summer music sessions helped to improve the situation.

In some places music introduced as an option in junior high schools eventually led to its acceptance in secondary schools, but in most cases music was extracurricular. Glee clubs, orchestras and operettas became a tradition long before music teachers as such were appointed.

Music in the Protestant schools of Québec paralleled progress in Ontario, but in the Catholic schools the situation was static. Recognizing the need for improvement, in 1934 the Montréal Catholic School Commission appointed Claude Champagne as director of music education.

Between the wars some universities retained their extramural degrees but, with few exceptions, music in higher education did not expand rapidly even where faculties of music were established — at Toronto (1918) and McGill (1920) or at Laval, where a school of music was created (1922). However, in the 1930s the Carnegie Foundation of New York financed record collections in many universities, a chair in music at U of Saskatchewan, and an expansion of extension programs at U of Alberta which led to the founding of the Banff Summer School. Through a Carnegie grant, Ernest Hutcheson examined the need for advanced training at U of T (1937). When recommendations of that report were finally implemented (1946), it represented a landmark in Canadian music education.

**1946-84** The remarkable growth of music education since WWII can be attributed to developments in higher education and secondary schools, particularly in the field of instrumental music. The creation of the CANADA COUNCIL (1957) added further momentum through its sustained support of the arts, nurturing vital areas of Canadian culture on a general level.

U of T was at the heart of this cultural transformation. Advanced training was offered in the conservatory's newly created Senior School (1946), which featured an opera division that ultimately led to the CANADIAN OPERA COMPANY. At the same time, the Faculty of Music introduced a degree in school music to prepare specialists for secondary schools. Under the leadership of Macmillan, Arnold Walter gave direction to these programs with insight and vision. Among the students enrolled were many returned servicemen and from this nucleus came a new generation of Canadian performers, composers and teachers.

The school music degree was based on American patterns — a combination of practical and theoretical music with courses in the liberal arts. Of faculty members recruited from the US, Robert Rosevear and Richard Johnston were strongly committed to music education. Concurrent with developments at the university, Brian McCool of the Ontario Dept of Education effectively promoted programs in the schools. In order to meet the demand, the department's summer school certificated a multitude of instrumental teachers who had performing experience but little if any university education. Consequently, there have been marked philosophical differences in the ranks of Ontario's teachers.

Across the country the climate was conducive to change; instrumental music was already emerging in the high schools of Montréal and parts of BC. Consequently, by the 1960s similar developments in other regions demonstrated the need for specialized teachers and, in time, most universities either created new music departments or expanded their course offerings. This unprecedented growth in higher education necessitated the recruitment of additional faculty but since Canada had produced few students with graduate qualifications, universities turned primarily to American personnel to fill these positions.

The province of Québec experienced its own profound change in the late 1960s when the Parent Report, followed by the Rioux Report, led to a comprehensive plan for music at all levels within a modernized educational system. Based primarily on N American models, these revisions brought Québec into closer line with other provinces.

Québec's unique venture — Conservatoire de musique et d'art dramatique — had been founded in 1942 by Wilfrid Pelletier. A leader in several spheres of French Canadian music, Pelletier strengthened the influence of this institution even further after he became director of music, Ministère des affaires culturelles du Qué-

bec, in 1961. The conservatoire consists of 7 teaching institutions throughout the province. By providing free tuition on a competitive basis, Québec has produced a system of professional training unmatched in any other province.

Individual instruction, in both private and institutional settings, has been influenced by the growth of applied music in higher education, particularly in the appointment of distinguished performers and artists-in-residence. To some extent, this has checked the predilection of Canadians to study abroad.

The recent flowering of summer schools, institutes and special projects has stimulated a more competitive milieu for aspiring professionals, including opportunities at regional and local levels. The National Youth Orchestra, JEUNESSES MUSICALES, BANFF CENTRE SCHOOL OF FINE ARTS, CBC Talent Festivals, National Competitive Festival of Music, to name only a few, have become familiar names to Canadians. Nevertheless, it is evident that the quality of individual instruction in private domiciles and commercial studios associated with music dealers is still inconsistent.

Elementary school music has retained close ties to the song method with an increasing interest in Canadian folk songs (see FOLK MUSIC). Listening, rhythmic, and creative elements are also integrated into eclectic curricula. Since the 1960s Orff and Kodály programs have flourished in a number of Canadian schools where specialized teachers have been used. Nevertheless, Canada has not taken full advantage of these international systems because music instruction is usually left to classroom teachers.

There is a diversity of choral, instrumental and general programs in junior high and secondary schools. Many of them are performance-oriented with a continuing stake in the competition festival, but, philosophically, there has been a trend towards a more balanced curriculum in order to foster aesthetic sensitivity. In the 1960s the John Adaskin Project addressed the lack of contemporary music in schools. This dialogue between composers and teachers, enhanced later by the books of R. Murray Schaffer, proved to be a catalyst for creative approaches and alternatives. Recent excursions into new areas of folk, contemporary and popular culture have raised concerns within the profession, especially where traditional priorities have been threatened in a rapidly changing society.

One measure of maturity in Canadian music education has been evidenced by the formation of its professional organizations: Canadian Music Educators' Assn (1959), Canadian Federation of Music Teachers' Assns (1961), Canadian University Music Society (1965, originally Canadian Assn of University Schools of Music), and Fédération des associations de musiciens éducateurs du Québec (1966). Through professional development and publications, they provide valuable leadership and, in 1978, co-operated in hosting the World Congress of the International Society for Music in Education, held in London, Ont. On that occasion delegates from around the world became more aware of our cultural achievements and, for the first time, music education in Canada came into an international limelight.

See also MUSIC HISTORY. J. PAUL GREEN  
Reading: *Encyclopedia of Music in Canada* (1981); H. Kallmann, *A History of Music in Canada, 1534-1914* (1960); A. Walter, ed, *Aspects of Music in Canada* (1969).

**Music History** Music has had a home in N America for the thousands of years that Indians and Inuit have lived on this continent. Their music, however, enters recorded history only with early 17th-century European observers such as Marc Lescarbot. Father Paul Le Jeune and Father Gabriel Sagard, who were as fascinated by the exotic sounds and sights of native music making as they were ill equipped to describe

and analyse it. Skilled investigators such as Franz BOAS, Ernest GAGNON and Alexander T. Cringan appeared only in the late 19th century, and another 50 years passed before composers integrated elements of native music into some of their works.

Since colonization began in the 17th century, the mainstream of musical development has been little affected by native music. The original settlers transplanted their songs, dances and religious chants, and successive waves of immigrants reinforced old-world traditions. The import of printed music, of teachers and of touring star performers, followed later by recorded and broadcasted music, has shaped taste and has by its weight stifled or at least retarded original expression. Music in Canada has paralleled the basic European style periods from the baroque to the classical, romantic and contemporary, usually lagging behind by a few decades. The attempt to transplant Old World patterns in a sparsely populated country with widely separated settlements could never be quite successful, however. The system of patronage and the professional resources for grand opera, symphony orchestras and other sophisticated manifestations of music were wanting; European-trained Canadian and immigrant musicians, settling down to their careers, were cut off from new developments in composition and therefore stagnated. In turn, adventurous young musicians sought their models from among foreign composers: until the middle of the 20th century the influence from outside has nearly always outweighed the influence from one Canadian generation to another. Imperceptibly, however, the Canadian environment began to assert its influence, first of all in the popular sphere. Song texts were adapted to local conditions and new ones invented; dance tunes were exchanged by French and Irish Canadians; amateurs and professionals outdid each other in writing patriotic music in the 1850-1920 era; and N American social dances came to be preferred to European genres. Such institutions as the competition festival, the "local centre" examination supervised by a conservatory or examination board, the touring company, the annual conference of specific branches of the profession, and the network broadcasting system — all these are typically and congenially Canadian ways of sharing artistic experiences and exchanging ideas. From the "history of music in Canada," nourished from the outside, we are moving to a "Canadian music history," growing from within through the individuality of our musicians, the quality of our institutions, and the strength of our communications systems.

**To the Fall of New France** Written contemporary records of music in NEW FRANCE are few. Most consist of incidental references in the diaries and travel accounts of explorers and the reports of missionaries to their superiors in Europe. They begin with Jacques CARTIER's mention of the singing of the mass at Brest (Bonne Espérance Harbour) on 14 June 1534 and of the playing of the "trumpets and other musical instruments" at HOCHELAGA (Montréal) a year later. In the following century the missionaries regularly translated religious texts into verses in native tongues, since singing proved a useful handmaiden in their efforts to convert the Indians to Catholicism.

As early as the 1630s French and Indian children at Québec City were taught to sing and play European instruments. Viols, violins, guitars, transverse flutes, drums, fifes and trumpets are among the instruments named in early accounts, but it would be wrong to conclude that all were cultivated continuously in New France.

By 1661 the Jesuit chapel at Québec City had an organ, and the parish church received one in 1663; 60 years later a craftsman, Paul Jourdain,

was engaged to do extensive repair and construction work. There hardly was a need for professional musicians — at least Bishop LAVAL seems to have been concerned less with training in church music than in the decorative arts — but some priests applied their talent or European training to take charge of the musical aspect of divine service (acting as *grand chantre*) or to play the organ. A French-born priest, René Ménard, composed motets around 1640, and the second Canadian-born priest, Charles-Amador Martin, is credited with the plainchant music for the *Prose "Sacrae familiae felix spectaculum"* (about 1700) in celebration of the Holy Family feast-day. Early literature contains other references to religious composition, but "composing" may have meant simply selecting music for the service or writing the words. Surviving copies of early 18th-century editions of motets, masses and cantatas by de Bournonville, Campra, Morin and other French composers make it reasonable to conclude that skillful part-singing was practised. Similar evidence for instrumental performance is provided by the 1980 discovery of a manuscript volume with nearly 400 keyboard pieces brought to Montréal (where the first organ was installed about 1700) by Jean Girard in 1724 (see also RELIGIOUS MUSIC).

Though it is unlikely that formal concerts were held, some of the administrators and explorers participated in music. Louis JOLLIET, the explorer, played the organ at church; Jacques RAUDOT, the intendant, encouraged vocal and instrumental performance; and one of his successors, Claude-Thomas Dupuy, owned a library of operatic scores. Although contemporary documentation is sparse, modern research has established that everyday life in New France abounded in yet another genre of music: the hundreds of French folksongs that preserved memories of the homeland, made hard work go faster and provided rhythm for dancing, accompanied perhaps by a fiddle, a drum or at least handclapping and foot-stomping (see FOLK MUSIC). Thus, musical life in colonial Canada was diversified from the beginning, even though outside the church it lacked formal organization.

**Urban Musical Life, 1750-1830** Vigorous immigration to the area between the Atlantic Ocean and Lk Huron and the stationing of British military bands in garrison towns were among the factors generating a more intensive and organized musical life in the second half of the 18th century. Our knowledge owes much to the introduction of the printing press to Canada (Halifax 1751), for in due time NEWSPAPERS began to announce concerts and carry advertisements for teachers and merchants. This information is supplemented by occasional references in travel literature, more often than not commenting on the French Canadians' love of dancing and singing. The singing of the VOYAGEURS was especially admired.

The regimental bands, featuring perhaps a dozen woodwind and brass instruments, entertained at parades, participated in festive ceremonies and played minuets and country dances at suppers and balls. A "Concert Hall" existed in Québec City by 1764 and subscription concerts by 1770, given, one may presume, by band players and skilled amateurs. Programs for the Québec City and Halifax concerts of the 1790s reveal orchestral and chamber music by Handel, J.C. Bach, Haydn, Mozart and Pleyel. Not until recent times was new music introduced to Canada more quickly. Beginning with the *Padlock* by Dibdin (Québec City, 1783), ballad and comic operas were heard in Halifax, Montréal and Québec City in performances by strolling actors-singers, often assembled in the US from among European artists but occasionally staged by resident amateurs, such as in Montréal's Théâtre de société, founded in 1789. One of that group's offerings was a light opera, *Colas et Colinette* (1790),

with words and music by Louis-Joseph QUESNEL. The vocal parts of this work and those for Quesnel's *Lucas et Cécile* survive, but the music of John Bentley's pantomime *The Enchanters* (Montréal, 1786) and of his *Ode* marking the establishment of Upper and Lower Canada in 1791 is lost.

In the late 18th and early 19th centuries, the only way to make a living from music was to be a jack-of-all-trades: performer on several instruments, bandleader, teacher, repairer of instruments, importer of printed music and composer of marches, dances or church music for special occasions. Such versatile musicians were Frédéric Henry Glackemeyer, Jean-Chrysostome Brauneis, Sr, and Theodore F. Molt, from Germany; Guillaume Mechler from Belgium; Louis Dulongpré (also a painter) from France; and Bentley and Stephen Codman from England. From the US came singing teachers — itinerant like the portrait painters and companies of actors — to teach the rudiments of notation and choral singing in "singing schools" set up in a community for a few weeks or months and ending with a concert. This movement spread west from the Maritimes after about 1800 and for over 100 years contributed to the improvement of church choirs. As a rule, until the mid-19th century, only the larger Anglican and Catholic churches could afford organs and skilled musicians; elsewhere a bass fiddle, serpent or bassoon might "give out" the hymn tune; yet other denominations frowned on elaborate music. Church music also received an impetus with the publication of liturgical and hymn collections. *Le Graduel romain* (1800, Catholic), the first music printed in Canada, *Union Harmony* (1801, Methodist) and *The Colonial Harmonist* (interdenominational, 1832) are the oldest, respectively, from Québec, NB and Ontario.

**The Victorian Age** The inventions of the steamship and the railway, the growth of towns into cities with a prospering middle class, and the establishment of RESPONSIBLE GOVERNMENT all helped in the 1840s to usher in the age of musical pioneering, the period when the foundations were laid for the institutions and relationships of present-day musical life. Beginning with the English singer John Braham in 1841, famous artists appeared in Canada: the violinists Ole Bull and Henri Vieuxtemps, the singer Jenny Lind and the pianist Sigismond Thalberg had all, by 1858, delighted audiences and set norms for resident artists to strive for. There were many musicians who took up the challenge through dedicated work in the cause of good music in good performance. In setting up teaching studios, in training their church choirs to appear in concerts and, together with other singers and with instrumentalists, to form "philharmonic societies" or "musical unions," in opening music stores and publishing firms, they drew on an abundance of natural talent and a thirst for "the finer things in life." The obstacles were many: the vanity of the newly prosperous merchant class was revealed in the shallowness of its taste; rivalries between musicians, dearth of performers on certain instruments and poor audience support made all musical enterprises precarious.

While a few of the first Canadian-born professional musicians were able to make decent livings at home — eg, the bandmaster Charles Sauvageau, the teacher Jean-Chrysostome Brauneis, Jr, and the church musician Jean-Baptiste Labelle — those who craved major careers in music had of necessity to seek them abroad, and indeed the exceptionally gifted found them, including Joseph B. Sharland, a music educator in Boston; Hugh A. Clarke, a professor at U of Pennsylvania; Samuel P. Warren, a virtuoso organist living in New York; Calixa LAVALLÉE, composer of Canada's national anthem ("O Canada"), who found success as a pianist and composer in Boston; Solomon Mazurette, who lived

as a pianist in Detroit; and, perhaps the most outstanding of all, Emma Lajeunesse, the great soprano who, under the name ALBANI, became Canada's first world-famous musician. Many skilled musicians from Europe assumed Canadian roles as teachers, organists and leaders of musical societies, among them James P. CLARKE in Toronto, Antoine DESSANE in Québec City, Gustave Smith in Ottawa, Frederick Herbert Torrington in Montréal and later Toronto, and Frantz JEHIN-PRUME, primarily a violinist, in Montréal.

Among the earliest musical societies were the New Union Singing Society (1809) of Halifax; the Québec Harmonic Society (1820); the singers and band of the Children of Peace at Sharon, UC, proof of how strong leadership could make music flourish in a small village community; the York [Toronto] Band (1824); and the Philharmonic Society of Saint John, NB (1824). When the West was opened to colonization, the speed of musical development was telescoped, and societies were formed in the earliest years of many settlements. Victoria had a Philharmonic Society in 1859; Calgary and Winnipeg had bands in the 1870s, and concerts were given in Regina and Saskatoon in the 1880s. After Confederation every city and town had a number of societies, usually built around the core of a choir, and assisting orchestras were formed for special concerts with the help of band players, music teachers and amateurs. The largest and most enduring were the Toronto (1872-94) and Montréal (1875-99) Philharmonic societies, under the principal leadership of Torrington and Guillaume COUTURE, respectively, and the Septuor Haydn (1871-1903), a Québec City instrumental group led by Arthur Lavigne. Programs ranged from the haphazard assortment of band overtures, piano solos, national songs and choral pieces (the "grand concert of vocal and instrumental music") to oratorio performances and concert performances of operas (eg, *Messiah*, *The Creation*, *The Flying Dutchman*, and Beethoven's *Symphony No 9*). For OPERA, Canadians depended mainly on visiting troupes, although, sporadically, amateur performances were staged locally, and the Holman English Opera Troupe resided in Toronto and London, Ont, for some years. Instead of the ballad operas of the 18th century, the repertoire now embraced Italian and French grand opera. From rare performances of truncated versions accompanied by a handful of instrumentalists about the mid-century, opera became a frequent entertainment by professional companies, including those from New York, by the end of the Victorian era. "Opera houses" opened in every community from Vancouver to Yarmouth, NS, but in general, except for Toronto's MASSEY HALL (1894), concert halls were inadequate.

On the popular level, orally transmitted folk songs yielded increasingly to fashionable ballads and dances (waltzes, quadrilles, galops, polkas) propagated by imported printed music. However, there was a counter-current in Québec, where songs like "A la claire fontaine" and "Vive la Canadienne" were quasi-national hymns and where new patriotic songs like "Un Canadien errant" (words 1842) and "Le Drapeau de carillon" (1858) gained wide popularity. Ernest Gagnon's collection *Chansons populaires du Canada* (1865-67) helped some 100 songs to a new life by bringing them to the attention of city folk and sophisticated musicians. Gagnon himself arranged folk tunes for choir, and Ontario composer Susie F. Harrison utilized such material in her *Trois Esquisses canadiennes* (1859) and her opera *Pipandor*, as did several foreign composers, eg, Sir Alexander Mackenzie in his *Canadian Rhapsody* (about 1905) for orchestra. James P. Clarke successfully captured a Canadian flavour in his group of songs "Lays of the Maple Leaf" (1853), but the bulk of composers accepted

without question the stylistic trends current during their student years in Paris or Leipzig in both the concert and the popular genres. Most of the surviving Canadian compositions of the Victorian era were intended for the immediate needs of churches, bands, dance halls, patriotic rallies and the ever-growing number of parlour pianists and singers. Rarely did such music rise above the level of competence and prettiness, but it matched the average music in these genres produced in other countries. Couture's *Rêverie* (1875), W.O. Forsyth's *Suite* (1888) and Clarence Lucas's 3 Shakespeare overtures (about 1899) are among the rare orchestral works. Given the local resources, there was a greater incentive to write cantatas and light operas. Landmarks were Charles W. Sabatier's *Cantata in Honour of the Prince of Wales* (1860), J.B. Labelle's *Cantata: La Confédération* (about 1867), Lavallée's US-produced light opera *The Widow* (1881) and *TIQ (The Indian Question/Settled at Last)* (publ 1883), Oscar F. Telgmann's "Canadian military opera" *Leo the Royal Cadet* (1889), which had over 150 performances, J.J. Perrault's *Messe de Noël* (1859-65) and Charles A.E. HARRISS's dramatic legend *Torquil* (publ 1896).

Progress in performance and composition was accompanied by the development of instrument building, music publishing and MUSIC EDUCATION. The making of pianos, pipe and reed organs began in the second decade of the 19th century in small workshops by German and US craftsmen and became a major industry by the end of the century, while violin making remained a cottage industry (see MUSICAL INSTRUMENTS). Important names were Samuel R. Warren and Casavant Frères in pipe-organ building, T.A. Heintzman in piano manufacturing (see HEINTZMAN AND CO), and the Lyonnais family in violin building. R.S. Williams & Sons and Whaley, Royce & Co Ltd were among the largest instrument dealer-manufacturers.

Following the publication of church-music volumes (see HYMNS), music was printed in newspapers (1831) and periodicals, and after 1839 it appeared on its own, as sheet music. Dance music, marches and parlour pieces for the piano and for songs made up the bulk of publications, but cantatas and light operas also found their way into print. Canadian works and foreign compositions were about equal in number. A. and S. Nordheimer, Arthur Lavigne, A.J. Boucher and Whaley, Royce & Co Ltd were among the most active companies. There were no public or university music libraries, but musical societies built collections of musical literature for their own members.

Music was introduced as an activity in many public schools after the middle of the 19th century; Alexander T. Cringan was one of its principal pioneers, and the Petit Séminaire de Québec had a school orchestra as early as 1833. King's College (later U of T) granted James P. Clarke a Bachelor of Music degree in 1846, and George W. Strathy received a Doctor of Music from the U of Trinity College (Toronto) in 1858, but only late in the century did several universities establish degree examinations, leaving the teaching to conservatories. The conservatories, of which the Toronto Conservatory (1886) soon became the leading institution, provided individual lessons (see ROYAL CONSERVATORY OF MUSIC).

**Flourishing and Transition, 1900-40** Grandeur — an expression of wealth and power — was a universal characteristic of the turn of the century, and it showed itself in musical life as well. Compositions such as *Cain* (1905) by Alexis Contant and *Jean le Précurseur* (publ 1914) by his fellow Montréalais Guillaume Couture were oratorios with full orchestra on a scale never before attempted in Canada. Joseph Vézina, bandmaster in Québec City, produced 3 comic operas. In 1903 C.A.E. Harriss organized the Cycle of Musical Festivals of the Dominion of Canada,

which involved over 4000 singers and instrumentalists in 15 communities from Halifax to Victoria. Choirs of hundreds of singers coexisted in the large cities, and Toronto came to be called the "choral capital of North America" largely because of its TORONTO MENDELSSOHN CHOIR founded by A.S. VOGT. Montréal boasted an ambitious Montréal (later National) Opera Company (1910-13; 1913-14), and visiting companies presented such giant works as *Tristan and Isolde*, *Parsifal*, the *Ring* cycle and *Otello*, though these were exceptional. For orchestral fare even the large cities depended on visiting ensembles, usually from the northern US, that would accompany Canadian oratorio choirs and present programs of their own. However, Québec City, Montréal, Toronto, Halifax and Calgary established semiprofessional orchestras (see ORCHESTRAL MUSIC). Piano companies flourished as never before (see PIANO MANUFACTURING) and Émile Berliner, inventor of the disc recording, established his gramophone business in Montréal. Conservatories mushroomed and examination boards were set up, the Académie de musique de Québec (1868), the Associated Board (British, operating in Canada from 1895 to 1953), the Dominion College of Montréal and the Toronto Conservatory, among others. After years of insular development, Canadians were able to find out about musical life in each other's cities from such periodicals as *Le Passe-Temps* (1895-1935, 1945-49), *Canadian Music Trades Journal* (1900-33) and *Musical Canada* (1906-33).

WWI produced a spate of patriotic songs, but it decimated orchestras, choirs and many other enterprises. After the war the era of active music making waned under the impact of the new technologies of recorded and radio-transmitted sound (see MUSIC BROADCASTING). Imports again dominated the market, filling homes with US popular and European concert music, providing only a modest outlet for Canadian performers and composers. In combination with the GREAT DEPRESSION, this shift caused a decline in the instrument industry and an employment crisis for musicians. There were significant new developments, however. Faculties or schools of music were established at the universities of Toronto (1918), McGill (1920) and Laval (1922). Orchestras, few of which had survived the war, were re-established, or new ones were founded, notably in Toronto (1922), Montréal (1930 and 1934) and Vancouver (1930; see TORONTO SYMPHONY; ORCHESTRE SYMPHONIQUE DE MONTRÉAL; VANCOUVER SYMPHONY), and broadcast studios employed musicians for musical and dramatic programs. Orchestras, choirs and solo performers could now be heard on networks across the country and in communities where concert facilities did not exist. Representative ensembles, in addition to the orchestras, were the Elgar Choir of BC, based in Vancouver, the Bach-Elgar Choir of Hamilton, the Toronto Mendelssohn Choir, the Arion Male Voice Choir of Victoria, the Schubert and Canadian Choirs of Brantford, the Winnipeg Male Voice Choir, the Disciples de Massenet of Montréal, the Dubois and HART HOUSE STRING QUARTETS of Montréal and Toronto, respectively, and the Société canadienne d'opérette of Montréal and its successor, Variétés lyriques. Recitals were fostered, in particular by the women's musical clubs. Famous popular groups were The DUMBELLS, a vaudeville troupe born in the trenches of WWI; Guy LOMBARDO and his Royal Canadians, a dance band that moved to the US; and the Bytown Troubadours, a male quartet. The western provinces found a congenial outlet for musical energies in the competition festivals. These were begun in Edmonton in 1908 and in the 1980s still bring thousands of children and music lovers together to match skills and take advice from visiting adjudicators (see MUSIC AWARDS AND COMPETITIONS).

The period between the wars also produced the first musician of national stature, Sir Ernest MACMILLAN, the only Canadian musician to have been knighted. Other musicians who achieved national or international recognition included, in chronological order, the singers Marie Toulinguet, Rodolphe PLAMONDON, Béatrice LA PALME, Edward JOHNSON, Louise Edvina, Florence Easton, Pauline DONALDA, Eva Gauthier, Sarah Fischer, Frances James and Raoul JOBIN; the organist Lynnwood Farnam; the pianists Emiliano Rénaud, Mona Bates, Léo-Pol MORIN, Ernest Seitz, Ellen Ballon and Muriel Kerr; the violinists Kathleen PARLOW and Frederick Grinke; the orchestra conductors Luigi von Kunits, Wilfrid PELLETIER, Reginald Stewart, Geoffrey WADDINGTON and Jean-Marie BEAUDET; the choir-leaders Herbert A. Fricker, Bruce Carey and Charles Goulet; the bandmasters John Slatter, Charles O'Neill and J.J. Gagnier; and the carillonneur Percival PRICE.

The field recording, archival deposit and publication of folk and aboriginal music by Marius BARBEAU, W. Roy Mackenzie, Helen CREIGHTON and others resulted in the discovery and preservation of an unsuspected wealth of traditional music and local compositions. The series of folk arts and handicrafts festivals organized by J.M. Gibbon for the CPR from 1927 to 1934 (especially in Québec City and Banff) promoted public awareness of folk music and stimulated arrangements and new compositions by W.H. arrangements and new compositions by W.H. Anderson, Claude CHAMPAGNE, Hector Gratton, Roy, Alfred Whitehead, Healey WILLAN and others. A foundation of regional folk idioms was widely believed to be the precondition for a distinctive Canadian music. However, although Champagne's *Suite canadienne* and MacMillan's *Two Sketches for Strings* have become Canadian classics, the majority of compositions were international in orientation. Anglo-Canadian composers and teachers of the craft, such as Douglas CLARKE, MacMillan, Leo Smith, Whitehead and Willan, were steeped in turn-of-the-century aesthetics and usually in British church traditions. On the whole, French Canadians such as Champagne, Laliberté, Rodolphe MATHIEU and Morin represented more modern influences, ranging from Scriabin to Debussy. Mathieu and Colin McPhee, who later investigated the music of Bali, were among the few exploring contemporary techniques. The majority of compositions were songs, choral settings and short piano pieces. Symphonies, string quartets and cantatas were usually written as degree exercises, but at least one composer, Willan, wrote in nearly all forms, from ballad and radio operas to symphonies, from organ pieces to choral music.

The teaching content at universities and conservatories and the concert repertoire were conservative, but to audiences in Canada the bulk of Bach, Mozart, Brahms and Debussy was still music to become familiar with. Without doubt, however, the dearth of pioneers for the radical new music of the day did delay the development of composers and audiences considerably.

**Expansion since WWII, 1940-84** A swift expansion, almost an "explosion," of musical activity occurred in the 1940s. Subsequent progress has been nothing short of spectacular, retarded only slightly by the economic austerity of the 1970s and 1980s. It manifested itself in the emergence of world-rank performers and ensembles, of a large number of professional composers, and in the import, and assimilation by audiences, of a diversified literature of new and old music from many parts of the world, offered in abundance in splendid new concert halls and arts centres, at festivals, on recordings and broadcasts (see RECORDING INDUSTRY). This growth has been concomitant with a new pride in Cana-

dian achievement and a conscious will to establish and maintain a cultural identity. It has been nurtured by enriched school music programs, the development of facilities for advanced education and scholarly research, and by new communications technologies. It has been built with the help of nationwide organizations setting standards, coordinating resources, promoting talent, protecting legal interests and lobbying governments. Agitation throughout the arts community has been largely responsible for new patterns of financial support for the arts from governmental agencies — foremost the CANADA COUNCIL — and, to a lesser degree, from private sources. Direct support is given through subsidies of various kinds (see ARTS FUNDING), indirect support through quotas set on the Canadian content of concert series and broadcasts.

Before WWII there had been a few national music organizations (all named here by their latest name only), Composers, Authors and Publishers Assn of Canada (CAPAC, 1925), the Canadian Band Directors' Assn (1931) and the Canadian Federation of Music Teachers' Assns (1935). Later ones include Performing Rights Organization of Canada (PROCan, 1940), the umbrella organization the Canadian Music Council (1945), the CANADIAN LEAGUE OF COMPOSERS (1951), the CANADIAN MUSIC CENTRE (1959), the Canadian Music Educators' Assn (1959), the Canadian University Music Society (1965), the Assn of Canadian Orchestras (1972), and others for folk music, music libraries, music publishers, record producers and other special concerns.

The improvement of music education began with the establishment of the Conservatoire de musique du Québec by the province of Québec in 1942, first in Montréal and later in 7 centres, and the creation of courses at the U of T for professional performers and school music educators (1946). The number of university music departments has grown from a handful in the 1930s to over 30. New research facilities include electronic music studios, folk and native music archives at the NATIONAL MUSEUM of MAN, Laval U and elsewhere, and the national collection of musical Canadiana at the NATIONAL LIBRARY OF CANADA (1970). The National Youth Orchestra (1960) provides experience for a young elite of instrumentalists, while JEUNESSES MUSICALES DU CANADA (1949) and CAMMAC (Canadian Amateur Musicians/Musiciens amateurs du Canada) (1953) and numerous summer music camps appeal to the wide range of music lovers. Music information and discussion has been fostered by such periodicals as *The Canadian Music Journal* (1956-62), *Opera Canada* (1960-) and *The Canada Music Book* (1970-76). THE ENCYCLOPEDIA OF MUSIC IN CANADA (1981, French ed 1983) bears witness to the growing interest in the history and current state of music in Canada.

The intensity and diversity of musical performance has assumed staggering proportions, whether one thinks of the 100 professional or community orchestras, the opera companies of Toronto (CANADIAN OPERA COMPANY), Montréal (Opéra du Québec, followed by Opéra de Montréal), Vancouver, Edmonton, Calgary (Southern Alberta Opera Assn), Winnipeg (Manitoba Opera Assn) and elsewhere, the chansonnier and *boîte à chansons* phenomenon of the 1960s, the summer FESTIVALS, the rock bands or the broadcast fare (see POPULAR MUSIC). Only a few highlights may be listed. The CBC had its golden age of music in the 1950s with its own symphony orchestra and opera company and its "L'Heure du Concert" (French TV), but has since turned from a prime producer of music programs into a channel for programs originating in concert halls (see RADIO PROGRAMMING). Festivals have included those in Montréal (1936-65), STRATFORD, Ont (1953-), Vancouver (1955-68), Ottawa (NATIONAL ARTS CENTRE, 1971-), as well as giant celebrations during EXPO 67 in Montréal

and the 150th anniversary of the city of Toronto in 1984. International acclaim has been won by such groups as the ORFORD STRING QUARTET (1965), the FESTIVAL SINGERS OF CANADA (1954-79), the CANADIAN BRASS QUINTET (1970), the GUESS WHO rock band (1965-75) and others (see CHAMBER MUSIC). The main cities have ensembles for the performance of medieval and renaissance music on authentic instruments and also societies for the most recent music, notably the Société de musique contemporaine du Québec of Montréal (1966).

Individual performers of world repute include the singers Maureen FORRESTER, Lois MARSHALL, Louis QUILICO, Léopold SIMONEAU, Teresa STRATAS and Jon VICKERS (see SINGING); the pianists Glenn GOULD, Anton KUERTI, André Laplante and Ronald Turini; the violinists Ida HAENDEL and Steven STARYK; the cellists Lorne Munroe and Zara Nelsova; the harpsichordist Kenneth GILBERT; and the JAZZ musicians Maynard FERGUSON (trumpet) and Oscar PETERSON (piano). Mireille Lagacé and Hugh McLean are among the best organists; Alberto Guerrero, Lyell Gustin, Yvonne Hubert and Lubka Kolesa have been renowned piano teachers; and the list could be continued for many other disciplines. Canadian conductors of the period include John AVISON, Mario BERNARDI, Alexander BROTT and Boris BROTT, Victor FELDBRILL, Pierre HÉTU, Elmer ISELER, as well as many outstanding immigrants. Rika Maniates is one of several fine musicologists (see MUSICOLOGY); Edith FOWKE and Conrad Laforte are distinguished folk song scholars. Nicholas Goldschmidt (festivals), Gilles Lefebvre (Jeunesses musicales) and Arnold WALTER (education) have been organizers on the grand scale. Popular and folk singer-songwriters have included Paul ANKA, Edith Butler, Félix LECLERC, Monique LEYRAC, Gordon LIGHTFOOT, Alan Mills, Joni MITCHELL, Anne MURRAY and Gilles VIGNEAULT. The list of talented performers is long and distinguished.

The breakthrough in composition that occurred about the middle of the century was 3 pronged: it established composition as a primary musical occupation; it introduced the teaching of contemporary techniques to the classroom, and it ended Canadian isolation from the avant-garde of Western music. Internationalism and diversity ruled as composers caught up with 12-tone technique, neoclassicism, electronic sound and other developments (see ELECTROACOUSTIC MUSIC). Many young Canadians polished their art in Paris, Rome or Darmstadt; some 3 dozen studied with the celebrated teacher Nadia Boulanger. Barbara PENTLAND, John WEINZWEIG and Jean PAPINEAU-COUTURE became leaders of the "radical" wing. Weinzwieg and Papineau-Couture also the first 2 presidents of the Canadian League of Composers, and teachers of great influence. Listing composers by their teachers can be misleading, since the relationship may have been short or long, may have influenced technique or style, and may have been superseded by stronger influences. To list composers by labels of style ignores the process of maturing. Therefore a chronological list within the most recent areas of activity will suffice. To indicate the variety of influences, the countries of birth of adult immigrants are given, and to show the variety of genres, specialties are named.

**Atlantic Provinces:** Janis Kalnins (Latvia).

**Québec:** Otto Joachim (Germany), Maurice Blackburn (film), Alexander BROTT, Gabriel CHARPENTIER, François MOREL, Clermont PÉPIN, Pierre MERCURE, Bengt Hambraeus (Sweden), Serge GARANT, Roger Matton, Gilles TREMBLAY, André Prévost, Alain Gagnon, Jacques Héту, Micheline Coulombe SAINT-MARCOUX, Bruce MATHER, Brian Cherney, Claude Vivier.

**Ontario:** Keith Bissell, Lucio Agostini (radio drama), John Weinzwieg, Eldon Rathburn (film), Samuel Dolin, Oskar MORAWETZ (Czecho-

slovakia), Louis APPLEBAUM (film), Godfrey RIDOUT, Udo KASEMETS (Estonia), Talivaldis Kenins (Latvia), István ÁNHALT (Hungary), Robert FLEMING (film), Harry FREEDMAN, Harry SOMERS, John BECKWITH, Lothar Klein (Germany), R. Murray SCHAFER, Norma BEECKROFT, Srul Irving Glick.

**Manitoba:** S.C. ECKHARDT-GRAMATTÉ (raised in France and Germany), Robert Turner.

**Alberta:** Violet ARCHER, Richard Johnston (USA), Gerhard Wuensch (Austria).

**British Columbia:** Murray ADASKIN, Jean Coulthard, Barbara Pentland, Rudolf Komorous (Czechoslovakia), Michael C. Baker, Barry Truax.

Considering the variety of genres, techniques and styles embodied in the works of these and many other Canadian composers, can one detect distinct regional or national traits? Some critics have drawn parallels between lonely scenery and stark climate and the austere vocabulary of certain composers; others deny such parallels. Folk idioms, historical subject matter (as in Somers's opera *Louis Riel*) and the blending of pioneer-age music with modern techniques (as in certain Beckwith works) also provide means towards distinctiveness. A close awareness of our "soundscapes" has led Schafer to some original experiments. To shake off international influences would be pointless and impossible; gradually Canadian music will be shaped by composers who, like other Canadians, are products of Canadian society and react to their environment in ways that are subtly different from those of others. Among these composers there will be, if there are not already, a few of such talent and individuality that their music will determine what is called Canadian.

**Musical Instruments** Canadian musical instruments have had a successful but specialized history. There has been little industrial or private manufacture of brass, woodwind or percussion instruments, which have been imported from other countries. The making of violins has flourished periodically, and the artistic traditions of the 19th-century Québec violin-making families Lyonnais, Martel, Lavallée and Bayeur have recommenced with the opening in 1979 of a school of stringed-instrument making in Québec by de Lellis and Lamarre. The vogue for free-bass accordion playing, fostered since the 1960s, has been supplied by imported instruments. Individual enterprise founded unique companies such as the Stoermer Bell Foundry (Breslau, Ont, 1931) and Norman Acoustic Guitars (La Patrie, Qué, 1972).

Through the dynamism and integrity of personal and family establishments, and the reliable quality of their products, the piano and the organ have been the principal musical instruments of Canadian manufacture for both national consumer markets and international export. The piano was fashionable and popular

before WWI in parlours, officers' clubs, church halls, schools, pioneer homesteads and gold rush saloons. The zealous religious conviction that partially motivated the settlement of Canada was given musical expression through the organ. Canadian-made harmoniums (reed organs) were popular from about 1870 to 1910.

Business acumen, high production standards and the involvement of several generations in family firms have characterized the manufacture of musical instruments in Canada: Nordheimer, HEINTZMAN, Willis, Lesage (pianos); Casavant (organ); Heintz (strings), to mention only a few. Individual commercial firms have been affected by social and economic factors. In 1912 30 piano factories produced 30 000 instruments, sold almost exclusively to a domestic market. A post-Depression slump was followed by a rise to a second sales peak (about 11 000 in 1965), but since then the Canadian piano industry has suffered a dramatic decline to the point that by 1982, after financial failure and merger, only Heintzman, Lesage and Sherlock-Manning survived. The piano is rivalled in the home by portable popular instruments, the record player, radio and TV, and small Canadian companies are unable to compete with international firms. In contrast, for organ builders such as Casavant Frères de St Hyacinthe, Qué, the maintenance of fine craftsmanship and reliance on national products for components has developed an output 80% of which is exported, with 18 installations in Japan alone.

Canadian forests have provided timber suitable for the manufacture of keyboard and stringed instruments that could function in the nation's climate. The availability of excellent wood has been a factor in attracting skilled craftsmen to this country, such as viola maker Otto Erdész who established a shop in Toronto in 1975. There is a developing interest in the construction of replicas or personal interpretations of medieval, Renaissance and baroque instruments. The new violin and bow specialists, harpsichord makers (Albarda, Kater, Redsell and Turner) and experts in the fashioning of lutes, viols and other early stringed instruments (Allworth, Philpot and Schreiner) have revived a positive attitude to the craft and a personal pride in home industry reminiscent of the original 19th-century workshops of Theodore Heintzman and Joseph Casavant. High-quality acoustic GUITARS are produced in limited numbers by craftsmen such as Frank Gay, Jean Larivière and Pat Lister in different centres across Canada.

**Collections** Canadian-made musical instruments, in various states of playing condition, may be seen in pioneer villages, forts and museums of local historical societies. The sound of the 19th-century Québec violin makers is lost, with only a few examples in private ownership. Working examples remain of early organ builders Samuel Warren (Chambly, 1854), Louis Mitchel (Vaudreuil, 1871), Casavant Frères (Lacolle, 1885) and Napoléon Déry (St Roch-des-Aulnaies, 1874). Listed in the *Encyclopedia of Music in Canada* are 23 public and private collections of instruments, of Canadian and international provenance. The largest holding is that of the Royal Ontario Museum, based on the R.S. Williams Collection. Over 1000 instruments are divided among its Far Eastern, Ethnology and European departments. Native Canadian and non-Western instruments are found in the UBC Museum of Anthropology (Vancouver), Provincial Museum of BC (Victoria), Glenbow-Alberta Institute (Calgary), Robertson Collection (Regina) and National Museum of Man (Ottawa).

WALTER H. KEMP

**Musical Theatre** includes pageants such as Augustus Bridle's *Heart of the World* (1927); spectacles like those at the CANADIAN NATIONAL EXHIBI-

TION, beginning with *Ivanhoe* (1906); OPERA; operetta, especially the ever-popular Gilbert and Sullivan repertoire; masques like F.A. Dixon and Arthur Clappé's *Canada's Welcome* (1879); and Broadway-style book shows and revues, composed of songs and comic sketches. The first theatrical performance in Canada, *Le Théâtre de Neptune* (1606) by Marc LESCARBOT, used music. Another early work, Joseph Quesnel's *Colas et Colinette* (1790) was a "comedy with ariettes." In the later 19th century most plays written to be performed were burlesques, parodies with original lyrics set to borrowed melodies. Local amateurs appeared in burlesques such as *'Our Boys' in the Riel Rebellion* in Halifax, *Dolorsolatio* in Montréal, *Piarmigan* in Hamilton and *The Tricky Troubadour* in Winnipeg. In the 1880s E.A. McDowell's professional company toured the country with William H. Fuller's *H.M.S. Parliament*, a satirical version of *H.M.S. Pinafore*. Although vaudeville was popular until the 1920s, it was dominated by Americans. Talented Canadians such as Eva Tanguay and May Irwin had to emigrate to achieve stardom.

Canadians excelled at writing reviews. The DUMBELLS, Canada's famous soldier entertainers of WWI, continued to perform through the 1920s. In the 1930s groups such as Toronto's Arts and Letters Club and the Winnipeg Press Club presented evenings in sophisticated satire, while workers' theatres staged more biting revues such as *We Beg to Differ* in Montréal and the "Beer and Skits" shows in Winnipeg (see THEATRE, HISTORY). Gratien GÉLINAS's annual *Fridolinolus!* revues entertained Québec audiences from 1938 to 1946 with the views of a cocky kid in a Montréal Canadiens' sweater. The annual satirical revue *Spring Thaw* was first produced by Toronto's New Play Society in 1948 under the direction of Mavor MOORE. Twenty-four consecutive editions of *Spring Thaw* used skits and comic songs to help Canadians laugh at themselves. *My Fur Lady* (1957), a McGill University show that toured Canada, was similar to *Spring Thaw*, but had a tenuous plot. *My Fur Lady* featured several songs by Galt MacDermot, who later composed the music for *Hair*. In the 1960s Toronto's Theatre in the Dell and Old Angelo's became the first of many licensed cabarets to open across Canada offering light, intimate, small-cast professional entertainment. Many cabarets are based on the work of one composer (eg, *Oh Coward*, a pastiche of Noël Coward's songs) or on similar types of songs (eg, *Flicks*, film music, and *Blue Champagne*, songs of the 1940s). Successful original cabarets have included *Sweet Reason*, David Warrack's *Oops!* and *Tease for Two*, Jacqueline Barreux's *Heureux celui qui Meurt*, Clémence Desrocher's Québec reviews such as *La Grosse Tête* and Mark Shekter's and Charles Weir's *Toronto Toronto*.

While most Canadian theatres, including Winnipeg's Rainbow Stage, which specializes in musicals, prefer to present Broadway musicals, Canadians continue to write book musicals. Mavor Moore tried to establish a Canadian musical theatre in the 1950s by writing shows such as *Sunshine Town*, which was based upon the work of Stephen LEACOCK. Then Moore helped found the Charlottetown Festival in 1964, which his successor Alan LUND dedicated to Canadian musicals. Charlottetown's most widely produced musical has been *Anne of Green Gables* (Norman Campbell/Donald Harron), both nationally and internationally (London, Eng, 1969; Osaka, Japan, 1970; on Broadway, 1971-1972). Also popular have been *Johnny Belinda* (John Fenwick/Mavor Moore), *The Legend of the Dumbbells*, which used the troupe's original songs, and the mini-musical for 4 performers, *Eight to the Bar* (Joey Miller/Stephen Witkin). Some of Canada's finest young musicians have written for the Charlottetown Festival: Jim Betts (*On a Summer's Night*), David Warrack (*Windsor*) and

Anne of Green Gables, the Charlottetown Festival's most widely produced musical, has also appeared in London, Eng.; Osaka, Japan; and on Broadway (photo by Barrett and MacKay/Masterfile).

Cliff Jones (*Kronborg: 1582*, a rock version of *Hamlet*). Jones's other Charlottetown shows have been *The Rowdyman*, based on Gordon PINSENT's book, and the mini-musical, *Love in the Back Seat*, which was later staged at the Citadel Theatre in Edmonton. The Citadel also premiered Jones's *Hey Marilyn!* an opulent tribute to American film star Marilyn Monroe.

While the Charlottetown Festival was concentrating on Broadway-style musicals, many Canadian writers and composers explored alternative forms; eg, Tom Hendry and Stanley Silverman's *Satyricon* (Stratford, 1969), which was a lush extravaganza; Hendry and Stephen Jack's *Gravediggers of 1942*, a chilling evocation of the DIEPPE raid; Jacques Languiand and Gabriel Charpentier's *Klondyke*, a Brechtian view of the gold rush; Robert and Elizabeth Sverdlow's *Justine*, a counterculture allegory; George Walker and John Roby's *Rumours of our Death*, a bizarre comedy; and Phil Schreiber, Gordon Stobbe and Nancy White's *I Wanna Die in Ruby Red Tap Shoes*, a song-and-dance perspective on Canadian theatre. Saskatoon's Persephone Theatre had an unexpected hit with *Cruel Tears*, based on *Othello*, written by Ken Mitchell and the bluegrass band Humphrey and the Dumprucks. One of the most spectacular contemporary musicals in Québec has been *Starmania*, a rock fantasy by Michel Berger and Luc Plamondon.

Vancouver composer, lyricist and librettist John Gray has become Canada's dominant personality in musical theatre on the basis of 3 consecutive successful mini-musicals: *Eighteen Wheels*, a trucker's musical; *Billy Bishop Goes to War*, a one-man tour de force about the WWI flying ace; and *Rock and Roll*, an ironic commentary on the faded dreams of a popular small-time, small-town band. Writers like Gray, who in 1982 formed themselves into the Guild of Canadian Musical Theatre Writers (which grew out of workshops conducted in Toronto by Broadway's Lehman Engel), are continuing the challenging task of developing a distinctively Canadian musical theatre.

ROSS STUART

**Musicology** is the study of the historical development of Western art music, folk and traditional music (ethnomusicology) and aspects of music in acoustics, aesthetics, psychology and sociology. As an academic discipline it was introduced to Canada in 1954 when U of T appointed Harvey J. Olnick to organize a course for the Master of Music degree. By 1982, 33 Canadian universities offered undergraduate instruction in musicology and ethnomusicology; 15 universities had graduate programs at the master's level, and 6 offered doctoral programs for musicology, ethnomusicology, composition, music education and performance.

Canadian musicologists make considerable contributions as participants, officers and organizers for international societies, since there is as yet no national society. Musicological papers are presented at the Canadian University Music Society (CUSM), the Assn pour l'avancement de la recherche en musique du Québec (ARMuQ), Canadian Folklore Society and other professional groups sponsored by the Canadian Learned Societies.

There are few outlets for scholarly articles on music in Canadian journals. Present publications are the *Canadian Folk Music Journal*, *Studies in Music from the University of Western Ontario* and *CUSM Review/Revue*. Canadian musicologists publish frequently in international journals and encyclopedias. Through these articles and monographs Canadians — including Gaston Allaire, Terence Bailey, Dimitri Conomos, Robert Falck, Andrew Hughes and Maria Rika Maniates on medieval and Renaissance music; Mary Cyr, Kenneth GILBERT and Hugh McLean on baroque/classical topics; and H. Robert Cohen, Donald McCorkle, Zoltan Roman and Alan Walker on more recent subjects — have contributed significantly to knowledge of Western art music.

Only brief, generally regional, surveys of Canadian music appeared before Helmut KALLMANN's *A History of Music in Canada 1534-1914* (1960). This pioneer publication was followed by Willy Amtmann's study of music under the French regime, *Music in Canada 1600-1800* (1975), and George Proctor's *Canadian Music of the Twentieth Century* (1980). The establishment of the CANADIAN MUSIC CENTRE in 1959 and the music division at the NATIONAL LIBRARY OF CANADA in 1970 facilitated the compilation of the *ENCYCLOPEDIA OF MUSIC IN CANADA* (1981). In 1982 the first complete overview in book form, Clifford Ford's *Canada's Music: An Historical Survey*, was published, and the Canadian Musical Heritage Society began publishing scholarly editions of early Canadian music in 1983. Individual researchers concentrated on specific areas to compile material from newspapers and periodicals: Phyllis Blakeley and Timothy McGee on NS; Nancy Vogan and J. Russell Harper on NB; William Bartlett on PEI; France Malouin-Gélinas and Juliette Bourassa-Trépanier on Québec City; J. Antonio Thompson on Trois-Rivières; Peter Slemmon and Lyse Richer-Lortie on Montréal; Beverley Cavanagh, Frederick Hall, Elaine Keillor and William Lock on various cities in Ontario; Carl Morey on Toronto; Norman Draper and Norman John Kennedy on Calgary; and Dale McIntosh on Victoria. Antoine Bouchard and John S. McIntosh have investigated the development of organ building, and Dorith Cooper the history of opera. Helmut Kallmann in particular has done the basic research and collecting of resources that have made Canadian studies in music history possible as an academic subject. At American and Canadian universities, theses have appeared on various genres of Canadian compositions and, more specifically, on individual composers such as W.H. Anderson, Claude CHAMPAGNE, Jean Coulthard, S.C. ECKHARDT-GRAMATTÉ, Robert FLEMING, Bruce MATHER, Rodolphe MATHIEU, Léo-Pol MORIN, Jean PAPINEAU-COUTURE, Barbara PENTLAND, Godfrey RIDOUT, Harry SOMERS, John WEINZWEIG and Healey WILLAN. In 1975 the Canadian Music Centre initiated its series of monographs on individual Canadian composers with Brian Cherney's *Harry Somers*.

In ethnomusicology, Mieczyslaw Kolinski developed cross-cultural analytical procedures that had considerable influence internationally and Jean-Jacques Nattiez developed a methodology based on semiology. With Charles Boilès, Nattiez published a history of the discipline to the mid-1970s in *Musique en jeu* (Sept 1977). Norma McLeod has outlined field methods and performance practices. The first ethnomusicol-

ogy studies done by Canadians occurred after the pioneer works by Theodore Baker (1882), Carl Stumpf (1886) and Franz BOAS (1888), which included studies of some Indian and Inuit music. James TEIT and Alexander T. Cringan began making cylinders of BC tribes and Iroquois, respectively, in the 1890s. In the 20th century, anthropologists and musical scholars, including Marius BARBEAU, have concentrated on Indian/Inuit music to define the musical style of various cultures, including the Eastern Woodlands area, Plains Indians and North Pacific Coast. Relatively little musical research has been done on the Montagnais/Naskapi, Athapaskan or Plateau tribal music, and in 1982 no comparative survey of Indian musical styles existed. The research on Inuit music saw much activity in the 1970s after the initial investigations of Boas, Knud Rasmussen, Diamond JENNESS and Helen Roberts (see articles under NATIVE PEOPLE).

In the FOLK MUSIC studies of French, English and other ethnic groups in Canada, folklorists have concentrated on the history, diffusion and variants of individual songs rather than the musical styles involved. Marius Barbeau of the Museum of Man and Carmen Roy, the first director of the Museum's Canadian Centre for Folk Culture Studies, collected thousands of Franco-Canadian folk songs. Conrad Laforte of the Archives de folklore, Laval U, tackled the problem of cataloguing these songs with a classification system based on poetic structure. Germain Lemieux, a notable collector in Ontario, became director of the Institut de folklore (now Centre franco-ontarien de folklore), U de Sudbury, in 1959. Acadian studies initially begun by Anselme Chiasson and continued by Charlotte Cormier are centered at U Moncton. Thousands of Anglo-Canadian songs have been collected by W. Roy Mackenzie, Gerald S. Doyle, Helen CREIGHTON, Louise Manny and Kenneth Peacock in the eastern provinces. Much research is being done at the Folklore and Language Archive at Memorial U under Neil Rosenberg. In 1957 Edith FOWKE began collecting in Ontario and has published many of the more than 1000 songs she has amassed. West of Ontario, Barbara Cass-Beggs, Tim Rogers and Philip Thomas have been the principal researchers. Of about 60 ethnic groups whose music has been collected in Canada, notable studies have been done on the DOUKHOBORS (Kenneth Peacock), Koreans (Bang-song Song) and UKRAINIANS (Robert Klymasz). (See also FOLKLORE).

In ACOUSTICS, Oswald Michaud of Montréal and R.W. BOYLE of Alberta, later of the National Research Council, were pioneers. In 1948 Jean Papineau-Couture gave the first course that directly related acoustics to musical composition. The Canadian project most prominent in research on the interaction of sound waves and people is the *WORLD SOUNDSCAPE PROJECT* at Simon Fraser U. In aesthetics, the only Canadian to promote new theories is R. Murray SCHAFFER, in *The New Soundscape* (1969). M.R. Maniates has written on French musical aesthetics and mannerism, and Geoffrey Payzant is completing a reassessment and translation of the writings of Eduard Hanslick. Shafer has published studies on the aesthetic views of E.T.A. Hoffmann and Ezra Pound.

Experimental aesthetics and psychophysics have been the areas of greatest interest for Canadians involved with the psychology of music. Rodolphe Mathieu began musical-aptitude tests at the Canadian Institute of Music (Montréal) in 1930, and in 1935 the first courses in the psychology of music at the Maritime Academy of Music (Halifax) were given by Cyril Cornelius O'Brien. Although psychology departments in universities have carried out studies in music education, more research has been done on the perception of musical stimuli of pitch structure, order and tone sequences in music and various

aspects of "absolute pitch." In experimental aesthetics, D.E. Berlyne, F.G. Hare and J.B. Crozier have explored arousal theory and information theory as related to music, and Paul Pedersen and David Rosenboom have applied psycho-physical research to music composition. In the relatively new field of the sociology of music, John Shepherd has been a pioneer with his publications *Whose Music? A Sociology of Musical Languages and Written to Order: A Survey of Tin Pan Alley (1900-1950)*.

**Muskeg** [Algonquian, "grassy bog"], term describing a type of landscape, environment, vegetation and deposit. It attained widespread use in the 1950s during northward expansion of resource development. Peatland and organic terrain are equivalent terms generally referring to northern landscapes characterized by a wet environment and vegetation (eg, black spruce muskeg) botanically classified as mire (subdivided into bogs and fens). Muskeg defies precise scientific definition. It may cover large areas (Hudson Bay Lowland) or occur as small, isolated pockets. Muskeg produces PEAT deposits of variable thicknesses and types because of incomplete decomposition of plant matter in the wet, acid environment. The particular vegetation and hydrological patterns allow recognition of different muskeg types by REMOTE SENSING. Most peat and muskeg in Canada is less than 10 000 years old and occurs in areas covered by the last GLACIATION. Peat accumulation rates and the distribution of muskeg are dependent on climate conditions and controlled by CLIMATE CHANGES. In northern regions, muskeg and PERMAFROST are closely associated and can present difficult engineering problems. No comprehensive, Canada-wide survey of muskeg has been made, but various estimates indicate that Canada may have more muskeg (over 1 295 000 km<sup>2</sup>) than any other country. Because of its importance to wildlife, WATER resources and the northern environment, muskeg is no longer considered wasteland. When managed properly, organic soils on peat have excellent capability for agriculture and forestry. Peat products have long-established uses in horticulture, and there is renewed interest in peat as an alternate ENERGY source. Peat provides raw materials for the CHEMICAL INDUSTRY (resins, waxes, paints, etc) and can serve as an efficient filter for some HAZARDOUS WASTES. See SWAMP, MARSH AND BOG; VEGETATION REGIONS.

J. TERASMAE

Reading: N.W. Radforth and C.O. Brawner, eds, *Muskeg and the Northern Environment in Canada* (1977).

**Muskellunge** (*Esox masquinongy*), large, predaceous, soft-rayed, freshwater FISH occurring naturally only in eastern N America. The largest member of the PIKE family (Esocidae), it has an oval body and a duck-billed snout with large teeth. The single dorsal fin, anal fin and caudal fin are close together. Muskellunge are distinguished by a pattern of dark markings on a light background, 6-10 pores on the underside of each lower jaw, and the absence of scales from lower portions of cheeks and gill covers. Although individuals exceeding 1.8 m and 45 kg were once known, most modern specimens are much smaller (70-120 cm, 3-16 kg). Muskellunge prefer clean, cool, weedy waters. In Canada, they occur from Québec to eastern Manitoba. Other common names include musky, lunge and maskinonge. One of the most prized Canadian fishes, it is sought for its aerial acrobatics and hard fight, and also because anglers hope to establish a new record by catching one exceeding 32 kg.

E.J. CROSSMAN

**Muskoka Lakes**, 3 interconnected lakes — Rosseau, Joseph and Muskoka — in the picturesque Ontario vacation land E of Georgian Bay. Lk Muskoka is fed from the E by the 2 branches of

the Muskoka R, the N branch rising in Lakes Vernon and Fairy at HUNTSVILLE and the S in Lake of Bays. Lk Muskoka is connected to Lk Rosseau by the Indian R, and Lk Rosseau to Lk Joseph by the St Joseph R. A lock at Port Carling and a canal at Port Sandfield enable watercraft to cruise among the lakes. A western continuation of the Muskoka R drains the whole system from Lk Muskoka into Georgian Bay. The name "Muskoka" is likely a corruption of "Misquickkey," an Algonquin chief whose name appears on 2 treaties surrendering the area to Britain Nov 1815. Samuel de Champlain (1616) and John Graves SIMCOE (1793) traversed the region, and David THOMPSON searched the area (1837) for a practical route from the Ottawa R to Georgian Bay.

Muskoka was opened to settlement when the Free Land Grant Act (1868) made land available, but although movement within the area was easy, a trip to Muskoka was an ordeal until the railway arrived in 1875. There is some arable land interspersed among the rock and forest, but farming has not been successful, accounting for less than 4% of employment in the area. The lumber industry was active during the late 19th and early 20th centuries, but is only of local importance today. The permanent population is about 35 000, with major concentrations at Huntsville, GRAVENHURST and Bracebridge. The scenic splendour and recreational attraction of the forests and lakes brought visitors from the growing cities of southern Ontario in Victorian times. The early focus of recreation was the resort hotel, replete with dance halls, croquet lawns, tennis courts, etc. There were about 30 establishments by 1879, and there are now over 400. The first summer cottages appeared in the late 19th century on western Lk Joseph. At first the preserve of the wealthy, the area now has roughly 20 000 vacation homes, about half of them owned by Toronto residents. Access today is mainly by paved highways N from Toronto.

JAMES MARSH

**Muskox** (*Ovibos moschatus*), shaggy, horned MAMMAL of the cattle family (Bovidae); occurs naturally only in Canadian arctic tundra (mainland and arctic islands) and in Greenland. Muskoxen are related to wild SHEEP and GOATS. They have humped shoulders and short legs, stand about 130 cm high, and weigh 180-270 kg. Muskoxen live in small herds in summer and larger groups (60 or more) in winter. Herds are loosely organized but a dominance hierarchy is present among bulls, cows and subadults. Synchronized cycles of alternating feeding and rumination keep the constantly moving animals together. Females produce a single calf in Apr-June. Though suckling may continue throughout their first year, calves begin feeding on plants within a few weeks of birth. The playful calves spend most of their time together, returning to the mothers only for suckling, travel or safety. When confronted by wolves or humans, muskoxen line up facing attackers, pressed tightly together with calves wedged in between. If surrounded, they form a solid ring and may charge out at the enemy. When harassed they stampede, sometimes leaving behind stragglers that are more easily killed by wolves. In mid-summer the thick layer of insulating underwool is shed, giving muskoxen a very shaggy appearance. Prolonged courtship begins in late July as bulls assess the females' reproductive state. In Aug, courtship with increasing contact leads to successful mating. Males may challenge the dominant bull for herd leadership. After exchanging deep, roaring bellows, opponents show the broad bases of their horns and rub the preorbital glands against their forelegs in a ritualized display. They then back up and gallop forward to meet in a series of head-on clashes. Head-to-head scuffling may then determine the

Muskox (*Ovibos moschatus*). The shaggy mammal, related to wild sheep and goats, occurs naturally only in the Canadian Arctic and Greenland (photo by Fred Breummer).

winner. Muskoxen dig craters in the snow with the forehooves to reach winter forage. Dominant herd members displace others from craters already dug. A wind-hardened crust is broken by pounding with the chin. In severe storms, muskoxen remain lying down for extended periods. Unusual snow conditions can lead to extensive deaths by starvation. Over hunting by explorers, fur traders and whalers led to a ban on HUNTING from 1917 to 1970. Muskoxen were protected further in 1927 with establishment of the Thelon Game Sanctuary. Inuit and sports hunting is now permitted in some areas. Muskox habitats are affected by resource exploration and development, and there are few places in Canada where muskoxen and their habitat are fully protected.

DAVID R. GRAY

**Muskrať** (*Ondatra zibethicus*), fairly large RODENT common throughout much of N America in wetlands and waterways where water 1-2 m deep supports rooted vegetation and does not freeze to the bottom. It was introduced to Eurasia around 1905. Muskrats are brown, chunky in appearance, and 40-63 cm long, with a distinctive, laterally flattened, sparsely haired tail contributing 18-25 cm. Adults weigh 0.5-1.8 kg. Large hindfeet and slightly webbed toes are edged with short, stiff hairs (swimming fringes). Four incisors cut and hold plant food and 12 cheek teeth grind it. Paired glands beneath the tail base produce musk for marking territories. Two or three litters of 5-7 (range 1-11) young are born Apr-Aug. In marshes muskrats build domelike houses of vegetation up to 1.2 m high and 1.8 m across; in ponds and streams they dig bank burrows. They swim and dive well and eat many kinds of aquatic plants, especially cattails. In winter they eat in "push-ups," minihouses over plunge-holes in the ice, where they can be trapped. Mink are their most important nonhuman predators. Their durable

Muskrať (*Ondatra zibethicus*), a large rodent common to the wetlands and waterways of N America (photo by Tim Fitzharris).

pelts are an important source of income for Canadian trappers. Muskrats occasionally damage banks and dams. Wildlife biologists manage muskrat populations for sustained yields by improving habitat and regulating harvests. Muskrat numbers decline drastically every 6-10 years, because of infectious diseases and breeding failures. See FUR TRADE; FUR TRAPPING.

DONALD A. SMITH

#### Muslims, see ISLAM.

**Musquodoboit Harbour**, NS, UP, pop 936 (1981c), located 40 km NE of HALIFAX, takes its name from the Micmac, meaning "rolling out in foam" or "suddenly widening out after a narrow entrance at its mouth." The Musquodoboit Valley, comprising the communities of Upper, Middle and Centre Musquodoboit Harbour, was mostly settled by LOYALISTS and second-generation "planters" from TRURO. Industries today include lumbering, and harvesting and exporting Christmas trees, an industry begun in the 1930s. Still an agricultural area today, farming is mainly devoted to raising livestock. Gold mines opened in nearby Caribou, Mooseland and Moose R brought prosperity to the valley as it developed service industries. LIMESTONE extraction is now a major industry, and the valley is known for its good hunting and fishing.

JANICE MILTON

**Mussallem, Helen Kathleen**, nursing educator (b at Prince Rupert, BC). After beginning her career as a staff nurse at the Vancouver General Hospital, she served overseas during WWII as a lieutenant in the Royal Canadian Army Medical Corps. A graduate of Columbia University's Teacher's College, she was an instructor, then director of education, at the VGH School of Nursing. Active throughout her career in nursing education, she served as executive director of the Canadian Nurses' Assn 1963-81. She received several awards and citations for her work as a nursing educator both in Canada and abroad where she advised international organizations such as the International Council of Nurses and the World Health Organization. In 1969 she was made an officer in the Order of Canada and in 1981 received the Florence Nightingale Medal — the highest award of the International Red Cross.

DANIEL FRANCIS

**Mussel**, bivalve (hinged shell) MOLLUSC of either the marine order Mytiloida or the freshwater superfamily Unionacea. Mussels, prized worldwide for food, are the *moule* of French cuisine. Marine mussels are elongated by enlargement of the posterior end. They are found attached to a support by byssal threads (filaments secreted by the mollusc) or partially buried. The blue, bay or common mussel (*Mytilus edulis*) occurs on Canada's East and West coasts and is the only mussel of commercial interest in this country. Recent AQUACULTURE operations in the Maritimes have been successful. More than 100 t are produced annually and an industry is starting on the West Coast. Two other mussels provide a recreational fishery and have potential for development: sea mussels (*M. californianus*), found on the exposed West Coast, and horse mussels (*Modiolus modiolus*), present in deeper waters of the Pacific and Atlantic coasts.

FRANK R. BERNARD

**Mutchmor, James Ralph**, Presbyterian and United Church minister (b at Providence Bay, Manitoulin I, Ont 22 Aug 1892; d at Toronto 17 May 1980). After serving in an artillery battery in WWI, he resumed his theological studies and from 1920 to 1936 served churches in Winnipeg's north end. In 1937 he moved to Toronto as associate secretary, and from 1938 to 1963 as

secretary, of the Board of Evangelism and Social Service and crusaded against drinking, gambling and social immorality. He was elected moderator of the United Church in 1962. A humanitarian and an able administrator, he led several delegations to the government demanding improved social conditions. He published his memoirs, entitled *Mutchmor*, in 1965.

NEIL SEMPLE

**Mutual Aid**, the principal economic means by which Canada assisted its allies with food, raw materials and munitions from May 1943 until the end of WORLD WAR II. The Mutual Aid Board, chaired by C.D. HOWE, supervised all Allied purchases in Canada and allocated over \$2-billion worth of Canadian production without charge, most of it going to Britain and the Commonwealth. Mutual Aid followed the BILLION DOLLAR GIFT and was a Canadian version of American LEND-LEASE. An act of enlightened self-interest, it adhered to the fundamental principle that there should be no war debts that would burden post-war trade. Mutual Aid was devised largely as a political solution to an economic problem, but it was no more popular than the Billion Dollar Gift. Both measures provided the financial basis for Canadian war production, which was the key to Canada's wartime prosperity and perhaps its most significant part in the victory.

HECTOR M. MACKENZIE

**Mutual Funds**, open-ended investment institutions that raise capital by issuing shares to investors. In contrast to closed-end funds, mutual funds do not have fixed capitalizations. They issue shares to investors continuously and are ready to redeem outstanding shares on demand. In principle, the types of securities in mutual-fund portfolios can vary widely but in practice a particular fund's portfolio is determined by the proffered investment objectives of the fund; some specialize in fixed-income securities, some in Canadian equities, some only in foreign securities, gold, securities of new ventures or securities of corporations in a particular industry.

Mutual funds are managed professionally by federally or provincially chartered management (investment advisory) corporations or by trust companies. Many firms will manage and distribute shares of only one mutual fund but on average a Canadian firm manages 4 different funds. The firms receive compensation in the form of management fees, calculated as a percentage of the net asset value of the fund (the difference between the market values of its assets and liabilities). In addition, some funds levy sales (load) charges at the time of purchase. The selling price of the shares of a fund with a load charge (usually 10%) is calculated by dividing the fund's net asset value per share by one minus the percent load charge. For example, if a fund levies an 8% sales charge and its net asset value per share is \$5, the fund's shares will be sold at  $\$5.43 = \$5 \div (1 - 0.08)$ . When shareholders sell shares in the fund, they will be redeemed at the prevailing net asset value per share. Most Canadian funds do not charge redemption fees.

Mutual funds are subject to provincial securities acts as are any fund's investment objectives and policies. In the 1970s the total asset growth of mutual funds declined as a result of the introduction of capital-gains tax; competition took the form of increased mortgage holdings, pension funds and corporate bonds.

S.M. TINC

**Mycorrhizae**, symbiotic associations between plant roots and FUNGI, are thought to occur on roots of 95% of all SEED PLANTS. They are probably essential to the survival in nature of both partners. The plant derives an enhanced ability to absorb essential minerals and greater resistance

to root diseases. The fungus obtains sugars directly from its partner, without competition from other micro-organisms. Mycorrhizae occur in several forms that differ in benefits conferred upon plants and fungi involved. The most widespread, endomycorrhizae, occur in about 90% of seed plants and involve approximately 50 species of fungi, thought to belong to the Zygomycotina. In these associations, the fungus invades cells of the root cortex (outer layer) and there forms swellings (vesicles) or highly branched and shrublike appendages (arbuscules). Less widespread types of mycorrhizae, restricted primarily to orchids and members of the heath family, resemble endomycorrhizae but involve Ascomycotina and Basidiomycotina. Ectomycorrhizae, which involve 5000-6000 species of fungi, occur on relatively few plants, mainly trees of pine, birch, willow and oak families. In ectomycorrhizae, the fungus forms a thick sheath around the root, often increasing its diameter several times; filaments penetrate between, but do not enter, root cells. In Canada ectomycorrhizae reach a particularly high level of development. Most Canadian forests are dominated by trees forming ectomycorrhizae and, during wet seasons, mycorrhizal fungi produce large numbers of MUSHROOMS.

Mycorrhizae are thought to enhance a plant's ability to absorb phosphorus. The role of nitrogen in mycorrhizal physiology is less well understood. Endomycorrhizae are thought to use simple sources of nitrogen. Ectomycorrhizae, able to absorb more complex forms of nitrogen, are thought to compete with soil micro-organisms for nitrogen locked in leaf litter. Orchid and heath mycorrhizae may be the most efficient in extracting complex nitrogen compounds. Mycorrhizae are under study by researchers in FORESTRY and AGRICULTURE worldwide. Tree seedlings inoculated with selected ectomycorrhizal fungi have been found to have improved survival rates and field growth, and the practice may prove especially effective in areas where natural mycorrhizal levels are low. The manipulation of endomycorrhizae in agricultural practice shows great promise and eventually may eliminate heavy use of FERTILIZERS. At present, however, the inability to grow endomycorrhizal fungi in laboratories has hindered attempts to produce adequate amounts of inoculum. The Jardin Botanique, Montréal, and Laval University, Québec City, intend to begin production of maple seedlings inoculated with mycorrhizae, which will allow the trees to grow in nutrient-poor soils.

DAVID MALLOCH

**Myers, Barton**, architect (b at Norfolk, Va 6 Nov 1934). He immigrated to Canada in 1968 to join the faculty of architecture at U of T. He was principal of the firm of Diamond and Myers until 1975, then founded Barton Myers Associates with offices in Toronto and Los Angeles. He is an original designer with a strong sense of context and heritage; his projects include the CITADEL THEATRE and U of A Housing Union Building (HUB) in Edmonton, Sherbourne Lanes housing in Toronto and the Seagram Museum in Waterloo, Ont. LEON WHITESON

**Mynarski, Andrew Charles**, gunner (b at Winnipeg 14 Oct 1916; d at Cambrai, France 12 June 1944). He was mid-upper gunner of a Lancaster bomber that caught fire. Though free to jump, he persisted in trying to save a trapped comrade. His parachute and clothing caught fire and he died from his burns, though his comrade miraculously survived the plane crash. Mynarski was awarded the VICTORIA CROSS posthumously for his effort to save another's life.

JAMES MARSH

#### Mysteries, see POPULAR LITERATURE.

**NABU Manufacturing Corporation**, see ELECTRONICS INDUSTRY.

**Nahani**, also **Nahanni**, is an Athapaskan word that, with various spellings, has been used to designate native groups in BC, the NWT and the YT. It is considered to be an inaccurate and inappropriate name for any specific group or for any cultural-linguistic grouping. European fur traders and explorers began to use the term **Nahani** in the early part of the 19th century, often in reference to an Indian group that was not in direct contact with them and only vaguely known from Indian reports. In the 20th century the term was gradually replaced by more accurate designations, although the Canadian government still used **Nahani** in the 1970s for the languages of 3 Yukon groups in the Whitehorse, Ross R and Liard R areas. These peoples have been identified as Southern **TUTCHONE** and **KASKA** speakers. See also **SOUTH NAHANNI R**; **NATIVE PEOPLE**, **SUBARCTIC**.

BERYL C. GILLESPIE

**Nahanni Butte**, NWT, UP, pop 85 (1981c), is located on the N side of the **SOUTH NAHANNI R** near its junction with the **LIARD R**, 507 air km SW of **YELLOWKNIFE**. Named after the **NAHANI** people, the tiny **Slavey DENE** community is the access point for **NAHANNI NATIONAL PARK** (est 1971), which recently became a UNESCO world heritage site. The area has been haunted for some 60 years by rumours of a lost gold mine, and 25 deaths and mysterious disappearances have been reported. The site became settled 25 years ago when the government relocated people from a settlement at **Netla River**, 24 km away.

ANNELIES POOL

**Nahanni National Park** (est 1972) is over 4700 km<sup>2</sup> of rugged mountains, wild rivers and luxurious hot springs stretched along the **SOUTH NAHANNI R** in the SW corner of NWT. Tales of lost gold mines and hidden tropical valleys lured prospectors in the early 1900s. Many disappeared without trace in the harsh land and, when 2 headless corpses were discovered, stories of fierce mountain men spread. No one found gold or tropical valleys, but prospectors did discover a land of incomparable beauty. The **South Nahanni R** twists for more than 320 km through the **PARK**, crashing through 3 immense canyons over 1000 m deep, plummeting 100 m over **Virginia Falls**, rushing past boiling hot springs, icy caves, soaring mountains and seething rapids. The vegetation is characterized by boreal and alpine species. Frequent, extensive fires have marked much of the forest. The park's 32 mammal species include Dall sheep, moose, woodland caribou and grizzly bear. Peregrine falcons, trumpeter swans and golden eagles are among the 120 species of birds recorded. The adventures experienced by the gold seekers can be recaptured by visitors canoeing, hiking or wilderness camping. Essential services and facilities are available in **Fort Simpson**, NWT. The park is a UNESCO World Heritage Site.

LILLIAN STEWART

**Nain**, Nfld, Town, pop 938 (1981c), inc 1970, located in N Labrador, is the most northerly community in the province. It was given its name when chosen by the **Unitas Fratrum** (Moravians) in 1771 as their first mission. The site, once used by the Maritime Archaic Indians and early Inuit, had been known as **Kauk Harbour**. Until the 20th century the mission served as a permanent trading base for trappers, hunters and fishermen who followed ancient seasonal migration routes. The mission members, the only permanent European settlers, ran the store and trading post until 1926, when the **HBC** assumed its operation. In the 1940s this store passed to the Newfoundland government; the **International Grenfell Assn** and the **Labrador E Integrated School Board** took over the medical and educational services. The modern fishing town has been settled year-round since the

1950s, its population being augmented by the resettlement of the former Moravian missions of **Okak** and **Hebron**.

JANET E.M. PITT AND ROBERT D. PITT

**Naismith, James A.**, physician, educator, inventor of **BASKETBALL** (b at **Almonte**, Canada W 6 Nov 1861; d at **Lawrence**, Kansas 28 Nov 1939). Orphaned at age 8, **Naismith** returned to **Almonte High School** at age 20 to complete his education. He showed prowess in athletics at **McGill**, and in Dec 1891, as a young instructor at the **YMCA International Training School** at **Springfield**, Mass (now **Springfield College**), he invented the game of basketball. At 37, **Naismith** graduated from the **Gross Medical School** of **Colorado U** with a medical degree. He was associated with the **U Kansas** for some 40 years as professor, physician, and director of physical education and published several books on sport. At 64 he became an American citizen. Basketball has grown to worldwide popularity.

FRANK T. BUTLER

**Nakamura, Kazuo**, painter (b at **Vancouver** 13 Oct 1926). After studying at **Toronto's Central Technical School** (1948-51), **Nakamura** became a member of **PAINTERSELEVEN**. His paintings, first of rectangular block structures recalling the prairies, and then of white oil paint over string laid horizontally on canvas, as in *Infinite Waves*

Spectacular **Virginia Falls** on the **S Nahanni R** in **Nahanni National Park**, NWT (courtesy Parks Canada/Prairie Region).

(1957), had a simpler structure and coloration (mostly monochrome) than the work of the **Eleven**. Like **JOCK MACDONALD's** painting, **Nakamura's** often concerned the new science, time and space. For this reason he is sometimes considered to have been the most advanced member of the group. He himself characterized his work as more geometric than hard-edge. His nature and landscape paintings, done at the same time as his abstractions, were equally general in tone. As part of **Nakamura's** explorations, he investigated number structure, the most complex field of mathematics, equating it with the structure of forms.

JOAN MURRAY

**Names** At common law a person's surname is a question of custom and repute only; it can be changed at will provided it is not done for a fraudulent purpose. Married women are not obliged to take their husbands' names. Provincial laws, typically called **Vital Statistics Act** (governing the naming of children at birth) and the **Change of Name Act**, have supplemented or supplanted the common law. Legitimate children generally have to be registered within a specified period from birth in the father's surname. Illegitimate children are registered in the mother's name unless the father agrees in writing to the child taking his name. Change of Name statutes document a legal change of name. If adults change their names, the consent of a spouse to a change of name affecting both partners is necessary. Divorced women can revert legally to their original names. To change children's names, the consent of one or both parents, and sometimes of the child (if over 14 years of age), may be required. Under **Québec** law spouses retain their own names for legal purposes. Children take the family name of one or both parents.

ALASTAIR BISSETT-JOHNSON

**Nanabozo** (**Nanabozho** or **Nanabush**), a mythological culture hero found in the cosmological traditions of the **Algonquian** tribes of central and eastern Canada. He is the impersonation of life, with the power to create life in others. He appears as diverse personalities which represent the various phases and conditions of the life cycle. In some myths **Nanabozo** creates animals and causes plants and roots to grow so men can eat. He plays a dual role in mythology, both as benefactor to the Indian and as a prankish and obscene fool.

RENÉ R. GADACZ

**Nanaimo**, BC, City, pop 47 069 (1981c), inc 1874, is located on the E coast of **VANCOUVER I**, 110

km N of Victoria and 27 km W of Vancouver, across the Str of Georgia. It is situated on a narrow coastal plain; a few areas in the city have elevations of 290 m. Nanaimo is surrounded by good agricultural land and rich timber resources. Its excellent deep harbour has made it an important distribution and regional centre. Also, it is the axis of several transportation routes: the Esquimalt and Nanaimo Ry; the Trans-Canada and Island hwy; and ferry services to and from the mainland. With its beautiful natural setting, mild climate and numerous beaches, parks and nearby camping sites, the city is an important tourist centre. It is governed by a mayor and 8 aldermen, but shares some responsibilities with the regional district of Nanaimo (est 1967). Nanaimo's most noted annual event is the "bathtub weekend," when "tubbers" from around the world race across the Str of Georgia to Vancouver in motor-powered bathtubs.

**History** The Coast SALISH Indians were the region's first inhabitants. The Spanish explorers Galiano and Valdés came in the 1790s. The HBC established a trading post 1849, but the discovery of coal in 1852 led to permanent settlement. In 1854, 24 families arrived from England to settle in Colville Town, the name first given the settlement, after Andrew Colville, governor of the HBC. In 1862 the Vancouver Coal Mining and Land Co bought out the HBC mines and expanded operations. Completion of the Esquimalt to Nanaimo Ry (1886) spurred development. The city grew with its increasing coal output. Production from the 3 main seams in the area reached its peak in 1923 when over 1 million tonnes were mined. Once the easily accessible coal was mined, however, it became increasingly dangerous and expensive to extract the fuel and by the early 1950s the city turned to forest products.

**Economy** Nanaimo has used its good harbour for trading, servicing and distribution industries. Fishing and lumbering have also grown since the 1950s. The Port of Nanaimo has 3 deep-sea berths, and the BC and CP Ry ferries have docks at Departure Bay. Duke Point Industrial Park, when completed, will focus on forest products and related industries. Nanaimo is one of a few resource towns that have achieved transformation to a diversified regional centre.

**Cityscape** The HBC fort, built 1853, is the oldest preserved HBC fort in Canada and houses one of the city's 3 museums. Central Nanaimo's

street pattern is based on a century-old radial pattern of streets converging on the waterfront and central business district. Until the 1950s Nanaimo was a city of contrasts — coal-mine officials and other businessmen built large homes in certain areas while the miners lived in "stark frame company houses."

ALAN F.J. ARTIBISE

Reading: E.B. Norcross, ed, *Nanaimo Retrospective: The First Century* (1979).

**Nanisivik**, NWT, UP, pop 261 (1981c), is located on the S shore of Strathcona Sound on the BORDEN PENINSULA OF BAFFIN I, 1650 air km NE of Yellowknife. The mining community is the home of Nanisivik Mines, which produces cadmium, lead, silver and zinc. Opened in 1974, the mine today employs Inuit as well as southern workers on a rotations system. The area has historically never been inhabited by Inuit and is devoid of wildlife, while vegetation is scarce.

ANNELIES POOL

**Nanogak, Agnes**, graphic artist (b on Baillie Is, NWT 12 Nov 1925). She is known for her energetic and colourful depictions of traditional myths and legends. Her works have figured prominently in every print collection published by the Holman artists' co-operative since 1967. Daughter of William Natkutsiak (Billy Banks-land) who came from Alaska to the Canadian Arctic with the explorer Vilhjalmur STEFANSSON, since 1937 Nanogak has made her home in Holman, NWT, where she married William Goose, raised a large family and developed her artistic career. Her narrative prints and drawings evoke a rich variety of stories reflecting the Alaskan roots of her father and the Mackenzie Delta/Copper Eskimo culture of her mother and husband. Nanogak illustrated a book of Inuit stories, *Tales from the Igloo*, ed and trans by Maurice Metayer (1972).

MARIE ROUTLEDGE

**Nanticoke**, Ont, City, pop 19816 (1981c), located on the N shore of Lk Erie, 58 km SW of Hamilton. It was created in 1974 by the amalgamation of several small rural communities, one of which was Nanticoke, an Indian word meaning "crooked or winding," referring to a nearby creek. Originally an agricultural community, it now has a growing industrial sector, including a massive Steel Co of Canada complex and a Texaco Canada oil refinery. Ontario Hydro has located a generating station here — the world's largest coal-burning plant.

Nanisivik, on Baffin Island, is one of the most northerly mining communities in the world (photo by Karl-Heinz Raach).

**Narwhal** (*Monodon monoceros*), once known as sea unicorn, is a toothed WHALE of arctic seas. It is best known for its straight, tightly spiraled tusk, which is one of 2 fully developed teeth in the upper jaw and projects through the lip, reaching 3 m in length. The tusk, found in adult males and, rarely, females is of unknown function. Double-tusked narwhals occur occasionally. Narwhals grow to a maximum length of 4.8 m (excluding tusk). Narwhals have no dorsal fin. Body colour is grey at birth, almost black in juveniles, and mottled black and white in adults. Old individuals can be almost completely white, with dark patches confined to the dorsal surface. The narwhal's distribution, centered in Davis Str, Baffin Bay and Lancaster Sound, also includes Hudson Str, Hudson Bay, Foxe Basin and waters surrounding most of the Canadian ARCTIC ARCHIPELAGO. Another population occurs in the Greenland Sea. Traditionally, narwhals were hunted by native people in Canada and Greenland, primarily for meat, oil, sinew and mukruk (skin and adhering blubber). A market for narwhal ivory developed during the Middle Ages in Europe and the Far East. Today, Inuit hunt largely to supply a trophy market. The ice-adapted narwhal is rarely found far from pack ice. It survives in the pack by using narrow cracks and small pools of open water, and eats mainly small fish, squid and crustaceans. In 1976, the narwhal population inhabiting Lancaster Sound was estimated at 20 000-30 000 animals.

R. REEVES AND E.D. MITCHELL

**Naskapi**, see MONTAGNAIS-NASKAPI.

**Nass River**, 380 km long, rises in the northern interior of BC and flows generally SW, draining approximately 21 000 km<sup>2</sup>, to reach the Pacific at Portland Inlet. Its major tributaries are the Bell-Irving, Meziadin and Cranberry rivers. The name comes from an Indian word meaning "food depot," referring to the biological productivity of the river. Its annual eulachon run in particular attracted Indians from afar who traded with the resident Nishga, today still the main inhabitants of the Nass Valley. While the lower valley is an important timber-production area, and many traditional resource-harvesting practices have altered as a result, the Nishga still adhere closely to a complex system of land ownership and title throughout the entire area (see LAND CLAIMS). There are 4 villages, all Nishga, along the river — New Aiyansh, Canyon City, Greenville and Kincolith. Recent lava flows are a feature of the valley near New Aiyansh and play an important role in Nishga history. According to Nishga sources, some 2000 people were killed by volcanic flows in the late 1700s.

ROSEMARY J. FOX

**Nathanson, Nathan Louis**, businessman (b at Minneapolis, Minn 24 May 1886; d at Toronto 27 May 1943). He purchased his first theatre in Toronto in 1916 and in 1920 sold a chain of theatres to Adolph Zucker's Paramount Pictures (US), becoming president of Paramount's newly formed Canadian subsidiary, Famous Players. The 1923 takeover of Allen Brothers Theatres established the predominance of Famous Players in Canadian film exhibition. Directly and through subsidiaries, Famous Players also dominated film distribution to Canadian theatres. Covertly, in the late 1930s, Nathanson began acquiring theatres on his own and making other arrangements with the intent of establishing his own theatre chain. He resigned from Famous Players in 1941 to join his son Paul in Odeon Theatres. A confidant of C.D. HOWE, Nathanson was appointed to the original board of governors of the CBC in 1936, becoming VP of the board in 1940.

ROBERT E. BABE

**National Action Committee on the Status of Women** is an action-oriented organization made up of about 280 member groups from all

Facade of National Arts Centre (Ottawa), designed by Fred Lebensold (courtesy Parks Canada/The Heritage Recording Service).

over Canada. Started in 1971 with 30 groups, it is the largest umbrella organization of women's groups in Canada. It focuses mainly on pressuring the federal government to make changes that will improve the STATUS OF WOMEN on equal pay, native women's rights, pensions and other matters, but supports provincial and local issues as well. Policy is set at the annual general meeting. The executive is elected from the membership and is volunteer.

DORIS ANDERSON

**National Advisory Council on Fitness and Amateur Sport**, est 1961 under the Fitness and Amateur Sport Act. The fitness, recreation and sport communities meet periodically and a general council meets twice a year to formulate recommendations for the minister of national health and welfare. The council attempts to involve all Canadians in physical recreation and amateur sport and supports Canadian athletes.

**National Arts Centre** is the most prestigious and beautiful performing arts complex in Canada. Designed by Fred LEBSOLD, the Centre consists of a 2326-seat opera house, a 969-seat theatre and a 350-seat studio. The National Arts Centre Act (1966) called on the Centre "to develop the performing arts in the National Capital Region and to assist the CANADA COUNCIL in the development of the performing arts elsewhere in Canada." Since its opening in June 1969 under director general G. Hamilton Southam, the NAC has been a major national and international showcase for Canadian theatre, opera, music and dance. It has also been a focus of controversy because of its large operating budget. Construction, originally estimated at \$9 million, mushroomed to over \$46 million. Though financed in part by the Dept of the Secretary of State, the NAC has never enjoyed the full political and financial support needed to carry out its ambitious national bicultural objectives. While the National Arts Centre Orchestra, under conductor Mario BERNARDI, achieved an international reputation, the English- and French-language theatre companies made only limited national tours and failed to win consistent critical and popular acclaim. In 1983 opera production and the annual summer Festival Ottawa were suspended and in 1984 the English-language theatre company was disbanded.

ANTON WAGNER

**National Assembly** (Assemblée Nationale), unicameral provincial legislature of Québec. Following the abolition of the legislative council of Québec in 1968, the legislative assembly

became the national assembly. It includes all provincially elected members of the governing and opposition parties. Its powers and procedures are comparable to those of the federal HOUSE OF COMMONS.

RÉJEAN PELLETIER

**National Atlas of Canada** The *Atlas of Canada* (1906), published by the Dept of the Interior, was one of the world's first national atlases. A second edition similar in style and content was published in 1915, as a collection of small-scale thematic maps dealing with relief, geology, communications, forests, population origin and density, major political boundaries, and plans of principal cities. No new edition appeared until 1958 when, stimulated by the International Geographical Union and the Canadian Social Science Research Council, the Dept of Mines and Technical Surveys (NOW ENERGY, MINES AND RESOURCES) published 110 sheets in a loose-leaf binding. In their entirety they show the nature, extent and use of the physical resources of Canada, and their effect on the economy and society of the country. An edition in French was also produced for the first time. In 1974 a fourth edition, now titled *The National Atlas of Canada*, was published, similar in content to the third, but with smaller pages and a fixed binding. For the first time the atlas, in both English and French, was produced by the federal government, though it was published by a commercial firm (Macmillan of Canada). A fifth edition now in preparation (1984) is being issued as a number of separate sheets.

N.L. NICHOLSON

**National Ballet of Canada**, with more than 60 dancers, is the country's largest professional dance company. It performs a majority of the full-evening story ballets that have survived from the 19th century as well as selections from its large accumulated repertoire of 20th-century works. Ballets by many of the century's leading choreographers such as George Balanchine, Frederick Ashton and Antony Tudor are included, but few of these works were originally created for the company. A majority of the original ballets have been created by Canadian choreographers, notably David Adams and Grant STRATE in the 1950s and 1960s and Anne Ditchburn, James Kudelka and Constantin PATSALAS during the late 1970s and early 1980s. Despite the large quantity of contemporary choreography it performs, the company's artistic character and public image is best defined by its lavish productions of such enduringly popular, full-length classics as *Giselle*, *La Fille mal gardée*, *Swan Lake* and *The Sleeping Beauty*.

The Toronto-based company was founded in 1951 by Celia FRANCA under the auspices of a

group of local ballet enthusiasts. Despite its title, the company never received an official "national" mandate. Franca and her board of directors decided independently to give the company a national base by drawing its dancers from across Canada and by undertaking costly and extensive Canadian tours. Franca also believed that only by staging the classics could the dancers be properly developed and finally judged by internationally accepted standards of excellence. The NATIONAL BALLET SCHOOL, fd in 1959, has played a major role in helping the company to meet these standards.

Though the company's early years were plagued by financial problems that restricted its range of activities, it went on tour within Canada and the US and has since performed in a number of European countries, Mexico and Japan. In 1964 it adopted the 3200-seat O'Keefe Centre in Toronto as the site for its hometown performances; and as well-equipped theatres were built across Canada, the company expanded to fill their stages with large-scale productions. Apart from Franca, a number of figures have played significant roles in the company's development. Erik BRUHN, who became artistic director in 1983, was closely associated with the company for the preceding 19 years as guest artist, teacher and producer. Rudolf Nureyev, who first danced with the company in 1965, returned in 1972 to stage his spectacular version of *The Sleeping Beauty*. Nureyev is widely credited with having advanced the company's standards of performance, with promoting the careers of Karen KAIN, Frank AUGUSTYN and Veronica TENNANT, and with attracting to it a larger measure of international attention.

Alexander Grant, artistic director 1976-83, increased the number of annual performances, placed renewed emphasis on developing Canadian choreographers and improved the opportunities for younger dancers, particularly the men. Bruhn's directorship has been marked by increased efforts to attract first-rate choreography from leading international choreographers and to answer criticisms of excessive artistic conservatism in the company by introducing more modernistic works. See also BALLET.

MICHAEL CRABB

**National Ballet School**, based in Toronto, is an independent, private residential and day school for students from grades 5 through 12. It offers an integrated program of academic studies and dance instruction for about 150 full-time students, designed to provide a balanced education for those contemplating a professional dance career. In addition to its regular program, the school offers a teacher-training course. Students who have graduated from grade 12 may continue to receive ballet instruction if necessary to prepare them for admission

Celia Franca (left), under whose direction the Toronto-based ballet company earned its national mandate (courtesy National Film Board/Photothèque).

to a performing company. Auditions for admission are held annually in major centres across Canada. Students from abroad are also occasionally accepted.

The school was founded in 1959 as a necessary adjunct to the NATIONAL BALLET OF CANADA. Although many of its graduates still join that company, the school has for most of its existence operated as an independent institution under the direction of its founding principal, Betty OLIPHANT. It is widely regarded as one of the world's leading ballet schools. Its students have distinguished themselves as prizewinners in a number of prestigious international ballet competitions and its graduates, among them such renowned artists as Veronica TENNANT, Karen KAIN, Frank AUGUSTYN, Kevin Pugh and Martine van Hamel, are to be found in leading dance companies around the world.

**National Bank of Canada**, with head offices in Montréal, is a Canadian chartered bank which commenced operations in 1979 as a result of the merger between the Banque Canadienne Nationale (fd 1874) and The Provincial Bank of Canada (fd 1861). In 1981 it purchased Laurentide Mortgage Corporation, which specialized in mortgage loan operations, and several active subsidiaries of Laurentide Financial Corporation. Today, it conducts a general banking business and offers related financial services at over 600 branches and offices throughout Canada. As of Oct 1983 it had revenue of \$2.1 billion, assets of \$17.8 billion (ranking 7th among banks and financial institutions in Canada) and 11 824 employees.

DEBORAH C. SAWYER

**National Capital Commission** is a federal crown agency. It was created by the 1958 National Capital Act to prepare plans for and assist in the development, conservation and improvement of the national capital region so that the nature and character of the capital of Canada would be in accord with its national significance. Put simply, the task of NCC, and of similar predecessor federal bodies (the Ottawa Improvement Commission and the Federal District Commission) since 1899, has been to plan and help build an attractive national capital. The National Capital Region comprises some 4662 km<sup>2</sup>, forming a rough square around Ottawa. About 60% of the region is in Ontario and the rest lies N of the Ottawa R in Québec. The NCC functions only within this region. Many of the responsibilities given to it are normally assigned to municipalities, which fall under provincial jurisdiction; thus the potential for federal-provincial municipal conflict has been considerable, and clashes over purpose and policies have been frequent since the 1950s. Nevertheless, the federal impact on the structure and appearance of the capital has been significant.

PM Mackenzie King brought Jacques Gréber from France (1938) as capital planning adviser, and Gréber's 1950 plan was accepted by local municipalities and largely implemented with federal money. Its key elements included the building of parkways, expansion of Gatineau Park, railway relocation and the creation of a greenbelt around OTTAWA. Most of Gréber's proposals involved land acquisition, since federal works were restricted to land it owned. The NCC's powers of expropriation were substantial; today, some 30% of the urbanized part of the Region is federal property. The Region itself has no juridical significance; it is not a federal district with powers of its own. The explosive growth of federal employment in the late 1960s and early 1970s, and the siting of new office buildings, helped shape the direction of the capital's growth. Notable was the 1969 decision to build federal offices on the Québec side of the river. Amenities such as landscaped gardens

and parkways, bicycle paths, ski trails and skating on the Rideau Canal are NCC initiatives.

NCC spending and planning have recently focused on projects jointly funded with the municipalities and provinces, including water purification, sewage disposal, roads and bridges. The commission has 20 members, drawn from across Canada with each province represented. Its committees meet periodically, but its autonomy is limited; almost all decisions reside with the federal government. The operating budget in 1983-84 was about \$53 million, and capital expenditures \$34 million.

DOUGLAS FULLERTON

**National Council of Women of Canada** (NCWC), founded in 1893 as part of Canada's first feminist wave, is a member of the International Council of Women. Led by its first president, Lady ABERDEEN, the NCWC became the champion of women and children. NCWC recruits have been overwhelmingly urban, anglophone and middle-class. A conservative leadership delayed adoption of a suffrage platform until 1910. A federal structure with local councils and nationally organized societies has moderated policy and contributed to the NCWC's influence as a lobbyist. In the 1960s it called for a Royal Commission on the STATUS OF WOMEN; in the 1980s it demanded the entrenchment of women's rights in the Constitution.

VERONICA STRONG-BOAG

**National Defence, Department of**, created 1 Jan 1923, the result of the amalgamation of the departments of Naval Services and Militia and Defence, and the Air Board. Intended primarily as an economy measure, but also to improve the co-ordination of national security policy, the formation of a single department brought the Royal Canadian Navy, the Militia (later Canadian Army) and the Canadian Air Force (later Royal Canadian Air Force) under one minister. Efforts to integrate the 3 service headquarters failed. WWII saw a major expansion and restructuring of the department. Although individual service departments were not created in law, a minister of national defence for air was appointed in May-1940 and a minister of national defence for naval services in July. In practice this meant that there were 3 separate ministries. Following demobilization, departmental organization reverted in 1946 to prewar form.

In an attempt to end triplication of effort, certain support services common to all branches were integrated over the next few years, and in 1951 a chairman, chiefs of staff, was appointed to co-ordinate training and operations among the 3 services. Integration followed in 1964, when 1 chief of the defence staff replaced the individual service chiefs; on 1 Jan 1968 these 3 services were unified into the Canadian ARMED FORCES. In Oct 1972 the civilian and military branches in Ottawa were merged into the single National Defence Headquarters. Senior appointments in DND are filled by both civilians and serving officers. The governor general, as the sovereign's representative, is commander in chief of the Canadian Armed Forces. The minister, deputy minister and chief of the defence staff (senior military adviser to the minister) are assisted by their staff at NDHQ. The vice chief of the defence staff is both head of his own division of the staff and the senior staff officer to the whole headquarters. Assistant deputy ministers may be either military or civilian. Including uniformed and civilian personnel, DND has been the largest government department since 1945, while its operating budget has consistently been among the 3 highest.

STEPHEN HARRIS AND O.A. COOKE

**National Development in the Arts, Letters and Sciences, Royal Commission on** (Massey-Lévesque Commission), established by order-in-council in 1949, was the broadest investigation of its kind ever undertaken in Canada. Its recommendations covered all aspects of education, culture and the mass media. The commission's work was pursued against the backdrop of a major transition in Canadian cultural affairs. Although the country's prewar cultural life was primarily focused on amateur, community-oriented, voluntary activities, the commission foresaw that these activities were giving way to a more urban, impersonal and national orientation; the overall character of the final report is a strange mixture of mourning for an age that was rapidly passing and of excitement at the new era of professional "mass culture" that lay ahead. It is generally believed that the commission's most important accomplishments were the ultimate establishment of arms-length federal support for the arts through the CANADA COUNCIL and the creation of the NATIONAL LIBRARY OF CANADA. It may be, however, that its most enduring legacies are the very high standards of analysis and writing that it set, standards that have not been surpassed by any of its successors. See ARTS FUNDING.

RICHARD STURTSBERG

**National Energy Board**, est 1959 under the National Energy Board Act. The 9-member board is responsible for regulation of oil, gas and electrical industries and for advising the government on matters concerned with the development and use of energy resources. The regulatory role encompasses the granting of permission for the construction of interprovincial PIPELINES, authorization of pipeline crossings, pipeline safety, regulation of pipeline tolls and tariffs, licences authorizing the export of oil, gas and electric power and control of exports of refined oil products. It has administered the National Oil Policy (1961-74) and the National ENERGY POLICY. The board is designated as a department and reports to the minister of ENERGY, MINES AND RESOURCES and has all the powers vested in a superior court of record.

**National Energy Program**, see ENERGY POLICY.

**National Farmers Union**, voluntary organization of farm families, democratically structured to assure members full control at the local, district, regional and national levels. Objectives of the NFU include the betterment of the social and economic status of farmers through education, promotion of improved legislation and agricultural marketing structures, and reduction of costs and service charges. As a general farm organization, the NFU focuses on promoting integrated policies on a broad range of issues to resolve conflicts of interest that exist between regions and between producers of various commodities (see AGRICULTURE AND FOOD POLICY). Active participation in NFU activities by its women and youth members is encouraged. Incorporated through a 1970 Act of Parliament, the NFU was founded in July 1969 through an amalgamation of provincial farm unions in Ontario, Manitoba, Saskatchewan and BC. It also has members in the Maritimes and Alberta. Estimates of individual membership range from 20 000 to 30 000. See CO-OPERATIVE MOVEMENT.

STUART A. THIESSEN

**National Film Board** was the principal focus for Canadian film activity for the first 2 decades of its history. The NFB has pioneered developments in social documentary, animation, documentary drama and direct cinema; and it has been a continuing initiator of new technology. Its films have won hundreds of international awards. The NFB was established 2 May 1939 under the terms of the National Film Act and following a report on government film activities by John GRIERSON, who was appointed the

first film commissioner in Oct 1939. The Act was revised in 1950, primarily to separate the NFB from direct government control; this revised Act includes the NFB's mandate to interpret Canada to Canadians and other nations. The NFB was originally designed as a modestly staffed advisory board, but the demands of wartime production, together with Grierson's personality, led to a shift into active production by absorbing (1941) the Canadian Government Motion Picture Bureau (formerly the Exhibits and Publicity Bureau, est 1919). By 1945 it had grown into one of the world's largest film studios with a staff of 787. More than 500 films had been released (including 2 propaganda series, *The World in Action* and *Canada Carries On*, shown monthly in Canadian and foreign theatres); an animation unit had been set up, non-theatrical distribution circuits were established and many young Canadian filmmakers trained.

Grierson resigned in 1945 and was replaced by his deputy, Ross McLean, who faced considerable difficulties in the postwar years. Budgets and staff were reduced and the NFB came under attack for allegedly harbouring left-wing subversives and as a monopoly that threatened the livelihood of commercial producers. McLean's replacement (1950), Arthur Irwin, calmed the storm, initiated a new National Film Act, restructured the NFB along modern bureaucratic lines and planned to move the NFB from Ottawa to Montréal (completed 1956 under Irwin's successor, Albert Trueman). Also during the postwar decade, production expanded into new areas: the first dramatic films were made, new techniques explored in animation, and the information film and production for TV initiated. Filmmakers paid more attention to style and technical polish, and new approaches emerged, more intimate in tone than the didactic approach of the war years. These were clearly evident in the films of one production group, Unit B, headed by Tom Daly, whose work led, in the late 1950s, to the world's first consistent use of direct cinema in the *Candid Eye* TV series. In Québec the NFB was viewed for some years as a federalist agency that denied Québec's cultural aspirations. French-language production was minimal until the late 1950s when the demands of TV and the move to Montréal provided catalysts for expansion. Many young Québec filmmakers were hired who were to play seminal roles in the flowering of Québec cinema in the 1960s, both within and outside the NFB. These filmmakers refused to accept the anglophone domination of the NFB's administration. After a series of protests, the appointment of the first French-speaking commissioner, Guy Roberge, initiated a series of changes that culminated (1964) in a total separation of production along linguistic lines.

Women filmmakers made major contributions during the war years but were then virtually absent from active production until the early 1970s. Encouraged by such series as *En tant que femmes* and *Working Mothers*, and the development of Studio D under Kathleen Shannon, women have since made significant contributions both as directors and technicians. Native peoples objected for many years to the folkloric and condescending images of themselves projected in NFB films. Only in the late 1960s, in such programs as *Challenge for Change*, did a truer portrait emerge. At the same time, Indians and Inuit were given access to NFB equipment to produce their own films. This initial impetus towards an increasing accessibility to the means of production was continued through the 1970s as the NFB established regional production centres across Canada. Animation has always been an NFB priority and, though the work of such pioneers as Norman McLaren is widely recognized, it has been the continuing commitment to encourage new talent that has maintained the vig-

our of this section and made it one of the most admired in the world (see FILM ANIMATION).

Production of dramatic feature films for theatrical release began in 1963-64 and has continued, despite debate about the appropriateness of such production within a state institution. Many NFB feature films have won international awards and have had wide release. The growth of the commercial film industry in the late 1960s and the expansion of film production within the CBC effectively eliminated the NFB from its once dominant position in Canadian film. But it has continued to attract talented new filmmakers, to emphasize high qualities of production, and to maintain its position as the world's most widely respected national film agency.

PETER MORRIS

Reading: D.B. Jones, *Movies and Memoranda* (1982); James Rodney, *Film as a National Art: NFB of Canada and the Film Board Idea* (1977).

**National Gallery of Canada** in Ottawa has the most distinguished collection of Canadian and European paintings in the country. When the marquis of LORNE was governor general he encouraged the foundation of the Royal Canadian Academy of Arts and the National Gallery of Canada, and presided over an exhibition of works by future members of the RCA on 6 March 1880 (see PAINTING). At first the gallery was a collection of the diploma works of academicians, supplemented by occasional gifts. It was only in 1913, with the adoption by Parliament of an Act to incorporate the National Gallery, the appointment of a board of trustees headed by Sir Edmund Walker, and the confirmation by the board of the 1910 appointment of Eric Brown as director, that the National Gallery could claim even the ambition of equalling other national galleries throughout the British Empire.

Both Walker and Brown were interested in Canadian art. Even before Tom THOMSON died in 1917, for example, the gallery had bought his work. Subsequent curators, such as Robert H. Hubbard, J. Russell Harper, Jean-René Ostiguy, Jean Trudel, Dennis Reid and Charles Hill have built up a representative selection of both historical and contemporary Canadian art. Sculpture and the decorative arts have also been acquired. The gallery has received gifts from many patrons, including J.M. MacCallum, Vincent Massey, Douglas Duncan, Mr and Mrs Harry Jackman and Henry Birks.

To provide a context for Canadian art, the gallery in 1907 began to buy European art from the end of the Middle Ages to our time. Even with the limited funds available before WWII, important works were purchased, such as paintings by Piero di Cosimo, Bronzino, Canaletto, Monet and Degas. After 1945 purchases were made from the Prince of Liechtenstein, including a Rembrandt, a Rubens and 2 Chardins, and from the Vollard Estate, among them paintings by Cézanne and pastels by Degas. In recent years a few pieces of decorative arts and major pieces of sculpture, including marbles by Puget, Bernini and Canova, have been added to the collection. Sir Edmund Walker, a print collector himself, encouraged the development of a prints and drawings collection (see PRINTMAKING, DRAWING). This tradition was continued under Kathleen M. Fenwick, curator from 1928 to 1968. In 1967 a PHOTOGRAPHY section was established, with James Borcoman as curator.

The National Gallery of Canada has always had a sense of national responsibility. By 1914 it was sending exhibitions and making extended loans to other museums across the country. It sponsors Canadian art abroad through the Venice Biennale and other exhibitions in places as distant as Tel Aviv and Peking. Gallery research, in conservation and the history of art, is exemplary (see ART WRITING AND CRITICISM; CONSER-

VATION OF CULTURAL MOVABLE PROPERTY). All media — exhibitions, film, television, radio — have been used to communicate with Canadians about gallery collections and Canadian art.

In 1968 the National Gallery was incorporated as part of the NATIONAL MUSEUMS OF CANADA, and in 1982 the Canada Museums Construction Corporation was established to provide the gallery with a home. After more than a century in borrowed space, the gallery will finally have a building of its own. The new building, designed by Moshe SAFDIE, will be in Ottawa.

JEAN SUTHERLAND BOGGS

**National Harbours Board**, a crown corporation est by Parliament in 1936 to administer and provide specialized professional services to the 13 harbours and 2 grain elevators under its jurisdiction. It reports to Parliament through the minister of transport.

**National Health and Welfare, Department of**, est 1944 by the federal Department of National Health and Welfare Act. It was originally formed in 1919 as the Department of Health, which was merged with the Department of Soldiers' Civil Re-establishment to form the Department of Pensions and National Health in 1928. It has charge of matters relating to the promotion and preservation of the health, social security and social welfare of Canadians and is responsible for investigation and research into public health and welfare, inspection and medical care of immigrants and seamen and supervision of public-health facilities. Other programs include the CANADA PENSION PLAN, FAMILY ALLOWANCES and Old-Age Security, Vocational Rehabilitation and New Horizons. The NATIONAL COUNCIL OF WELFARE and the MEDICAL RESEARCH COUNCIL report to the minister. The department's 1984-85 budget was \$23.9 million.

**National Hockey League**, established at Montréal 26 Nov 1917. The original teams were MONTREAL CANADIENS, Montreal Wanderers, Ottawa Senators and Toronto Arenas; Québec held a franchise but decided not to operate that season. In the next 25 years the league underwent numerous changes in composition, scheduling and playoff format. Boston Bruins were the first American club to join (1924); by 1926, 6 of the 10 teams were from the US. In 1942 there were 6 teams left (Montreal, TORONTO MAPLE LEAFS, Boston, Chicago Black Hawks, Detroit Red Wings and New York Rangers) and the league remained stable until 1967 when 6 new US-based teams were added (California — later Oakland — Seals, Los Angeles Kings, Minnesota North Stars, Philadelphia Flyers, Pittsburgh Penguins and St Louis Blues). Buffalo Sabres and VANCOUVER CANUCKS joined in 1970 and Atlanta Flames and New York Islanders in 1972. The number of teams reached 18 by 1974 (with the addition of Kansas City Scouts and Washington Capitals) — of which only 3 were based in Canada. One team folded in 1978 but Hartford Whalers, EDMONTON OILERS, QUEBEC NORDIQUES and WINNIPEG JETS joined the following year after the collapse of the WORLD HOCKEY ASSN. The Atlanta franchise moved to Calgary (see CALGARY FLAMES), bringing the number of NHL teams in Canada to 7. The majority of players in the NHL are still recruited from Canadian junior hockey, although the number of players from Sweden, Finland, Czechoslovakia and the US has increased dramatically. The NHL has failed to win large TV contracts in the US and its image of supremacy has been tarnished by its encounters with European teams, but it remains the premier professional hockey league in the world. The STANLEY CUP, awarded exclusively to NHL teams since 1926, is emblematic of the world professional championship. JAMES MARSH

**National Holidays** As with most countries, Canada's national holidays mark religious, quasi-religious or patriotic occasions. Statutory holidays are established by Act of Parliament and are observed, without fail, by federal employees and by most Canadians, although, increasingly, statutory holidays are becoming days for shopping and for large sales. Canadian statutory holidays are as follows: New Year's Day; Good Friday; Easter Monday; Victoria Day; Canada Day (formerly called Dominion Day); Labour Day; Thanksgiving Day; Remembrance Day; and Christmas Day.

The derivation of the 3 Christian holidays needs no explanation. New Year's Day, Jan 1, marks the beginning of the new year. VICTORIA DAY (variously known as May 24th, the Queen's Birthday, EMPIRE DAY or Commonwealth Day) is celebrated in all provinces except Québec on the Monday before May 25 and has been a national holiday since 1901. Traditionally, cottages are opened for the summer and gardens planted on this weekend, and the day is still celebrated in some parts of the country with fireworks displays. CANADA DAY, July 1, commemorates the day on which Canadian CONFEDERATION came into existence in 1867, and is celebrated on the first Monday in July. Originally celebrated in rather quiet — and hence very Canadian — ways, Canada Day is now the occasion for elaborate cultural and entertainment spectacles, paid for by the federal government to foster Canadian nationalism.

LABOUR DAY is celebrated on the first Monday in Sept, once again providing an occasion for a long summer weekend. The day honours the contribution of organized labour and has been celebrated since at least 1872 and as a statutory holiday since 1894. Labour Day is usually celebrated with large parades and union picnics. Thanksgiving Day, which provides another long weekend, is observed on the second Monday in October (unlike the holiday in the US which falls on the last Thursday in Nov) and celebrates the harvest season. The statutory holiday began in 1879, almost certainly as an imitation of the American celebration, but earlier in the year as a recognition of the shorter growing season in Canada.

REMEMBRANCE DAY is observed on Nov 11, the day of the armistice that ended the Great War in 1918. Usually celebrated with ceremonies at cenotaphs in towns and villages and at the National Cenotaph in Confederation Square, Ottawa, the day is marked by a moment of silence at 11 AM and by gatherings or parades of veterans of the world wars and the Korean conflict.

A substantial number of holidays are celebrated in the provinces. Boxing Day, Dec 26, is becoming almost universally observed as a day to recover from the exertions of the Christmas season. Civic Holiday, variously called Heritage Day in Alberta and Saskatchewan and Simcoe Day in Ontario, is also celebrated in Manitoba and the NWT and gives a long weekend at the beginning of Aug. Quebecers celebrate St Jean Baptiste Day on June 24 and take a day off work on the last Monday in June. Newfoundland observes St Patrick's Day, St George's Day, Discovery Day, Memorial Day (July 1) and Orangemen's Day. See also RELIGIOUS FESTIVALS.

J.L. GRANATSTEIN

**National Income**, strictly, is a money measure of the incomes received or accruing to residents of a country as owners of the agents of production, during a specified period of time. National income includes wages, rents, interest and profits, not only in the form of cash payments, but as income from contributions made by employers to pension funds, income of the self-employed, and undistributed business profits.

In market economies such as Canada's, the

Gross National Expenditure, Canada (Billions\$)	
Personal expenditure on consumer goods and services	206.0
Government current expenditure on goods and services	75.7
Gross fixed capital formation of government	10.6
Gross fixed capital formation, private	65.8
Value of physical change in inventories	-8.7
Net exports of goods and services	1.2
Residual error of estimate	-1.7
GNE at market prices	348.9

measures of national income include (with some exceptions) only those economic activities in which goods or services are sold in markets; the few exceptions ("imputed values") are illustrated by the inclusion in the estimates of a rental income for owner-occupied homes, and by the inclusion in the income of farmers of an estimate of the value of the produce from their own farms consumed by the farm families themselves. At the same time, official and nearly all private estimates do not include anything for the value of all of the services performed in the household by the unpaid homemaker (see HOUSEWORK). This large omission is serious if national income is being used to measure the well-being of a country's people. As it stands, this measure of national income is exactly equivalent to what the net production of goods and services would sell for on the market if there were nothing else added to the prices of goods and services; it is therefore a measure of the net value of products measured at factor cost. However, the prices at which goods are exchanged in markets do include indirect taxes such as sales taxes and customs duties. In the national accounts, these taxes and the allowances for depreciation and obsolescence may be added to the net national income at factor cost to obtain the measure "gross national product at market prices."

In Canada, official national income estimates are prepared by Statistics Canada. By collecting a wide range of economic and other statistical data, Statistics Canada incidentally obtains information useful in estimating national income and related items in the system of national accounts; when necessary, it conducts surveys specifically designed to elicit data for national income estimates. In addition, it can obtain information provided to other public bodies, eg, tabulations prepared from both personal and corporate income-tax returns.

The components of national income given in the official accounts partly depend on the available data. Wages and salaries paid to hired

National Income and Gross National Product, Canada (Billions\$)	
Wages, salaries and supplementary labour income	199.5
Military pay and allowances	2.2
Corporation profits before taxes less dividends paid to nonresidents	18.4
Interest and miscellaneous investment income	29.7
Accrued net income of farm operators from farm production	4.6
Net income of nonfarm unincorporated business including rent	14.0
Inventory valuation adjustment	-3.8
Net national income at factor cost	264.8
Indirect taxes less subsidies	40.6
Capital consumption allowances	41.9
Residual error of estimate	1.7
GNP at market prices	348.9

workers (the largest component) are shown because they can be obtained from data sources such as the census of manufactures, reports filled by financial institutions, and income-tax returns. Similarly, estimates of property income, the recompense for the productive services of capital goods, natural resources and entrepreneurship, are obtained from much the same sources and are shown in interest and rental income and corporation profits. Net interest and dividends paid to residents of other countries are not included. Incomes of unincorporated self-employed persons must be otherwise estimated. Incomes of farmers are estimated by subtracting from the receipts from sales of farm products the expenses incurred in production; the resulting farm income is a mixture of labour income (for the work of the farmer and his unpaid family), and of property income. Incomes of other unincorporated businesses, eg, those engaged in the professions, and in merchandising or service industries, are calculated in the same way, or, in some instances, from income-tax tabulations.

The indirect taxes and capital consumption allowances (depreciation) added to national income to yield GNP are derived respectively from government records and from business and other records; some imputation of depreciation is necessary in certain cases, eg, those involving government-owned buildings and owner-occupied housing.

The national accounts include 4 main categories of expenditure: consumer purchases; purchases of new capital goods by businesses, governments and persons; government purchases; and net exports of goods and services. The measure of these expenditures reflects the prices actually paid for goods and services. The expenditure on capital goods also includes both the component of capital expenditure that just makes up for capital consumption and the net addition to the capital stock. The sum of these expenditures is gross national expenditure.

Gross domestic product (as opposed to GNP), is a money measure of the value of all goods and services produced in Canada regardless of the fact that some of the income generated in their production may belong to residents of other countries. GNP is a measure of the goods and services that are available to residents of Canada. The former exceeds the latter to the extent that interest and dividends paid abroad exceed those received from abroad.

The UN has encouraged its members to prepare uniform national income calculations, but comparisons of the resulting per capita national incomes must be interpreted with care for 3 reasons. First, the exchange rates used to put such measures into a common currency so that the comparisons can be made, reflect the comparative prices in each currency only of goods that are traded internationally (comparative prices of untraded goods may not be at all well reflected in exchange rates); second, the size of nonmarket production and hence the portion of production that is not measured in national income estimates vary greatly among countries (typically, less-developed countries have relatively large nonmarket sectors of production); third, patterns of consumption vary greatly among countries and comparisons of money incomes may not reflect the effect of these variations on a population's well-being.

Comparisons are also made intertemporally for a single country. National income and related estimates are usually calculated first in the prices of the period (most commonly a year) to which they apply. For year-to-year comparisons, the aggregates, usually the national expenditure estimates, are deflated by price indices to remove the effects of price change from the changes in the aggregate production; they are then said to be measured in constant prices, ie, the prices of a particular year. M.C. URQUHART

**National Indian Brotherhood**, *see* ASSEMBLY OF FIRST NATIONS.

**National Library of Canada** was established by the National Library Act (1953) as a government department to collect, preserve and promote the printed heritage of Canada, and it is housed in the same building as the PUBLIC ARCHIVES OF CANADA in Ottawa. A broad collection of foreign publications in the humanities and the social sciences is also available. The library maintains a central file of the principal collections held by Canadian libraries. It publishes the national bibliography (*Canadiana*), other bibliographies, checklists, indexes, union lists (inventories of periodicals collections), results of surveys, technical reports and exhibitions catalogues. Collections and reference services are available to users through mail, telephone and telex. A national system of interlibrary loan, with international connections, is co-ordinated by the library. Especially noteworthy are the following collections: *Canadiana*; official publications of the Canadian, provincial and foreign governments; music and other performing arts; economics; bibliography; and Judaica. The library holds the largest collection of Canadian newspapers and periodicals in Canada. Theses of most Canadian universities are filmed for preservation, sale or loan. Information can be provided on virtually all subjects through access to hundreds of Canadian and foreign information data banks. The National Library co-ordinates federal libraries and promotes the development of a nationwide library network to increase the sharing of library resources. Participation in international programs facilitates the exchange of books and information between countries. The library develops and promotes bibliographic standards to aid transfer of information between libraries both in Canada and internationally. Legal deposit regulations require that 2 copies of current Canadian publications be deposited with the library. Canadian publications are promoted both at home and abroad through general and specialized catalogues and exhibits. The library is directed by the National Librarian (W.K. Lamb 1953-68; G. Sylvestre 1968-83; M. Scott 1983- ), assisted by a National Library Advisory Board comprising librarians and scholars from all parts of Canada.

GUY SYLVESTRE

**National Museum of Man (NMM)** traces its origins to 1841, when Queen Victoria granted £1500 for the "creation of the Geological and Natural History Survey of the Province of Canada" (*see* GEOLOGICAL SURVEY OF CANADA ). The Survey was located in Montréal and scholars spread out across Canada collecting geological, archaeological and biological material. In 1877 an Act of Parliament ensured the continued existence of the Survey, which had broadened the collection base to include botanical, zoological and ethnographic specimens and artifacts. Four years later the Survey moved to the Clarendon Hotel in Ottawa. The fieldwork continued and the national collections grew. In 1911 the Survey occupied the new Victoria Memorial Museum building, an imposing piece of Gothic architecture usually called "the castle."

In 1910 a new Anthropology Division was established, under the direction of Edward SAPIR, which included 2 sections in charge of archaeological and ethnological fieldwork. Since 1911 the museum has been a centre for research in Canadian anthropology. When fire destroyed most of the PARLIAMENT BUILDINGS in 1916, however, the Parliament of Canada was housed in the museum building and the collections put in storage until 1920. In 1927 an Act of Parliament created the National Museum of Canada, although it was not until 1950 that its operational links were finally severed from the Geological Survey.

Artist's conception of the new National Museum of Man building, designed by Douglas Cardinal. Construction began in Hull, Qué, in 1984 and the building is scheduled for opening in 1988 (courtesy National Museums of Canada/National Museum of Man).

In 1942 the Canadian War Museum, established in 1880 but in storage since 1897, was formally inaugurated in the War Trophies Building. The CWM became a division of the National Museum of Canada in 1958, and expanded significantly when it took over the old PUBLIC ARCHIVES OF CANADA building in 1967.

The NATIONAL MUSEUMS OF CANADA Corporation was established in 1968, comprising the NATIONAL GALLERY, National Museum of Man (including the Canadian War Museum), NATIONAL MUSEUM OF NATURAL SCIENCES and NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY (and its National Aeronautical Collection).

By 1984 the NMM had grown to be one of the largest museums in the world. There are 5 scientific divisions: ARCHAEOLOGICAL SURVEY OF CANADA, Canadian Ethnological Service, Canadian Centre for Folk Culture Studies (*see* FOLKLORE), Canadian War Museum, and the History Division. The NMM carries out the usual museum activities in the areas for which it is responsible: collection of artifacts and data; conservation and preservation; scientific research; and exhibition and publication. Monographic series are published in archaeology, physical anthropology, ethnology, linguistics, folk culture studies and history, including military history. In the decade 1974-84 approximately 200 travelling exhibitions were circulated within Canada and to the US, Europe, Africa, New Zealand and Japan. Museum kits for schools, fact sheets and catalogues, and film and video programs are also produced.

Subsequent to a 1982 government announcement, in 1984 construction began on a new NMM building in Hull, Qué, designed by Douglas CARDINAL and scheduled to open to the public in 1988.

FRANK CORCORAN

**National Museum of Natural Sciences (NMNS)** The origins of the NMNS may be found in the GEOLOGICAL SURVEY OF CANADA (1842) and the National Museum of Canada. In 1956 Natural and Human History branches were established that were to become the NMNS and NATIONAL MUSEUM OF MAN (NMM) under the National Museums Act of 1968. Following a major renovation of the Victoria Memorial Museum in the early 1970s, only the permanent galleries of the NMNS and NMM remained in the build-

ing, with staff and collections being dispersed throughout the National Capital Region. After the 1988 relocation of the NMM to a new site in Hull, the NMNS expects to expand its exhibitions throughout the building's 8000 m<sup>2</sup> of available display space. The NMNS is a component of the NATIONAL MUSEUMS OF CANADA, a crown corporation reporting to the minister of communications.

The collections of the museum are its prime asset and in their scientific, heritage and commercial value are irreplaceable. Although used in exhibits, they are much more than display collections for they contain the essential standards against which all biological and geological research is conducted. These specimens are the definitive proof of the existence, variation and distribution of animals, plants and minerals in time and space.

Curators, while collecting for the national collections, played an important role in exploring western Canada and, in more recent times, the Arctic. Notable were John MACOUN, who made valuable botanical studies of the Prairies in the 1870s; Percival Algernon TAVERNER, whose ornithological research culminated in the classic *Birds of Canada*, published in 1934; Charles Mortram STERNBERG, who collected more dinosaur fossils than any other individual, mostly from the Alberta Badlands; and Alf Erling FORSILD, an authority on the alpine and arctic plants of N America and Greenland.

The NMNS maintains collections of vascular plants, mosses, bryophytes, lichens, algae, birds, mammals, film and audio records of bird and mammal behaviour, reptiles, amphibians, fishes, invertebrate animals (notably molluscs, polychaetes and crustaceans), minerals, gemstones, rocks, vertebrate fossils (notably dinosaurs and Quaternary mammals), and fossil spores and plants. The majority of these collections are the most complete of their kind in Canada and many rank among the best in the world. The museum also houses a collection of natural history art, and collections of mounted birds and mammals that are available with specimens and models for exhibit and education programs. In total, the NMNS collections, soon to be rehoused in a new curatorial complex, contain over 2.5 million accessioned specimen lots that include about 5 million species. Approximately 100 000 specimens are added to the collections annually, with most collected by staff. An arctic research station is maintained on BATHURST I to support field projects.

Among the museum's first public successes were an exhibition of economically valuable minerals for the 1851 Great Exhibition in London and the instigation of specimen loans for schools in 1874. Currently, there are 8 exhibition galleries that average one-half million visitors annually, and more than 70 travelling exhibits that circulate to institutions throughout Canada and abroad are produced each decade. Innovative education programs continue to be an essential component of exhibitions, with theatre, film, workshops, field trips and other media being used to meet the needs of special audiences such as preschool children, the aged and the handicapped. A natural history information and identification service is available to the public. The NMNS publishes 2 scientific series, *Sylogues* and *Publications in Natural Sciences*, in addition to trade publications which have included such national best-sellers as *The Birds of Canada* by W. Earl Godfrey.

The museum is organized into 6 curatorial research divisions (Botany, Invertebrate Zoology, Paleobiology, Mineral Sciences, Vertebrate Zoology, Zooarchaeology), 3 public programming divisions (Exhibit Planning & Design, Technical Operations, Public Services), an administration section and a directorate. In 1984 the NMNS had a budget of \$7.7 million and a full-time staff of 140. Library, security and other support is provided to the museum by the National Museums of Canada Corporation.

RIDGELEY WILLIAMS

Reading: A.F. Key, *Beyond Four Walls: The Origins and Development of Canadian Museums* (1973).

**National Museum of Science and Technology (NMST)** had its roots in the GEOLOGICAL SURVEY OF CANADA Museum (1842), renamed the National Museum of Canada in 1927. In 1966 a separate Science and Technology Branch was created, under its own director, and small collections of artifacts which had been under the trusteeship of other branches of the National Museum were transferred to it. In Apr 1967 an industrial warehouse on the outskirts of Ottawa was put at its disposal and the museum was opened to the public on 16 Nov 1967. The following year it became the NMST, a part of the NATIONAL MUSEUMS OF CANADA.

The NMST collects and preserves objects and data relating to scientific and technological history and development in Canada, carries out research, and sponsors exhibits and public programs. Major subject areas include pure science (mathematics, physics, chemistry), astronomy, transportation, communication, agriculture, forestry, fishing, extractive industries, industrial technology, energy, aviation and space, marine technology, fire technology, graphic arts technology, medical technology and photography. Collections total approximately 17 000 artifact lots with 54 000 individual objects, and 55 000 photos as well as associated archival material.

The National Aviation Museum, an autonomous submuseum of the NMST, is considered one of the world's finest aeronautical collections, and in 1984 construction began on a new building to house the historic aircraft and aero-engines assembled from Canadian Armed Forces, the Canadian War Museum and the first National Aviation Museum augmented by 30 aircraft since 1967. The new facility will provide for temporary aerotechnology and chronological displays of aircraft, a mock control tower, and permanent restoration and collections storage space. WWI aircraft demonstrations by museum staff at airshows and exhibitions across the country are very popular.

The museum's observatory houses Canada's largest refracting telescope, obtained from the Dominion Observatory, which is used for education programs. In 1983 astronomy evenings and telescope viewing attracted 5000 visitors.

Monthly skysheets were distributed to 11 000 readers, and the monthly Stargazing column was published by 19 newspapers across Canada. Other public programming activities include steam train excursions between August and Thanksgiving from the museum to Wakefield, Qué., artifact demonstrations, regional science fairs, special tours and films, travelling exhibits and publications. Public attendance in 1980-83 averaged over of 700 000 each year. Exhibits, both continuing and temporary, use innovative design and display methods and stress visitor participation. In 1983-84 the NMST co-operated in several joint projects: with Agriculture Canada, in a new Agriculture Museum at the Central Experimental Farm; with Atomic Energy of Canada Ltd, on the uses of nuclear energy; with the CBC, on the history of public radio in Canada, from Marconi and Fessenden to satellite distribution and digital transmission; and with the National Research Council, on scientific expeditions to the North Pole and on a "Canadarm" space exhibit.

NMST has been in the forefront of developing modern museum practices, with experiments in the use of computers, traffic management studies, analysis of visitor patterns, and the use of the outdoor surroundings of the museum as a technology park. Its expertise in restoration of heavy objects, particularly those in transportation, has been made available to museums both nationally and internationally. DAVID M. BAIRD

**National Museums of Canada** is the collective title of the NATIONAL GALLERY OF CANADA, NATIONAL MUSEUM OF MAN, NATIONAL MUSEUM OF NATURAL SCIENCES and NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY, joined in a single corporation with the Canadian Conservation Institute, the Museum Assistance Program, the National Museum Library, and a range of museums' support and administrative units. Together, the museums collect and conserve data and artifacts, particularly in relation to the Canadian heritage; conduct research in their various disciplines; sponsor publications as well as public programs and exhibits both in Ottawa and across the country; aid and advise institutions and individuals abroad; and assist and partly fund galleries and museums within Canada.

The NMC Corporation owed its origin to many factors, including a desire for more dynamic leadership and to simplify the procedure of reporting to government, but also to augment the role of the museums nationally and thereby attract more funding to the institutions. Several resignations and feuds inside the National Museum during the 1950s and 1960s also attracted unwelcome attention, which was increased when a long-delayed new building was again postponed in 1967. In Nov 1967 Secretary of State JUDY LAMARSH introduced a bill in the House of Commons providing for the reorganization of the federal government's cultural repositories into one corporation. Despite some vociferous objections, the National Gallery was embedded in the new entity, while the former National Museum was divided into 3 parts. Within the corporation, the 4 directors reported to a new board of trustees, who, with a secretary general, supervised the National Museums, in conjunction with special advisory committees for each museum or gallery. The National Museums Act took effect on 1 Apr 1968.

A further change occurred in 1972 when Gérard PELLETIER, as secretary of state, announced a new policy intended to strengthen the role of the national museums within Canada. A Museum Assistance Program was established to furnish subsidies to regional and local museums, and other central services were expanded to help local collections unable to afford elaborate and expensive equipment and highly trained personnel (see CONSERVATION OF MOVABLE CULTURAL

PROPERTY). The effect was most beneficial, although critics noted that subsidies, once started, tended to become permanent as local museums integrated them into their budgets. It also proved impossible, in the long run, to accommodate every museum and every purpose in the subsidy program.

Although much progress was made in rehabilitating the central museum facilities during the 1970s, it remained true that new buildings were a relatively low priority of government, with the effect that museum facilities were dispersed all over the Ottawa region, sometimes in highly inappropriate quarters and locations. The style in which the museums and the National Gallery were administered varied according to the particular board and secretary general. Relations between the board and the secretaries general were not always smooth, and in case of conflict it was still necessary, as it had been before 1968, to appeal to the attention of an often busy and preoccupied minister. While, in the early 1980s, money was finally made available for new National Museum of Man, National Gallery and National Aviation Museum buildings, direction of their construction was assigned to a new CROWN CORPORATION, the Canada Museums Construction Corporation, separate from the National Museums. In retrospect, it appears that the attempt to distance the National Museums from the public service, which seemed so promising in 1967-68, was not entirely successful, while the attempt to broaden the museums' national service, and therefore their political support, was achieved at the cost of postponing necessary improvements at the centre. It was, in short, a very Canadian compromise.

ROBERT BOTHWELL

**National Policy**, tariff protection for Canadian manufacturers, the rallying cry of Sir John A. MACDONALD's Liberal-Conservative Party in its successful 1878 general election campaign. Alexander MACKENZIE's Liberal Party, in office 1873-78, adhered to a policy of tariffs for revenue purposes — around 20% CUSTOMS duties on manufactured goods — despite the depression of the 1870s and the failure of the government's 1874-75 attempt to negotiate a RECIPROCITY agreement with the US. Macdonald's National Policy became a public issue after the Liberal government failed to raise the tariff in the 1876 budget. It was set in motion in the budget of 14 Mar 1879 after consultation with business interests. It was intended to be a nationalistic policy which would broaden the base of the Canadian economy and restore the confidence of Canadians in the development of their country. That the National Policy would also assist in the development of a group of wealthy businessmen who could be counted on to contribute generously to the Conservative Party was another factor that Macdonald acknowledged. The tariff on most foreign manufactured goods was increased, affording substantial protection to Canadian manufacturers. Equally important to the manufacturers were the reduced customs duties on the necessary raw materials and semi-processed products, which lowered their costs of production.

Over time the National Policy took on a broader meaning in Conservative Party rhetoric, which tended to equate the National Policy with its larger development policies: the CANADIAN PACIFIC RAILWAY (1880); western settlement (the DOMINION LANDS Act of 1872 and immigration policy); harbour development; and the subsidization of fast steamship service to Europe and Asia to facilitate the export of Canadian products. It became the centrepiece of Conservative Party policy for decades, being espoused by R.B. BENNETT in the 1930s as fervently as it was by Macdonald in the 1880s. Macdonald's last election, in 1891, was fought in defence of his Na-

tional Policy. Sir Wilfrid LAURIER's Liberal government, 1896-1911, adopted the PROTECTIONIST principles if not the rhetoric of the National Policy tariff and kept its general tariff at similarly protectionist rates. Even the Laurier government's famous reciprocity agreement with the US in 1911 made only a few concessions on import duties on manufactured goods; the bulk of the agreement abolished duties on natural products, and customs duties were lowered on a restricted list of manufactured goods. But this alarmed manufacturers enough to swing their support back to the Conservatives in the 1911 general election. Campaigning on the argument that a mature economy had developed under the National Policy, that reciprocity threatened the Canadian economy, and that the choice before the electors was "whether the spirit of Canadianism or of Continentalism shall prevail on the northern half of this continent," Robert BORDEN's Conservatives swept to victory, bringing a continuance of the National Policy. See also CONTINENTALISM; NATIONALISM; ECONOMIC NATIONALISM.

ROBERT CRAIG BROWN

Reading: V.C. Fowke, *The National Policy and the Wheat Economy* (1957); Robert Craig Brown, *Canada's National Policy, 1883-1900* (1964); P. Russell, "The National Policy, 1879-1979," *Jnl of Canadian Studies* 14 (1979).

**National Research Council of Canada (NRC)**, federal CROWN CORPORATION responsible to Parliament, through the minister of state for science and technology. The NRC was formed in 1916 as the Honorary Advisory Council for Scientific and Industrial Research. It immediately funded research committees for special needs, offered science fellowships at Canadian universities, and carried out a research inventory (the first statistical review of Canadian scientific manpower and budgets). Early plans to found an NRC national laboratory at Ottawa were not authorized until 1928. During the presidency of H.M. TORRY (1923-35), laboratory staff reached 153, including 54 scientists and research engineers all but one of whom were employed on industrial or applied research. Torry's successor, Gen A.G.L. MCNAUGHTON, enlarged the staff to 300 and prepared the NRC laboratories for their central role in war research (from medicine and food packaging to weapons and synthetic fuels). Under C.J. MACKENZIE, president from 1939 to 1952, NRC staff reached 2000 and was reorganized to provide a stronger foundation in basic (pure) SCIENCE. Pres E.W.R. STEACIE (1952-62) established the principle that NRC extramural budgets for university grants and fellowships should rise to match the intramural budget (\$21.5 million in 1962-63) and initiated the Industrial Research Assistance Program for extramural grants to private industry (see INDUSTRIAL RESEARCH AND DEVELOPMENT).

Many of the NRC's functions have been "spun off" to separate bodies. For example, the council was the government's general adviser on SCIENCE POLICY from 1916 until the Science Secretariat was created in 1964. Laboratory activities initiated by the NRC and delegated to separate bodies include military research (to the DEFENCE RESEARCH Board, 1947), atomic research (to ATOMIC ENERGY OF CANADA LTD. 1952), medical research grants (to the MEDICAL RESEARCH COUNCIL, 1966), and university grants and scholarships (to the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL, 1978).

#### Structure and Functions

In 1984 the NRC had a total staff of 3207 (including 1061 scientists and research engineers) and a budget of \$500 million. The 13 laboratory divisions, all but 4 of which are situated in Ottawa, include those for oceanography (the Atlantic Research Laboratory, Halifax); biology (Plant Biotechnology Institute, Saskatoon, and Division of Biological Sciences); physics and chemistry (Canada Centre for Space Science,

Division of Chemistry, Division of Physics and Herzberg Institute of Astrophysics); engineering (Institute of Marine Dynamics, St John's, Industrial Materials Research Institute, Montréal, Division of Building Research, Division of Electrical Engineering, Division of Mechanical Engineering and National Aeronautical Establishment). Another institute was being planned in 1984, for biotechnology (at Montréal).

Since about 1920, continuing extramural activities have included dozens of Associate Committees on special problems, from tuberculosis to railways, from tribology (the science of lubrication and friction) to the National Fire Code. The NRC represents Canada in several international bodies and co-ordinates multilateral special projects, such as the Canada-France-Hawaii astronomical OBSERVATORY and the Tri-University Meson Facility in Vancouver. The NRC library, founded in 1924, became the national science library in 1957 and, in 1974, was renamed the Canada Institute of Scientific and Technical Information. CISTI collects all the world's major scientific journals for the main branches of science and engineering and a selection of others, totalling 33 642 serials in Apr 1982. In 1981 it supplied more than 200 000 requests, made in person or by mail or telex, and carried out more than 200 000 computer searches of the scientific literature. The NRC founded the *Canadian Journal of Research* in 1929. It now publishes 11 scientific journals and subsidizes 15 others. Also, since 1929, it has maintained a Technical Information Service to provide advice and information to INDUSTRY. In 1981-82 it answered 28 000 inquiries, chiefly from medium- and small-sized manufacturers.

**National Resources Mobilization Act**, was passed 21 June 1940 by Parliament as a result of stunning German victories in the spring. The Act enabled the government to requisition the property and services of Canadians for effective home defence. An earlier promise made by PM Mackenzie King in 1939 not to introduce CONSCRIPTION for overseas service was honoured, but it was reversed in Apr 1942 following a national referendum. The amended NRMA added a conscript army to the existing regular volunteer forces, creating a duality in Canada's military that was to last until the war's end. The NRMA's most important contribution to the war effort was that it provided trained recruits for the regular forces: from 1940 to 1944 close to 60 000 NRMA men ("zombies") volunteered for general service, and several thousand more were sent to the front after the introduction of general conscription late in 1944.

N.F. DREISZIGER

**National War Labour Board**, est 1941 with 5 regional boards to enforce the Canadian government's program of wage stabilization in the volatile wartime economy. The first chairman was Humphrey MITCHELL, later also minister of labour. In early 1943, strong pressures created by a steel strike and worker agitation led to his replacement by Justice C.P. McTague. McTague had broad powers to deal with labour militancy and, unlike Mitchell, he was not identified with partisan politics. PM Mackenzie King instructed him to recommend modifications to the Wage Stabilization Order and to draft a labour-relations code. McTague and his colleague on the board, lawyer Joseph Cohen, had strong personal and political disagreements that resulted in separate reports being presented in Aug 1943. Cohen was dismissed, but McTague's report considerably affected government policy. McTague recommended that the board should have the authority to adjust wages that had been held

down unfairly by the government and that family allowances might be considered as an alternative policy if it appeared that wage adjustment would be inflationary. The government eventually adopted both recommendations. McTague's wartime labour code took form on 17 Feb 1944. It defined the right of labour to organize and established a system for defining and certifying bargaining units. It formed the basis for the postwar Canadian system of LABOUR RELATIONS. The board's authority declined soon afterwards, when McTague resigned to become a Conservative candidate.

JOHN ENGLISH

**Nationalism** is the doctrine or practice of promoting the collective interests of the national community or STATE above those of individuals, regions, special interests or other nations. In the arts, nationalism is the expression of, or the appeal for, distinctive national styles. Although its historic origins are diverse, in its modern forms nationalism is a product of the late 18th and 19th centuries, particularly of the American and French revolutions and the unification movements in Germany and Italy. Emulating the European and American models, national movements of self-determination and liberation have, over the past 200 years, transformed nationalism into a worldwide political and cultural phenomenon. In the first 25 years after WWII, 66 new nations were created.

In Europe nationalist thought has contained a central (though often merely implicit) notion of racial superiority which has frequently been expressed in the display and use of military force. In contrast, US nationalism blossomed from the romantic conception of a free people joined together under God to create a new and perfect union, free forever from European sins and weaknesses. Nationalism does not necessarily have a particular ideological slant, but varies from right to left on the political spectrum; its flavour and content depend upon the historical circumstances.

Canada came to consciousness in a period when world war had undermined European power and discredited types of European nationalism and when the national power and influence of the US had spread throughout the world. In the Western world, the 2 wars, which were widely attributed to the excesses of nationalism, have contributed (along with liberal and Marxist historical thought) to strong anti-nationalist and internationalist reactions. Since 1945, Canadians have been divided about the Canadian variety of nationalism. Their federal governments, reflecting this confusion, have varied from the antinationalist to the nationalist — with incongruous results. The postwar prime minister most committed in rhetoric to the defence of national interests, John Diefenbaker, was probably the least effective in that defence; the prime minister most ardently opposed in principle to nationalism, Pierre Elliott Trudeau, zealously defended a nationalist ENERGY POLICY.

The aftermath of WWI brought a surge of cultural nationalism, centered in Toronto and reflected in the painting of the GROUP OF SEVEN, in the founding of the *Canadian Forum*, and the literary commentary of William Arthur Deacon in *Saturday Night* magazine. Political nationalism, under the guidance of the Liberal government of W.L. Mackenzie King, was directed against the fading symbols of colonial ties with Great Britain. This anticolonial nationalism met no resistance from Great Britain, but it conflicted with the attachment many English-speaking Canadians felt for British symbols, an attachment most persistently expressed politically through the CONSERVATIVE PARTY WWII thrust Canada, willy-nilly, into close military and economic integration with the US, which seriously undermined the possibility of independent Canadian nation-

hood. By 1945 the federal Liberal government and its influential senior civil service were inclined to believe that the country had passed beyond the era of nationalism into internationalism (in diplomacy) and CONTINENTALISM (in economic and cultural relations with the US), a condition considered blessed. In his last years of power, however, King sometimes brooded about the dangers of this absorption, and dreamed of independence. But, after the spring of 1946, COLD WAR hysteria caused King, as well as most Canadian politicians and their followers, to suppress such ideas.

Canadian national consciousness and the articulation of national interests were unexpectedly placed in suspension for a decade. English-speaking Canada was absorbed in economic development and Québec remained enveloped in its past. A vast and generally comfortable cultural and economic invasion from the south took place with the country's tacit consent. Only very tentative nationalist alarms could be sounded in this atmosphere of approval. The first of these in the postwar period was the Report of the Massey Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES (1951). It noted that the Canadian community faced not only dispersal in a vast landscape, but "influences from across the border as pervasive as they are friendly." In education, book publishing, magazine publishing, filmmaking, and radio the commission surveyed the American influences of Canadian life and warned of "the very present danger of permanent dependence." Its nationalist program for containing the cultural challenge was increasingly accepted by the Liberal government of the early 1950s, while the same government maintained its indifference to any measures of ECONOMIC NATIONALISM. The Gordon ROYAL COMMISSION ON CANADA'S ECONOMIC PROSPECTS warned in 1956 of the potential dangers of economic subordination to the US and offered a mildly nationalist program of countermeasures. It was ignored by the ST. LAURENT administration. In view of the growth of direct US investment in Canada (see FOREIGN INVESTMENT), and Liberal encouragement of it, both the Conservative and CO-OPERATIVE COMMONWEALTH FEDERATION (CCF) opposition parties spoke in nationalist tones before the 1957 general election that brought the Conservatives to power. But in 6 years the Diefenbaker government could not work out a coherent cultural or economic program and continued, in practice, to promote economic and military integration with the US, while at the same time antagonizing the US administration with its defiant manner.

The Conservative defeat of 1963 brought a reformed Liberal Party to power under Lester B. PEARSON. In the beginning the Pearson government was dominated by the nationalist economic views of the minister of finance, Walter GORDON, a dissenting and atypical member of the Toronto business establishment. Gordon's program for gentle patriation of the economy suffered setbacks in Parliament and in party caucus almost immediately, but measures to limit foreign ownership of newspapers, magazines, radio and television were adopted in 1965, and the CANADA DEVELOPMENT CORPORATION was eventually established. After 1965 the Pearson government retreated into quietism and came to terms with the opponents of nationalist policy in the business community. The Report of the Watkins Task Force on FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INDUSTRY (1968) was officially ignored, as had been the Gordon Report. The government's renewed anti-nationalism was reinforced by the accession in 1968 of Pierre Trudeau, whose dogmatic opposition to nationalism was the product of his experiences in Québec under DUPLESSIS and from his interpretation of European history.

The relative failure of Canadian nationalist policies in the 1960s and the evidence of overwhelming American influence in Canada stimulated the growth of a variety of popular nationalist organizations and activities in English-speaking Canada from 1968 onwards. The COMMITTEE FOR AN INDEPENDENT CANADA, led by Walter Gordon, Abraham Rotstein, Mel Hurtig, Peter NEWMAN and others lobbied during the 1970s for a range of nationalist policies. The WAFFLE group sought to stiffen the nationalist backbone of the NEW DEMOCRATIC PARTY but was eventually defeated and dispersed. The Public Petroleum Association incorporated nationalists from both movements in its campaign for repatriation of the oil industry. A select committee of the Ontario legislature on economic and cultural nationalism, a national commission on Canadian Studies at the university level led by T.H.B. Symons, and various commissions on national identity in the media were active in the early 1970s. During its MINORITY GOVERNMENT of 1972-74, the federal Liberal government conceded to evidence of increasing popular support for nationalist policies by creating the FOREIGN INVESTMENT REVIEW AGENCY and PETRO-CANADA, although both organizations lacked any clear direction from the Cabinet during their early years.

The nationalist movement in English-speaking Canada was weakened in the 1970s by an unreconciled division over attitudes to Québec nationalism. One element, while sympathetic to the cultural and linguistic aspirations of the Québécois, regarded Québec nationalism as a subversive force threatening the integrity of Canada. Another element saw it, on the contrary, as a potential complement to Canadian nationalism, to be emulated by English-speaking Canadians. The division has lasted into the 1980s, when both Québec and Canadian nationalism seem to have lost their popular momentum. Following the Liberal Party's defeat in 1979, the Conservatives under Joe CLARK adopted a generally antinationalist stance favouring appeasement of MULTINATIONAL CORPORATIONS and the provinces, but the stance was uncertain and was incoherently applied in policy. The government's early parliamentary defeat precipitated the election campaign of 1980, during which Pierre Trudeau and Marc LALONDE, in response to what they perceived as the forces of national disintegration in Québec and the West, adopted strong nationalist-centralist attitudes that led, on their return to power, to a drive for unilateral patriation of the Constitution and to the National Energy Program of November 1980. This new Trudeau nationalism was blunt and heavy-handed, aimed at undercutting the growing power of the provinces rather than promoting national objectives for their own sake. It promoted strong responses from the provinces and from international business, who were able to appeal both to an unusual Canadian sense of fair play and to strong latent distaste for the prime minister's style. In the face of this opposition, the government's constitutional policy was adjusted to meet some provincial objections (though not those of Québec); and the energy policy was modified.

In the fall of 1982 the Federal Cultural Policy Review Committee (Applebaum-Hébert) completed the first comprehensive survey of federal cultural policy since Massey's 1951 Royal Commission Report on Arts, Letters and Sciences. This review lacked the clear national vision and impact of the Massey Report. While it reflected the vastly expanded range of Canadian cultural enterprise in the intervening years, and contained over 100 policy recommendations, its proposals for retrenchment in the NATIONAL FILM BOARD and the CBC gave the Canadian cultural community confusing signals about national policy.

Since 1945 the provinces, with only occasional exceptions (particularly Saskatchewan under the NDP's Allan BLAKENEY from 1971-82), have followed open-door economic policies in competitive pursuit of foreign investment, regarding Ottawa's intermittent ventures into economic nationalism as misguided or worse. In the 1970s, however, the resource-rich provinces at last began to retrieve substantial shares of the economic rents formerly lost to the multinationals, but they typically did so in the name of provincial rather than national interests.

Canadian interests and the expression of national sensibility have been relegated to the margins of Canadian public life because of the overwhelming influences of American business and American culture in Canada and of the pressures of provincialism. Policies of national self-protection accepted as normal and uncontroversial in other industrial countries have been regarded with widespread alarm and disapproval in Canada. Efforts to sustain the Canadian arts have always been faced with the mass-marketing advantages of American competitors, whose products spill over the border, and with the dispiriting effects of rapid changes in technology that frequently render regulation obsolete. Nationalism in Canada, under the persistent barrages of the provincial governments, the business community, and the American private lobbies, administrations and media, has remained defensive and apologetic, rarely aggressive and never expansionist. It has become tenacious, but it remains the precarious nationalism of a diverse community that is still only dimly aware of itself, existing always in the American shadow and beset by doubt. See FRENCH CANADIAN NATIONALISM; NATIONAL POLICY; ECONOMIC NATIONALISM; IMPERIALISM; REGIONALISM. DENIS SMITH  
*Reading:* D. Cameron, *Nationalism, Self-Determination and The Quebec Question* (1974); W.L. Gordon, *A Choice For Canada* (1966); G. Grant, *Lament For A Nation* (1965); K. Levitt, *Silent Surrender* (1970); Denis Smith, *Gentle Patriot* (1973).

**Nationalist League** fd in Montréal 1 Mar 1903, during renewed British IMPERIALISM, increased anglophone aggressiveness towards Francophones and growing Canadian INDUSTRIALIZATION. Comprising a few largely unknown journalists and lawyers, including Olivar Asselin (president), Omer Héroux (secretary) and Armand Lavergne, the league sought to spread the nationalist views of its indisputable mentor, Henri BOURASSA. Its program focused on achieving a purely Canadian NATIONALISM and was based on 3 points: autonomy of Canada in the British Empire and the provinces in Confederation; respect for Canadian duality; and establishment of uniquely Canadian economic and cultural policies.

The league had no clearly defined structure and had few members. After a promising beginning, when it launched the weekly *Le Nationaliste* and organized public meetings featuring Bourassa, it almost disappeared in 1906. The league then inspired the "nationalist movement." The nationalists were stubbornly doctrinal, tireless opponents of the governments in power and fervent participants in Québec electoral politics. But because it was poorly organized, elitist and too closely associated with Bourassa, the "nationalist movement" gradually declined after the 1912 provincial election without having attained its major objectives. (See FRENCH CANADIAN NATIONALISM.) RÉAL BÉLANGER

**Nationalization**, the takeover of ownership and control of a privately owned enterprise by the STATE. States have traditionally taken private property for public purposes, eg, land for construction of roads; but this "right of eminent domain" is in contrast to nationalization, which is often carried out in pursuit of economic, social or political policies, eg, to increase Canadian

ownership in the petroleum industry through the takeover of foreign oil companies by the federal crown corporation PETRO-CANADA. Whether it is justified for pragmatic reasons, eg, the provision of an essential service, or for broader collectivist goals, such as ECONOMIC NATIONALISM, nationalization infringes on the liberal tenet of the security of property. The state uses or threatens to use its power to obtain property either by expropriation, with or without compensation, or by acquiring property in a sale by using pressure and excluding other purchasers. Although compensation may be prompt and fair, the threat of coercion may reduce the value of property, and the state claims to be the final arbiter.

When a state nationalizes the holdings of foreign investors, the position of Western industrialized countries (especially the US) is that nationalization is only justified after prompt and adequate compensation, determined by an impartial authority. However, developing countries, in which there is often great resentment of foreign control, argue that states have perpetual sovereignty over their own resources and have the right to nationalize in order to further economic self-determination and economic development. They claim that nationalization and compensation are subject only to the laws of the nationalizing country — a position embodied in resolutions of the UN General Assembly, including Resolution 1803 of Dec 1962. However, nationalization is usually accompanied by compensation in recognition of fairness and of the need to maintain the confidence of foreign investors.

Although Canada generally supports the ideology of free enterprise, the extent of foreign ownership and control of Canadian resources prompted nationalizations during the 1970s, particularly by NEW DEMOCRATIC PARTY governments in BC (1972-74), which nationalized a number of firms in the forest-products industry, and in Saskatchewan (1975), which announced that it would nationalize at least 50% of the potash industry. Throughout the decade, the federal Liberal government proposed "Canadianization" of the oil industry, but Canadianization does not necessarily mean nationalization, since it includes the purchase of foreign firms by private Canadian companies. Moreover, state control was achieved by purchase, involving little coercion. Nonetheless, critics claimed that government measures distorted the market values and that too little or too much was paid.

The spate of nationalizations and a reaction against the increasing power of the state in the economy resulted in a countermovement, dubbed denationalization or "privatization." The BC Social Credit government "privatized" the BC Resources Investment Corporation, a crown corporation established by the previous NDP government, by giving away 5 free shares for every adult and child in the province and by exhorting residents to purchase more; they did, but the value of the shares dropped from \$6.00 to \$3.00. Federally, the short-lived Progressive Conservative government under Joe CLARK espoused the same philosophy, but its threat to "privatize" Petro-Canada was instrumental in its defeat in the subsequent election. The succeeding Liberal government re-emphasized Canadianization in the National Energy Program of 1980; this emphasis again shifted in Sept 1984 when the new Conservative government announced its intention to sell off several crown corporations and to alter the NEP.

J. DONNER

**Native Council of Canada** Up to the 1950s, MÉTIS interests were represented by a variety of local political organizations and activists (see LOUIS RIEL; Gabriel DUMONT; James BRADY; Malcolm NORRIS). In 1961 the National Indian Council was founded as an umbrella group for

Métis and Indian concerns. When these 2 groups proved politically incompatible, the Council split in 1968 to form the Canadian Métis Society (since 1970 the Native Council of Canada) to represent Métis and nonstatus interests and the National Indian Brotherhood (now ASSEMBLY OF FIRST NATIONS) to represent status Indians. The NCC is composed of provincial and territorial organizations, usually called Native Councils or Métis and NonStatus Indian Assns.

The NCC holds an annual assembly at which member organizations are represented, and is governed by a board of directors, consisting of presidents of the member associations, and an executive elected by the assembly. It is funded almost entirely by the federal government's Native Citizens' Directorate. The Constitutional Review Commission also receives federal funds to participate in the First Ministers' conferences on ABORIGINAL RIGHTS.

The number of persons represented by the NCC has been a matter of controversy. The NCC asserts there are one million Métis and nonstatus persons, but Statistics Canada data from the 1981 census indicate that only 75 110 persons identified themselves as nonstatus Indians and 98 260 identified themselves as Métis. The accuracy of these statistics is still unknown. Proposed changes in the INDIAN ACT to remove sections that treat some Indian women and their children differently from Indian men and their children will restore status to many persons now represented by the NCC (see Jeanette LAVELL). The NCC's constituency was reduced in Mar 1983 when provincial member associations from Manitoba, Saskatchewan and Alberta (always a distinct force within the organization) withdrew to establish the Métis National Council.

NCC policy operates around the premise of Métis nationalism within the Canadian context and the deeply felt sense of Indianness among the nonrecognized native people. It asserts that these groups have the right to define themselves historically and culturally, and to improve their

position in modern Canadian society. NCC rests its demands on aboriginal rights (as mentioned in the Constitution) as well as on needs, and seeks a special relationship for Métis and nonstatus Indians with the federal government. See also NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM.

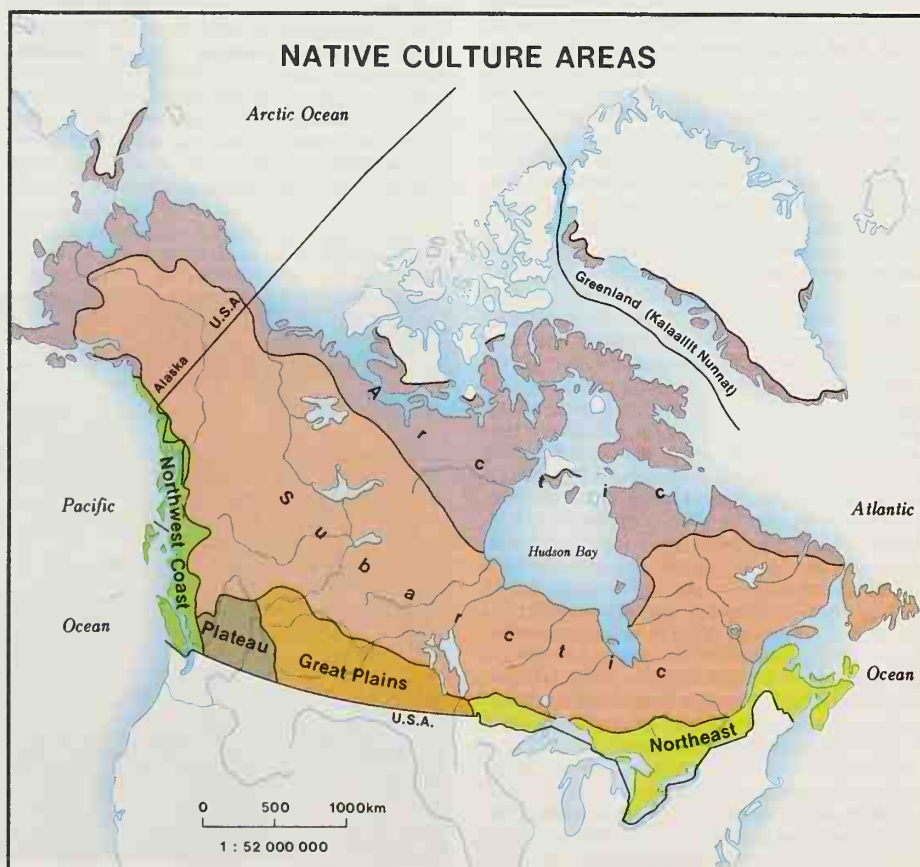

MICHAEL POSLUNS

**Native People** The native peoples of Canada are considered under 6 subheadings: Arctic, Eastern Woodlands, Northwest Coast, Plains, Plateau and Subarctic. Cross references are provided to entries on tribal groups and to thematic articles on native peoples.

#### Arctic

**Territory and Natural Environment** The INUIT have enjoyed almost exclusive occupation of the Canadian Arctic, those inland and coastal areas N of the TREELINE. In areas close to the treeline, Inuit and Indians have traditionally occupied similar environments (though rarely at the same time) and have hunted and fished similar game species. The arctic regions are characterized by long daylight hours in summer, with moderate temperatures. Winters are long and cold, and at more northerly locations there is a midwinter period when the sun is entirely absent. Plant cover may be continuous, especially in well-watered locations, although rocky outcrops and barren dry areas are common. Trees are entirely lacking in the Arctic, though low shrubby plants occur, including several varieties bearing edible berries. Landforms are variable, from lake-studded lowlands to glacier-strewn alpine areas (see VEGETATION REGIONS).

**Major Language and Tribal Groups** There are 8 main Inuit tribal groups in Canada, the LABRADOR, UNGAVA, BAFFIN ISLAND, IGLULIK, CARIBOU, NET-SILIK, COPPER and Western Arctic Inuit (see NATIVE PEOPLE, DEMOGRAPHY). The Western Arctic Inuit (or Inuvialuit) are recent immigrants, or their descendants, from Alaska, taking the place of the MACKENZIE INUIT, who were decimated by

Etching (c 1824) of a group of Inuit by Capt G.F. Lyon. Inuit skillfully made clothing and footwear from animal skins. The parka usually consisted of an inner and outer jacket of caribou fur, and the footwear was of sealskin (courtesy Public Archives of Canada/C-25703).

several smallpox and influenza epidemics at the turn of the century. The SADLERMIUT, in north-western Hudson Bay, died out following contact early this century (see NATIVE PEOPLE, HEALTH).

All of the Canadian Inuit speak one language, Inuktitut or Eskimo-Aleut, though there are 6 different dialects (see NATIVE PEOPLE, LANGUAGES). However, because of improved travel opportunities and the development of Inuit-language radio and TV programming, language differences are diminishing (see COMMUNICATIONS IN THE NORTH, NATIVE PEOPLE, COMMUNICATIONS). Traditionally, there was no written language, but after contact with missionaries, writing systems were widely adopted. Since 1920 the adult literacy rate has been almost 100%.

**Historical Summary** The first sustained contact with outsiders occurred between Moravian missionaries and Labrador Inuit in the late 18th century. Fleeting trade contacts were established at a few other locations in the Arctic, but most contact occurred nearly a century later. During the latter half of the 19th century, explorers and commercial whalers introduced various trade items to the Inuit, though it was only following the end of commercial whaling, at the time of WWI, that trading posts became more or less permanently established in the arctic regions. Mission stations and police posts were also established during this period. Following WWII there was an intensification of government activity, including the establishment of schools, nursing stations, airports and communication installations, and housing programs in the newly established settlements and hamlets (see NATIVE PEOPLE, GOVERNMENT POLICY; NATIVE PEOPLE, GOVERNMENT PROGRAMS).

**Traditional Culture** Inuit tribal groups in traditional times contained 500-1000 members. The most important social and political unit was the regional BAND, several of which together constituted the larger tribal group within which marriages occurred and all members spoke a similar dialect. Regional bands would congregate for short periods, customarily during the winter months, when people would gather in sealing camps. During the rest of the year, they lived in smaller bands, often composed of 2 to 5 families. Each household generally consisted of a married couple and their children, though elderly or unmarried relatives might also be present. Many economic and social activities involved interhousehold co-operation, and widespread sharing was, and still is, a predominant characteristic of Inuit social life. Most families who chose to live together were closely related, with leadership of the group generally assumed by the oldest active male member.

Marriage was nearly universal among Inuit and customarily took place in early adulthood; it was usual for the young couple to reside close to the parents of one or the other spouse. Many households included adopted children, an indi-

cation of the high value accorded children. Children were an important means of establishing valued interfamily relationships through adoption, betrothal, adult-child relationships established at birthing ceremonies, and naming practices. The family was an important economic unit, relying on a decided division of responsibilities among all household members, including children and elderly relatives.

Most Inuit groups based their economy on sea-mammal hunting. In summer and fall many groups hunted caribou or moved to favoured coastal locations to hunt and fish a variety of game species. Fishing and food gathering (for bird eggs, shellfish and berries) were important seasonal activities, as were hunts for polar bear and whale. Though high value was placed on fresh food, quantities were also stored for future use. Drying, and caching in cool areas, were common techniques, although several special techniques (such as storing in oil) were also used.

The traditional technology was based on locally available materials, principally bone, horn, antler, ivory, stone and animal skins. In some areas grass or baleen was used for basketry, wood substituted for bone, native copper for antler or bone, and bird or fish skins for animal skins. Use was made of special parts of animals, eg, sinew, intestine and bladders. The improvising abilities of Inuit are well known today, and many Inuit inventions are considered technological masterpieces. The domed snowhouse (IGLOO), the toggling harpoon head and the KAYAK are noteworthy examples.

There was an understandable relationship between location of settlements and seasonably available food resources. The composition of settlements might change periodically in response to social needs and desires to interact with kinsmen residing elsewhere. Many hunting methods became more effective when several hunters worked co-operatively, eg, during winter seal hunting.

Sleds and skin-covered boats were universally employed by Inuit, though regional variations in both design and use were common. Dogs historically served as hunting animals and were used to locate seals under the sea ice or to hold bears or muskoxen at bay. They were also used as pack animals in the summer. Men used single-seat kayaks for hunting seal mammals or caribou in rivers and lakes. In Alaska, large skin-covered UMIKs were used for whale hunt-

ing, although in the Canadian Arctic (and Greenland) such boats were more usually used by women to transport households from place to place.

The skin tent, often with a short ridgepole, was generally made from dehaired sealskins and weighted down along the ground with rocks. Among the Caribou Inuit, the tent was often conical in shape, and constructed from dehaired caribou skins. Tents were used when suitable snow was not available for snowhouses, or when away from the sites where sod and stone-walled houses were situated.

Snowhouse design was variable. At winter settlements the main living chamber could be quite large, perhaps 4 m in diameter and almost 3 m high. In addition, there were chambers for storage and an entrance passage, and often extra living chambers attached to the side. In some regions it was customary to line the walls with caribou skins for insulation. Most snowhouses had a snow sleeping platform and a window (made from clear lake ice) set into the roof (see HOUSE). Smaller, less elaborate snowhouses are still commonly used during winter travelling. In the western Arctic, where driftwood logs occur, permanent dwellings were constructed for winter use. Windows in this case were made from translucent animal-skin parchment.

Inuit skillfully manufactured footwear and clothing from locally obtained and prepared animal skins. Even though parkas, gloves and boots followed a similar basic design, regional variations in pattern and technique persisted. For most Inuit groups, footwear was made from the skin of 2 different species of seal, either haired (for winter use) or hairless (for spring and summer use); the latter were entirely waterproof. In some areas caribou skin replaced sealskin, especially for winter boots. The parka traditionally consisted of an inner and outer jacket, usually of caribou fur. Among some groups, sealskin parkas were commonly worn in spring through autumn, and caribou fur was preferred for winter clothing. Women's clothing was often more elaborate than men's, with a voluminous hood on the tailed and aproned parka. Infants were carried in a pouch against the woman's back, not in the hood. There was little bodily adornment, though women's facial tattooing was practised.

Birth was associated with several socially significant rituals. Among some groups, in addition to an attending midwife, there was another adult who served as the child's ritual sponsor, assuming responsibilities for the child's moral upbringing. Throughout life, special terms of

Inuit with traditional summer dwelling and kayak at Peel River, NWT, 1901 (courtesy Public Archives of Canada/PA-124050/C. W. Mathers Coll).

address were used, and in the case of a boy, his first killed game animals, and in the case of a girl, her first sewn items, were presented to this adult. Naming occurred at birth and had special significance, as Inuit names included part of the identity and character of the name bearer. Betrothal of children could occur at any time, even before birth. Young people promised to each other used a special form of address, and their families related in ways appropriate to the future relationship. There were many rituals associated with hunting, although these are becoming less common. Animal bones or ceremonial bundles, and ceremonies involving self-induced trance, were used to foretell future events. Marriage, an exceptionally stable institution among Inuit, was customarily preceded by a period of trial marriage. Polygamy, and more rarely polyandry, also occurred, but were not common practices.

In the 20th century, Inuit have universally embraced Christianity, and a large number of communities are now served by ordained Inuit clergy or trained catechists. Prior to missionary activity, Inuit religious leaders were shamans who often underwent lengthy and arduous training. Shamans were intermediaries between the Inuit and the various spiritual forces that influenced human affairs. Inuit life in pre-Christian days required strict adherence to various prohibitions and rules of conduct, so that the role of the SHAMAN was usually to determine transgressors and to prescribe appropriate atonement (see NATIVE PEOPLE, RELIGION). Early missionary activity was similarly constituted, with many new rules and prohibitions introduced and penitence demanded after sinning.

Young Inuit were expected to learn by example, through close association with adults. Desire to be praised by respected elders and to attain social competence were strong incentives for young people to join adult society (see NATIVE PEOPLE, EDUCATION). Many of the values and beliefs of the society were demonstrated implicitly in behaviour; eg, the constant sharing of food and other commodities was a manifestation of the value of generosity and co-operation and a negation of stinginess, greediness or selfishness. Reinforcements of these lessons were contained in the stories that elders enjoyed telling, especially to children (see INUIT MYTH AND LEGEND).

The traditional musical instrument was the drum, up to 1 m in diameter, made by stretching a skin membrane across a wooden hoop. Among Western Arctic Inuit several sitting drummers usually accompanied one or several dancers, whereas elsewhere in the Canadian Arctic drumming was an individual performance at which the drummer stood and chanted, swaying rhythmically with the drum beat. Following contact with outsiders, instruments such as concertinas, accordians, violins, harmonicas and, more recently, guitars became widespread. Square dancing, often in extended and intricate performances without a caller, was very popular. "Throat singing" occurred among some groups, usually performed by 2 women producing a wide range of sounds from deep in the throat and thorax.

Decorative arts were associated with skin sewing, or were inscribed on utensils. Recent innovations in INUIT ART, eg, soapstone carving, printmaking and wall hangings, stem from traditional skills, sometimes using new materials or techniques. Skills in creating string figures, and other games that develop memory, manual dexterity and patience, continue to be practised.

**Culture Change** Since contact with outsiders, many changes in Inuit society and culture have occurred (see NATIVE PEOPLE, ECONOMIC CONDITIONS, NATIVE PEOPLE, SOCIAL CONDITIONS). The early adoption of iron tools, firearms, cloth and wooden boats altered or replaced certain material items. Adoption of Christianity has resulted in the loss

*Indian Encampment on Lake Huron* (c1845-50) by Paul Kane depicts the characteristic birchbark dwellings and canoes of the Ojibwa (courtesy Art Gallery of Ontario)

of many traditional religious ideas and practices, and Canadian law has replaced customary law in areas concerned with marriage, dispute settlement and game management (see NATIVE PEOPLE, LAW). Even the language has changed, with English words replacing numerals above 6 (though the Inuit words for 10 and 20 are still retained). However, many material items cannot be satisfactorily replaced; among these are harpoons used in marine mammal hunting, sealskin boots and caribou parkas required for winter hunting, snowhouses and sleds used in winter travelling, and the techniques of preparing animal skins and sewing skin clothing. Important elements of the value system also resist change, including traditional child-rearing practices, concerns about environmental matters, the continued survival of the Inuit language and culture, and respect for individual autonomy (see INUIT CO-OPERATIVES).

In the early 1970s a national organization, the INUIT TAPIRISAT OF CANADA, was established to protect Inuit cultural and individual rights. The organization created several agencies in response to expressed needs. An Inuit Language Commission, for example, was formed to seek the best means of ensuring the increased use of Inuktitut for governmental, educational and communications purposes, and a Land Claims Office was established to research and negotiate Inuit LAND CLAIMS. Many of these issues, such as protection of the arctic environment, are international in scope. Therefore, an international Inuit organization, the Inuit Circumpolar Conference, was formed with committees seeking to strengthen pan-Inuit communication, cultural and artistic activities, and international co-operation in environmental protection. This organization has affiliation with numerous international bodies, including the United Nations, thereby ensuring that Inuit concerns become widely understood throughout the world.

MILTON M.R. FREEMAN

#### Eastern Woodlands

**Territory and Natural Environment** The Canadian Eastern Woodlands are part of a larger biotic region that extends SW to Illinois and E to coastal N Carolina. The deciduous forests of southern Ontario, the St Lawrence lowlands and coastal Atlantic provinces phase N into the mixed deciduous-coniferous canopy of the Canadian shield in the W and the Appalachian uplands in the E (see VEGETATION REGIONS). Except in the Atlantic provinces, the Great Lakes-St Lawrence watershed provided access to water

transportation to all Eastern Woodland peoples. Climate and soil conditions allowed peoples S of upland regions to grow corn, beans and SQUASH; by far the largest portion of their diet consisted of products of their extensive fields. The white-tailed deer was perhaps the most important game animal in Indian subsistence except in the N, where moose and caribou were found. Seals were hunted by some coastal peoples. Inland, freshwater fish, and along the seaboard eels, molluscs and crustaceans, were taken. Waterfowl and land birds were seasonally important in some areas. During the historic period, fur bearers, especially BEAVER, were significant to the Indian economy. A variety of berries, nuts, tubers and plants was collected, and some groups harvested maple and birch sap and WILD RICE.

**Major Language and Tribal Groups** Eastern Woodland Indians spoke languages belonging to 2 unrelated families, Iroquoian and Algonquian. At the onset of the historic period, Iroquoians occupied much of southern Ontario, northern Ohio, Pennsylvania and New York, and the St Lawrence Valley as far E as the Québec City area. Algonquian groups extended from Lk Superior N of Lk Huron to the Ottawa Valley, thence E through New England and the Atlantic provinces to the coast. Iroquoian peoples included Erie (S of Lake Erie), NEUTRAL (Grand R-Niagara R area), Wenro (E of Niagara R), Five Nations IROQUOIS — SENECA, CAYUGA, ONONDAGA, ONEIDA, MOHAWK (Genesee R to Mohawk R and N to the Adirondack Mts), HURON — 5 tribes (Georgian Bay to Lk Simcoe), PETUN (SE of Georgian Bay) and St Lawrence Iroquoians (Montréal to Québec City). Algonquian peoples included OJIBWA (Lk Superior to northeastern Georgian Bay), OTTAWA (Manitoulin I and Bruce Pen), Nipissing (Lk Nipissing area), ALGONQUIN (Ottawa R and tributaries), ABENAKI (Vermont, NH, western Maine and southeastern Québec), MALISEET (St Lawrence Valley S to Bay of Fundy, eastern Maine and western NB) and MICMAC (southeast Gaspé Pen, eastern NB, PEI and NS).

The speakers of Iroquoian languages belong to 2 branches, a southern one composed of Cherokee, and a northern branch that includes all of the tribes noted above. The languages of the Canadian Iroquoians (the St Lawrence Iroquoians, the Huron, Petun and Neutral) are now all extinct, and the 6 Iroquoian languages spoken in

Canada today (Mohawk, Oneida, Onondaga, Cayuga, Seneca, Tuscarora) were brought by groups of immigrants (LOYALISTS) from New York state. Within the Canadian Eastern Woodlands there are 2 branches of the Algonquian family, Central Algonquian (Ojibwa, Ottawa, Nipissing and Algonquin) and Eastern Algonquian (Abenaki, Micmac and Maliseet). Languages within each branch show a high degree of mutual intelligibility, with the Central Algonquian forming dialect chains (see NATIVE PEOPLE, LANGUAGES).

**Historical Summary** Although the NORSE seem to have made sporadic visits to the eastern seaboard between the 11th and 14th centuries, major European influences were initiated by fishermen to the Grand Banks — who also began trading for furs in the early 16th century just prior to Jacques CARTIER's contacts with Micmac and St Lawrence Iroquois in 1534-35. During the late 16th century the FUR TRADE expanded to involve, either directly or indirectly, most Eastern Woodland peoples. During this period the St Lawrence Iroquois deserted their longtime homelands and, although there is debate as to whether its origin is precontact or postcontact, the famed Iroquois Confederacy became prominent.

By the early 17th century there were European settlements on Sable I (temporary), at Tadoussac, briefly on the St Croix R in Maine, and at PORT-ROYAL in the Annapolis Valley. In 1609 Henry HUDSON explored the New England coast and the river named after him, while Samuel de CHAMPLAIN accompanied a MONTAGNAIS war party against the Mohawk near Lk Champlain, an event that marked the beginning of European participation in the almost continuous intertribal hostilities that lasted for a century. By 1624, when the Dutch established New Amsterdam, fur bearers had been largely exterminated along the Atlantic coast. During the first half of the 17th century, European epidemics (see NATIVE PEOPLE, HEALTH) and warfare drastically reduced Indian populations, and subsistence cycles of hunter-gatherers were disrupted. Dependency relationships developed when a variety of European trade items replaced aboriginal ones, and new forms of territoriality and leadership emerged. In New England the Pequot War (1637) and King Philip's War (1675-76) led to population shifts clearing the way for European settlement. Some Abenaki moved to St Francis near the St Lawrence after about 1660. In the Great Lakes area, the Five Nations Iroquois intensified their attack on other Iroquoians and Algonquians during the 1640s and 1650s, forcing many peoples to flee from their homelands (see IROQUOIS WARS). Remnant groups of Huron, Petun, Neutral and Erie fled W and became known as Wyandot. One group of Huron settled at Lorette near Québec City. The Five Nations Iroquois, reduced by warfare and disease, replenished their numbers by adopting war captives and refugees. During the late 17th century, as Iroquois power began to wane, Ojibwa and Algonquin expanded into southern Ontario; their descendants occupy reserves there today. In 1722 the Iroquois accepted the Tuscarora, a northern Iroquoian-speaking people who had fled north from the Carolinas. Following this addition, the confederacy was often called the Six Nations, although the Tuscarora were never politically equal to the 5 founding nations.

Throughout the first half of the 18th century most Algonquians of the Eastern Woodlands supported the French and supplied them with furs in exchange for European commodities. Except for a group of Mohawk who had settled near Montréal, the majority of the Iroquois were allied with the British. At the time of the SEVEN YEARS' WAR and after the fall of NEW FRANCE to the British in 1759-60, Ottawa and Ojibwa, dis-

pleased with new policies, temporarily captured Detroit and Michilimackinac. Most Algonquians, however, supported the British cause during the AMERICAN REVOLUTION, but the struggle split the loyalties of the New York state Iroquois, many of whom subsequently moved to lands granted to them by the British in southern Ontario. Members of all the Six Nations Iroquois settled along the Grand R, and some Mohawk settled at the Bay of Quinte. Land cessions in New York, a growing dependency on whites, and general demoralization stimulated a revitalization movement in 1799 led by the Seneca prophet Handsome Lake. The new religion spread to other Iroquois communities in the US and Canada (see HANDSOME LAKE RELIGION). After the WAR OF 1812 some Ojibwa, Ottawa and Potawatomi moved from the US to the Georgian Bay area. A portion of the Oneida settled on the Thames R. During the first half of the 19th century, reserves were surveyed for Algonquians along Georgian Bay, the Robinson-Huron and Robinson-Superior treaties of 1850 enfranchising most Algonquians in Ontario. In the Atlantic provinces some 60 Micmac reserves were established (see INDIAN RESERVE; INDIAN TREATIES).

As white settlements throughout the Eastern Woodlands grew larger and more numerous, hunting and gathering by various Algonquians waned in importance. Small-scale horticulture, often the result of missionary influences, increasingly supplemented a diet which came to include store foods as well as locally obtained fish and game. Some Indians were employed by Euro-Canadians in such activities as lumbering, mining and the fur trade, or as part-time labourers.

On reserves, an elected system of chiefs and councillors replaced traditional political institutions, except among some Iroquois whose confederate chiefs filled political offices. At Six Nations the traditional system was formally replaced by an elected system in 1924, but the old confederate system often continued in opposition to the elected officers and the federal government that failed to recognize it (see NATIVE PEOPLE, GOVERNMENT POLICY).

By the 20th century the majority of Eastern Woodland Indians had adopted Christianity, albeit sometimes only nominally. Many Iroquois continued to practise the Longhouse religion of Handsome Lake. Dependency on government sources of economic support, owing to few employment opportunities or inadequate training, resulted in poverty on most reserves not situated near large urban centres. Following the GREAT DEPRESSION of the 1930s, many Indians moved to urban centres in Canada and the US to work, and many more have since done so. Often they make frequent trips to the reserve and, when not employed or after retirement, return (see NATIVE PEOPLE, URBAN MIGRATION). After about 1960 new government-sponsored job programs on reserves and the revitalization of old arts and crafts lessened economic dependency (see NATIVE PEOPLE, ECONOMIC CONDITIONS). Health clinics and modern medical treatment have resulted in dramatic population growth so that many tribal groups are now numerically larger than at the time of contact (see NATIVE PEOPLE, DEMOGRAPHY). By 1980 there were over 20 000 Iroquoians on 8 reserves in Canada, including 1200 Huron at Lorette. Some 11 525 Micmac are affiliated with 27 reserves in the Atlantic provinces and 694 Abenaki with the St Francis reserve. The number of other Algonquians residing in the Canadian Eastern Woodlands is difficult to determine since not all are registered Indians associated with reserves (see INDIAN). A figure of 15 000, however, seems reasonable.

**Traditional Culture** *Iroquoian:* All Iroquoians relied primarily on cultivated corn, beans and squash. Fishing, hunting and gathering supplemented domestic crops. Men cleared forest areas

while women planted and harvested and made pottery. The Huron exchanged corn for fish and hides with Nipissing. Crop storage permitted sedentary and often palisaded settlements varying from small hamlets with a few families to towns where as many as 2500 persons resided. Population density was high, reaching a peak of perhaps 24 persons per km<sup>2</sup> (60 persons per sq mile) among the Huron. Although estimates vary, there may have been from 70 000 to 90 000 northern Iroquoians at contact.

A typical village contained a large number of elm- or cedar-bark longhouses. Each LONGHOUSE sheltered several related families. Residence in these households was matrilineal; ie, upon marriage a man would move into his wife's longhouse. As well, descent inheritance and succession followed the female line. One or more households formed a matrilineage. Several lineages composed an exogamous clan designated by a particular totem emblem (crest). Tribes appear to have been composed of from 3 to 10 clans whose members were scattered in several villages. Among some groups, clans were divided into 2 categories or moieties. Clan mates, regardless of village, and among the Five Nations even through tribal affiliation, considered themselves to be siblings.

Most Iroquoian peoples possessed both civil chiefs and war chiefs. The Five Nations Confederacy had a council of 50 permanent and hereditary offices which has survived in modified form to the present. Among the Five Nations, condolence ceremonies commemorate deceased confederate chiefs, replace them and bestow on the successors the honorary names associated with the office. The Huron had a similar political system.

All groups possessed religious specialists (SHAMAN), engaged in seasonal rituals often associated with crop harvests and held periodic feasts (see NATIVE PEOPLE, RELIGION). The Huron held elaborate FEASTS OF THE DEAD, usually at the time when villages were to be moved to new locations. The bones of dead relatives were gathered and placed in mass graves (ossuaries) with grave goods. The Five Nations had a number of medicine societies focused on curing, the best known being the FALSE FACE SOCIETY. During performances members wore elaborately carved wooden masks.

*Algonquian:* Horticulture as a subsistence activity was either absent or marginal among most Eastern Woodland Algonquians. Ottawa, Algonquin, Abenaki and Maliseet grew some crops; the Ojibwa and Micmac grew none, and the Nipissing traded fish for Huron corn. Hunting and fishing provided the bulk of the food. Deer, bear, moose, caribou and even seals, porpoises and whales were harvested in areas where they could be found. Bows, arrows, lances, traps, snares and deadfalls were used in hunting, and hooks, weirs, leisters and nets were employed to procure fish. In the Great Lakes area wild rice was harvested in the early fall, and maple or birch sap was collected in the early spring. Meat was either boiled or roasted for immediate consumption or smoke-dried for future use. A seasonal round of activities tended to inhibit a strictly sedentary existence, although the abundance of certain food, especially fish, and some horticulture permitted a greater degree of sedentation than among Subarctic peoples farther north. Dwellings were smaller and less permanent than among Iroquoians, varying from conical birchbark TIPIS to domed WIGWAMS or rectangular structures that housed several families (see HOUSE). Village size varied seasonally, with the largest population concentrations occurring in summer. Some Ottawa and Abenaki villages may have numbered 300 persons. Unlike the Iroquoians who travelled mainly on land or in crude elm-bark CANOES, the Algonquians made graceful birchbark canoes. In

winter they used SNOWSHOES, sleds and TOBOGANS. Trade and visiting appear to have been common activities among adjacent Algonquian peoples.

The aboriginal population of the different Algonquian groups is difficult to estimate owing to postcontact movements and the effects of diseases. There may have been from 15 000 to 20 000 Central Algonquians in Canada and an equal number of Eastern Algonquians either in Canada or whose descendants later moved to Canada. More research is required before these estimates can be refined.

Prior to European intervention, the largest political unit among most Woodland Algonquians appears to have been the band-village, there being no confederacies of village chiefs. Each BAND or band-village appears to have possessed at least one chief or headman, whose position was usually hereditary within the male line. Patri-lineal groups designated by an animal totem seem to have been characteristic of all peoples. Village-band territories were not strictly demarcated, and all members had equal access to basic subsistence resources. While intertribal feuds may have occurred, it is doubtful that warfare was conducted on the same scale as that which characterized the early historic period.

The most important religious figure was the shaman, who engaged in curing and performed magical rites to ward off evil spirits such as WINDIGO and to appease or locate game. Impersonal powers pervaded the universe, and Algonquians made no conceptual distinction between the human and animal worlds. Seasonal rituals and feasts were held, as well as rituals associated with birth, puberty and death. The vision quest associated with the acquisitions of a personal supernatural guardian helper existed among all groups. Central Algonquians held Feasts of the Dead that were similar but not identical to those of the Huron. During the 17th century these feasts attracted large numbers of persons, often from several tribes. Because quantities of goods were given away and the names of new chiefs raised, they came to resemble the Northwest Coast funerary POTLATCH.

**Culture Change** There has been considerable culture change among all Eastern Woodland groups. Hunting, gathering and fishing have become marginal subsistence activities except among some Micmac, for whom fishing has remained significant. Agriculture, altered by new technologies, crops and rules regarding the sexual division of labour, declined as reserve populations grew, lands were partitioned, and new job opportunities arose. Such traditional foods as corn bread and corn soup are still eaten, and tobacco continues to be grown for ritual purposes. Different reserve populations and different groups on the same reserve represent varying degrees of acculturation and assimilation (see NATIVE PEOPLE, SOCIAL CONDITIONS). Some Algonquians still maintain an essentially animistic world view, while Iroquois following the Longhouse religion adhere to modified aboriginal beliefs and principles. Traditional beliefs and values tend to remain strongest among those who regularly speak the native language. A revitalization of selected aspects of traditional cultures, particularly arts and crafts (see INDIAN ART) but also dances and rituals, as well as a greater political awareness (see NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM), have served to reinforce identity and esteem after over 3 centuries of cultural erosion.

CHARLES A. BISHOP

#### Northwest Coast

**Territory and Natural Environment** The Canadian portion of the Northwest Coast is a region of extremes in topography, from wide beaches to deep FJORDS and snowcapped mountains. Temperatures are moderate, the Jan mean above freezing and July less than 18°C. The

northern coast and outer islands receive 155-655 cm of rain annually, and the protected south coast 65-175 cm, mostly in winter. Heavy coniferous forests thrive, and beaches and streams are lined with dense undergrowth (see VEGETATION REGIONS).

In the precontact period, food was plentiful: black-tailed deer, bear, elk and mountain goat were available locally, and sea mammals (seals and porpoises) as well as vast quantities of fish and shellfish were found everywhere. Most important of all were the great runs of Pacific salmon, which arrived in regular annual migrations and were eaten fresh or dried for year-round use.

**Major Language and Tribal Groups** Of all the aboriginal regions in Canada, the Northwest Coast exhibits most diversity in language. The Inland Tlingit of the northwest tip of BC and the southwest Yukon are an interior branch of the Tlingit of the south Alaska coast. On the QUEEN CHARLOTTE IS. are HAIDA. Both Tlingit and Haida are language isolates, unique languages with no proven relationship to any other. Along the Nass and Skeena rivers and adjacent coast are people speaking 3 languages of the Tsimshian language family, which may be remotely related to several other language families, collectively called Penutian, spoken from Oregon southward. Strung along the coast from Tsimshian territory to NE Vancouver I are Haisla (KITAMAAT), Heiltsuk (BELLA BELLA), Oowekyala (Rivers Inlet) and Kwakwaka (Southern KWAKWATL). They in turn are related to Westcoast (Nootka) and Nitinat, languages spoken on the west coast of Vancouver I and Makah on Cape Flattery in Washington. All of these languages belong to the Wakashan language family. The remaining coastal people of BC speak languages of the large Salishan family. In the north, surrounded by Heiltsuk and Haisla, are the BELLA COOLA. In Georgia Strait, below the Southern Kwakiutl, are speakers of 7 mutually unintelligible Coast Salish languages: Comox, Pentlatch (extinct) and Sechelt, together referred to as NORTHERN GEORGIA STRAIT COAST SALISH, and Squamish, Halkomelem, Nooksack (now only in Washington state) and Straits Salish, together called CENTRAL COAST SALISH.

In summary, there are 19 mutually unintelligible languages spoken on the Northwest Coast of BC, and these in turn belong to 5 separate units among which no relationship has yet

*Interior of a Clallam Winter Lodge (1851-56), oil on canvas, by Paul Kane. Huge winter dwellings of post-and-beam construction were created in distinct regional styles — in this case a Salishan people (courtesy National Gallery of Canada/John Evans, 1959).*

been clearly established (see NATIVE PEOPLE, LANGUAGES).

**Historical Summary** Although the earliest settlement of the Northwest Coast occurred probably 10 000 years ago (see PREHISTORY), the first contact with Europeans came late in the 18th century, when Spanish and British explorers opened the way for traders seeking rich stocks of sea-otter pelts. All tribes eagerly adopted firearms, iron tools and other European goods, but permanent trading posts awaited establishment of a series of forts by the HUDSON'S BAY CO., which by 1850 controlled the trade.

Discovery of gold on the Fraser R in 1857 brought a rush of miners and settlers to the newly established colonies (see GOLD RUSHES). Towns were few, but Indians were attracted to them from afar for trade goods. Contagious diseases, particularly smallpox, wrought havoc among the Indians, who were reduced to a minority within the population by 1885.

Gov James DOUGLAS made a few small treaties with Indian villages on Vancouver I between 1850 and 1859 (see INDIAN TREATIES). This recognition of Indian title was less clear when BC entered Confederation in 1871. Commissions were established in 1876 and 1912 and charged with creating and confirming INDIAN RESERVES. Neither commission had authority to make treaties or deal definitively with Indian grievances. Though reserves were imposed unilaterally and did not always meet Indian requests, they did provide minimal protection for many village sites as the influx of strangers continued.

The unsettled land question and government oppression, including an anti-POTLATCH clause in the INDIAN ACT in 1884, led to protests by local groups. Organized pan-tribal associations emerged later with formation of the Allied Tribes of British Columbia in 1915 and the Native Brotherhood of British Columbia in 1931 (see NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM).

From earliest contact with outsiders, coastal Indians traded willingly and worked as labourers, boatmen and house servants. Those living in dispersed locations with viable subsistence economies were ideal seasonal workers in the early stages of resource development. However, as mechanization and centralization of the fish and timber industries proceeded, participation of Indians as workers and independent small producers diminished. Resource industries still dominate Indian occupational patterns, but by the 1960s unemployment and underemployment in coastal communities was chronic (see NATIVE PEOPLE, ECONOMIC CONDITIONS).

**Traditional Culture** Throughout the North-

west Coast the material bases of life were similar. Carpentry was men's work, and with blades of stone and shell, wooden wedges and stone hammers they fashioned the myriad items of everyday use. Huge winter dwellings of post-and-beam structure covered by split cedar planks were created in distinct regional styles (see HOUSE). So too were dugout CANOES, which provided transportation along rapid streams and on the open sea.

It fell mainly to women to spin twine required for fishnets and lines and to weave items from cedar bark and roots — large storage containers, open-work collecting baskets and exquisite, finely decorated hats. Mats fashioned from cedar bark or rushes provided furnishings and lined houses for additional warmth. Women also twined cedar-bark skirts and cloaks for everyday wear. Elaborately decorated CHILKAT BLANKETS of twined cedar bark and mountain-goat wool were worn on special occasions by people in northern tribes. Among Coast Salish, mountain-goat wool supplemented by dog wool was twilled into heavy blankets with decorative borders. These were items of daily wear in cold weather. Everywhere on the coast, fur cloaks supplemented this simple stock of clothing.

Fishing, hunting and gathering were the means of subsistence on the Northwest Coast. Resources from the sea were of first importance. Fishing devices were adapted to suit specific conditions of sea and stream and local occurrence of fish species; techniques included trolling and jigging with baited hooks, harpooning and spearing, use of nets, and construction of tidal traps, or weirs, in streams. Land mammals were taken with bow and arrow, snares, dead-falls and nets; sea mammals with harpoons at sea and with clubs or nets wherever animals came ashore. The abundant waterfowl fell prey to a variety of ingenious nets. Gathering of shellfish, berries, edible roots, bulbs and green shoots provided additional nutritious foods.

None of these varied resources was evenly distributed in all regions, and coastal tribes followed a pattern of moving or dispersing from winter villages to outlying sites as the season came round for each resource, and then returning to the main base.

While fishing and hunting were mainly the work of men, and women did most gathering of plant and beach foods, the division of labour was complementary and often co-operative. Both men and women made the tools necessary for work. Because almost all foods were produced at times in quantities greater than immediate need, they were preserved. Men did most of the initial production of fish and game, but women did the cooking and preservation (see SMOKEHOUSE).

The primary unit of society everywhere on the Northwest Coast was a large group of kinsmen who usually shared a common ancestor. Among northern peoples, membership in the kin group was passed down through women, but in the south membership could be claimed through either the male or the female lines. In both areas the result was a core of close kin with in-married spouses living together in a house or house cluster under the direction and guidance of capable leaders. These leaders held formal titles or prominent names hereditary within the family line and acted as managers of family property, including nonmaterial possessions such as names, ritual performances, special songs or secret knowledge. The foundation, however, was ownership of real property such as house sites, berry patches, hunting territory, seal rookeries and fish-trap sites. While some territory and waters were open to general use, more productive harvesting places were privately owned.

Real property, combined with skillful man-

Haida village on the Queen Charlotte Is, BC (courtesy Geological Survey of Canada/255).

agement of family labour and individually owned capital equipment, enabled kin groups and their chiefs to achieve high productivity and accumulate tangible wealth. Property was the basis and vehicle of the Northwest Coast system of rank and class. In some tribes there was precise status with internal ranking; in others, flexible categories. An upper-lower distinction of some form was universal, as was the institution of SLAVERY. Slaves were acquired in war or by purchase and, although they lived in owners' houses, lacked full civil rights and were required to perform menial chores.

Villages were always close to navigable water, with houses ranged parallel to the beach facing the water. Although united by kinship, dialect and common interest in territory, villages had no government except that effected by powerful lineages. During the early historic period, among Coast Tsimshian and Northern West-coast (Nootka), strong village leaders emerged and began to extend their influence through the confederation of villages. These alliances were the only form of tribal organization.

Feuding occurred in response to injury or trespass, and occasionally escalated into warfare. Acquisition of property, including slaves, was also a motivation for conflict. The small size and divisiveness of village units, and the practice of restituting wrongs with gifts, helped to limit the scale of warfare.

High-ranking individuals from separate kin groups and villages found common cause in class membership and ritual associations, often termed secret societies. Most important of all were bonds of marriage and gift exchanges which accompanied them. Marriages were contracted between people of different kin groups, often in widely separated villages. In order to validate lineage rights and maintain class position, assemblies of people from many kin groups were convened to witness claims. Guests were fed and given gifts at these potlaches. Barter and trade occurred, but gifts and feasts were major means of distribution and exchange.

All tribes conducted serious religious rites in winter and viewed summer as more appropriate for games, feasts and naming activities. There was no strict segregation of the sacred and secular, as the sacred was implicit in all thought and action. Belief in potent spirits identified with animate objects and forms was fundamental.

Spirits could interfere in human affairs, but by self-purification an individual might induce them to become personal helpers. They were a source of power for religious practitioners or shamans, but also endowed ordinary folk with special competence or good fortune, and in some areas became hereditary privileges. This awareness of power in the animate, nonhuman sphere was consistent with widespread use of prayers and welcoming ceremonies to foster continuation of annual runs of fish.

The course of each person's life brought changes of status as puberty was attained, names received or marriage made. Taboos and elaborate ritual and feasting accompanied these events. Illness, while associated with physical causes, was also ascribed to soul loss or intervention of spirit forces, and shamans were called upon for diagnosis and corrective treatment. All tribes believed in life after death and in ghosts that could be harmful to the living. Funeral and memorial ritual served to separate the living and the dead and to sustain, honour and placate the dead.

Music and decorative arts were associated with both sacred and secular activities. Spirit helpers conferred songs, and secret society or family tradition was transmitted through songs which often accompanied masked reenactments of mythic events. There were songs for all occasions — soothing infants, playing games, expressing love and sorrow. The voice was the only melodic instrument, although a variety of percussive devices, whistles and horns was used as accompaniment.

Sculptural and decorative art was also part of daily life, applied to tools, houses, baskets, clothing and items associated with the supernatural. Wood sculpture and painting, notably TOTEM POLES, are the most renowned features of Northwest Coast culture. Archaeological evidence suggests that art has a long history in the area and that regional styles share basic similarities of form with an earlier tradition. In the N the art is highly formalized and often depicts family crests on property. Wakashan sculptors excelled in creating MASKS for dramatic performances. The Salish put emphasis on religious implements with little concern for crests. In all areas ownership of sculptural and decorative art was indicative of wealth and denoted class position (see NORTHWEST COAST INDIAN ART).

**Culture Change** Though early acceptance of European clothing and tools brought visible changes to Northwest Coast cultures, villages,

often on ancient sites, still retain their original orientation to the sea and traditional foods are favoured in the diet. Enforced Westernization was the policy of missionaries and government administrators until recent times. Compulsory education in centrally located boarding schools, where native speech was forbidden, had devastating effects on community structure, Indian socialization and languages (see NATIVE PEOPLE, EDUCATION). Several Northwest Coast languages now have only a few fluent speakers and are in danger of extinction, despite efforts to reverse the trend with formal language-teaching programs. Tlatch, for example, is already extinct.

Despite the ban on the potlatch from 1884 to 1950, feasts and ceremonious exchange, especially among the Southern Kwakiutl, never completely ceased and have experienced revival in recent decades. The few Coast Salish villages where spirit dancing survived have served as centres for a dramatic religious revival that has continued to attract followers. These institutions remain private to the Indian communities, where they strengthen Indian identity and self-esteem (see SHAKER RELIGION).

The population of Northwest Coast tribes has continued to increase since a low point in 1915 (see NATIVE PEOPLE, DEMOGRAPHY). In 1983 there were about 35 000 registered Indians and perhaps as many again who are nonregistered descendants of coastal tribes (see INDIAN). Isolated villages have lost residents as unemployment and educational opportunity induced people to move to urban centres (see NATIVE PEOPLE, URBAN MIGRATION). More than one-third of the registered population are off-reserve residents.

Northwest Coast Indians have remained steadfast in objecting to policy and practice that have reduced ABORIGINAL RIGHTS and left LAND CLAIMS unsettled (see NATIVE PEOPLE, GOVERNMENT POLICY). They have been strong supporters of provincial and national Indian associations.

MICHAEL KEW

## Plains

**Territory and Natural Environment** The Plains Indian culture area extended from southern Manitoba and the Mississippi R westward to the Rocky Mts, and from the N Saskatchewan R south into Texas. This was a region of continental climate — hot and dry summers and very cold winters. High grass covered the rolling prairies in the east; short grasses, sage and cacti the arid high plains to the west. Flat land and rolling hills extend in all directions. Flowing eastward, rivers have cut deeply into the land, and provide practically all the scarce available water. Tree growth on the high plains is restricted to these valleys, becoming rapidly more noticeable toward the margins of the area (see VEGETATION REGIONS).

Plains Indian culture was based primarily on the immense herds of BISON or buffalo which roamed over and fed upon these grasslands until the early 1880s. Bison herds shared these resources with pronghorn antelopes, elk, mule deer, jack rabbits, prairie dogs and a range of small herbivores, grouse, prairie chicken, geese, ducks and cranes. This wildlife was preyed upon by wolves, coyotes, grizzly bear, mountain lion, eagles, other birds of prey and man.

**Major Language and Tribal Groups** The languages spoken by the various Plains tribes belong to 6 linguistic families, of which 3 were represented on the Canadian Plains. Algonquian languages were spoken by the BLACKFOOT, Gros Ventre (Atsina), Plains CREE and Plains OJIBWA; Siouan languages were those of the ASSINIBOINE, STONEY and DAKOTA SIOUX. Athapaskan was spoken by the SARCEE. Languages from 2 families were as divergent as German is from Chinese, and within each family languages were as different as English from Dutch. This linguistic diversity and the high mobility of the

nomadic population on the Plains encouraged the development of communication by means of hand gestures or sign language (see NATIVE PEOPLE, LANGUAGES).

Before epidemics in the early 1800s reduced the population, the northern Plains Indians numbered an estimated 33 000. Tribal populations in that region ranged from about 700 for the Sarcee to about 15 000 for the 3 Blackfoot tribes.

**Historical Summary** Small bands of nomadic hunters roamed the Plains some 10 000 years ago (see PREHISTORY). Most of these people, however, slowly drifted southward to be succeeded by other migrants. About 200 AD a horticultural population from the Mississippi Valley spread northward, ultimately reaching, temporarily, the southern parts of Saskatchewan and Alberta (see CLUNY EARTHLIDGE VILLAGE). They settled in semipermanent villages near their gardens along the rivers. Through their contacts with more elaborate cultures in southeastern N America, these gardeners played an important role in the northwestern expansion of certain religious ideas and rituals. The prehistoric hunters and gardeners established the general cultural patterns basic to the Plains Indian culture of the historic period.

Spanish colonists from Mexico introduced horses to the southern Plains in the 16th century. By intertribal trade and raiding, the animals spread northward, reaching the Canadian Plains by the 1730s. The use of horses altered hunting techniques and enabled the people to transport larger and more comfortably furnished dwellings. Their obvious improvement of the life of the nomadic hunters caused the development of HORSE raiding as the most common form of intertribal warfare. Warfare was a dangerous game, as ritualized as medieval knight-hood in Europe, with social prestige and wealth as its goals. Small war parties would raid enemy territory, run off the horses and sometimes kill a few people.

At approximately the same period that horses were moving north, fur traders arriving from the East introduced firearms. From 1730 to 1870 the Plains Indians played an important role in the FUR TRADE, which in turn profoundly changed their way of life. Adjusting their hunting to the demands of the traders, the Indians gradually gave up their original independence for the amenities offered by the fur trade.

*Assiniboin Hunting Buffalo* (nd), oil on canvas, by Paul Kane. The main source of food for the Plains Indians was the buffalo hunt, which was greatly facilitated by the acquisition of the horse (courtesy National Gallery of Canada).

**Traditional Culture** Women gathered edible roots and berries whenever they were available but the main source of food came from hunting by the men, especially buffalo hunting. The Plains Cree and Plains Ojibwa added fish to the diet, but fish was unimportant elsewhere on the Plains. Animal-skin disguises were used to get close enough to the game for the effective use of bows and arrows. Buffalo herds were driven into pounds or corrals and killed, or were stampeded over steep cliffs (see BUFFALO HUNT). While acquisition of the horse greatly facilitated buffalo hunting, muzzle-loading guns proved inferior to bow and arrows, which were given up only after shorter breechloaders were introduced by the 1860s.

When men hunted, women were busy processing the results of this activity, particularly in preserving (through drying) foods. Some meat was cooked and eaten immediately, but most was sliced and sun-dried for the winter, or ground and mixed with fat and berries to make PEMMICAN. Buffalo hides were used for robes, tent covers, mocassin and shields; tools and utensils were made of the bison's horns, hooves, hair, tail, bones and sinew; buffalo dung was used as a fuel on the treeless plains. Skins of antelope and elk were preferred in the manufacture of clothing: breechcloth, leggings and shirts for men, long dresses and leggings for women.

The family property was transported on a TRAVOIS (a triangular frame of poles) dragged along by dogs. Travois also provided the framework of the conical dwelling called T tipi, which was covered with buffalo skins sewn together (see HOUSE). After the introduction of the horse, larger travois and tipi were constructed. SNOWSHOES were used during the winter by some tribes on the northern Plains.

Many utilitarian articles manifested the rich yet tribally distinct artistic temperament of the Plains Indians. They ranged from skin tattoos, clothing painted or embroidered with dyed porcupine quills, paintings on tipi covers, shields and rawhide containers, carvings on wooden bowls, horn spoons and stone pipes, the extensive use of feathers in ceremonial regalia, to large boulder monuments laid out on the ground (see INDIAN ART). Certain individuals were known and approached for their exceptional ability in a specific craft, but, even for them, craft production was not a permanent or exclusive occupation. Most of the colourfully decorated Plains Indian artifacts seen in museums were made by women. Men produced equipment for the hunt, war and ceremonial activities.

Cree camp on the prairie, south of Vermilion, Sept 1871. The conical tipi was covered with buffalo skins (courtesy Public Archives of Canada/PA-5181).

The adjustment of the native way of life to the natural environment, and in particular to the movements of the buffalo herds, was reflected in their social organization. Most tribes consisted of loosely organized and independent bands. Band chiefs had the respect and support of their followers as long as they were successful in the quest for food and in defence against enemy attacks. Chiefs were advisers rather than rulers; their decisions were based on unanimous approval reached in the council of elders. Public shame and ridicule were the principal means of social discipline. Most of the year the bands moved around independently of each other. In lean periods even the band might have to split up into smaller groups that would have a better chance of finding sufficient food. Only in mid-summer, when the buffalo were concentrated in large herds, would the bands come together for a few weeks in one large tribal encampment. Then the people joined in the celebrations of their ceremonial and military societies, which were the principal means of tribal cohesion. After the performance of the SUN DANCE and possibly a tribal buffalo drive, the bands separated again; in the fall they moved to well-protected campsites in river valleys, foothills and parklands, where they spent the winter.

Religious ideas and practices permeated all aspects of daily life. Fundamental to Plains Indian religion was the belief that animals and other natural phenomena possessed spiritual power that could, under proper circumstances, be manipulated to personal advantage. The individual seeking such power went to a lonely spot where he fasted and prayed until a spiritual guardian appeared to him in a dream (vision quest). The difference between ordinary men and ritual leaders was a gradually developing one, primarily based upon the amount of spiritual power acquired either by personal visions or by ritualized purchase from other individuals. Mystical experiences gave rise to cults that either disappeared when the initiator died, or became increasingly popular. All tribal rituals had their origins in such individual cults.

**Culture Change** The normally slow and gradual rate of societal change accelerated rapidly for the Plains Indians after they came into contact with European civilization. Though distinctly native in character, historic Plains Indian culture would have been impossible without the European horse and the European trader. The introduction of metalwares made native pottery, stone chisels and arrowheads obsolete in the mid-18th century; glass beads gradually replaced quillwork after 1830; cloth became as common as skin for clothing after 1850. For

more than a century the fur trade was the sole medium of contact between Euro-Canadian society and the northern Plains Indians. During this period the native people were generally free to accept or reject whatever the European had to offer, and as such the fur trade provided a measure of adjustment that prepared the Indians for the more intensive culture change later forced upon them. The MÉTIS, descendants of European-Indian parents, trace their origins to the early trading period. However, the fur trade did not bring only greater material wealth; epidemic diseases of European origin swept the northern Plains in 1781, 1819, 1837, 1845, 1864 and 1869 (see NATIVE PEOPLE, HEALTH). Each time thousands of Indians died, and the survivors were left with their world views and beliefs undermined. During this period the consumption of alcohol became widespread, particularly after the arrival of American whisky traders in the 1860s (see NATIVE PEOPLE, SOCIAL CONDITIONS). In these years also, the depletion of the buffalo herds became noticeable, owing to indiscriminate overhunting for profit, especially after the completion of a transcontinental railway in the US.

In response to the increasing violence in the region, the newly formed North-West Mounted Police came west in 1874 and enforced law and order within a short time. However, they could neither halt the disappearance of the buffalo herds nor stop the settlers from establishing farms and villages all over the plains. In 1870

the federal government purchased the North-West from the HUDSON'S BAY CO. and, in a series of treaties between 1871 and 1877, the Indians surrendered their lands (see INDIAN TREATIES). In 1880 the total population of the Canadian plains reached 120 000, in which the approximately 30 000 Indians had become a minority. Most Indians were then living on reserves (see INDIAN RESERVE), where government agents tried to introduce them to new means of subsistence, primarily agriculture. Years of scarcity and starvation followed, in which the people depended upon the frequently inadequate rations of the government. Throughout this difficult period of social and economic adjustment, missions of various Christian denominations played a major role in providing a new education system, frequently acting as mediators between the natives and white society.

Life on the reserves slowly improved until the GREAT DEPRESSION of the 1930s, when the trend towards larger mechanized farming brought disillusionment and defeat for many tribal groups. On all reserves large areas were leased to white farmers, but the rapidly increasing population since the 1930s and the lack of employment have become chronic problems over the years. After 1940 growing numbers of Indians left the reserves and moved to nearby cities (see NATIVE PEOPLE, URBAN MIGRATION). On the reserves, various economic programs have been initiated and government agents have increasingly transferred their administrative responsibilities to elected chiefs and tribal councils. Accurate population numbers are hard to obtain, but in 1980 there were at least 60 000 Indians living on the Canadian plains: 18 000 in southern Alberta, 22 000 in southern Saskatchewan; 20 000 in southern Manitoba. TED J. BRASSER

#### Plateau

**Territory and Natural Environment** The Plateau culture area is named after the geographically defined Columbian Plateau. In Canada this area consists of the high plateau between the BC coast range of mountains and the Rockies. Scholars over the years have suggested a variety of northern borders for the Plateau culture area. In 1932 Diamond JENNESS referred to this area as "The Cordillera," extending as far N as TAHLTAN territory. Other scholars have taken the SEKANI homeland or CARRIER country as the limit. The most recent anthropological consensus affiliates all of these peoples with the subarctic cultural area and uses the northern boundary of Shuswap territory as the northern border of the Plateau.

Hot, dry summers and cold winters are typical throughout the Plateau. This climate creates an environment well suited to mule and white-tailed deer, caribou, black bear, grizzly bear, elk and mountain sheep, as well as smaller animals including coyote, fox, lynx, wolf, raccoon, porcupine, marten, weasel, beaver, marmot and hare. The major rivers supported annual runs of PACIFIC SALMON and other fish, which were the mainstay of subsistence.

**Major Language and Tribal Groups** The linguistic families represented by this culture area in Canada are the Athapaskan (NICOLASIMILKAMEEN, now extinct), Salishan (Interior Salish — Shuswap, Lillooet, Thompson, Okanagan; see SALISH, INTERIOR) and Kutenai (KOOTENAY). See also NATIVE PEOPLE, LANGUAGES.

**Historical Summary** Archaeologists postulate that about 9000-10 000 years ago, not long after the glaciers from the most recent ice age receded, the BC Plateau was populated by native people who had migrated northward from more southerly areas of this same Plateau, where the glaciers had receded earlier (see PREHISTORY). Gradually there emerged a culture adapted to the forested mountains, sage- and cactus-covered hills, and riverine resources of the area.

Ju-Ah-Kis-Gaw, [Ojibwa] Woman with her Child in a Cradle (1835), oil on canvas by George Catlin (courtesy National Museum of American Art, Smithsonian Institution/Gift of Mrs Joseph Harrison, Jr).

The Plateau's abundant natural resources were the major stimulus that attracted non-Indians to this area. At first it was furs — the lure of furs brought the explorer Alexander MACKENZIE into contact with the Northern Shuswap people in 1793, and David THOMPSON into Kootenay country in 1807. In 1808 Simon FRASER explored the entire length of the river that now bears his name. All of these explorers were received hospitably by the Plateau Indians. One chief took Fraser by the arm and directed him to shake hands with every one of the 1200 Indians assembled at Lytton to meet him.

By the 1820s, fur-trading posts were established throughout the Plateau. With the introduction of firearms and metal implements, the hunting of fur-bearing animals became much more efficient, and soon their numbers dwindled. At the same time, diseases such as measles, influenza and smallpox swept through the native settlements, killing thousands of Indian people (see NATIVE PEOPLE, HEALTH).

Gold was the impetus for the next wave of non-Indians to overrun the Plateau. The discovery of gold in 1857 on the Fraser R attracted almost 30 000 fortune seekers of many ethnic backgrounds (see GOLD RUSHES). Not surprisingly, violence erupted immediately.

In an effort to restore peace and protect Indian lands from further encroachment, the new governor of BC, James DOUGLAS, began working out a policy of native rights. He decided the best way to handle the problem of land ownership was to extinguish Indian rights to their lands through treaties and compensation. The native people would then live on INDIAN RESERVES. On the Canadian Plateau, no INDIAN TREATIES were signed and no compensation was paid, although reserves were surveyed and allotted. By the late 1880s all of the Plateau Indian peoples had been assigned to live on scattered, small reserves.

**Traditional Culture** We have only an incomplete record of what Plateau life was like before it was affected by the presence of Euro-Canadians. When the first detailed studies of these people were made in the late 1880s and early 1900s, the traditional ways had already changed dramatically. The summation that follows from the works of pioneer ethnographers James TEIT, Franz BOAS, George Mercer DAWSON and Charles HILL-TOUT, supplemented by the work of contemporary researchers, reflects our gaps in knowledge of traditional Plateau life.

In this region groups of related people worked and travelled together in the spring, summer and fall, then joined with other such groups to winter in relatively permanent winter villages. Plateau society was egalitarian and communal in most respects, although men were the major decision makers. Within each village there were a number of chiefs or headmen who organized economic activities; eg, there was a salmon chief for fishing, and so on. The advice of these men was taken seriously, but every adult male took part in gatherings to discuss the general concerns of the group. There were no formal councils; when confronted with an issue affecting the group at large, a man invited other males to discuss it. Often it was the advice of the old people or the most experienced that was accepted.

The division of labour was based on gender. Men were responsible for hunting, trapping, fishing and manufacturing implements from bone, wood and stone, and also for warfare. Women's responsibilities included preparing food for meals and for winter storage, harvesting plants, maintaining the home and caring for small children. There was little formal specialization of roles. Those men who had acquired certain physical and spiritual abilities during their adolescent training became "professional" hunters of bear and mountain goat. All men were expected to be competent deer hunters.

Contemporary Okanagan dancing. The Winter Guardian Spirit Dance was practised in Canada mainly by the Okanagan (photo by Dorothy Kennedy).

Land was considered communal property, with a few exceptions. Some salmon-fishing stations were privately owned, while others were owned by village groups. Hunting grounds and root-harvesting grounds were generally open to all those who spoke the same language, and consent to use these areas was sometimes extended to others.

Food was shared liberally among all villagers. At salmon-fishing stations, a weir or net was used to catch fish for the entire village, and men with harpoons caught fish for their individual families' needs. As the Plateau economy was based on hunting, fishing and gathering, all seasonal and unreliable activities, much time and effort was spent smoking food or drying it for storage. The entire community, children and adults, was involved in this activity. Food was not always plentiful — there were occasions when the salmon runs failed, certain animals were not available, or root and berry crops did not materialize. At such times the people had to travel farther and work harder to survive. Each spring the appearance of the first run of salmon and the first fruits or berries was celebrated with a special ceremony.

Transportation on the Plateau was by means of dugout CANOES made from red cedar or cottonwood, or bark canoes from white pine or birch. SNOWSHOES were commonly used — their designs were specially suited to the varying conditions of snow and terrain. In early times dogs were used as pack animals as well as in hunting deer. By the 1730s the HORSE was introduced into the Canadian Plateau from farther S and dramatically improved the mobility of native peoples. It is likely that the Kootenay were the first Plateau group in Canada to obtain horses.

The 3 main house types found on the Plateau were the semisubterranean pit house, the tule-mat lodge and the TIPI. The pit house most often consisted of a circular excavated pit protected by a conical roof of poles covered with brush and earth. Variation was found from area to area — the pit could be circular or square, the roof conical, pyramidal or almost flat, and the entrance either a hole (which also served as an exit for smoke) in the centre of the roof or a door at the side of the roof. Sometimes tunnels acted as entrances or connected several pit houses together. Although pit houses were most commonly used as winter dwellings, recent information suggests they were sometimes used at other times of the year.

Lodges covered with bark, or mats of tule or grass, were employed throughout the Plateau. There were 3 main ground plans: rectangular, parallel sides with rounded ends, or rectangular with one end rounded. For winter use these lodges were banked around their bases with dirt and snow. One or more fires were positioned in the centre of the lodge. In the Kootenay area of the Plateau, hide-covered tipis were used in addition to the other dwelling types. The Kootenay tipi was of the 4-pole-foundation type, with about 15 supplementary poles. Lean-tos of poles and brush were also used for shelters at temporary camps. Other structures included a SWEAT LODGE for men and a menstrual isolation place for women. Traditional-style dwellings were generally last used in the Canadian Plateau around the mid-to late 1880s, although in some areas their use extended into the early 1900s.

Plateau peoples felt a deep connection with the inanimate beings that inhabited their environment. Everything around them was imbued with special powers, even rocks and trees. This spiritual relationship with nature permeated all aspects of daily life (see NATIVE PEOPLE, RELIGION).

During adolescence, every individual underwent special training to receive guardian-spirit power from a nature-helper. The spirit came to the person when he or she was in a trancelike state, told the recipient how to use the gift, and provided a "power song." Shamans who trained longer and more intensively received special powers enabling them to cure the sick or cause harm to others and were both respected and feared. They used their guardian-spirit powers in curing performances (see SHAMAN).

The Winter Guardian Spirit Dance, the major ceremony of most Plateau peoples in the US, was practised in Canada mainly by the Okanagan. The dance was likely celebrated in former times by the Shuswap, Thompson and Lillooet as well, although in a slightly different manner. Some Canadian Okanagan people still participate in winter dances today, in both BC and the US. The winter dance was hosted by shamans, who used the occasion to communicate their spirit powers in public. After one or several nights of dancing and administering to the needs of the sick, the host or hostess presented the guests with gifts. Other Salishan groups in the Plateau held similar ceremonies, marked by the singing of spirit songs, at any time of the year.

Among the Kootenay, a ceremony was held which united a spirit power and its possessor for such purposes as predicting future events and finding lost objects. This ceremony, along with the SUN DANCE, points to the relationship of the Kootenay people with the Plains Indians.

Clothing for the Plateau peoples was sewn from the tanned hides of animals and woven from local grasses or from the pounded bark of bushes. MOCCASINS were common; most often they were made from deer hide, but occasionally from salmon skin. Winter clothing consisted of the thick skins of fur-bearing animals. Among some groups clothing was decorated with dentalia shells, ochre paint, porcupine quills or native-made beads or seeds. Mats and baskets woven for utilitarian purposes were often beautiful as well. Tattooing and nose and ear piercing were common but not universal.

Songs were important in traditional Plateau life, and were used by individuals to summon religious and magical powers. Singing was sometimes accompanied by bird-bone flutes, rattles of deer hooves, and sticks being struck on boards, but mainly by hide-covered wooden-frame drums. One type of song still known and widely performed today is the stick-game song, sung while playing an indigenous gambling game involving 2 opposing teams.

The extensive Plateau oral literature that once occupied the long winter evenings now fills only the pages of books. A complex cycle of

Kutchin man's summer costume of tanned caribou-skin decorated with beads, dentalia (highly prized shells obtained in trade with Northwest Coast tribes) and red ochre (courtesy National Museums of Canada/National Museum of Man/K75-954).

tales, frequently with humorous and bawdy episodes, involved the trickster-creator known as Coyote.

**Culture Change** Hudson's Bay Co officials and early missionaries tried to introduce literacy and calendars to the Plateau peoples, but it was a Catholic missionary, Father Le Jeune, who had the most success. Contemporary attempts to teach native people to write the various Plateau languages have not yet proved as successful as Le Jeune's work at the turn of the century, when more than 2000 Interior Salish became literate.

For a time, Plateau groups universally adopted Christianity, but there has been a resurgence of the old religions. Since the establishment of Indian reserves in the late 1800s, Plateau Indians have played a major role in struggles relating to native LAND CLAIMS in BC. The influential Indian organization, the Allied Tribes of British Columbia, was initiated at Spences Bridge in the Canadian Plateau in 1915 by several Interior Salish Indians assisted by ethnographer James Teit. This organization was active for 12 years.

Since the early 1970s some younger Plateau Indians have made a conscious attempt to reinterpret traditional ways, resulting in a "pan-Indian" native movement that is becoming more widespread (see PAN-INDIANISM). The mid-to late 1970s saw the establishment of powerful Indian tribal councils in the Canadian Plateau, organized along linguistically defined lines and consisting of several bands (see NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM). Both the bands and the tribal councils are strong advocates of Indian government, economic development of reserve lands (see NATIVE PEOPLE, ECONOMIC CONDITIONS, NATIVE PEOPLE, SOCIAL CONDITIONS), educational opportunities for Indians (see NATIVE PEOPLE, EDUCATION), cultural and linguistic survival, and equitable settlement of the long-standing land-claims issues with both federal and provincial governments.

DOROTHY KENNEDY AND RANDY BOUCHARD

## Subarctic

**Natural Environment** The area of Subarctic cultures lies largely within the 5-million km<sup>2</sup> zone of northern or boreal coniferous forest that extends from the arctic tundra to the mountains, plains or deciduous forest in the S and across N America from Labrador nearly to the Bering Sea. Three-quarters of the area lies on the Canadian Shield, Hudson Bay and Mackenzie R lowlands. It is dotted with many lakes and crossed by innumerable rivers. The rest consists of western mountain ranges, plateaus and the Yukon R lowlands. Winters are long and harsh but forest cover and snow provide shelter for peoples and animals. Temperatures often reach minus 50 in winter but can rise to plus 35 in summer (see VEGETATION REGIONS).

Mammals commonly found in the area are moose, caribou, black bear, Dall sheep (north-western mountains), beaver, hare ("rabbit") and either marmot or ground hog, which were important for materials and subsistence; and wolverine, otter, marten, mink, weasel, muskrat, lynx, wolf, coyote, fox and others which, together with some of the subsistence species, provided furs for trade. Musk-oxen, bison and wapiti also were available at a few localities. Fish abound in the rivers and lakes, and include several species of whitefish, pike, lake trout, grayling, and suckers in the Arctic drainage and salmon in the Pacific and, to a lesser extent, Atlantic drainages. Migratory waterfowl pass through the Subarctic seasonally in great numbers.

**Major Languages and Tribal Groups** Most peoples of the Eastern Subarctic speak languages of the Algonquian family; those of the Western Subarctic, Athapaskan languages. Northern Subarctic Algonquians, including the ATTIKAMEK and MONTAGNAIS-NASKAPI of Québec and Labrador, speak dialects of the Cree language, and Algonquians to the south of them speak dialects of Ojibwa. The BEOTHUK of Newfoundland spoke a language of uncertain affinity. Linguists have identified more than 20 different Northern Athapaskan languages within the Western Subarctic (including Alaska). See NATIVE PEOPLE, LANGUAGES.

Most Indians of the Subarctic were not organized politically as tribes, but they can be divided into named groups of people, members of contiguous bands (local populations exploiting defined territories) who spoke the same language dialect and were related by kinship and common traditions. Within each of the 2 major language families, neighbouring groups often shared similar lifeways. Perhaps because the Western Subarctic is physically more diverse than the East, there was more linguistic and cultural diversity among the Athapaskans than the Algonquians.

**Historical Summary** Contact with Europeans changed Subarctic cultures profoundly. The effects of contact differed according to time and place. Early contact during the 17th century caused extensive migration of Subarctic people such as the CREE and brought about new and different intertribal relationships. The 19th century was characterized by direct contact between native people and Europeans engaged in the FUR TRADE. Different tribes experienced the effects of contact with greater or lesser severity. In Newfoundland, loss of habitat and killing by whites led to complete extinction of the native Beothuk by 1829. By contrast, the neighbouring Montagnais-Naskapi developed a trapping economy and systematic trade relations with Europeans. They adapted successfully to contact conditions because Europeans needed them to trap furs and had no immediate use for their hunting territories. Other Indians such as the Cree became fur-trade middlemen between the HUDSON'S BAY CO and Subarctic Athapaskans to the west. Following Alexander MACKENZIE'S

voyages of exploration along the Peace and Mackenzie rivers in the 1790s, the rival NORTH WEST CO established trading posts that gave them direct contact with the Athapaskans. In 1821 these posts were taken over by the HBC, which has remained an important influence in the area.

The 20th century has increasingly seen a period of industrial-resource development in the North and the movement of non-natives into the Subarctic. These conditions have motivated contemporary Subarctic natives to press for LAND CLAIMS settlements and increased control over their own affairs.

**Traditional Culture** All natives of the Subarctic lived by hunting, fishing, trapping and gathering wild plants. Indigenous farming was not practical within their territory (crops successfully grown in the North today did not reach contiguous areas until after European contact). Men did most of the big-game hunting, while women snared hare, fished, cut and dried meat, and processed hides. Some hunting techniques such as drives and the construction and operation of corrals involved most adult members of a BAND (see BUFFALO HUNT).

Since game animals were thinly distributed over vast territories in the boreal forest, or were available only locally or seasonally, Subarctic human population densities were among the lowest in the world. Some scholars estimate that the entire area may have supported as few as 60 000 people, although others believe that before the introduction of European diseases, populations could have been larger.

Subarctic natives lived typically in local bands of 25-30 people. Each band moved frequently from one place to another within an overall territory as game supplies changed from season to season and from year to year. A group's size and the nature of its annual economic cycle were strongly influenced by the availability of local resources. The TUTCHONE, Athapaskans of the Yukon Plateau, and others west of the Rocky Mts, gathered along rivers during the summer to catch and dry salmon. The CHIPEWYAN, Athapaskans living north of Lk Athabasca, moved to the edge of the barren grounds to follow the caribou herds. Montagnais and Naskapi spent their summers near the Atlantic, Gulf of St Lawrence or James Bay coasts and their winters inland. A single band often did not have exclusive access to its territory since adjacent bands frequently obtained hunting rights, especially if they faced food scarcity, or certain peripheral areas were used in common. However, rich sites such as lakes or rivers where fish could be taken regularly were usually exploited by the same band year after year. During the summer, when food was abundant, several local bands often resided together.

Most Subarctic bands did not have formal chiefs before European contact. People aligned themselves with persons who manifested leadership abilities and took the initiative for undertaking specific tasks such as trading, war, or communal hunting, including the necessary prior preparations. Aside from the prestige and respect this brought them, their authority did not generally extend beyond these tasks. White fur-traders, however, attempted to establish chiefs and to endow them with considerable power to better control the Indian population tied to the trading post.

Most adult men and women had a part in making decisions that affected the band. Families or individuals who did not agree with a particular decision were free to join another band, camp or act for themselves for a time. Subarctic people were noted for the value they placed on personal autonomy as well as for the flexibility of their social organization. These characteristics helped them respond to the opportunities and limitations of their environment.

Ties of kinship, reckoned primarily matrilineally among Pacific drainage Athapaskans, bilaterally among those of the Mackenzie drainage, and both bilaterally and patrilineally among the Algonquian speakers, joined people together. Normally, people who had regular contacts used kinship terms, in part structured according to generation (eg, the eldest people become grandfather or grandmother), to address and refer to one another. Kinship relations often determined membership in groups and regulated marriages. In addition, tribes west of the Mackenzie R were organized into clans, and also in some cases by dual divisions (moiety) adopted from West Coast tribes. These divisions served primarily to insure hospitality and protection to clan members who might be visiting from other camps or tribes, to fulfil certain largely ceremonial obligations to the opposite division (cremation of the dead and reciprocal feasts, for instance), and to regulate marriage through the requirement of clan exogamy.

Since their food quest necessitated mobility, natives of the Subarctic had limited material possessions. They travelled light and preferred to make heavier tools and implements as they were needed rather than carry them from place to place.

Success in hunting depended on accurate knowledge of animal behaviour. Children were taught to be self-reliant, observant and resourceful. They were expected to learn the habits of game animals and to find their way through large areas of difficult terrain. They were assisted in these skills by listening to long hours of practical narrative accounts and mythological tales and by learning special trapping and hunting songs and innumerable riddles. Those who made stupid mistakes from failure to be observant were the butt of ridicule.

Northern forest Indians made MOCCASINS, leggings, skirts, shirts and coats of soft tanned hides from which the hair had been removed by scraping. Unique among the Athapaskans was the short V-tailed summer slipover caribou skin cloak, highly ornamented with dyed porcupine quills, dentalium and beads made from seeds (later glass trade beads). This exquisite cloak was worn with trousers with moccasins attached. For wear during the coldest months, rabbit skins were cut into strips, twisted and woven into parkas and sleeping robes, and 2-piece suits were made from caribou hides with the hair left on and turned inside. Several different styles of moccasins lined with rabbit skin or dried grass were used.

Hunting implements included bows, various types of arrows, and a variety of ingenious traps, snares, deadfalls, and such devices as the caribou drift fence and pound. People caught fish with dip and gill nets, traps, spears, and hook and line. They dried berries in the fall or stored them in baskets in pits in the ground. Often the berries were mixed with fat and fish to make "Eskimo ice cream" in the far northwest, or were mixed with pounded dried meat and grease to make PEMMICAN. Women were skilled in preparing meat for drying, hide tanning and sewing, and making cooking and storage containers of skins, and birchbark or coiled spruce root basketry.

Men made SNOWSHOES, TOBOGGANS, sleds and hunting implements. Survival depended on being able to travel long distances. Snowshoes were essential for winter travel. Heavy loads were transported on toboggans and, in the far northwest, sleds pulled both by dogs and people. Aboriginally, few dogs were available for traction. During the summer, people and their belongings were moved along rivers and lakes by canoe.

Because of their mobile existence, northern forest people built shelters constructed of easily transported bark or skin covers and of locally

available materials. Dwellings varied considerably depending on local materials and traditions, but in all areas they were designed to be heated and lit by a single fire. They did not usually accommodate more than 2 families. Among the northern OJIBWA, summer dwellings were bark TIPS or dome-shaped lodges also covered with birchbark. Many of the Arctic drainage Athapaskans lived in conical shelters covered with hides, similar to the Plains tipi. Among the KUTCHIN and HAN of the Yukon, as well as in northern Alaska, the conical tent was replaced by a domed or hemispherical one. Double lean-to structures covered with hides and brush also were used in the Arctic (Mackenzie) drainage and the northwestern mountain and plateau region. At fishing camps in the Cordillera there were unchinked "smokehouses" that resembled roughly built log cabins. In order to provide added warmth in winter dwellings, the hair was left on the hide coverings of conical and domed tents which, although bulky, nevertheless were portable. Some Athapaskans of the Mackenzie District and Cordillera as well as Indians of the eastern Subarctic wintered in conical log structures chinked with moss and partially covered with dirt and snow. The Han near Dawson, as well as many Alaskan groups, built rectangular pit houses that were heavily banked with turf to withstand the cold, while far to the south in BC, groups such as the CHILCOTIN made pit houses similar to those used in the Plateau.

Considerable effort was taken to cache food and equipment not needed for the season at hand, in specially prepared pits, strong cribbed and conical structures and cairns, or on racks and platforms in trees.

Myths and legends taught about a time when animals had great power and could assume human form. Many Subarctic people tell stories about a "culture hero," the first person to become powerful. For them, power and knowledge were one. They said someone with power "knows something." The culture hero demonstrated the personal knowledge and self-reliance that were recognized as important survival skills, and could outwit evil medicine persons and overcome dangerous animals of the myth time, and thus make the world a safer place in which humans could live. Beliefs about the interdependence of people and nature, embodied in myth, helped Subarctic natives interpret their environment.

Religious leaders were people who used their powers for the benefit of others, though to some people they sometimes used their power for evil. Among many Algonquians, these SHAMANS, or medicine people, conducted the SHAKING TENT ceremony in which distant spirits of people or animals were conjured for curing and prophecy in a special tipi. Elsewhere, shamans performed under a blanket or dressed in a special manner as a signal of their office. Western Athapaskan medicine men and women charged high prices for their services and asserted prerogatives or took liberties among their people, for which reason some of them were feared and hated. Among the Naskapi, certain men and women told about the trail ahead by scapulomancy, a form of divination done by interpreting the pattern of cracks on a caribou shoulder blade heated by fire. The BEAVER of the Peace R region had prophets called Dreamers — people who had experienced death and flown like swans to a spirit land beyond the sky. They were healers and leaders in religious dances based on songs they brought back from their journeys to heaven. Like many other Subarctic people, they sang to the accompaniment of single-headed hand drums. Most people, however, had certain varying amounts of medicine power. In addition, there was a body of belief and practices, proscriptions (taboos), prescriptions and minor rituals which existed apart from shamanism,

divination and curing. Among these customs were the special observances taken prior to and after killing animals, as in bear ceremonialism and that attendant to the deaths of humans.

**Culture Change** Contact with Europeans presented a challenge to native peoples of the Subarctic. Many quickly became dependent on trade goods such as guns, knives, axes, cooking pots and clothing, and eventually food, since they turned from harvesting animals for food and skins to trapping those species desired in European markets. Bands moved to within travelling distance of trading posts, and the traders endeavoured to control the Indians. Trading chiefs who could negotiate with the Europeans became as important as the earlier hunt leaders. The fur trade had a considerable impact on Subarctic ecology. Many species of game and fur-bearing animals were depleted. European diseases such as smallpox, tuberculosis, measles and influenza killed large numbers of people (see NATIVE PEOPLE, HEALTH). Other people died of starvation during periods of disease and game scarcity. Native people adopted many elements of Christianity but also retained many of their own spiritual traditions, sometimes covertly. The ability to assimilate new techniques and ideas is a typical attribute of the Subarctic native culture.

In modern times, large-scale resource development and settlement of the North by large numbers of outsiders have threatened the native economy of trapping and subsistence hunting. In 1975 the Grand Council of the Cree signed the James Bay and Northern Quebec Agreement accepting compensation for social and ecological impacts of the James Bay Hydroelectric Project (see JAMES BAY AGREEMENT). Natives of the western Subarctic in the District of Mackenzie, organized politically into the DENENATION, are seeking a settlement that recognizes their right to a certain degree of self-determination within the Canadian national context.

Zaslow, ed., *A Century of Canada's Arctic Islands 1880-1980* (1981).

**Native People, Communications** After the late 19th century a few periodicals were published for native audiences by non-Indian missionary organizations, notable examples being the Chinook-language *Kamloops Wawa* (1891-1905) and the Inuktitut-language Oblate publications of the 1940s and 1950s. Among the few purely Indian journals was the Hagersville, Ont., *Indian* (1885-86). Native journalism in Canada is not well documented, except for the Indian impersonators Grey Owl (A.S. BELANEV) and BUFFALO CHILD LONG LANCE who published extensively on native issues in the 1920s and 1930s.

Rapid progress in communications technology in the 1960s, coupled with increased exposure to radio, TV and newsprint, has caused INDIAN, INUIT and MÉTIS leaders to become more aware of the power of mass communications as a means of influencing the political process. Convinced that the mass media was intended for the non-native audience and controlled by non-native interests, many native organizations, at the BAND, provincial and national levels, started to publish their own newsletters and newspapers in the 1970s. These publications

were concerned mainly with advocacy on native issues, with little space allotted to news or human-interest features. Many later publications reflect a wider range of audience interests.

In the mid-1960s, working with seed money from the province of Alberta, Eugene Steinhauer, a Cree who later became president of the Alberta Indian Assn, purchased a tape recorder and some rudimentary editing equipment and started producing news and public-affairs items for broadcast on the CBC outlets in Alberta. By 1968 Steinhauer's one-man communications operation had become the Alberta Native Communications Society, a nonprofit organization funded by the province and the federal secretary of state, which eventually expanded beyond radio into TV production and the publication of a tabloid newspaper, *The Native People* (1968-82). It took as its slogan, "From Smoke Signals to Satellites." Other native communications societies, all funded at least in part by the secretary of state through the Native Communications program of its Native Citizens' Directorate, and some partially funded by provinces, sprang up in various parts of Canada.

By 1984 there were 13 native communications societies: Indian News Media Inc (S Alta); Native Communications Society of British Columbia (Vancouver); Ye Sa To Native Communications Society (YT); Inuvialuit Communications Society (Inuvik); Native Communications Society of the Western Northwest Territories (Yellowknife) and Nunatsiakmiut Society (Frobisher Bay); Okaalakatigik-Labrador Inuit Communications Society (Postville, Labrador); Native Communications Inc (Thompson, Man); Wa Wa Ta Native Communications Society (Sioux Lookout, Ont); Taqramiut Nipingat Inc (Sugluk, Qué) and James Bay Cree Communications Society (Val D'Or, Qué); Saskatchewan Native Communications and Whetamatouin Corporation (Regina); and Native Communications Society of NS (Membertou Reserve, Sydney). The secretary of state had plans for expansion of its native communications program to include societies in other parts of Canada where native people expressed an interest and capability in operating a society.

From its inception, the secretary of state program was based on the principle that the societies should serve both status and nonstatus audiences and should not be controlled or unduly influenced by native political organizations, extending the "free and independent" press tradition of the non-native society. This principle was accepted by some native leaders, but strongly rejected by others. This rejection was particularly strong in Saskatchewan and NB, where most native leaders adopted the position that there could be no native communications societies unless they were part of or strongly influenced by the native political organizations and served separate status or nonstatus audiences. In Dec 1982 both the province and the secretary of state ceased funding the Alberta Native Communications Society because of management and financial problems. In March 1983, however, the newly formed Aboriginal Multi-Media Society of Alberta was funded to serve the same audience.

Casual or unlicensed broadcasting in native languages had been carried out since the earliest days of northern radio. Perhaps one of the most important developments in native communications in the early 1980s was a decision by the CRTC to license the Inuit Broadcasting Corp in Frobisher Bay to produce television programs for the mainly Inuit audience in northern Québec and the eastern Arctic and to link them via the CBC's satellite channel. Another development was the licensing of CANCOM, a privately owned satellite transmission company, to provide satellite TV and radio service to "underserved" areas (see COMMUNICATIONS IN THE NORTH;

SATELLITE COMMUNICATIONS). By April 1984 native communications groups in various northern locations, including Whitehorse, Yellowknife and Sioux Lookout, Ont, were establishing native radio networks which would use satellite distribution. All of these were funded by secretary of state under its Northern Native Broadcasting Access Program.

ROBERT J. RUPERT

**Native People, Demography** Although estimates vary of the native population of Canada at the time of the arrival of Europeans, anthropologists give a tentative figure of about 1 million, excluding INUIT. Thereafter, the number of native people declined dramatically owing to disease, starvation and warfare. By 1867, it is thought that between 100 000 and 125 000 Indians remained in what is now Canada, along with approximately 10 000 MÉTIS and half-breeds in Manitoba and 2000 Inuit in the Arctic. The native population of Canada continued to decline until 1920 (see NATIVE PEOPLE, HEALTH). Since then, however, it has increased at a rate faster than that of the general population. The annual INDIAN population growth rate, eg, peaked in the late 1950s at slightly under 4% (the postwar Indian "baby-boom"), and since then has gradually declined to about 1.5%.

In 1981, according to Statistics Canada, there were in Canada 293 000 status Indians, 25 000 Inuit, 98 000 Métis, and 75 000 nonstatus Indians, comprising a total population of 491 000, or 2% of Canada's total population. Indian and Inuit population figures are generally accurate but those for Métis and nonstatus Indians are problematic. Difficulties in census enumeration in remote areas and the absence of acceptable and consistent definitions of "Métis" and "nonstatus Indian" for demographic purposes may have depressed Statistics Canada figures for these native groups. Other Canadian government and academic surveys estimate the Métis and nonstatus Indian population to be between 700 000 and 1 million, thus raising the native population to about 5% of the total Canadian population.

Native people comprise 58% of the total population of the NWT and 18% in the Yukon. Among the provinces, they range from 6% of the population in Manitoba and Saskatchewan to 3% in Alberta and BC to 1% in the eastern and Atlantic provinces. Ontario, however, has the greatest number of native people (110 000), followed by BC (83 000), Alberta (72 000), Manitoba (66 000), Saskatchewan (59 000) and Québec (52 000).

Of the total Indian population of Canada, 65% live in rural or remote areas of the country and 35% live in urban or semiurban areas. The proportions are comparable for the Métis and nonstatus Indian population. Among the provinces, BC, Saskatchewan and Manitoba have the highest proportion of native people living in rural or remote areas, while Ontario, Québec and the Atlantic provinces have the highest proportion living in urban and semiurban areas. Inuit, Indians and Métis in the Yukon and NWT live almost entirely in rural and remote regions.

Since the mid-1960s an increasing number of native people have moved away from their reserves (Indians) or home communities — usually to urban centres (see NATIVE PEOPLE, URBAN MIGRATION). This migration stems primarily from the lack of economic opportunity in or near INDIAN RESERVES and native communities. The Dept of INDIAN AFFAIRS AND NORTHERN DEVELOPMENT estimates that 28% of the total Indian population now lives off-reserve, compared to just 18% in 1960. Inuit communities are relatively stable in comparison to native communities in southern Canada.

DAN GOTTESMAN

Reading: T. Berger, *Northern Frontier, Northern Homeland* (1977); H. Hawthorne, *A Survey of the Contemporary Indians of Canada* (1966-67); *Indian Conditions: A Survey* (1980).

**Native People, Economic Conditions** Aboriginal economies were based primarily on *sharing* (a familialistic, egalitarian pooling of resources) in the 26 simple or BAND-level societies to the north; on *reciprocity* (a calculated, give-and-take exchange) in the 17 intermediate or "tribal" level societies to the south; and on *redistribution* (a centralized and politically organized administration of the economy) in all 11 developed chiefdoms of the Northwest Coast.

No native societies had true money or any medium of exchange with high "liquidity," by which one thing such as coins could buy a wide variety of goods and services. There were no true markets where prices were primarily set by the supply and demand of goods. There was no such thing as employment for wages. During the FUR-TRADE period, however, the elements of a barter/wage economy infiltrated many native communities.

To the degree that native people in Canada today participate in their aboriginal economic heritage, they have problems in integrating with the general Canadian economy. A native trying to get into business has to learn details of a new and complex system involving such things as accounting, bidding, contracts, licences, loans, unions and taxes.

Three factors have been particularly important in patterning modern native economies: the specific evolutionary heritage of each of the surviving traditional societies; the extent to which individuals were drawn in the past into the money, market and wage economy; and the federal governments' role in the support and administration of the economies of native communities.

In general the more socially and politically complex aboriginal societies adapted most successfully, at the time of contact, with the non-native economy, and this holds true of their participation in the modern economy. Natives with a heritage that goes back to the chiefdoms of BC or to the southern tribes, such as the BLACKFOOT, MOHAWK or HURON, have higher incomes than the INUIT, DENE and northern Algonquian peoples with a band heritage. Historical differences in participation in the modern economy have shown up in the same societies; the CREE and OJIBWA, eg, who moved onto the prairies with the fur trade, made economic advances over those who remained in their homelands in northern Québec and Ontario. This economic boom made Cree and Ojibwa the largest and second-largest native societies in Canada, respectively.

After WWII, and especially in the 1960s, the federal government began to play a more active role in the delivery of social, educational and economic development services to native communities (see NATIVE PEOPLE, GOVERNMENT PROGRAMS). The annual federal expenditures on native programs were estimated (1983) to be \$2.6 billion (\$1.9 billion on status Indians), with the following approximate distribution: community affairs 35%, education 32%, health 13%, administration 6%, economic development 5%, employment 5%, policy and research 1%, and other areas including housing, native associations and sports 3% (see NATIVE PEOPLE, SOCIAL CONDITIONS).

The greatest economic advantage that native people have is that they do not pay income tax, provincial tax or certain excise taxes when they reside and work on their reserves (see NATIVE PEOPLE, LAW). In some respects the 576 INDIAN bands are like municipalities in that they have many

Employment and Dependency	Indians	National
Employed	18%	37%
Dependents (young/infirm)	44%	34%
Nonparticipating and unemployed	30%	29%
Traditional economy	8%	0

Occupational Representation	Indians	National
Fisherman, trappers, hunters	17%	1%
Farmers and farm workers	19%	12%
Loggers	12%	2%
Labourers	14%	6%
Other, mostly indoor work	38%	79%

powers of self-administration. They may levy property taxes or manage businesses that can operate on reserves without paying taxes. Also important in the economy of Indian reserves is the fact that most of their costs of education, health and welfare are paid for by the federal government.

Native people are caught in a swirl of choices. In the traditional communities, a high value is placed on such noneconomic values as the maintenance of proper family and social relations and a tolerant acceptance of individual life-styles, often with strong elements of aesthetics and spirituality. Natives often live in a material state that most Canadians would despise and call "poverty." Native politicians play up this sympathy for native poverty to win material programs for their communities, but most natives have visited the cities of Canada and still prefer to live in their own rural communities (see NATIVE PEOPLE, DEMOGRAPHY).

We expect that all people who choose to live in rural areas will have fewer modern conveniences than urban people simply because of the high costs of delivering those services to highly scattered locations. In Canada about 60% of all houses in rural, summer cottage and remote bush areas have running water, sewage disposal and indoor plumbing, but only about 40% of the native houses in rural and remote communities have all of these facilities. Part of the answer to this discrepancy is that there are many very remote native communities: 48% of the band areas are "remote" or "inaccessible," which means that they cannot be reached by roads — only by foot trails, by water or by aircraft; 23% are considered rural; and only 29% are semiurban or urban.

The land base of the 2242 INDIAN RESERVES, the 85 crown-land communities, and other northern settlements tends to be quite small, so the native population has few resources to work with. The land base is only about 13 ha per status Indian in Canada, compared with 62 ha per person for Indians in the US. Most of the land is suitable only for primary production such as fishing and forestry. About 20% of Indian land has good agricultural potential, but this land is located largely in southern Canada where natives already have access to other forms of employment.

Statistics for the 1979 labour force indicate a high level of dependency and a level of wage employment that is only half that of the national average. A significant number of natives still harvest fish and game for subsistence purposes in the traditional style. Native people are strongly represented in outdoor and seasonal work, though these occupations pay less than such indoor and year-round work as professional, technical, managerial, clerical, sales and service occupations.

The low incomes, poverty and unemployment of native people are, to a considerable degree, the result of cultural heritage, choice of occupation, and residence far from the main centres of the economy; by comparison, racial discrimination and education are secondary factors. Almost all native people now complete elementary school, most have some secondary education, and a small percentage are going on to complete college or university (see NATIVE PEOPLE, EDUCATION). On average, the formal education of native adults is only about 2 years below the national average; and the gap is closing, with non-native rural students and native students spend-

ing roughly the same number of years in school. Anti-Indian discrimination is not generally severe enough to influence economic matters except in some communities in the Prairie provinces and northern Ontario.

Indications of a prosperous future are seen in several current Indian enterprises. There is a national distribution of small businesses in native communities — retail stores, beauty salons and barber shops, laundromats, tourist camps and leasing of cottage lots; in NS, the Abenaki Motor Inn; in Québec, manufacturing of canoes and lacrosse sticks, a fish-packing plant and a shopping centre; in Ontario, manufacturing of shoes and fur coats, an industrial park, a ski resort, a large cranberry farm and over 125 tons of WILD-RICE production per year; in Manitoba, 2 bush airlines, a shopping centre and honey production; in Saskatchewan, farming and ranching; in Alberta, manufacturing prefabricated houses, petroleum production and cattle ranching; in BC, fish farming and packing, forestry and lumber milling, mining services and office rentals; in the NWT, Inuit Development Corporation investments in mining, a hotel and office buildings. Although many of these enterprises are heavily subsidized by government and band funds, they are hopeful signs of the growth of an independent native entrepreneurial system.

The national unemployment rate for adult Métis and nonstatus Indians is around 32%. Those who are employed have an average income 16% lower than the national average. They live generally in the same regions as Indians, with a greater tendency for urbanization. Eight Métis communities in 5 areas in Alberta live on provincially established reserves and are involved in fishing, farming and logging. In some provinces the Métis have separate rights and regulations from other native people. Alberta and the NWT, eg, permit them to do general subsistence fishing, and Ontario and NB have special Métis provisions for certain fishing areas.

In Ontario there are 50 000-90 000 culturally active Métis and nonstatus Indians, depending upon the criteria used. In 1978-79 a core of 5444 politically active Métis in 66 communities was surveyed and it was found that 23% of the adults in the work force were unemployed, about 3 times the provincial unemployment rate at the time. However, 60% owned their own home, which is just slightly lower than the Ontario general rate of 66%, and housing facilities were found to be fairly good for a largely rural population: 94% had electricity, 85% had running water and 82% had sewers.

The arctic economy is still primarily based on government programs, such as those of northern development and defence. An oil pipeline is being constructed from Zama, Alta, to Norman Wells on the Mackenzie R and employs over 100 northern natives. The sale by Inuit of sculptures, prints, tailored clothing and furs has become important in the economy (see INUIT CO-OPERATIVES).

JOHN A. PRICE

*Reading:* DIAND, *Indian Conditions: A Survey* (1980); Ministry of Culture and Recreation of Ontario, *Métis and Non-Status Indians of Ontario* (1980); Native Council of Canada, *Native People and the Constitution of Canada* (1981); John A. Price, *Indians of Canada: Cultural Dynamics* (1979) and *Native Studies: American and Canadian Indians* (1978).

**Native People, Education** Traditional education among most INDIAN and INUIT was by observation and practice, family and group socialization, oral teachings, and participation in tribal ceremonies and institutions. With these methods children learned the values, skills and knowledge considered necessary for adult life. This style of education continues today, but its importance to many Indians has been overshadowed during the past 350 years by the introduction of a formal European-American classroom style of education.

Formal European education of Indian children began in the early 1600s in NEW FRANCE, in mission schools operated by French religious orders such as the Recollets, Jesuits and Ursulines. These schools established a pattern of church involvement in Indian education that dominated until after WWII. The major goals of these mission schools were the "civilization" and Christianization of Indians. In the late 1700s and early 1800s Protestant churches also became active in the education of Indian children in what is now Canada.

From 1763 to 1830 the imperial government dealt with "Indian Affairs" through the military; provision for education for native peoples was minimal. After 1830, when administration was transferred to the secretary of state for the colonies, some money was diverted to education by means of donations to church organizations. This funding allowed the building of schools on some reserves. During this same period various colonies began to provide limited resources for the education of tribal groups within their boundaries.

From the 1830s the churches, mainly the Roman Catholic and Anglican denominations, in co-operation with the colonial governments and later the federal government, began to establish residential (boarding) schools for Indians. By 1900 there were 64 residential schools in Canada. Staffed by missionary teachers who gave vocational and manual as well as religious instruction, these schools were seen as the ideal system for educating Indians because they removed children from the influences of traditional family life. They complemented the prevailing policy of assimilating Indians into white society. Indian parents saw residential schools as necessary evils; necessary because many Indians saw Christianity as a new and positive force in their lives, or because they recognized the need for European skills; but evil because they removed children from their homes and family ties. Most Indians regarded the regime in residential schools as harsh and cruel: children were physically punished for disobedience, and most school staffs forbade the use of native languages by students and made the children feel ashamed of their native identity.

After 1867, education for native peoples fell into 2 categories: education for status Indians became a federal responsibility under the constitution and the treaties; that for nonstatus Indians, Inuit and MÉTIS a provincial or territorial responsibility. By 1900 there were some 226 federally funded day schools in INDIAN RESERVES; the majority of teachers were missionaries and the curriculum included a large proportion of religious instruction. By the 1930s the curriculum began to be more closely patterned on that of the non-Indian provincial schools.

By 1940 statistics revealed that few status Indian children were benefiting from their formal education experiences. Many children were repeating 3 or 4 grades in elementary school, and only a small percentage were graduating from elementary school and going on to high school. During the 1940s the federal government, in co-operation with provincial education authorities, established a policy of integration: federal funds would be provided to enable Indian students to attend provincial elementary and high schools. The expectation was that by removing Indian students from the poorly staffed, inadequately equipped, heavily church-oriented day schools, assimilation would be accelerated and the performance of students improved.

Enrolments in provincial schools rose rapidly and by 1960 there were about 10 000 Indian students attending off-reserve provincial schools. Numerous problems became evident in the program, which led to its re-evaluation by Indian parents and political leaders. Although the

Story hour at an Inuit school at Repulse Bay, NWT  
(photo by Fred Breummer).

qualifications of provincial teachers were superior, they lacked specialized training to teach Indian students. Indian parents criticized the removal of children to boarding homes as well as the daily commuting by bus to attend provincial schools. Most Indian students were not achieving success: in 1967 only 200 Indian students were enrolled in Canadian universities out of a total native student population of some 60 000.

In 1972 the National Indian Brotherhood produced a policy on Indian education, "Indian Control of Indian Education," which was subsequently adopted by the Dept of Indian Affairs and Northern Development (DIAND) as federal policy. It identified the importance of local community control to improve education, the need for more Indian teachers, the development of relevant curricula and teaching resources in Indian schools, and the importance of language instruction and native values in Indian education. Since the presentation of this policy several changes have occurred. By 1983 over 200 schools on reserves were operated entirely or in part by band councils. Over 80 reserve schools offer native language classes, and 38% of native children attending school are given some form of native language instruction. Several programs to increase the number of native teachers have been established in universities in Ontario, Manitoba, Saskatchewan, Alberta, BC and NB. In an effort to improve teaching materials for and about native people, DIAND and the Museum of Man have co-operated in the preparation of dictionaries, grammars and reading texts.

Trent U in Peterborough, Ontario, was the first Canadian university to establish a native studies program, followed since 1969 by similar programs in 9 other universities. A unique approach to post-secondary education is under way at U of Regina, where an Indian Cultural College is part of the university federated system.

Although some Inuit were educated in mission schools in Labrador as early as the 1790s, formal education for Inuit began on a national

scale only in the 1950s with the construction of elementary and residential schools throughout major settlements in the Arctic. The decrease in residential schools in the Arctic paralleled the decrease in residential schools for Indians and led to a school-construction program by the federal government in most Inuit villages by 1970. Education for Inuit has been impeded by similar problems to those encountered by other native students.

Statistics are not available for Métis and nonstatus Indian students, but studies generally indicate that, owing to poor socioeconomic conditions and the absence of a federal responsibility, they do not profit as they should from classroom education.

For native people to benefit from their formal education, several changes are necessary. Indian bands, through their boards, will have to exercise more control of policy, budgeting, teacher hiring and school programs. Teaching resources and curricula will need to incorporate and reinforce the culture and values that native children acquire within the family. Greater consideration must be given to instructing native children in the primary grades in the language of the home and community, particularly in areas where the native language is in danger of becoming extinct (see NATIVE PEOPLE, LANGUAGES). It is clear from past experience that efforts to alienate native people from their culture have not promoted learning in the formal education process.

HARVEY MCCUE

**Native People, Government Policy** For the most part, government policy towards native people has meant INDIAN policy. THE INUIT were barely touched by government until the 1940s, while special responsibility for MÉTIS and nonstatus Indians has been largely denied. The early history of Indian policy in Canada is characterized by the presence of both France and Britain as colonizing powers. Post-Confederation policy was largely based on the Upper Canadian model, although there have been significant regional differences.

The very scientific and social revolution that made European expansion overseas possible made it more difficult for Europeans to coexist with the preindustrial peoples they encountered

throughout the world. The European technological society sought to conquer nature and shed traditional values — in sharp contrast with native cultures, which were based on very close relationships with nature and on strong reliance on tradition. When the 2 societies had to share the same territory, the differing outlooks were irreconcilable. European states attempted to solve the problem by assuming dominance. They claimed by right of "discovery" the less populated lands around the world and declared indigenous people living there to be subject to the colonizing power. However, the material and practical dependence of the Europeans who first came to N America upon the more numerous and better-adapted native people led to Indian-white trading and military alliances. During the period of alliances, which lasted until the early 19th century, Indian policy was diplomatic and military in orientation because native people were considered in some sense to constitute sovereign and independent nations (see NATIVE PEOPLE, LAW).

French contacts with Indians involved trade, war and missionary work. Official French policy had 2 objectives: to evangelize the Indians and to assimilate them into French society. Although a few Indian groups settled on church-controlled agricultural reserves near the French, the vast majority continued to live apart as independent nations. By the 1690s, the failure of large-scale assimilation of Indians was accepted even by missionaries and government officials. Fur traders had always discouraged it as being bad for trade (see FUR TRADE). Since the French settlements did not expand extensively into Indian territory and displace the inhabitants, the French never recognized formally that Indians had rights in the land and no land cession treaties were ever made. The more populous English colonies, however, expanded towards the West. Although some of them had made treaties with the Indians whom they displaced, they posed a constant threat to neighbouring tribes.

Conflicting alliances between native groups and Europeans dated from the early 17th century when Champlain built an alliance with the HURON and hence alienated the Huron's enemies, the IROQUOIS. Throughout the next 2 centuries the French and British each attracted Indian allies in their competition for trade, land and empire in N America. With the collapse of French imperial power after the SEVEN YEARS' WAR (1756-63), France's erstwhile Indian allies faced the threat of unobstructed British expansion. Indian resistance was expressed in a series of risings associated with the OTTAWA chief, PONTIAC. The Imperial authorities responded by issuing in the ROYAL PROCLAMATION of 1763 an assurance to the Indians that they would not be disturbed in their territories beyond the settled colonies. Indian land could only be surrendered to the Crown and at a general assembly of Indians. This principle formed the basis of the later treaty system (see INDIAN TREATIES).

Within 20 years, the successful revolt of Britain's Thirteen Colonies revived alliances as Indian nations vainly strove to protect their territory from American expansion. Britain willingly used their assistance in its own diplomatic and military endeavours to protect its Canadian conquests. Indian support proved valuable to the British in the WAR OF 1812.

This twilight of the alliance period overlapped with the beginning of the second stage of Indian policy extending through Confederation to the mid-20th century. Its characteristic features were the imposition by European governments of treaties, reserves and paternalistic social policies, all intended to promote Indian assimilation to the general population. As land was needed for settlement in Upper Canada, treaties were made to "extinguish" ABORIGINAL RIGHTS to the soil according to the principles of

the Royal Proclamation of 1763. By contrast, land cession treaties were not made in the older colonies of the Maritimes or in Québec even when new areas were opened to settlement.

As the non-Indian population increased, Indians ceased to be treated as independent nations and were settled on reserves (see INDIAN RESERVE). There, Indian "bands" were organized under the supervision of Indian Dept superintendents or agents. No longer military diplomats, but local managers of reserve land and BAND affairs, they encouraged Indians to farm, become self-supporting by nontraditional means, and generally live like the surrounding population. Schools and churches were usually provided. These activities were organized by a civilian Indian Dept, which replaced the military authority in 1830. The establishment of common property in reserves and band funds, special legislation and treaty rights led to the development of the legal concept of Indian status. Some persons of Indian ancestry — the Métis and nonstatus Indians — never qualified for Indian status or lost it in a variety of ways. Apart from land or scrip grants and special hunting rights for Métis in certain areas, the government has denied any special responsibility towards these people. They are, however, mentioned in the new CONSTITUTION ACT, 1982. The ultimate goal of Indian policy in most of the post-Confederation period was to eliminate all Indian status by assimilating Indians and encouraging them to apply for ENFRANCHISEMENT. This legal process has never been popular with Indians and has failed in its overall objective.

At Confederation, responsibility for Indians was allocated to the central government in Ottawa. This did not affect the general direction of Indian policy, which remained largely unchanged until at least the mid-20th century. As the Dominion prepared for the settlement and development of new territories, the treaty system continued to be used as an expansionist arm of Indian policy. Where the land was not yet wanted, Indians were left without treaties. This situation has given rise to comprehensive LAND CLAIMS in northern Canada. While the federal government made treaties on the Prairies where it controlled the land, it could not do so in BC where there was also a provincial interest in Indian lands. Hence, aboriginal rights and a unique type of reserve claim remain to be settled there. The distinctive course of Québec policy led to the special arrangements embodied in the JAMES BAY AGREEMENT. The administrative arm of Indian policy also continued with little change after Confederation. The Indian Dept became a federal office in 1868 and has continued under various titles until the present day. Indian legislation was consolidated into one INDIAN ACT in 1876. The diversity among Indian people and the regions of Canada, combined with the differences in historical experience, however, led to variations in regional administration. In the more settled regions, Indian administration was linked by the common goals of interim protection and ultimate assimilation. In the remoter regions, prudence and economy dictated neglect.

A 1939 court decision ruled that Inuit were a federal responsibility, but they have not been subject to the Indian Act. Separate programs of economic development and services were applied to them, especially since the 1950s as development increasingly invaded their homeland and disrupted their way of life.

Prior to WWII, Indian policy was made by government without consulting Indians and with little public attention. By the 1940s this began to change. Indians became politically more active and less willing to accept their marginal position in society or to have others make decisions for them. Public opinion became more informed and disturbed about Indian poverty and marginality. Policy reflected this changing

situation through new and expanded programs. The government sought to promote economic development and to provide equality of services to Indians, particularly through agreements with the provinces (see NATIVE PEOPLE, GOVERNMENT PROGRAMS).

The Indian Act was revised in 1951, but the quickened pace of change soon required a further revision. Consultation meetings (1968-69) with Indian representatives created the expectation of participation in the proposed revision. Indians made it clear that they wanted their special rights honoured and their land and treaty claims settled before Indian Act revision. Indian expectations were dashed with the release of the government's policy proposals (White Paper) in June 1969, which seemed to ignore all of their stated priorities. The proposals suggested a phased abolition of the Indian Dept and of the Indian Act within 5 years, eliminating Indian status. The importance of Indian treaties and aboriginal claims was downplayed. The Indian response to the proposed government policy was hostile and sustained. A comprehensive network of Indian political organizations was formed and made counterproposals of their own concerning a wide range of claims. The government, facing an awakened public conscience, retreated from its proposals and then provided funding to support Indian efforts to clarify their demands. Indian people nevertheless remain suspicious that the White Paper policies remain the goals of government even yet (see NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM).

Since the White Paper, Indian political activity has greatly increased awareness of Indian problems and goals among the general public and the Indian population itself. Most Indian political organizations with whom governments deal obtain their support and validity from a strong community base. An experienced Indian leadership has emerged capable of meeting the government's stated willingness to negotiate issues, which resulted in the inclusion of aboriginal and treaty rights in the Constitution Act, 1982, and in the first amendment to the Act (1984). Negotiations are also proceeding on recommendations of the House of Commons Special Committee on Indian Self-Government (the Penner Report) released in 1983. These would provide Indian communities with options for new forms of band government replacing the present limited structures under the Indian Act. Recognizing that Indian nations were self-governing before the period of dependency and paternalism, the report recommends the establishment of Indian governments as another order of government separate from the federal and provincial.

A third stage of Indian-government relations appears to be emerging from developments of the recent past. Present policy aims to replace paternalism with self-determination, assimilation with cultural development, and destitution with personal and community well-being.

**Native People, Government Programs** In Canada, government programs for native people have been implemented by the federal government and some of the provinces. Historically, the Government of Canada has recognized

special program responsibilities and obligations only toward status Indians (see INDIAN), and INUIT. MÉTIS and nonstatus Indians have been denied federal government recognition as native people with special rights. Their needs have been left to be met by whatever programs provincial governments might implement from time to time. Limited federal funding of Métis and nonstatus Indian organizations for political and cultural development finally began in 1970, but economic, social and health programs for these native people remain with the provinces or do not exist at all (see NATIVE PEOPLE, GOVERNMENT POLICY).

Since Confederation, the INDIAN ACT has been the major piece of legislation through which the federal government has defined its administration of Indians and Indian lands. From the 19th to the mid-20th century, Canada's Indian policy had twin contradictory goals: protection of Indians from white society and assimilation of Indians into white society. These goals were implemented by the government through a program of strong managerial control which, by the 1960s, led to much public criticism. These goals were expressed in political, economic and cultural programs aimed at destroying the traditional basis of Indian life. An integral part of this exercise was the ENFRANCHISEMENT, or loss of legal Indian identity, of over 20 000 Indians between 1876 and 1974 by the government. Enfranchisement, along with the denial of native recognition and rights to the Métis, created a native population abandoned by the Canadian government to the fate of assimilation.

In practice, a substantial shift in federal policy and program orientation has occurred since the early 1950s. Native cultures are allowed free expression; native political organizations are recognized and funded; Indian bands and Inuit organizations have taken over responsibility for some government program administration; residential schools and missionary teachers have given way to a mixed system of federal, provincial and Indian/Inuit-run schools funded by the Dept of INDIAN AFFAIRS AND NORTHERN DEVELOPMENT (DIAND); the paternalistic caretaker role of Indian agents and bureaucrats has become a technical and professional role, though by no means to the extent that Indians prefer.

In spite of these improvements, some attitudes and practices have changed very little. The Canadian government continues to minimize its responsibilities and obligations toward Indians and other native people and, consequently, seeks to transfer to provincial or Indian BAND authorities its expenditures on programs and services. In 1978-79 total federal expenditures for Indians amounted to \$829 million, or only 1.7% of the federal government's annual budget — a percentage unchanged between 1970 and 1980. (Total expenditures for non-Indian native programs amounted to an additional \$40.5 million.) Growth in Indian and Inuit Affairs Program (IIAP) expenditures for Indian programs and services, 1970-80, was two-thirds less than the growth in expenditures for non-Indian social programs in Canada. In real terms, IIAP expenditures for Indians during this time period increased by approximately 15% per capita, while federal expenditures for non-Indians grew by 128% per capita. All the while, by the government's own reckoning, socio-economic conditions in Indian communities are actually growing worse.

Compounding the problem of Indian and native program underfunding is the allocation of scarce funds within the IIAP budget to various types of programs. Approximately 94% of all IIAP appropriations are directed to "maintenance and remedial programs." In contrast, about 6% of the budget is directed to job-creation and economic development initiatives. In 1978-79, 22.3% of the IIAP budget went for so-

cial assistance, while only 6.6% went for economic development. In 1981-82, the figures were 27% and 7.5%, respectively. Outside of education (which represents about 40% of the annual IAP budget), the greatest proportion of program funds goes to what can only be described as welfare dependency programs.

In addition to the programs of DIAND, the Canadian government provides funding, services and programs to native people through 5 other federal departments. These include National Health and Welfare, Secretary of State, Regional Economic Expansion, Employment and Immigration, and the CANADA MORTGAGE AND HOUSING CORPORATION. The following are the main areas of program activity for these departments.

**Health** Since 1945, public health services have been provided to Indian bands by the Medical Services Branch of National Health and Welfare, with DIAND funding program administration at the band level. Increasingly, public health programs, health liaison workers and public health nurses are being managed by Indian band health committees. In 1978-79, Indian health care expenditures amounted to \$100 million (see NATIVE PEOPLE, HEALTH).

**Housing** DIAND funds the construction of houses on-reserve, the purchase of houses off-reserve, road construction, water, sewer and electrical services. However, the role of CMHC in funding on-reserve housing is increasing. Under its rural native housing and rehabilitation programs, CMHC accepts Indian bands, tribal councils, Métis, and nonstatus Indian and Inuit organizations as nonprofit housing societies for funding purposes (see INDIAN RESERVE).

**Education** DIAND provides comprehensive support for the education of Indian children through secondary school. Schools on-reserve are run by the department or by Indian bands directly; off-reserve, provincial schools receive tuition subsidies from the department for each Indian student enrolled. Support for Indian students in university and professional programs is provided, but has been cut back in recent years. Overall, in 1978-79, DIAND expenditures for education amounted to \$266 million (see NATIVE PEOPLE, EDUCATION).

**Social Support** With provincial support unavailable to status Indians (except in Ontario),

DIAND provides social assistance to those in need of basic income support. This funding is usually administered directly by Indian bands. In addition, child-care, adult-care and counselling services are sometimes purchased for Indians by DIAND from provinces. In 1978-79, DIAND spent \$147 million on social support programs (see NATIVE PEOPLE, SOCIAL CONDITIONS).

**Economic Development** The economic development of Indian communities is supported primarily by DIAND, DRIE and Canadian Employment and Immigration Commission (CEIC). DIAND provides nonrepayable grants to cover basic economic development project costs, as well as loans for additional capital needs. DRIE, through Special Agricultural and Rural Development Act grants and other agreements, funds various sorts of Indian and native economic development projects. CEIC, through its Canada Works, Manpower Training and Youth Employment programs, provides short-term jobs, vocational training and employment services for native people (see NATIVE PEOPLE, ECONOMIC CONDITIONS).

**Communications** The Native Citizens Directorate of Secretary of State supports native newspapers, newsletters, and radio and television programming through its Native Communications Program and its Northern Native Broadcast Access Program. Their combined budget in 1982-83 was approximately \$8 million (see NATIVE PEOPLE, COMMUNICATIONS).

**Political Organizations** The Native Citizens Directorate of Secretary of State, through its Native Representative Organizations Program, funds basic organizational, administrative and developmental costs for national and provincial native associations and organizations. In 1982-83 this amounted to \$13.5 million (see NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM).

**Cultural and Urban Support** DIAND and the Native Citizens Directorate fund cultural development programs, Indian-operated cultural centres, native women's organizations, individual native artists and cultural projects. The NCD also funds an extensive network of native FRIENDSHIP CENTRES, which provide cultural support, social and informational services to native people in urban centres.

**Land Claims** Through its research branch, DIAND funds research into treaty rights and LAND CLAIMS undertaken by Indian bands, tribal councils or provincial organizations.

**Indian-Government Consultations** Regional, provincial and national native organizations

receive funding from DIAND and Secretary of State to assist in preparing for meetings and negotiations on major policy developments, such as revising the Indian Act and patriation and amendment of the Constitution.

Decisions on what programs and services to provide to native people and at what levels they should be funded are primarily influenced by the overall political and economic agenda of the federal government. Native priorities and needs are an important, but secondary influence on policy and program development. Increasingly, native people are demanding the right to design and implement their own programs to make them effective and efficient in meeting their needs.

Weaver, *Making Canadian Indian Policy* (1981).

**Native People, Health** From the 16th to the 19th century, both permanent and seasonal (whalers, fishermen, fur traders) immigrants to Canada brought with them infections that had long been established in the Old World but were rare or nonexistent among the native populations of N America. Lack of acquired resistance caused minor viral infections such as "colds" as well as measles, influenza and smallpox to become deadly epidemics, spreading in waves through the INDIAN and INUIT tribes, reducing most groups to a fraction of their original number and wiping some out completely. Those not killed by acute viral epidemics suffered from depressed immunity against other infections for a period of weeks or months. Tuberculosis became the "white death," the main scourge of native people in the S and E from the mid-18th century and in the W and N of Canada since 1850.

Exposure to infection was increased by crowding on reservations and permanent settlements with poor housing, sanitation and water supply (see NATIVE PEOPLE, SOCIAL CONDITIONS). Resistance to disease was further lowered by famines or malnutrition resulting from loss of traditional food supplies and by alcohol abuse. The continued physical and socio-cultural decline was such that Diamond JENNESS wrote in the early 1930s that most Indian and Inuit groups in Canada would disappear as distinct peoples within a few decades.

The numerical decline came to a halt for southern Canadian Indians in the 1920s and 1930s and for Indians and Inuit of northern Canada after WWII. Gradually acquired resistance to the new infections, improved medical care, effective drug treatment, and massive efforts by the Canadian government to improve housing, sanitation and nutrition on INDIAN RESERVES and in northern settlements helped to turn the tide and save most native tribes from complete physical extinction — the fate of their brethren in Newfoundland (BEOTHUK) and Southampton I (SADLERMIUT). Indians and Inuit became in the 1950s and 1960s the fastest growing sector of the Canadian population by a natural increase, respectively, of 3 and 4% annually, thereby regaining and in recent years exceeding maximal numbers estimated to have existed in precontact times (see NATIVE PEOPLE, DEMOGRAPHY). Infant mortality, although by the late 1970s still double the rate of other Canadians, had been reduced to 25 and 15% of rates recorded for Indians and Inuit, respectively, 20 years earlier. Life expectancy doubled for Canadian Indians between 1950 and 1969, when the gap in relation to other Canadians had narrowed to approximately 10 years.

The physical, mental and social well-being of modern Indians and Inuit is not the success

Government programs provide support to Indian-operated cultural centres, such as this art centre at Cape Dorset, NWT (courtesy National Film Board/Photothèque).

story that these biostatistics might suggest. While acute and chronic infections have been effectively eliminated as main causes of death, an increasing proportion of deaths are now caused by violence, suicides and accidents, most of them related to alcohol abuse. The majority of these accidents kill and cripple adolescents and young adults, and grave concern is expressed by natives and non-natives about this indirect "genocidal" process. In recent years, this extraordinary high loss of life has interrupted and partially reversed some of the previous gains in life expectancy.

Less dramatic, but also of increasing danger for the well-being of Indians and Inuit, is the loss of their previously superb physical fitness and the emergence of insidious diseases of modern man such as obesity, gallbladder problems, sugar-diabetes, high blood pressure, heart infarcts and other arteriosclerotic diseases.

Graham-Cumming, "Health of the Original Canadians 1867-1967," *Medical Services Journal Canada* 23 (1967); Otto Schaefer, "The Changing Health Picture in the Canadian North," *Canadian Journal of Ophthalmology* 8 (1973); O. Schaefer et al, "General and Nutritional Health in Two Eskimo Populations at Different Stages of Acculturation," *Canadian Journal of Public Health* 71 (1980).

**Native People, Languages** As nearly as can be determined, 53 distinct indigenous languages are spoken in Canada. These languages fall into 11 separate families. Three of the families consist of only a single language, for which the term *isolate* is used. Of the remaining 8 families, some are groupings of languages as closely related as those comprising the Romance, Germanic or Slavic families of Indo-European, while others are more ramified groupings on the order of Indo-European as a whole. In a few cases the indigenous language families of Canada and the rest of N America have been found to be genetically related, although far more proposals of relationship have been advanced than have actually been proven. In the light of present knowledge the majority of indigenous language families of N America appear to be as independent from one another as Indo-European is from Uralic, Sino-Tibetan or Japanese. N America is unquestionably one of the most complex linguistic regions in the world.

Many of the 53 indigenous languages of Canada are spoken in several more or less mutually intelligible dialects, particularly when the language is distributed over a large area. Thus, Cree is a single language spoken in 6 recognized dialects (Plains, Swampy, Northern, Woods, Moose and East) in dozens of communities and reserves from the Rockies across central Canada and well into Québec; and Ojibwa, whose local dialect variants go by such names as Ottawa, Mississauga, Chippewa, Algonquin and Saulteaux, is found in many communities throughout central Canada. Such dialects grade into one another to form chains whose members may approach mutual unintelligibility at the geographic extremes. Nevertheless, these chains are considered single languages for purposes of classification. Cree and Ojibwa are 2 of the 9 Algonquian family languages spoken in Canada; some of these and still others are spoken in the US.

In the early 1980s there were an estimated 154 000 speakers of Canadian indigenous languages, a figure which suggests that slightly less than one native person in 2 then retained knowledge of his mother tongue.

**Geographic Distribution of Canadian Indigenous Language Families** Not one of the Canadian indigenous language families falls exclusively within Canada and most of them straddle the US-Canadian border. Eskimo-Aleut extends not only into the US (Alaska) but also into Siberia on the west and Greenland on the east.

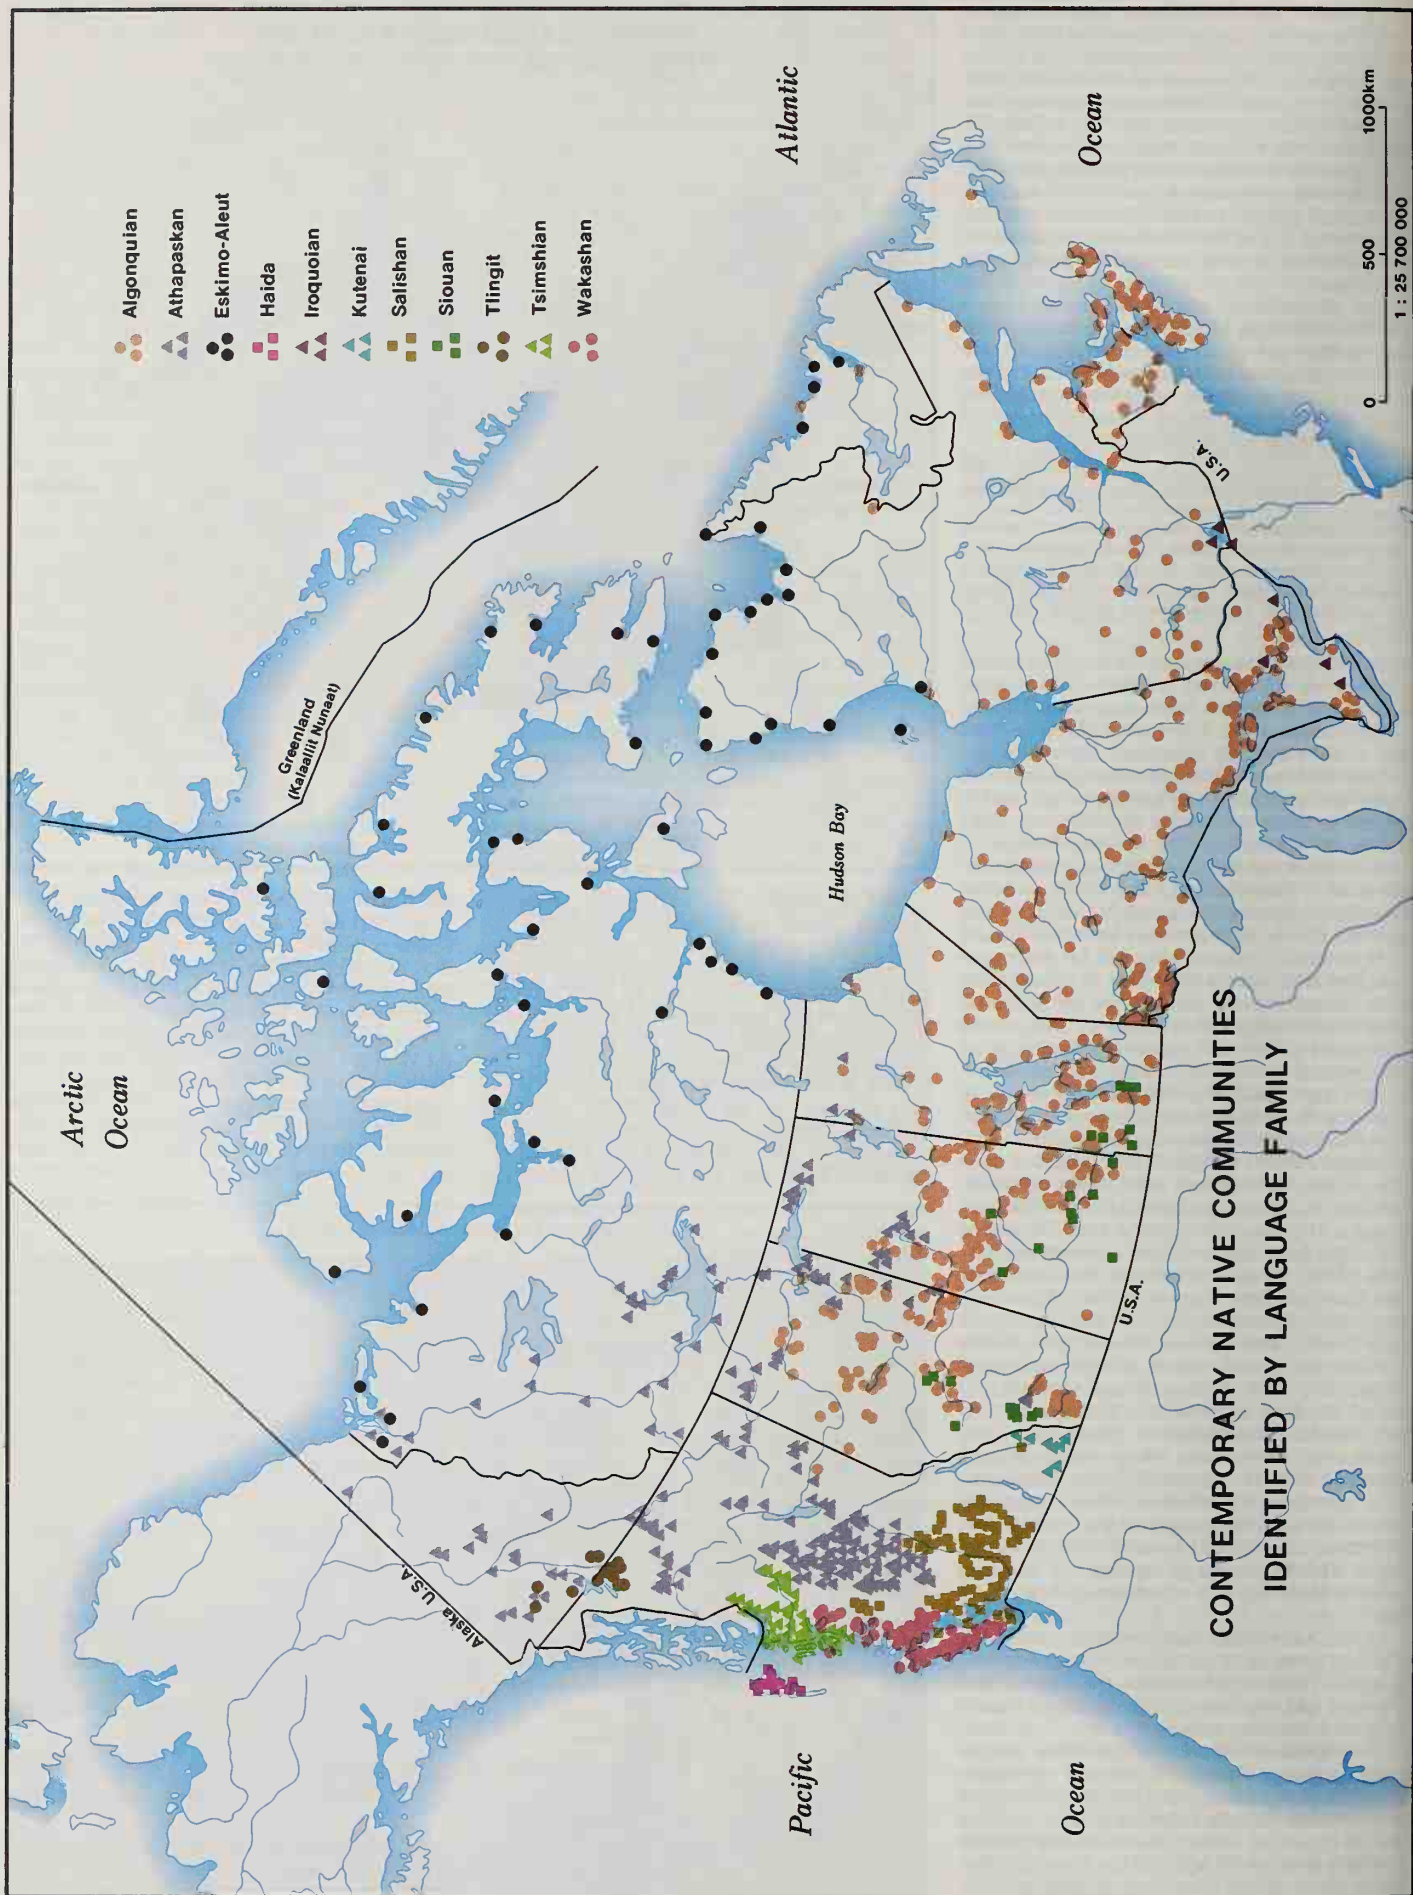

Within Canada, the indigenous language families concentrate in the West. Except for Eskimo-Aleut, whose Eskimo branch stretches across the entire Canadian Arctic, only 2 language families are found east of Lk Winnipeg, Algonquian and Iroquoian, and only the latter is found exclusively beyond this point. Siouan, Algonquian and Northern Athapaskan are present in the prairies, although the latter 2 belong primarily to the Boreal Forest area; and Northern Athapaskan and Tlingit are spoken in a number of communities in the BC interior. Along the West Coast and its inland waterways

are found large numbers of Salishan, Tsimshian, Wakashan and Haida communities. The isolate Kutenai is located in southeastern BC near the lake and river of that name (Kootenay). Nine of the 11 language families are spoken within BC alone. This concentration of families has suggested to students of Indian history that the West is a linguistically old area and the most likely staging area for successive migrations of speakers to the south and east, a view which accords quite well with archaeological and ethnological findings. By contrast, central and eastern Canada are dominated by the Algonquian

#### Indigenous Language Families of Canada

Family/Isolate	Approx Number of Speakers in Canada	Language Spoken in Canada (with principal dialects in parentheses)
✓ Algonquian	100 000	9 languages in Canada: Abenaki (Western dialect), Blackfoot, Cree (Plains, Swampy, Northern, Woods, Moose and East dialects), Delaware (Munsee dialect), Maliseet, Micmac, Montagnais-Naskapi, Ojibwa (Algonquin, Ottawa [Odawa], Mississauga, Chippewa, Saulteaux dialects), Potawatomi
✓ Athapaskan (Northern)	17 000	15 languages in Canada: Beaver, Carrier, Chilcotin, Chipewyan, Dogrib, Han, Hare, Kaska, Kutchin, Sarcee, Sekani, Slave, Tagish, Tahltan, Tutchone
✓ Eskimo-Aleut	16 000	1 language in Canada: Inuktitut (as many as 6 dialects)
✓ Haida	150	Language isolate (Skidegate and Masset dialects)
✓ Iroquoian	2 700	6 languages in Canada: Mohawk (2 dialects), Oneida, Onondaga, Cayuga (2 dialects), Seneca, Tuscarora
Kutenai	30-40	Language isolate
✓ Salishan	3 000	10 languages in Canada comprising Coast and Interior divisions, each with further subdivisions: Bella Coola, Comox (Sliammon), Halkomelem (several dialects), Lillooet, Okanagan (2 dialects), Sechelt, Shuswap, Squamish, Straits (several dialects), Thompson
✓ Siouan	5 000(?)	1 language in Canada: Dakota (Santee, Teton or Lakota, and Assiniboin dialects)
✓ Tlingit	100(?)	Language isolate (inland dialect spoken in Canada)
✓ Tsimshian	2 300	3 languages, all in Canada: Coast Tsimshian, Nass-Gitksan, Southern Tsimshian
✓ Wakashan	3 400	5 languages in Canada belonging to North and South Branches: Haisla, Heiltsuk, Kwakwaka [Kwakiutl], Nitinat, Nootka

family and particularly by the 2 languages Cree and Ojibwa. This situation suggests far more recent language spread relative to the West.

**Classification of Indigenous Languages** Linguistic classification involves both the question of internal relationships among members of the same family, and the question of external links between families in still larger groupings, termed *stocks* or *superstocks* depending upon how comprehensive they are. While the membership within families of all of the 53 languages spoken in Canada today is well known and adequately established, higher order groupings of families into stocks are far less certain. It is an interesting feature of the development of linguistic research in N America that students of Amerindian languages were once considerably more daring about external classification than they are now.

The high-water mark of indigenous language classification was achieved by Edward SAPIR in a famous paper published in the *Encyclopaedia Britannica* in 1929, a paper which set the directions of indigenous language research for decades afterwards and which still provokes lively discussion. In this classification the numerous families of N America were first grouped into 12 middle-level stocks considered reasonably assured, and then — far more speculatively — into 6 far-reaching superstocks considered possible though far from proven. All but one of the Canadian indigenous language families were subsumed under 4 superstock headings: Algonquian-Wakashan (Algonquian, Kutenai, Wakashan, Salishan, plus 3 families in the US); Na-Dene (Athapaskan, Haida and Tlingit); Penutian (centered in California and Oregon, with Tsimshian as the sole Canadian member); Hokan-Siouan (numerous families in the western US and some in Mexico, with the Siouan and Iroquoian families spilling over into Canada). One family, Eskimo-Aleut, was regarded then, as today, as constituting a separate stock. In recent decades there has been a steady retreat from this and other massively integrative classificatory schemes, back at least to the middle-level stocks. In some cases additional middle- or lower-level links have been proposed even as the higher order links have come undone through continuing research. Thus Eyak, a language isolate in Alaska, has been joined with Athapaskan during the same recent period which has seen the dismantling of the Na-Dene superstock as a whole; and the link between Siouan and Iroquoian, while problematic, is on firmer footing today than in 1929, although little remains of Sapir's Hokan-Siouan superstock in which both families were originally placed.

**Structural Diversity of Indigenous Languages** Early descriptions of the indigenous languages of N America tended to cast all of them in the same mold as "polysynthetic" or "holophrastic" in order to capture a tendency found in a number of them toward great complexity of the word, particularly the verb. It was found that many of the formal elements expressed in familiar European languages by separate words or word endings were, in the majority of Amerindian languages, combined as chains of prefixes or suffixes surrounding basic roots, or both. Certainly there are families such as Eskimo-Aleut, Iroquoian and Algonquian where the term polysynthesis can be said to characterize the verb, but such general typological labels leave a spurious impression of structural uniformity and obscure important differences sometimes found even among languages belonging to the same family. Moreover, there are Amerindian languages which are as "analytic" as English, and others which are as "inflective" as Latin and Greek, so that it is impossible to speak of all the indigenous languages of this hemisphere as fitting a single structural type or set of types.

In addition, virtually every grammatical cate-

The Status of Proposed Distant Genetic Relationships of Canadian Indigenous Language Families

Family	Proposed Larger Group Affiliations	Stocks, Families or Isolates Included	Status of Groupings and Links in Current Research
Algonquian	Algonquian-Ritwan (Algic)	Algonquian + Ritwan (Wiyot and Yurok of NW California)	Widely accepted as established. Wiyot and Yurok may not form a separate subgroup as the term Ritwan implies.
	Algonquian-Wakashan	Algic (as above) + Mosan (Wakashan, Salishan and, in the US, Chimakuan) + Kutenai + possibly Beothuk (the extinct language of Newfoundland)	The overall hypothetical construct considered doubtful; some links (Kutenai with Salishan and/or Algonquian) considered possible. Link with Beothuk now discounted
	Macro-Algonquian (Algonquian-Gulf)	Algic + Gulf grouping in SE US (Muskogean, Natchez, Tunica, Chitimacha, Atakapa)	The status of the Gulf grouping uncertain, that of the larger construct even more so
Athapaskan	Athapaskan-Eyak	Athapaskan (Northern, Pacific and Southern) + Eyak (Alaska)	Widely accepted as established
	Na-Dene	Athapaskan-Eyak + Haida + Tlingit	Tlingit possibly remotely related to Athapaskan-Eyak, Haida now thought not to be. No relationship yet found between Haida and Tlingit
Eskimo-Aleut		Eskimo-Aleut + Chukotan (Siberia)	The connection with Chukotan, now generally accepted, makes Eskimo-Aleut the only indigenous language family of N America with a proven Old World connection
Haida	Na-Dene	See Athapaskan	See Athapaskan
Iroquoian	Macro-Siouan	Iroquoian + Siouan + Caddoan (central US)	The Iroquoian-Siouan link is firmer than the postulated Siouan-Caddoan and Iroquoian-Caddoan links

gory known from the languages of the Old World (systems of person, case, number, gender, tense, mode, aspect, voice) is found among the languages of N America, and there are some unusual categories which have been the focus of considerable interest in indigenous language research: verb stems to denote categories of shape and motion, sets of demonstratives to indicate whether an object mentioned by the speaker is visible or invisible to him, verb modes to indicate whether what the speaker is saying can be verified from his immediate experience, even different sets of numerals to count different classes of objects. One particular line of research, which has developed around the so-called world-view problem, has attempted to determine if, and how, such categories influence habitual thought patterns among speakers.

Amerindian languages exhibit great diversity in their sound systems. In some families, such as Iroquoian and Eskimo-Aleut, the inventory of basic sounds is limited; in others, such as those located in the Plateau and on the Pacific Coast, the inventories of basic sounds, particularly in consonant series, are quite large. **Native People, Law** Owing to Canada's complex social and constitutional history, the special legal rights of Canada's native peoples vary from one part of the country to another and in their application to different groups. Under Canadian law, there are no longer special disabilities attached to native status. Earlier rules (eg, those preventing Indian people from voting, making some types of contracts or leaving reserves without permission) are now extinct; other discriminatory laws are unlikely to be enforced. The one thing native people cannot legally do is bargain away their ABORIGINAL RIGHTS, treaty rights or reserved lands to anyone other than the Crown in right of Canada. This concept, that natives enjoy all the usual rights of citizenship and additional native rights, has been described as "Citizenship Plus." In order to claim these special rights, however, native status must be shown — and proof of status has been an awkward issue.

**Native Status** Section 35 of the CONSTITUTION ACT, 1982, defines "the aboriginal peoples of Canada" as the INDIAN, INUIT and MÉTIS peoples. Much discussion will be devoted to the definition of these 3 groups, particularly if their rights are not equivalent or if the federal government does not accept similar responsibilities for each of them.

In our early history, people who followed the Indian way of life and lived among Indian communities were recognized as Indians. Not until 1850 was a bloodline requirement prescribed in Lower Canada to define who could occupy reserve lands. Since Confederation, fed-

eral law has elaborated upon the original definition, mainly by adding exclusionary rules and assigning status by patrilineal descent rather than by racial or social relationships. The best known is the rule depriving an Indian woman of her status if she marries a non-Indian (see INDIAN ACT).

Government has been embarrassed by widespread criticism of the way Indian status is defined. Many Indian groups oppose government definition of their membership, and they are likely to gain greater control over such definition in future.

The courts have held that Parliament's power in relation to "Indians" includes legislative control over Eskimos or Inuit, but there is no "Inuit Act," possibly because there have not been "Inuit reserves" to regulate. Inuit status is likely to be defined legally as LAND CLAIMS are negotiated and the question of "beneficiaries" is addressed. For northern Québec Inuit this process was accomplished by an initial enrolment of beneficiaries with future additions on the basis of descent, marriage or adoption.

Métis, however, is a term of uncertain application, used variously to describe everyone of mixed native/non-native blood, or those who took land scrip rather than treaty (see INDIAN TREATIES); those entitled to Métis lands under the MANITOBA ACT, 1870; those requested under the Alberta Métis Betterment Act; or the francophone segment of the mixed-blood communities of the Northwest. Depending on which definition is used and through how many generations it is extended, estimates of the Métis population range from 100 000 to 1 million. Generally, no continuing Métis rights are recognized under federal law, and in the constitutional discussions in 1984 federal government representatives took the position that Métis, unlike Indians and Inuit, were not under federal legislative jurisdiction. Some provincial laws do make special provisions for Métis communities within their boundaries. If Parliament does have parallel jurisdiction over Métis and their lands, these provisions could generate constitutional confusion.

**Land Rights of Native People** Parliament also has the power to make laws in relation to "lands reserved for the Indians," and the federal government has the power to bargain with native groups for the release of native land rights. Under Canadian CONSTITUTIONAL LAW, once such a release is given those lands are subject to the general provincial ownership of crown lands and natural resources and the federal government loses all rights to deal with such lands on behalf of the natives. Even the clear provisions of the Indian Act dealing with federal management of surrendered Indian reserve lands cannot operate unless there is a federal-provincial agreement in place concerning the status of the surrendered lands.

Such agreements have been made with NS, NB, Ontario and BC, and by the Statute of Westminster, 1931, which affects Alberta, Saskatchewan and Manitoba. There are no special arrangements with Québec, PEI or Newfoundland; none are required for the territories which are under federal jurisdiction.

The land rights of native peoples are largely undefined, but they have been described as "usufructuary," referring to a Roman law right to use land owned by another; in this case it is the native right to use lands technically owned by the Crown. Native rights to land as defined by the Indian Act are communal in nature, belonging to the group rather than the individual member, and cannot be bargained away except by the group to the Crown in right of Canada (see INDIAN RESERVE).

**Laws of General Application** Native people are subject to the general law of the land, together with other Canadians, unless there is

Jim Igloliarte, Inuk judge at Nain, Labrador (photo by Karl-Heinz Raach).

some aboriginal, treaty or other provision affording special protection. If a law conflicts with native life-style or culture, and there is no special protection, the courts will apply that law to natives.

Laws of general application can be provincial laws or federal statutes such as the Criminal Code or the Fisheries Act.

In the field of social services there have been many disputes, not because the provincial laws do not apply to natives, but because provinces are reluctant to provide such services without compensation from the federal government.

**Hunting and Fishing Rights** Many of the Indian treaties included promises that hunting and fishing would not be disturbed. In those areas where there are such treaties, the courts have held that hunting and fishing can be regulated by the federal government, as they have been by the Fisheries Act (1970) and the Migratory Birds Convention Act (1970). In the Prairie provinces, in order to consolidate treaty promises, the BNA Act, 1930, guaranteed Indians the right to hunt and fish for food, free of provincial regulation, on unoccupied crown lands and other lands to which they have a right of access. Métis have failed in their attempt to claim these rights.

Where there are no treaty rights, however, as in most of BC, provinces can regulate native hunting and fishing. In the territories there are special exemptions in the Yukon Act and the Northwest Territories Act permitting Indians and Inuit to hunt for food.

**Legal Status of Native Communities** While native rights are regarded as communal, the formal legal status even of Indian bands is not clearly defined in Canadian law: bands may not

Native representatives from the James Bay region discuss the administrative structures governing control over aboriginal lands (courtesy Canapress).

be able to sue or be sued in their own names or limit financial liability for debts to communal assets. Some groups avoid this by incorporation, a legal procedure to acquire certain rights and immunities; others avoid incorporation because it entails the loss of tax exemptions relating to Indian status.

Inuit and Métis groups have incorporated political and development associations (see NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM) and formed co-operatives (see INUIT CO-OPERATIVES), but do not as communities have statutory powers under federal law. Indian bands and BAND councils are given limited powers under the Indian Act. One of the goals of Indian self-government is to enhance and constitutionally recognize the legal rights and powers of bands.

**Customary and Cultural Practices** Canadian law has recognized certain native traditions. One example is the early recognition courts gave to customary marriages, although without a parallel recognition of customary divorce. The Indian Act refers to "customary adoptions," without explanation, and the courts have recognized these adoptions not only in Indian, but also in Inuit communities, on the basis of recognition of indigenous customary law. Similarly, because the election provisions of the Indian Act are not mandatory, band leaders who are chosen by customary means can exercise the statutory powers of a chief and council.

It is likely that the catalogue of legally recognized customary practices will increase in future. The CANADIAN CHARTER OF RIGHTS AND FREEDOMS, for example, refers to customary language rights and these rights may apply to native languages (see NATIVE PEOPLE, EDUCATION; NATIVE PEOPLE, LANGUAGES).

**Taxation** Under the Indian Act the interest of an Indian or a band in reserve lands, and the personal property of Indians or bands situated on a reserve, are exempt from taxation. Complex questions have arisen in applying this provision to sales and income taxes.

The federal government takes the position that income taxes are not payable by Indians if their income is payable on a reserve. Federal sales tax, which is a hidden tax, is generally paid by all native people regardless of where they live. The same is true of provincial sales taxes in most jurisdictions, although some provinces recognize specific exemptions for reserve residents or for on-reserve purchases by Indians.

There is no special exemption from customs and excise duties, notwithstanding provision in JAY'S TREATY (1794) and the TREATY OF GHENT (1814) that Indians could cross the Canada-US border freely with their goods. In the *Francis* case (1956) the Supreme Court of Canada held that these were not Indian treaties and that, while they were international treaties, they had not been given legislative force within Canada.

Native groups can be expected to advocate extended tax exemptions in the course of constitutional and land-claims negotiations.

**Equality before the Law** Democratic theories of majority rule and equality before the law often give insufficient regard to minority rights, and this inherent tension has found its way into native cases. The 1960 Canadian Bill of Rights affirmed the right to equality before the law and, in the *DRYBONES* CASE (1969), the Supreme Court of Canada held that an Indian had been unfairly discriminated against on the basis of race by being convicted under an Indian Act provision that made it an offence for an Indian to be intoxicated off reserve. The Indian Act provision which imposed slightly heavier penalties, was struck down since it denied the accused equality before the law.

In a later case, the court did not apply the Canadian Bill of Rights. Its decision in the *LAVELL* case (1973) was based on reasoning that if the court struck down a discriminatory mem-

bership provision of the Act, it might effectively repeal the whole statute that discriminates on the basis of race. The court's decision in *Lavell* was widely criticized.

This potential conflict between minority rights and equality before the law is apparent in the Canadian Charter of Rights and Freedoms, where specific provision is made that none of the guarantees, including that of equality before the law, shall be construed so as to diminish aboriginal or treaty rights.

**Summary** Following the Constitution Act, 1982, the constitutionally recognized legal rights of native peoples are of 3 types: those determined to be "existing" for the purposes of constitutional protection; those acquiring constitutional protection by way of land-claims settlements; and those given constitutional or statutory recognition as the result of negotiations between native groups and governments.

**Native People, Political Organization and Activism** Since the arrival of Europeans in Canada, political organization among the native peoples has been influenced to a great extent by their relations with the institutions and agencies of Euro-Canadian society. Their political aims for more than 300 years have been to protect their lands, communities, and right to exist as socially and culturally distinct peoples.

Economic relations formed between Indians and Europeans during the early stages of the FUR TRADE created partnerships and rivalries that gave rise to military alliances between European and native nations. The League of the Iroquois (later the Five Nations, and then Six Nations, Confederacy), whose formation pre-dated the establishment of NEW FRANCE, played an essential part in the 17th and 18th century struggles between France and Britain in N America (see IROQUOIS WARS). Indians' alliances with European powers were constructed with a view towards protecting their territories and ways of life from being overrun by the newcomers. These motives were especially evident in the PONTIAC uprising of 1763 and the involvement of Indians on the side of the British in the WAR OF 1812.

With the cessation of colonial hostilities, the need for military alliances between Indians and Euro-Canadians disappeared. As agricultural settlement overtook the fur trade, relations between native peoples and settlers underwent a further transition. No longer required as partners or allies, indigenous peoples came to be seen by whites as potential obstacles to settlement. With the reduction or loss of subsistence hunting and trapping activities, Indians were obliged either to retreat into areas not suited for agricultural settlement or to submit themselves to new forms of government Indian administration erected in the 19th century to protect, "civilize" and, ultimately, to assimilate them into Euro-Canadian society (see NATIVE PEOPLE, GOVERNMENT POLICY).

The paternalistic form of Indian administration introduced in Upper and Lower Canada and extended to the West following Confederation featured the establishment of reserves where, under the tutelage of government agents, missionaries and educators, Indians were supposed to be transformed into Christians and self-sufficient agriculturalists (see INDIAN RESERVE). The reserve system diminished Indians' political autonomy and separated them into individ-

ual bands that were both geographically and politically cut off from one another. In consequence, political activism among Canada's Indians since the latter part of the 19th century has largely reflected their attempts to organize political associations beyond the BAND level in order to pursue their common interests.

One of the earliest of these Indian associations, the Grand General Indian Council of Ontario, was the outcome of missionaries' efforts to establish a council of OJIBWA nations prior to Confederation. In existence from the 1870s until 1938, the council pursued a cautious and conciliatory course in its dealings with federal Indian administrators. The Plains CREE, in contrast, in the 5 years prior to the NORTH-WEST REBELLION of 1885, began to form a political alliance to force the federal government to honour what Indians viewed as treaty commitments (see INDIAN TREATIES). Though limited in scope and largely unintended, Indian participation in the rebellion pre-empted a previously scheduled gathering of Indian leaders from across the Prairies to decide how they might best press for desired changes in federal Indian policy and administration. The rebellion led to a tightening of government control of reserves and further erosion of Indian autonomy. While political organization and activism were severely constrained by the terms of the INDIAN ACT and by the fact that most Indians were not entitled to vote in federal and provincial elections until after WWII, the struggle to realize their various aims continued.

In the 1890s the Nishga in BC began their campaign to obtain government recognition of their aboriginal land rights, while in 1906 the chief of the Capilano Band travelled to England to place a LAND CLAIMS petition before King Edward. A new organization, the Allied Tribes of British Columbia, was formed in 1915 in an unsuccessful attempt to force a judicial decision on land claims by the British Privy Council. Following the government's rejection of the Allied Tribes' land claims in 1927, the organization folded, only to be succeeded in 1931 by the Native Brotherhood of British Columbia, an organization that represented Indians along the northern coast and that arose out of Indian labour-oriented activities in coastal industry.

Attempts to create a national political organization for Indians first began in Ontario and Québec during WWI when the American-based Council of Tribes began a short-lived but energetic campaign to expand into Canada. In 1918 the League of Indians of Canada was formed in Ontario by F.O. Loft, a returning veteran and member of the Six Nations Reserve who advocated resolution of a set of grievances common to Indians across Canada: loss of reserve lands and the failure to recognize aboriginal land rights; restriction of native people's hunting and trapping rights; educational policies and administrative practices that sought to eliminate Indian languages and customs; and the generally poor economic and health conditions on reserves. Loft's efforts in the early 1920s to bring western Indians into the league were surprisingly effective, despite the opposition he encountered from senior officials of the Dept of Indian Affairs who attempted, among other measures, to revoke his legal status as an INDIAN. In view of the logistical difficulties entailed in uniting geographically separated and ethnically, linguistically and religiously divided bands in a national Indian organization, the league's eventual failure was less remarkable than its initial success.

During the late 1930s and 1940s there was an increase in native political organization, especially at the regional and provincial levels, with the formation, for example, of the Indian Assn of Alberta in 1939 and the Saskatchewan Indian Assn in 1944. The creation of the North

American Indian Brotherhood in 1943 by Andrew PAULL, a BC Indian leader, was another attempt to establish a national organization of Canadian Indians, but failed, partly because of the suspicion it was an organization primarily for Catholic Indians.

Public concern over the anomalous social, economic and legal status of Indians in Canada led to the convening of special parliamentary inquiries into the administration of Indian Affairs 1946-48 and 1959-61. Both inquiries prompted the formation of a number of associations that sought to speak on behalf of regional and provincial Indian constituencies. In Saskatchewan, for example, the merger during the 1940s and 1950s of a number of small organizations, including the Protective Assn for Indians and their Treaties, Saskatchewan Indian Assn, Union of Saskatchewan Indians, and Queen Victoria Treaty Protective Assn, led to the creation of the Federation of Saskatchewan Indians, an association which since the late 1950s has served as the principal representative organization of Indians in that province.

The extension of the federal franchise to Indians in 1960 and of the provincial franchise to Indians in Alberta in 1965 and Québec in 1969 erased a major political distinction between Indians and other Canadians. Nevertheless, many Indians were and continue to be reluctant to exercise their right to vote partly for fear of compromising their special legal and constitutional status. Since 1962 a steadily declining proportion of eligible Indian voters has cast ballots in federal elections; by 1979 their rate of participation in federal elections was less than half that of non-Indians. Participation in Indian band elections, however, remains at a high level, suggesting a lack of faith on the part of Indians that normal federal and provincial political channels and processes can satisfy their interests.

The federal government's 1969 proposals to abolish both the Indian Act and the Dept of Indian Affairs and to transfer administrative responsibility for Indians to provincial governments sparked a dramatic increase in the scope and intensity of political organization and activism among Canada's native peoples. Opposition to the government's proposals led in the early 1970s to the creation of several new provincial associations and the transformation of some existing ones into active political organizations that began to receive political recognition from governments as the appropriate representatives of their people. Provincial and territorial associations also received public funds to operate a variety of research, liaison and service programs on behalf of native peoples. The special legal and administrative interests of registered Indians led them in most cases to keep their organizations separate from those established by the MÉTIS and nonstatus Indians.

Beyond the provincial level, the National Indian Brotherhood (which became the ASSEMBLY OF FIRST NATIONS representing 90% of chiefs across Canada in 1982) and the NATIVE COUNCIL OF CANADA (representing Métis and nonstatus Indians) pursued changes in government policies with respect to ABORIGINAL RIGHTS, economic development, education and many other fields (see NATIVE PEOPLE, GOVERNMENT PROGRAMS). Between 1978 and 1982 Indian, Métis and nonstatus organizations, along with the INUIT TAPIKISAT OF CANADA, intervened in the repatriation of the Canadian constitution in order to ensure legal enshrinement of their aboriginal rights. Since the 1970s Canadian native leaders have also become leading participants in international minority-indigenous-peoples organizations such as the Inuit Circumpolar Conference and the World Council of Indigenous People, founded at a conference in Pt Alberni, BC, in 1975, whose international secretariat was located in Lethbridge, Alta, and moved to Ottawa in 1984.

In addition to native people's involvement in provincial, national and international representative organizations, a variety of other, often short-lived, special interest groups have appeared: Canadian Indian Youth Council (1960s), Saskatchewan Native Youth Movement (1970s), Calgary Urban Indian Treaty Alliance (early 1970s), Canadian Native Communications Society (1960s-1970s), Indian Rights for Indian Women (1970s), and National Native Women's Assn of Canada (1970s). The National Alliance for Red Power (1960s, early 1970s) and the American Indian Movement (1970s), organizations that advocated more radical programs of action than those adopted by officially recognized provincial and territorial organizations, also received limited support from native people in Canada.

The political activism of Canada's native peoples since WWII has afforded them increasingly greater access to various levels of political decision making and has substantially altered some aspects of their situation. Notwithstanding the election of native candidates to parliament, provincial legislatures and territorial councils on several occasions, however, native activism has for the most part been conducted outside the bounds of electoral politics. Since 1969 considerable effort has gone into establishing communication channels and negotiating mechanisms to facilitate dealings between native peoples and governments. The leaders of native organizations have also discovered a number of effective political tactics, including the use of the mass media to communicate their concerns to potentially sympathetic non-native audiences in Canada and elsewhere in the world who may in turn apply pressure on Canadian political leaders.

Native leaders have tended to eschew threats of violence but have become adept at mounting symbolic protests; one example was the mounting of the "Constitutional Express" that took large numbers of native people to Ottawa by train during the constitutional negotiations so they might personally convey their opposition to the government's position. Yet while native political organizations have become publicly prominent and have succeeded in changing government policy in a number of fields, their dependence on government financing serves indirectly to limit their political autonomy. Nevertheless, limited autonomy has been a feature of the political situation of native peoples for more than 100 years.

In coming years, native political organizations will be confronted both by internal and external challenges. Native people represent only a small minority within the overall population of Canada. The political influence that native leaders have exercised during the past 2 decades to persuade governments to extend special treatment to their people has been largely contingent upon a general level of affluence and tolerance within Canadian society. How native people will be treated by governments in the future remains to be seen. Equally important, however, will be the determination of native people at the community level to insist that their organizations continue to defend the political values and objectives that have long guided political organizations and activism among indigenous peoples in Canada. **Native People, Religion** Indian and Inuit religions consist of a complex set of social and

*Giver of Life* by Jessie Oonark (courtesy Sanavik Co-operative, Baker Lake, NWT).

cultural customs for dealing with the sacred and the supernatural. There are rich traditions of religious mythology and ceremonial in most areas. Spectacular religious manifestations are found on the Northwest Coast (KWAKWAKWATL, HAIDA, TSIMSHIAN), the northern Great Plains (BLACKFOOT, PEIGAN, BLOOD, SARCEE) and the Central and Eastern Woodlands (OJIBWA, CREE, HURON, IROQUOIS). In general, the subarctic Athapaskan groups and the arctic Inuit have less elaborate religious ceremonies, but are rich in mythic tradition (see INUIT MYTH AND LEGEND).

While their mythologies defy simple classification, 3 main types of myths, features of which often occur in combination, are particularly important in the religion of native peoples. The first group consists of creation myths that describe the origins of the cosmos and the interrelations of its elements. Here belong the Earth Diver myth, in which either the Great Spirit or the Transformer dives or orders other animals to dive into the primeval water to bring up mud, out of which he fashions the Earth (Eastern Woodlands, Northern Plains); the Trickster myths, which frequently but not always represent the Transformer as a comical character who steals light, fire, water, food, animals or even mankind and loses them or sets them loose to create the world as it is now (RAVEN among the BELLA COOLA, Tsimshian, Haida; HARE, NANABOZO or Nanabush among the Ojibwa; Frog in the Columbian Plateau; Coyote among the Blackfoot); and the Culture Hero myths, in which the Transformer appears as a human being of supernatural powers who brings the world into its present form by heroic feats (GLOOSCAP of the MICMAC, MALISEET, ABENAKI). Especially in the Columbian Plateau and the Great Plains, there are said to be 2 Transformers (more precisely, a Transformer and a companion who is a brother, sister or other relative). They try to outdo each other in feats of strength, ability or cunning that result in the formation of the world as it now exists.

Many myths tell of the origin of the moon, the sun and the stars. In these myths there is usually a tension between the heavenly bodies; eg, the cool moon by night is said to be necessary to counteract the burning of the Earth and the killing of people by the heat of the sun. An Inuit myth tells of the sun and moon as brother and

sister, but since they have engaged in incest in their human lives they are doomed to eternal separation. Among many forms of myth about human origins are those that tell of the Transformer changing various animals into people. Others tell of the origin of death. The second group of myths is the institutional myths, which tell of the origins of religious institutions, such as the SUN DANCE (northern Plains), sacred MEDICINE BUNDLES (Blackfoot, Cree, Ojibwa, Iroquois), winter ceremonies (Coast SALISH, NOOTKA, Kwakiutl) and the Green Corn Ceremony (Iroquois; see also FALSE FACE SOCIETY).

Where there is a belief that primordial times were very different from the present, the pattern in which the ancient mythic beings arranged their social and religious institutions becomes the norm for people now. Myths of the third group, the ritual myths, serve as detailed texts for the performance of ceremonials and rituals by which cosmic order is dramatically represented (Plains Sun Dance, Ojibwa MIDEWIWIN ritual and the Iroquois Green Corn Ceremony). Fertility, birth, initiation and death rites are often clearly stipulated in mythology. Shamanic performances may also be described (see SHAMAN). Ceremonials are often preceded by stringent purification rites, such as sweat baths (eg, Salish, Blackfoot, Eastern Woodlands), fast-

Bone carving by sculptor Stanley Hill depicting the traditional Iroquoian myth of creation (courtesy Stanley Hill).

ing and sexual abstinence (see SWEAT LODGE). Feasting is a common feature of ceremonial performance.

The use of hallucinogenic drugs such as peyote appears to be limited and relatively recent in religious observances among Canadian native people, although trance states seem to be reasonably common (eg, in Salish winter dancing, shamanic performances among many groups, and perhaps in the SHAKING TENT rituals).

Some myths appear to have lost their religious sacredness and, while considered to be basically true accounts of true mythic beings, have become folktales recounted for entertainment or instruction. All religious myths and many folktales have a moral or ethical dimension in which behaviour patterns are prescribed, prohibited, commended or condemned.

Myths of the Orpheus type are prominent in the Eastern Woodlands (Huron, Ojibwa, MONTAGNAIS-NASKAPI, Iroquois, OTTAWA), the Northwest Coast (Salish, Kwakiutl, Nootka, Haida, Tsimshian, TLINGIT) and the Columbian Plateau (Thompson, Okanagan, CARRIER; see SALISH, INTERIOR). They tell of the Culture Hero or other prominent religious figure making a perilous journey to the realm of the dead to bring back a deceased loved one. These myths contain detailed characterizations of the land of the dead, and are important to an understanding of such diverse phenomena as the Plains Ghost Dance, concepts of the soul and many aspects of shamanism.

Among societies that have practised agriculture at some time in their history, many groups believe in a senior Great Spirit or Great Mystery (*Wakan Tanka* of the Plains societies and *Kitchi Manitou* of the eastern Algonquians). In general, supernatural mystery or power is called *Orenda* by the Iroquois, *Wakan* by the Plains peoples and *MANITOU* by the Algonquian societies, and is potentially beneficent, though it can be dangerous if treated carelessly or with disrespect. This mystery or power is a property of the spirits, but it also adheres to the Transformer, Trickster, Culture Hero, or spirit figures. Shamans, prophets and ceremonial performers are endowed with it. The spirits of all living things are powerful and mysterious, as are many natural phenomena and ritually significant places. Ritual objects such as rattles, drums, MASKS, medicine bundles and ritual sanctuaries are filled with mystery (see CALUMET; MEDICINE WHEELS).

Most Northwest Coast groups consider time to be divided into the present and a remote mythological period when things were different from now, and believe that the state of things in the present was brought into being by the Transformer. Concepts of the future are developed principally as they refer to the death of the individual and his afterlife. The world of the dead is usually believed to lie at a great distance from the world of the living, often beyond a great river, on islands far out at sea, in the remote mountains or in the underworld. It can only be reached after a difficult journey by the dead, or a very perilous one for the living (eg, shamans, the spirit figures of the Orpheus myth). The world is believed to have a circular surface covered with a domelike overworld. These levels are joined by a "cosmic axis" which may be represented by a "world tree," a "rainbow bridge" or the "backbone of the worlds" (the Milky Way). Religious myths of the Star Husband (Temagami Ojibwa), the Chain of Arrows (Tlingit) or the Stretching Tree (CHILCOTIN) tell of contacts made between humans and the world beyond via this axis. Ceremonially, such elements as columns of smoke, central house posts or the central pole of the Sun Dance lodge represent this axis. Whirlpools or caves may represent the way to the underworld. Many groups tell of a primeval sea or world deluge. Most recognize at least 6 cardinal directions (the 4 corners of the world, plus the

zenith and the nadir). Northwest Coast societies such as the Kwakiutl divide the year into 2 major seasons: the summer ("profane") time and the winter ("supernatural") time, in which most religious ceremonials take place. Agricultural societies such as the Iroquois have more complex ceremonial calendars organized around the harvest times of various food plants, with a life-renewal ceremonial usually held in midwinter.

A key concept among Indian and Inuit societies is the notion of the Guardian of the Game, a supernatural person who is said to control or hold stewardship over one or all of the animal species, especially those hunted by man. Typical examples are to be found in the Bear ceremonial of the Abenaki and Montagnais-Naskapi, the Spirit of the Buffalo in Plains societies, and Sedna the sea goddess and Guardian of the Seals among the Inuit.

Of several religious figures, shamans are the most notable. They function as healers, prophets, diviners, custodians of religious mythology, and are often the officiants at religious ceremonies. In some societies, all these functions are performed by the same person; in others shamans are specialists. Healing practitioners may belong to various "orders," as in the Midewiwin or Great Medicine Society of the Ojibwa, or to secret or closed societies (Kwakiutl, Blackfoot). The Ojibwa Midewiwin was a closed society containing 4 (sometimes 8) orders of men and women who could be consulted at any time of sickness or communal misfortune and who performed the annual Midewiwin world-renewal ceremonial in late summer. Shamans were co-ordinators of the Plains Sun Dance (Blackfoot, Sarcee), which was also a world-renewal ceremonial. Closed, or even secret, shamanic societies played an important role in the Winter Ceremonial of the Kwakiutl, Nootka and other Northwest Coast societies. Shamans were associated with powers generally thought to be beneficial to the community, but were believed in some cases to use their powers for sorcery. Shaman-prophets and diviners were concerned with predicting the outcome of the hunt, relocating lost objects and determining the root causes of communal discontent and ill will. Blackfoot, Cree, Ojibwa and other societies had diviners who made their prophecies (perhaps in trance states) in the dramatic Shaking Tent ceremony. Shamans in Cree, Blackfoot and Ojibwa societies were custodians of the sacred medicine bundles containing objects and materials endowed with great mystery and power.

Natural causes were recognized for many diseases, especially physically curable ones; others were commonly believed to be the result of intrusion into the body of objects placed there by sorcerers. The shaman-healer's treatment of such diseases was dictated by his tutelary spirit, but usually consisted of the shaman ritually sucking the disease agent out of the body, brushing it off with a bird's wing, or drawing it out with dramatic gestures. Illness could also result from "spirit loss." The shaman-healer's action was then directed to recovering the patient's spirit (either his soul or his guardian spirit power, or both) and reintroducing it to the body. Personal or communal disorders were often held to be the result of disrespectful behaviour toward game animals, tribal sacred objects or natural phenomena.

The Guardian Spirit Quest once occurred throughout most of the tribal groups of Canada; it is undergoing a revival in Northwest Coast tribal religions, especially among the Coast Salish. Males, especially at puberty but also at other times of life, made extended stays in remote areas while fasting, praying and purifying themselves by washing in streams and pools. The goal was to seek a vision of, or actual encounter with, a guardian spirit — very frequently an animal, but also a mythological fig-

ure. Establishment of contact with a guardian spirit was held to make an individual healthy, prosperous and successful, particularly in hunting and fishing. The guardian spirit could be hinted at (Salish) or even directly represented or dramatized (Kwakiutl) in songs, masks, TOTEM POLES, house paintings, facial and body painting, or in personal religious regalia (see INDIAN ART; INUIT ART; NORTHWEST COAST INDIAN ART; PICTOGRAPHS AND PETROGLYPHS).

Seasonal ceremonials and "life-crisis" rituals are very common. Among the seasonal rituals are "firstfruits" and harvest ceremonies, and New Year life- and creation-renewal rites (Ojibwa Midewiwin ceremony, Plains Sun Dance, First Salmon rites of the Northwest Coast). Among the life-crisis rituals are ceremonies at birth or the giving of a name, at puberty, marriage and death, all of which are normally accompanied by some solemnity. The 17th-century Huron Feast of the Dead may have incorporated features of both seasonal and life-crisis rituals.

Contact with European religious systems has produced several types of religious reactions among native peoples, although it has brought change in some way to all aboriginal religious forms. Some Indian religions eventually rejected European forms and turned to "nativistic movements," which seek to revive previous religious practices and beliefs (eg, the Iroquois HANDSOME LAKE RELIGION). "Syncretistic religions" seek to combine traditional native forms with European observances (eg, the SHAKER RELIGION of the Salish area and the Native American Church of the Plains). Other religious movements radically opposed European forms (eg, the 19th-century Ghost Dance of the Sioux and other Plains tribes).

Indian and Inuit religious institutions should be understood in the context of the kinship, political and social-control institutions with which they are intricately interrelated.

**Native People, Social Conditions** The social conditions of native people in Canada are affected by the federal Dept of INDIAN AFFAIRS AND NORTHERN DEVELOPMENT (DIAND), the various native organizations and the BAND administration of INDIAN RESERVES. The minister of Indian affairs and northern development has responsibility for exercising the duties and functions of the INDIAN ACT on behalf of the federal government. Indian organizations are representative associations at the national, provincial and tribal or band levels and often have mandates that include the improvement of social conditions both on and off reserves. The band administration, as the elected body, has direct responsibility for the operation of the reserve and the social conditions of the band members.

Nonstatus Indians and MÉTIS are not subject to the Indian Act, and therefore are not eligible for assistance by DIAND (see INDIAN). Legally, the provinces are responsible for social assistance for these groups. They obtain some support from the federal Dept of the Secretary of State and have national, provincial and local associations that are concerned with their social conditions. INUIT, although not covered under the Indian Act, were included in the term "Indian" in the Constitution Act, 1867, and are thus subject to federal responsibility. They receive assistance from DIAND, and from the provincial governments of the NWT, Québec and Newfoundland.

Social conditions of Canada's native people must be discussed as a set of interconnected phenomena including geographical location, income level and cultural factors. Place of residence may be an isolated northern community or reserve and for others a large urban centre (see NATIVE PEOPLE, DEMOGRAPHY). There has been a major shift of natives to urban centres over the last 20 years, particularly among the young (under 40) southern native. The Clatworthy Study (1981) reported that over 1000 natives moved to Winnipeg each year (see NATIVE PEOPLE, URBAN MIGRATION). In the Far North, Inuit live in settlements ranging from a few dozen people to several thousand in size, although many still depend to a large extent on trapping, hunting and fishing. Over 50% of food is "country" food, harvested directly by native people.

Employment rates for natives are the lowest of any ethnic group, income per family often falling at or below one-half of that of the general city population (see NATIVE PEOPLE, ECONOMIC CONDITIONS). Up to 70% of natives are therefore dependent on some form of social assistance. Population increase of Indians is reported at 53% in the period 1961-81. Although no accurate figures are available for the Métis and non-status Indian, it is thought to be about the same. The Inuit population increase in that period was 115%. This increase has resulted in greater demands for social assistance, health services and jobs (see NATIVE PEOPLE, GOVERNMENT PROGRAMS).

Cultural factors interact significantly with social conditions. They may support and protect the family, or they may limit its success and be viewed as obstacles in the process of acculturation. Perhaps the most debated of the cultural patterns is the importance placed upon sharing. Historically, sharing was necessary to survival: a successful hunter shared food with the group and could expect others to share with him when he had need. In the contemporary cash economy and nuclear family, sharing can create problems; a family living in a small apartment is disrupted if another family moves in to share the proceeds of income and living quarters.

**Housing** Adequate housing in native communities and Indian reserves continues to be a major problem. One of every 3 Indian families lives in crowded conditions. Although the number of houses on Indian reserves increased 64% between 1958 and 1977, need has outstripped production and in 1977 there was a need for 11 000 new units. Houses built in the past were often inadequate or poorly constructed and now require major repair. The need for major repair increased tenfold to 24% in the years 1960-77. Inuit housing is largely supplied by governments of each jurisdiction on a rental basis keyed to income. Although early housing was inadequate, new designs have been developed in consultation with Inuit.

Utility services in native communities and Indian reserves, with the exception of electricity, are far below the national average. Running water is found in only about 50% of Indian homes, with greater percentages in the Maritimes, Québec, Ontario, Alberta and BC and less in Saskatchewan, Manitoba and in the North. Sewage service is also lacking in over half of the Indian homes (55%), distribution being similar to that of running water. Most arctic communities have trucked water and sewage systems, and many have "utilidors," encased above-ground piped water and sewage services.

Inadequate fire protection for Indians living on reserves is related to the extremely high rate of fire deaths. This rate in 1978 was 28 per 100 000, as compared to the national level of 4 per 100 000. In 1975 about 11% of the bands owned and operated their own fire-protection units; an additional 20% were dependent on outside municipal units under contract. Many arctic settlements have small water trucks and

pumps, but few have formal fire-protection equipment.

Road construction on Indian reserves has increased in recent years; in 1977-78, eg, 360 km of new road and over 640 km of reconstructed road were completed. This increase appears to be related to resource development.

**Health** Native death, illness and accident rates are 2 to 4 times the national average, reflecting poor health conditions such as inadequate nutrition, housing, sewage disposal, potable water supplies and access to health services. The highest death, illness and accident rates are in the infant, youth and middle-aged populations. Better prenatal care and improved health conditions are lowering infant mortality. Deaths from one to 45 years of age are caused mainly by violence — motor vehicle accidents, suicides, burns and fire, firearms and drownings. It is estimated that 50-60% of accidents and deaths are alcohol related. Indians surviving to 65 years have a greater life expectancy than the national average. The federal government provides health-care services for Indians and Inuit in both the Yukon and the NWT. See NATIVE PEOPLE, HEALTH.

**Antisocial Behaviour** The incidence of crime among the native populations of Canada is several times that of the general population. Crime, however, is not an isolated phenomenon: it is related to poverty, crowding, alcohol and cultural disintegration. It is estimated that over half of all crimes committed by natives are alcohol related. Native representation in penitentiaries in 1977 was 280 per 100 000, as compared to the non-native figure of 40 per 100 000. Prison rates are highest on the Prairies and in the North (over 40% of inmates are natives), followed by Alberta and BC (under 30%), and lowest in the Atlantic and central provinces (under 10%). Natives commit different crimes from whites and are more likely to be involved in violent offences against other persons than against property. They tend to be given shorter sentences than non-natives, which may reflect an understanding of the social conditions by the courts or the fact that the violence is of a more minor kind. Arctic correctional facilities emphasize traditional activities such as seal hunting and other innovative measures. The rapid increase in natural-resources employment for Inuit during the 1970s seems to have contributed to an increase in alcohol problems and related offences such as assaults. Increasingly, native people play an active role in their own policing services. Inuit-operated alcoholism-prevention and -treatment programs combat what Inuit see as a critical problem. In the 1970s and 1980s Indians began to develop their own police forces. RCMP and other police forces have added native constables to their staffs, and Indian bands and native communities have upgraded local constable skills and equipment.

The Indian juvenile delinquency rate is alarmingly high in Canada: 353 per 100 000, as compared to the national average of 128 per 100 000. This rate in part reflects the fact that fewer native juveniles are let off with a warning (15%) as compared to non-native (46%). The difference is still significant, even when the number of warnings is taken into consideration, and probably reflects the number of children living in care outside their homes, social conditions of their home communities, and the breakdown of the traditional family unit and support group. It seems unlikely that the crime and juvenile delinquency rates for natives will improve before major changes are made in the social conditions of native communities.

**Family Life** Formal Indian separations and divorces increased at a faster rate than for non-Indians in the 1971-76 period, but were still only one-half the rate for non-Indians in 1976. This figure, however, reflects the costs of court

divorces for an economically depressed population as much as anything else. The proportion of children born outside of marriage is typically some 5 times the national average, but this fails to take account of customary (ie, common-law) marriage. It is believed that the rates for Métis, nonstatus Indians and Inuit are comparable.

The number of children taken into care by social agencies increased fivefold between 1962 and 1977, a result of increased migration to urban areas and attendant social problems, notably alcohol abuse, the decline in the effectiveness of extended families under rapidly changing conditions, and the extension of non-native child-care agency services to Indians on reserves. Native groups, both Indian and Métis, have responded by developing their own agencies, and in the early 1980s Indian organizations contracted with DIAND and the provincial governments to assume responsibility for dependent and neglected children. The rate of adoption of native children by non-native — over 80% of such adoptions — is expected to drop, and Child and Family Services has attempted to locate and return to native communities many of the children previously placed in non-native homes; the courts, however, have considered continuity of placement in a stable situation to be more important than cultural factors. The number of children in care will also likely decline, given the native emphasis on treatment within the family rather than the non-native stress on apprehension and agency guardianship. The Inuit adoption rate has always been high, ranging from 15 to 70% of children born in arctic communities, because of the desire of older people for children; and the extended-family recognition of responsibility. Since the 1950s, traditional Inuit adoption practices have been formally recognized by the courts.

ART BLUE

Reading: DIAND, *Indian Conditions: A Survey* (1980); H.B. Hawthorn, *A Survey of the Contemporary Indians of Canada* (1967); J.A. Price, *Indians of Canada: Culture Dynamics* (1979).

**Native People, Urban Migration** Native people are the most rural ethnic population in Canada and there are strong antiurban, prurulent traditions within native society. Two-thirds of a million native people are tied to the bush and rural country by heritage, by inalienable rights in a rural land base, and by a broad range of community services paid for by the federal government. These conditions are supported by the CONSTITUTION ACT, 1982, a legal guarantee that is unique in the world for an aboriginal population with a predominantly hunting heritage (see ABORIGINAL RIGHTS).

The modern market system and other features of Canadian culture have penetrated most native communities to such an extent that the traditional subsistence way of life is being redefined as socially inferior, as "unemployment" and "poverty." Thus, with the added factors of an increase in native population and the depletion of game in some areas, people leave hunting, fishing and fur trapping to find "real employment" and the more materialistic way of life in the towns and cities.

A semiurban life in large villages was indigenous among the agricultural HURON and IROQUOIS in the E and the coastal SALISH, NOOTKA, KWAKWIKWUTL and TSIMSHIAN in BC. This heritage prepared people from these societies to live in cities somewhat better than natives with a seminomadic hunting heritage. Some 11% of the population of registered INDIAN bands have become urbanized because they are located adjacent to or within urban centres. The general level of urbanization of a province also affects the urbanization of the Indians who live there. Thus the level of off-reserve migration is high in Ontario and BC, moderate in the Prairies and

low in Québec, the Maritimes and the NORTH. The high rates of migration have come from the Indian bands that are of smaller size, have a tradition of working off the reserve, have poor on-reserve opportunities, higher education levels, more racially integrated schools and a poorly developed BAND government (see also INDIAN RESERVE).

While 28% of the status Indians officially live off the reserve, in fact the figure seems to be about 38%: 16% rural nonreserve, 11% in towns and small cities and 11% in cities greater than 100 000 in population (1979). The approximately 400 000 people who have a significant "self-identity" as MÉTIS or nonstatus Indians (which is more relevant than the broader category of Indian biological heritage) seem to have a similar rural-urban distribution to the off-reserve status Indians.

In moving off the reserve the Indian is leaving the jurisdiction where services are supported primarily by the Dept of INDIAN AFFAIRS AND NORTHERN DEVELOPMENT (DIAND), and moving into the jurisdiction of dozens of other federal and provincial agencies. All of the federal ministries, except Defence and External Affairs, now have Indian programs, and 21% of the billion-dollar federal budget for native programs is spent outside DIAND. The SECRETARY OF STATE in particular funds off-reserve Indian programs, providing several million dollars annually to support native political associations, urban Indian FRIENDSHIP CENTRES across the country, women's associations, and social and cultural associations (see NATIVE PEOPLE, GOVERNMENT PROGRAMS). The urban Indian centres provide valuable social functions and help to integrate the diverse social services available to Indians in cities. The Ontario Task Force on the Needs of Native People in an Urban Setting (1981) surveyed 232 people across the province in educational, political and social service positions, 87% of them native, 65% female and 53% with a university degree. Their ranking of the 10 most important services currently available to urban native people was as follows: drug and alcohol therapy; education; cultural awareness; employment and housing; family and children's services; justice and social welfare; youth services; recreation; women's services, health care and nutrition; and senior citizen's services.

Indian women tend to go further in school and take lower paying but steadier jobs than the men, and make up 54% of the urban Indian migrants nationally. A 1978 survey by the Ontario Native Women's Assn of 1094 Indian women showed only slight differences in the activities and attitudes between the women who lived on and off reserves. Most of the off-reserve Indians live in towns and the smaller range of cities, and continue to maintain strong kinship and friendship ties with those who live on reserves.

Social-workers' statistics often make urban Indian life look bleak and depressing, and ignore the warmth, humour and good times of daily life. Toronto, for example, has an estimated 30 000 Indians and ethnically active MÉTIS scattered across the metropolitan area from a wide range of tribal backgrounds and income levels. An important cultural creativity can be seen in the new kind of Indian society that is developing in urban Canada. The evolution of urban Indian institutions (Québec has a unique, more assimilating, urban pattern) has generally been in 4 stages: urban bar cliques and welfare services provided by non-Indians; normal family-oriented kinship-friendship networks as the Indians themselves take over social services such as court work, therapy for alcoholics, and social work with poor single-parent families; an elaboration of artistic, educational, political, recreational and religious voluntary associations; and the development

Features of Indian Life in Four Cities, 1979 (percent)

of academic, entrepreneurial and professional services by Indians. While it is normal to find elements of all stages present in a single city, one stage will usually be predominant at any particular time. Individual Indian migrants make an easier adjustment when they migrate to cities with a more mature Indian ethnic institutional system.

Studies across the country show that Indians usually make an initial urban migration to find a job when they are young. At first they correspond and return regularly to their reserves for visits and vacations, but gradually they settle into a stable life with a job, family and house in the city and make fewer return visits. Successful urban adaptations are related to several factors: the cultural background of individuals according to the traditional evolutionary level of their native social heritage; historical elements such as the length and intensity of white contact; ecological elements such as the urban proximity of their communities; the local quality of white receptivity such as the extent of anti-Indian racism; and the maturity of urban Indian ethnic institutions in the city they move to. A regional ranking of successful urban adaptations starts high with Québec, where few Indians leave reserves but are relatively well received when they do move; next are southern Ontario, southern Alberta and Vancouver, which are high on evolutionary level, urban proximity and mature ethnic institutions; then BC, the Yukon, the NWT and the Maritimes; and, finally, northern Alberta, Saskatchewan, Manitoba and northern Ontario, which have the poorest urban adaptations on account of widespread anti-Indian racism, simply organized band societies, low urban proximity and relatively immature urban Indian ethnic institutions.

Urbanization across the Arctic, from Siberia to Greenland, has been a process of concentration

from hundreds of very small seminomadic aboriginal hunting groups into dozens of permanent villages, and a few large towns such as INUVIK and FROBISHER BAY. Since INUIT, mixed-bloods and whites must live co-operatively in the same communities, people get to know each other and there is less racial prejudice and discrimination than in the northern part of the Prairie provinces, where Indians and MÉTIS tend to live in reserves or other communities segregated from the white towns. Social problems in the Arctic tend to develop in the large towns, or where there is a high turnover of southern workers in boomtown conditions, as at TUKTOYAKTUK, the base for the oil exploration in the Beaufort Sea.

JOHN A. PRICE

Reading: D. McCaskill, "The Urbanization of Indians in Winnipeg, Toronto, Edmonton and Vancouver: A Comparative Analysis," *Culture* (1981); J.A. Price, *Native Studies: American and Canadian Indians* (1978) and *Indians of Canada: Cultural Dynamics* (1979).

**Native-White Relations** Europeans first visited N America in their quest for fishing grounds. By the late 17th century they had penetrated into the northern half of the continent in search of furs. Over several centuries and across half a continent, many kinds of individual and group relations between native people and whites were established. The situations of contact changed over time, the pattern of change from S to N and from E to W reflecting the movement of Europeans. The BEOTHUK and the MICMAC were among the first Indians of Canada to meet the Europeans. The Beothuk, a small group, were treated as enemies and as wild animals to be destroyed. They responded with resistance and flight. Most were killed or died off as a result of economic, social and physical disruption of their lives. The Micmac, however, became allies and partners of the French.

Peaceful and friendly relations, linked to common goals such as the FUR TRADE, were maintained when they suited the needs of the parties involved. These ties sometimes led to marriages and personal friendships and to greater cultural understanding. When there was no basis for co-operation and material aid, there was likely to be competition, friction and violence. Prejudices and stereotypes were aggra-

The Red Lake chief making a speech to the governor of Red River at Ft Douglas, 1825; coloured lithograph by Peter Rindisbacher. The vast majority of Indian groups continued to live as independent nations into the 19th century. Fur traders discouraged assimilation as being bad for trade (courtesy Public Archives of Canada/C-1939).

vated and reinforced by economic conditions and the desire by the whites to acquire more and more Indian land.

The fur trade, at which the native people were adept because of the nature of their economy and technical skills, dramatically affected the organization of Indian societies. In exchange for pelts, the Europeans offered new, decorative and often useful goods, eg, weapons and utensils that were longer lasting and more efficient than some of the native people's own stone, bone, wood and hide artifacts.

Like the Indians, the Inuit generally received the Europeans with an initial attitude of curiosity and cordiality. The Inuit had their earliest European contact with explorers (in the 16th century) and whalers (by the early 18th century). Inuit hunted food for the whalers and were hired as sailors and harpooners, and they traded pelts for European goods. European diseases, introduced first by whalers, spread among the Inuit in epidemic proportions. By the late 19th and early 20th centuries whalers had depleted the whale population, first in the eastern Arctic waters and then in the western Arctic. By this time the Inuit in those areas had become dependent on European trade goods.

The experience of each people that came into contact with the Europeans was unique, but the overall effect of such contact was similar. The technology and economy of native culture began to change even before face-to-face contact had taken place, because the items that the Europeans traded frequently preceded the Europeans themselves. Native people moved from their aboriginal territory to pursue the pelt-bearing animals, and this altered their economy and sometimes led to conflict with the previous occupants of an area. Native people also became overspecialized in their economic dependence on the fur trade and European goods, neglecting their aboriginal technology and in some cases their traditional food base. When the fur trade moved deeper into the interior, it left the native people dependent upon European goods and upon new forms of employment, eg, as canoeists, mercenaries, food suppliers, guides and translators. As the traditional economic base deteriorated, many native people became destitute. At the same time, disease decimated their populations. The HURON and PETUN populations were reduced by 50% in one decade (1630s) as a result of EPIDEMICS. The HAIDA on the Queen Charlotte Islands declined from a population of about 8000, in the early 19th century, to about 800 by the late 19th century.

From the mid-17th century to the late 19th century, this population decline led many Europeans to believe that native people would disappear. The autonomy of the native people first in the economic and technological spheres, then in the social, political, demographic, religious and even artistic spheres, was increasingly eroded as the Indians moved from a position of collaboration and partnership with the fur traders to a condition of dependence and then subjection. Missionaries, messianic religions and revitalization movements contributed to or reflected the collapse of traditional systems of social and religious organization. Cultural survival was sought in Indian-based religions, some of which borrowed and adapted elements of Christianity. Responses to the missionary appeal varied among native people from acceptance to rejection; some native people believed the power of the newcomer might be drawn upon by the Indians (see NATIVE PEOPLE, RELIGION).

By the middle or late 19th century, relations between Indians and Europeans had entered a new phase because hundreds of thousands of Europeans had settled in the Maritimes and in central Canada. The new dominant economy — agriculture — pushed the Indians to the sidelines and backwaters of social and economic

life. In the same year as the Royal PROCLAMATION OF 1763, PONTIAC organized an armed resistance of more than a dozen tribes in the Ohio Valley and Great Lakes area against the British takeover from the French after the Seven Years' War and the encroachment of British colonial settlers across the Appalachian Mountains. TECUMSEH, like Pontiac, tried to resist white settlement; his alliance with the British was intended to help achieve this goal, but after the War of 1812 the Great Lakes Indians were no longer important military or economic allies. As the European population became a larger and larger majority, European culture came to dominate N America.

The Royal Proclamation gave the imperial government the sole right to alienate lands from the Indians and initiated the procedure of signing land-surrender treaties between the British and Indians in N America. In the late 18th and early 19th centuries, there followed, in Upper Canada [southern Ontario], a series of land surrender treaties that confined Indians to small holdings and made large tracts of land available to settlers. Indians were relieved of their lands, through treaties of land surrender, through designation of reserves, and through expropriations of reserve lands. In the Maritimes, Québec, most of BC, the Yukon and parts of the northern territories, where treaties were not signed, the Indians were nevertheless obliged to give up large areas of land. It is very doubtful that Indians and whites had the same understanding of the land surrender treaties. In most Indian cultures, land was not regarded as a commodity that could be bought and sold. Evidence from Indian testimony shows that Indians understood these agreements to be matters of sharing, of friendship, of mutual respect, and not final and irrevocable sales of land. On the European side, however, these treaties were regarded as legal purchases of land, with attending obligations such as the provision of annual payments, farm supplies, medical aid, and so forth.

Throughout the 19th century, federal legislation shaped the life of native people. In 1876 the INDIAN ACT was passed, consolidating previous legislation and more clearly defining and confining the native people. Public and legal affairs of status Indians were governed by successive amendments and a new Indian Act in 1951. Bands were assigned reserve lands, which constituted the remains of the vast homelands once held by the native people. These reserves were to be training grounds for assimilating the native peoples into the general society. At the same time, the Indians were to be removed from the influences that were judged as "undesirable" and submitted to controlled culture change toward "civilization" and self-sufficiency.

Like the Indians of the Prairie provinces, the MÉTIS also experienced the effects of the flood of European settlers. Their efforts to resist this threat resulted in the RED RIVER REBELLION and NORTH-WEST REBELLION. Their resistance was crushed after brief outbreaks of war and their political leader, LOUIS RIEL, was convicted of treason and executed (1885). In the late 20th century, paralleling some of the more recent Indian movements, the Métis have begun to reassert their identity.

From the early 19th century, government has pursued a policy of encouraging the assimilation of the native people. European colonizers regarded Indian culture as "backward," "stagnant," "primitive," and "inferior" to European culture. The policy of assimilation would, it was thought, remedy the situation. Indians who seemed to accept programs for cultural change were seen as "progressives"; those who resisted were "conservatives." The enfranchisement system removed an Indian from this group; in exchange for citizen status and voting privileges Indian status was lost. In the late 19th century and early 20th century, Indian administrators

interfered increasingly in the everyday affairs of reserve life. Indian landholdings came to be seen as an impediment to "progress" and "development," and this justified the expropriation of reserve lands, especially those close to urban settlements.

To ensure their own survival, Indian leaders have frequently made compromises with the Europeans. CROWFOOT expressed his appreciation for aid given the Blackfoot and signed Treaty No 7 (1877) as a means of further protection. Chief Herbert Wallace, a Port Simpson Tsimshian of the early 20th century, credited the missionaries with assisting the Indians to understand better their own LAND CLAIMS and land rights. At that time the Nishga renewed their land protest with the Nishga Petition (1913). By the late 20th century some of the most acculturated Indian leaders had also become the most insistent critics of the poor treatment accorded Indians and advocates of greater concern for the survival of Indian traditions as well as political and economic rights. The White Paper of 1969, which threatened Indian survival, and to which Indian spokesmen such as Harold CARDINAL responded vigorously, changed the course of Indian protest. New Indian organizations sprang into existence and existing organizations were rekindled with enthusiasm.

Pan-Indianism has been fostered to a degree by the meeting of peoples of various tribes and cultures in the cities and as a result of a common language, residential schools (before the second half of the 20th century) and increased physical mobility. One of the most exciting adaptive possibilities lies in the Northwest Territories where, unlike most of Canada, native peoples constitute the majority of the population.

Since 1971, the year the Inuit national organization, the Inuit Tapirisat of Canada, was formed, Inuit have also made a greater effort to gain control over their own affairs. Leaders have emerged from among a generation of younger people more familiar with the culture of southern Canada, but determined to preserve and develop Inuit land and culture.

The native people, though socially, culturally and economically exploited by centuries of relations with non-natives, have survived as a people. They now demand greater control of and participation in all the spheres of public affairs that govern them. See also NORTH and various entries under NATIVE PEOPLE. E.P. PATTERSON *Reading: E.P. Patterson, The Canadian Indian (1972).*

**NATO (North Atlantic Treaty Organization)**, Canada's first peacetime military alliance, placing the nation in a defensive military arrangement with the US, Britain and the nations of Western Europe. In 1947 there was much concern in Ottawa as the Soviet Union created a buffer zone in Eastern Europe between itself and Germany. The USSR was apparently pursuing a policy of aggressive military expansion at home and subversion abroad, and there was real fear that France or Italy might become communist (see COLD WAR). The problem was complicated by what Ottawa saw as a resurgent isolationism in the US, an unwillingness by Congress to pick up the international burdens that France and Britain, both weakened by WWII, could no longer bear. The answer seemed to lie in an arrangement that would link the democracies on both sides of the Atlantic into a defensive alliance, thus securing W Europe from attack while involving the US firmly in world affairs. An extra advantage for Ottawa was that such an arrangement would bind together all of Canada's trading partners, and it thus suggested potential economic benefits.

The initial public expression of this thinking was that of ESCOTT REID, Dept of External Affairs, at the COUCHING CONFERENCE on 13 Aug 1947. Other Canadians, including Reid's minister,

Louis ST. LAURENT, picked up the idea, and it was soon being discussed in Washington and London. Secret talks between the British, Americans and Canadians followed, and these led to formal negotiations for a broader alliance in late 1948. Canada's representative was Hume WRONG, ambassador to the US and a hardheaded realist. Wrong believed any treaty should be for defence alone, a view popular among the other participants. But Ottawa had grander visions, and L.B. PEARSON and Reid pressed him to argue for the inclusion of a clause calling for the elimination of economic conflicts among the parties. Despite misgivings, Wrong secured the inclusion of Article II, the "Canadian article." Regrettably, little came of it.

The treaty was signed 4 Apr 1949, but it was largely a paper alliance until the KOREAN WAR. That led the NATO states to build up their forces, and for Canada this had major consequences: a huge budget increase and the first stationing of troops abroad in peacetime. The Canadian contribution was small, but its quality was widely considered to be second to none. Nonetheless, high costs and the nuclear arms given the forces in 1963 worried critics. After a major review of foreign policy, the Trudeau government decided in 1969 to cut the Canadian contribution drastically, reducing the army and air elements. Although in 1983 Canadian troops continued in Europe in these diminished numbers, and although a new Soviet truculence in the 1980s raised concerns, the Canadian commitment of arms and men to the alliance remained substantially lower than other NATO partners wished.

J.L. GRANATSTEIN

**Natrass, Susan Marie**, trapshooter (b at Medicine Hat, Alta 5 Nov 1950). She has dominated her sport as few athletes ever have. By 1981 she had been women's world champion 6 times (setting several records in the process) and was the perennial Canadian and N American champion. At the 1976 Montréal Olympics, she was the first woman to compete in her sport. In 1981, Natrass won the LOU MARSH TROPHY as Canada's athlete of the year, gained Canada's female athlete of the year honour, and was awarded the Order of Canada. GERALD REDMOND

**Natural Resources**, see RESOURCES.

**Natural Sciences and Engineering Research Council**, est 1978 as a crown corporation, reports to Parliament through the Ministry of State for Science and Technology. It comprises a president, a vice-president and 20 members representing Canadian universities, industry and labour. It was established to promote science and engineering outside the health sciences; it also responds to the minister's requests for advice on specific research.

**Nault, André**, Métis leader (b at Point Douglas, Red River Colony 1829; d at St Vital, Man 1924). Although a kinsman of Louis RIEL and always considered a Métis, Nault was not of mixed blood. Interference with his hay privileges by surveyors provoked the first armed resistance in the North-West in 1869. During the rebellion of 1870 he was in charge of the party that seized Ft Garry, and he sat on the council that condemned Thomas SCOTT on 3 Mar 1870. Nault commanded the firing squad the next day. Chased across the border and left for dead by Orangemen shortly after the Canadian takeover, Nault returned to St Vital and in 1873 was arrested with Ambroise Lépine for Scott's murder. Unlike Lépine he was not tried and was pardoned as part of the general amnesty of 1875.

J.M. BUMSTED

**Nault, Fernand**, stage name of Fernand-Noël Boissonneault, dancer, choreographer, teacher, director (b at Montréal 27 Dec 1921). As resident choreographer of Les GRANDS BALLETS CANADIENS Nault has created a succession of highly the-

atrical ballets which have greatly contributed to the company's popularity. Trained in Canada, the US and Europe, he danced with American Ballet Theatre 1944-65 and was also a company ballet master from 1958. His lengthy association with Les Grands Ballets Canadiens began in 1965 and he has variously held the positions of associate director 1967-74, director of schools 1974-76 and resident choreographer. Nault was guest choreographer of the Colorado Ballet 1978-81 and its artistic director 1981-82.

MICHAEL CRABB

**Naval Aid Bill** As early as 1909 the Conservative Party believed that Canada should contribute "emergency" funds to help the Royal Navy maintain its superiority over the German navy. In Mar 1912 the RN required more "dreadnought" battleships. After consulting with Winston Churchill, First Lord of the ADMIRALTY, in July 1912, PM Borden agreed to provide up to \$35 million for 3 dreadnoughts. Payment was authorized by the Naval Aid Bill, introduced by Borden in Dec. The Liberals resisted bitterly, angered by Borden's neglect of the Canadian navy (est 1910 by the NAVAL SERVICE ACT). The Conservatives carried the bill on 15 May 1913 only by imposing CLOSURE on debate for the first time in Canadian history. However, the Liberal majority in the Senate defeated the bill 2 weeks later. WWI began before Borden could do anything more about naval policy.

ROGER SARTY

**Naval Service Act** established the Royal Canadian Navy, 4 May 1910. The Act proposed a small navy under the control of the Canadian government, with emergency provision for transfer to the British Admiralty. PM Wilfrid LAURIER had been under increasing pressure from the British government and Canadian imperialists to contribute directly to the Royal Navy, in the face of a growing challenge from the German navy. The Act was bitterly opposed by French Canadian nationalists, led by Henri BOURASSA, who opposed deeper involvement in imperial affairs. Laurier's compromise placated neither group, severely reduced his support in Québec, and ultimately contributed to his defeat in 1911. The navy survived, although it entered WWI with only 2 warships, the RAINBOW and the *Niobe*. See ARMED FORCES.

ROGER SARTY

**Navigation Acts**, a complex set of British laws dating from 1651 and 1660, regulating British and later imperial shipping and trade to foster economic and naval power (see MERCANTILISM). They governed ownership and crew nationality of vessels trading to Britain and her colonies, and the acceptability of routes and commodities. They were used to try to link British North America economically with the West Indian colonies; more generally, trade among BNA colonies and theirs with Britain had to be conducted in British or colonial vessels. Trade on the Great Lakes did not entirely fit the system; enforcement was lax before 1815 and by 1822 legislation permitted cross-lake trade in many commodities. Following repeal of the CORN LAWS in 1846, Canadians resentfully denounced the Acts as a burden. They were repealed in 1849 as part of Britain's overall movement to free trade.

DOUGLAS MCCALLA

**Navy Island**, Ont, 130 km<sup>2</sup>, the only Canadian island in the NIAGARA R, is owned by the federal government and managed by the Niagara Parks Commission; access is solely by boat. So named because its timber was used to build British naval vessels in the mid-1760s, it was occupied by insurgents during the REBELLIONS OF 1837-38. By the 1880s it contained a summer resort hotel, orchards and farm buildings. It was proposed as the site for a permanent United Nations headquarters in 1945, but remains an isolated, uninhabited wilderness reserve rarely visited except for summer camping.

JOHN N. JACKSON

**Navy League of Canada**, a volunteer organization fd 1918 under federal charter, but tracing its origins to branches of the British Empire Navy League established in Canada from 1895. The league's central function is the promotion of Canada's maritime interests, and it has consistently supported expansion of the merchant marine. The league provided seamen's comforts during wartime and has been active in youth training. Boy's Naval Brigades (now called Sea Cadets) were begun in 1903, and after 1945 training was extended to girls and preadolescents (Navy League Cadets). See CADETS; ARMED FORCES.

MARC MILNER

**Neatby, Hilda Marion**, educator (b at Sutton, Eng 19 Feb 1904; d at Saskatoon 14 May 1975). Best known as author of *So Little for the Mind* (1953), a critique of Canadian education, Neatby was also an influential member of the Massey Commission (see NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, ROYAL COMMISSION ON), a historian of Québec and a professor at U of Sask. In her 1953 study, Neatby called for a return to basics in primary education and an emphasis on traditional education for the best students in high school. She presented her ideas forcefully. These were strongly criticized by educational bureaucrats and widely debated throughout Canada. She published *Quebec, The Revolutionary Age, 1760-1791* (1966). The following year she became a companion of the Order of Canada.

MICHAEL HAYDEN

**Neatby, Kenneth William**, agricultural scientist (b at Sutton, Eng 30 Mar 1900; d at Ottawa 27 Oct 1958). Son of an English doctor who immigrated to Saskatchewan in 1906, Neatby joined the Winnipeg Rust Laboratory as a wheat geneticist in 1926, and in 1933 discovered how to forecast rust resistance in new wheat hybrids. He taught at U of A 1935-40 and then spent 6 years as farm liaison agent for a wheat wholesaler. After becoming director of the Dept of Agriculture's science service in 1946 he doubled its size and trebled its budget, laying the foundation for a new research branch that was formally created some months after his death. The dept's Neatby Building, housing 125 laboratories, commemorates him. DONALD J.C. PHILLIPSON

**Nechako River** rises in the COAST MTNS in W-central BC and flows E to form the principal tributary of the FRASER R. Because of massive damming of its headwaters, it is no longer possible to give its length or tell exactly where it used to rise. Since the 1950s its headwaters have been backed up into the huge Nechako Reservoir behind Kenney Dam, and two-thirds of this flow is diverted W to provide power for aluminum production at KITIMAT. The river drains 46 000 km<sup>2</sup> (14 000 km<sup>2</sup> above the dam). Its principal tributaries are the Cheslatta, Nautley and Stuart rivers. James McDougall of the NWC was the first non-native to reach the Nechako (1806), called *Incha-Khoh* ("big river") by the local CARRIER Indians. In 1807 SIMON FRASER established Fort George (now PRINCE GEORGE) at the Nechako-Fraser confluence. Fur traders in the valley were followed in the late 19th century by prospectors heading for the Omineca and Klondike gold-fields and by workers on the Yukon telegraph line. Homesteaders came to farm in the early 20th century. Today the river valley supports an economy based on farming, forestry and mining. The Nechako and its tributaries are also important salmon-spawning streams. Diversion and regulation of the river for power generation caused the displacement of native and non-native people in the 1950s and adversely affected salmon stocks.

ROSEMARY J. FOX

**Neel, Louis Boyd**, conductor, administrator, lecturer, surgeon (b at Blackheath [London], Eng 19 July 1905; d at Toronto 30 Sept 1981). In 1932, while maintaining a busy surgical prac-

tice in London, Neel formed the Boyd Neel Orchestra, a chamber ensemble of 17 string players performing and recording contemporary music as well as the established repertoire. A surgeon in the British navy in WWII, he organized concerts for the armed forces. He guest-conducted most important symphony orchestras and opera companies before coming to Toronto as dean of the Royal Conservatory of Music (1953-71). He conducted the CBC Symphony Orchestra (1953-64), founded and conducted the Hart House Orchestra (1954-71) and conducted the Mississauga Symphony Orchestra (1971-78). Awarded honorary degrees from the Royal Academy of Music and U of T, he was a Commander of the British Empire. MABEL H. LAINE

**Nègres blancs d'Amérique** (1967), a Marxist analysis of Québec history and a program for the future, written under the guise of autobiography by Pierre Vallières. Written while Vallières was confined in a Manhattan jail for FLQ activities, it dramatizes his impoverished, frustrated childhood during the Duplessis era as the son of working-class parents in Longueuil-Annexe; his checkered career as a philosophy student, office worker, Franciscan postulant, writer and friend of the poet Gaston MIRON and of the intelligentsia associated with CITÉ LIBRE, PARTI PRIS and *Le Devoir*; and his "conversion" to Marxism and FLQ involvement following a trip to France and Spain. To Vallières, Québec's working class reveals the characteristics of a colonized people; "white niggers" denotes a condition of being which he felt could be altered only through violent revolution. The work was revised and expanded in 1969, and it was translated in 1971 by Joan Pinkham as *White Niggers of America*. MICHÈLE LACOMBE

**Nelles, Percy Walker**, naval officer (b at Brantford, Ont 7 Jan 1892; d at Victoria 13 June 1951). Nelles achieved his first command, HMS *Dragon*, in 1929 and 2 years later took over HMCS *Saguenay*, the first warship built specifically for Canada. As chief of the naval staff 1934-44, he was instrumental in the navy's survival of the Depression and the architect of its phenomenal wartime growth. An able, if colourless, administrator, Nelles was sent to London in Jan 1944 as liaison officer following a bitter break with naval minister A.L. MACDONALD over the handling of naval expansion. He retired in Jan 1945. MARC MILNER

**Nelligan, Émile**, poet (b at Montréal 24 Dec 1879; d there 18 Nov 1941). A romantic, Parnassian and symbolist, Nelligan was an outstanding turn-of-the-century writer. Except for a few summer vacations in Cacouna and a sea voyage about which little is known, Nelligan spent his entire life in Montréal. He attended the École Olier 1886-90, Mont Saint-Louis 1890-93 and the Petit Séminaire de Montréal 1893-96. In Sept 1896 he enrolled in the Collège Sainte-Marie, which he left in Mar 1897. He became friendly with Louis Dantin and Arthur de Busières, and on 10 Feb 1897 he was elected a member of the École littéraire de Montréal and began writing poetry with increasing ardour.

His first poem, "Rêve fantasque," had been published in *Le Samedi* on 13 June 1896, under the pseudonym of Émile Kovar. Other poems appeared in *Le Monde illustré*, *Alliance nationale* and *Le Petit Messager du Très-Saint-Sacrement*. In the course of his reading, he discovered Lamartine, Hugo and Millevoeye, Verlaine, Baudelaire and Pierre Dupont, Rodenback and Rollant, Catule Mendès, Heredia and Leconte de Lisle, and other Parnassian and symbolist poets such as Sully Prudhomme, Théodore de Banville, Albert Samain and Arthur Rimbaud. He was fascinated by the dark world of Edgar Allan Poe.

Nelligan recited his poems brilliantly at the 4 sessions of the École littéraire de Montréal. At

Poet Émile Nelligan (1904), whose sad and nostalgic poetry has given him almost legendary status in Québec literature (courtesy Public Archives of Canada/C-88566/Laberge/Gill Collection).

the last meeting, held in the Château de Ramezay on 26 May 1899, he performed a forceful reading of his "Romance du vin," which, with his unforgettable "Vaisseau d'or," has contributed to his almost legendary fame. On 9 Aug 1899, exhausted, ill and on the verge of insanity, Nelligan was taken to the Retraite Saint-Benoît; in 1925 he was transferred to the Hôpital Saint-Jean-de-Dieu, where he remained until his death.

Nelligan's work, which includes some 170 poems, sonnets, rondels, songs and prose poems, is strikingly lyrical. The poet's voice is sad and nostalgic, oscillating between the theme of the passage of time and a hallucinatory vision of the world. Conveyed through traditional prosody, Nelligan's imagery often attains the symbolic. His work was collected by Louis Dantin and published in 1904. Three subsequent editions were issued in 1925, 1932 and 1945. In 1952 Luc Lacourcière published a critical edition of the work, which was reprinted in 1958, 1966 and 1974. Two deluxe editions appeared in 1967 and 1979. PAUL WYCZYNSKI

**Nelson, BC, City**, pop 9143 (1981c), inc 1897, named after Hugh Nelson, Lt-gov of BC, overlooks the W arm of Kootenay Lk, 660 km E of Vancouver. The prehistoric boundary of the Interior SALISH and the KOOTENAY is nearby. In 1887 Silver King Mine on Toad Mt led to rapid growth in Nelson. The first railway in the Kootenay reached here in 1892; the Spokane Falls and Northern Ry (Burlington Northern) followed in 1894. Nelson soon became a transfer point for lake traffic and, with completion of the Crow's Nest Pass Ry and the Kettle Valley line (1898), developed as a railway maintenance and

service centre. A copper and lead smelter operated in Nelson 1896-1907. Disease virtually eliminated fruit farming between 1920 and 1950. Nelson remains the administrative and wholesale distribution centre for the Kootenay region. For a time, logging and sawmilling became important, but the plywood plant was permanently closed 1982. The instability caused by closure of Notre Dame U seemed to have been overcome by the establishment of the David Thompson University Center, but the centre was also closed (1984). WILLIAM A. SLOAN

**Nelson River**, 644 km long, flows NNE out of Playgreen Lk, at the NW tip of Lk Winnipeg. It spills out into a number of lakes, including Cross, Sipiwek, Split and Stevens, flowing E from the latter into Hudson Bay. Its main tributaries are the Burntwood R, on which THOMPSON, Man, is located, and the Grass R. Sir Thomas BUTTON wintered at its mouth 1612 and named it for Robert Nelson, a ship's master who died there. The entrance to the river became the scene of a bitter struggle for the fur trade, and YORK FACTORY was established at Marsh Point, a peninsula separating the Nelson and HAYES R. However, the Hayes, not the Nelson, became the main route from the bay inland. The Nelson takes an often turbulent course through the granitic shield; as the last link in the long SASKATCHEWAN R system and as a conduit for the waters of the Red and Winnipeg rivers as well, it has a mean flow at its outlet of 2370 m<sup>3</sup>/s — roughly the same as the Columbia R. Today the Nelson's drop and huge volume are exploited for hydroelectric power. The largest developments are Kettle Rapids, built 1970-74 (1.2 MW), Long Spruce, built 1977-79 (0.9 MW), and Kelsey, built 1960-72 (0.2 MW) to provide power for nickel smelters at Thompson. JAMES MARSH

**Nematoda**, phylum of unsegmented, cylindrical worms; approximately 30 000 species are known. Nematodes exhibit both radial and bilateral symmetry. The smallest adults are under 0.25 mm long; the largest (whale parasites) may exceed 9 m. Nematodes are pseudocoelomate, ie, have an unlined space between the body wall and digestive tract. Flexible cuticle covers the fluid-filled body. The digestive tract (a muscular, glandular esophagus and simple intestine) extends from mouth to anus. The mouth may contain elaborate, cuticular (horny) teeth, plates or a hollow spear. Circulatory and respiratory systems are absent. Sexes are separate. All nematodes, regardless of habitat or life-style, possess similar life cycles: 4 larval stages, separated by a molt in which old cuticle is shed and replaced, precede the adult stage. Molts may be the only indication of development since larvae may be superficially identical to adults. Most

nematodes are free-living scavengers, herbivores or predators, in soil, fresh water or salt water. Parasitic species living in plants or animals are less common but more notorious. The golden nematode has decimated potato crops in Newfoundland and southern Vancouver I. Others cause serious damage to timber, field and greenhouse crops. *Trichina* worm in pigs or bears and dog round worm are familiar animal parasites. Virtually every animal can be infected with several species. Nematodes have been classified variously as an order, class or phylum, and were once considered a class of phylum Aschelmintha.

T.F. MACE

**Nepheline Syenite**, white to whitish grey, medium-grained igneous rock. It consists of nepheline, potash and soda feldspar and accessory magnesium and iron-rich minerals. The Canadian nepheline syenite industry began in 1932 with the staking of claims on Blue Mt near Peterborough, Ont. A long period of persistent efforts in technical and market research and in development was necessary to establish this unique industry. The use of nepheline syenite as a raw material for glass, ceramic and filler industries was first developed in Canada, which was the world's only producer for many years. Over the years, nepheline syenite has become preferred to feldspar as a source of alumina and alkalis for glass manufacture. It promotes more rapid melting at lower temperatures, thus reducing energy consumption, lengthening the life of the furnace and improving yield and quality of glass. The material is used in ceramic glazes and enamels and in fillers in paints, papers, plastics and foam rubber. A growing market is developing in the white-ware industry where the material is used as a body and a glaze ingredient for bathroom fixtures, vitreous enamels, china, ovenware, electric porcelain and ceramic artworks. The 2 Canadian nepheline syenite operations are located on Blue Mt in Ontario — giving the local pottery its characteristic name. Other occurrences have been identified but these are either too high in iron content or too variable in chemical composition for exploitation. Nepheline syenite occurs in southern BC, in the Bancroft area of Ontario and in southern Québec, but none of these deposits is, as yet, of economic significance. Extraction in the Blue Mtn area is by open pits. Ore is hauled to the mill where it is put through a magnetic separation circuit to remove iron-bearing minerals. The mill produces several grades of nepheline syenite, based on grain size and iron content, to meet a wide variety of markets. Shipments in 1981 were 605 000 t, worth about \$18 million. Canada exports 70% of its production; over 90% of exports go to the US. See METALLURGY.

J.Y. TREMBLAY

**Neptune Theatre**, in Halifax, named after Canada's first theatre in 1606, Marc Lescarbot's Théâtre de Neptune, opened on 1 July 1963 in a 525-seat former vaudeville house. Tom Patterson, founder of the STRATFORD FESTIVAL, and Leon Major, Neptune's founding artistic director, with the support of the CANADA COUNCIL, had visited Halifax in 1962 to explore the possibility of establishing a professional theatre there. The response was positive and, with dedicated support from the community, the theatre was obtained and renovations were undertaken.

The first company in Canada to engage its artists and technicians on a 52-week basis and to adopt the repertory system, Neptune attracted directors such as George McCowan and Mavor Moore. But within 4 years, the company was in grave financial difficulties and was rescued by the provincial and municipal governments. In 1978, when the theatre was in trouble again because of a decline in subscriptions, actor John NEVILLE was appointed artistic director. Within 5 years, Neptune's deficit had been eliminated

and the number of season-ticket holders had doubled. In addition to traditional offerings, Neville presented plays by Canadians such as Rick Salutin and John Gray. In 1983 Tom Kerr became artistic director.

**Netball** is a ball-goal game, with 7-a-side teams, played by girls and women, chiefly in English-speaking countries. As in BASKETBALL, the aim is to score goals by sending the ball through a goal ring attached to a 10-foot (3 m) pole. Players may not run with the ball, and are restricted to prescribed areas of the court. After the early form of basketball was introduced into England in 1895, it was modified as a sport for girls. Netball spread throughout the Commonwealth and was introduced in Canada in the early 1960s, the first games being played in Montréal in 1962. The Canadian Amateur Netball Assn was formed in 1973. In the 1979 world tournament, Canada placed 11th out of 22 countries. Netball in Canada is played mainly in NS, Qué, Ont, Alta and BC.

BARBARA SCHRÖDT

**Netsilik Inuit** (or Netsilingmiut) is one of several groups of INUIT who live on the Arctic coast of Canada W of Hudson Bay. When visited by the Greenlandic explorer Knud Rasmussen in 1923, the 259 Netsilingmiut were scattered throughout a territory of about 103 600 km<sup>2</sup> between Committee Bay, Victoria Strait and Somerset I. Until recently they were nomadic hunters. Their name means "people of the place where there is seal" and probably derives from the name of a lake, Netsilik (Seal), on BOOTHIA PENINSULA. The Netsilingmiut traditionally lived in small shifting family groups with simple nonhierarchical social organization. There was no formal government and no institutionalized group relationships. They hunted seal, caribou, musk oxen and occasionally polar bear, and fished for salmon, trout and char. By ingenious technology, they converted the bones, skins and flesh of these animals, as well as stone, snow and ice, into all the necessary survival materials.

The Netsilingmiut speak a dialect of Inuktitut, the language spoken by Inuit from northern Alaska to eastern Greenland. The Netsilingmiut had a detailed knowledge of an enormous expanse of territory. They sometimes spent several years on journeys to the coast of Hudson Bay and to the Thelon R, where they obtained knives, needles, wood for sledges and kayaks, and, early in the 20th century, firearms.

White men first entered Netsilik territory early in the 19th century, some in search of a NORTHWEST PASSAGE from the Atlantic to the Pacific; others in search of the remains of the FRANKLIN expedition. Explorers were a second source of goods from the outside world. A third source appeared in 1923, when the first HBC post was established on KING WILLIAM I. The HBC was followed in the 1930s by missionaries, then by the RCMP; and in the 1950s the process of change accelerated with the establishment of schools and nursing stations. Today, most Netsilingmiut live in or near the settlements of Spence Bay and Pelly Bay on Boothia Peninsula, and Gjoa Haven on King William I. They are Christian, many speak English and Inuktitut, and their life is heavily influenced by southern goods, services and institutions. Many of their values and ways of relating to one another remain Inuit. See also NATIVE PEOPLE, ARCTIC.

JEAN L. BRIGGS

**Nettilling Lake**, 5543 km<sup>2</sup>, elev 29 m, max length 123 km, is located toward the S end of Baffin I, in the Great Plain of the Koukdjuak, about 110 km SW of Auyuituq National Park, 160 km W of Pangnirtung and 280 km NW of the Frobisher Bay settlement. The third-largest lake of the Far North and tenth-largest in Canada, it is fed by AMADJUAK LK and several other small lakes and streams. The largest lake on Baf-

fin I, it is dotted by numerous islands and contains 3 bays: Mirage, Camsell and Burwash. It empties into FOXE BASIN from its W shore via the very shallow Koukdjuak R.

DAVID EVANS

**Neutral** in the early 17th century lived in the Hamilton-Niagara district of SW Ontario and in New York state. They spoke an Iroquoian language and were known to the HURON as the *Attiwandaronk*, meaning "people whose speech is awry or a little different." In 1615 Samuel de CHAMPLAIN misnamed them "la Nation neutre" since they were then at peace with the Five Nations and the Huron. The Neutral numbered about 40 000 and had an army of 4000 to 6000 warriors prior to the smallpox epidemics of 1638-1640. They lived in LONGHOUSES in about 40 settlements that included large palisaded towns, villages and smaller specialized seasonal hamlets distributed around the Niagara Peninsula and along the Niagara Escarpment. The main concentration of settlements was within a 32 km radius of Hamilton, Ont.

The Neutral had trading and war alliances with surrounding Iroquoian-speaking peoples, particularly the PETUN, Huron, Wenro, Kakwa, Erie, Andaste and probably some of the Five Nations of IROQUOIS. They were also allied with the OTTAWA against the Algonquian-speaking Mascouten of Michigan and Ohio. The Mascouten were long-standing, bitter enemies, and in 1643 the Neutral army captured and brought back 800 prisoners, both male and female, torturing some of them.

They relied upon horticultural crops of corn, beans and SQUASH, as well as on considerable hunting of deer, raccoon, black bear and the now extinct passenger pigeon. Their diet was augmented by fishing and nut collecting, and tobacco was cultivated for ritual and trade purposes. The men were heavily tattooed and in summer wore little if any clothing. They were extremely proficient at knapping chert arrowheads and scrapers, and the women made pottery, though it was gradually replaced by European copper containers. Such trade items were often included in their cemeteries as grave goods.

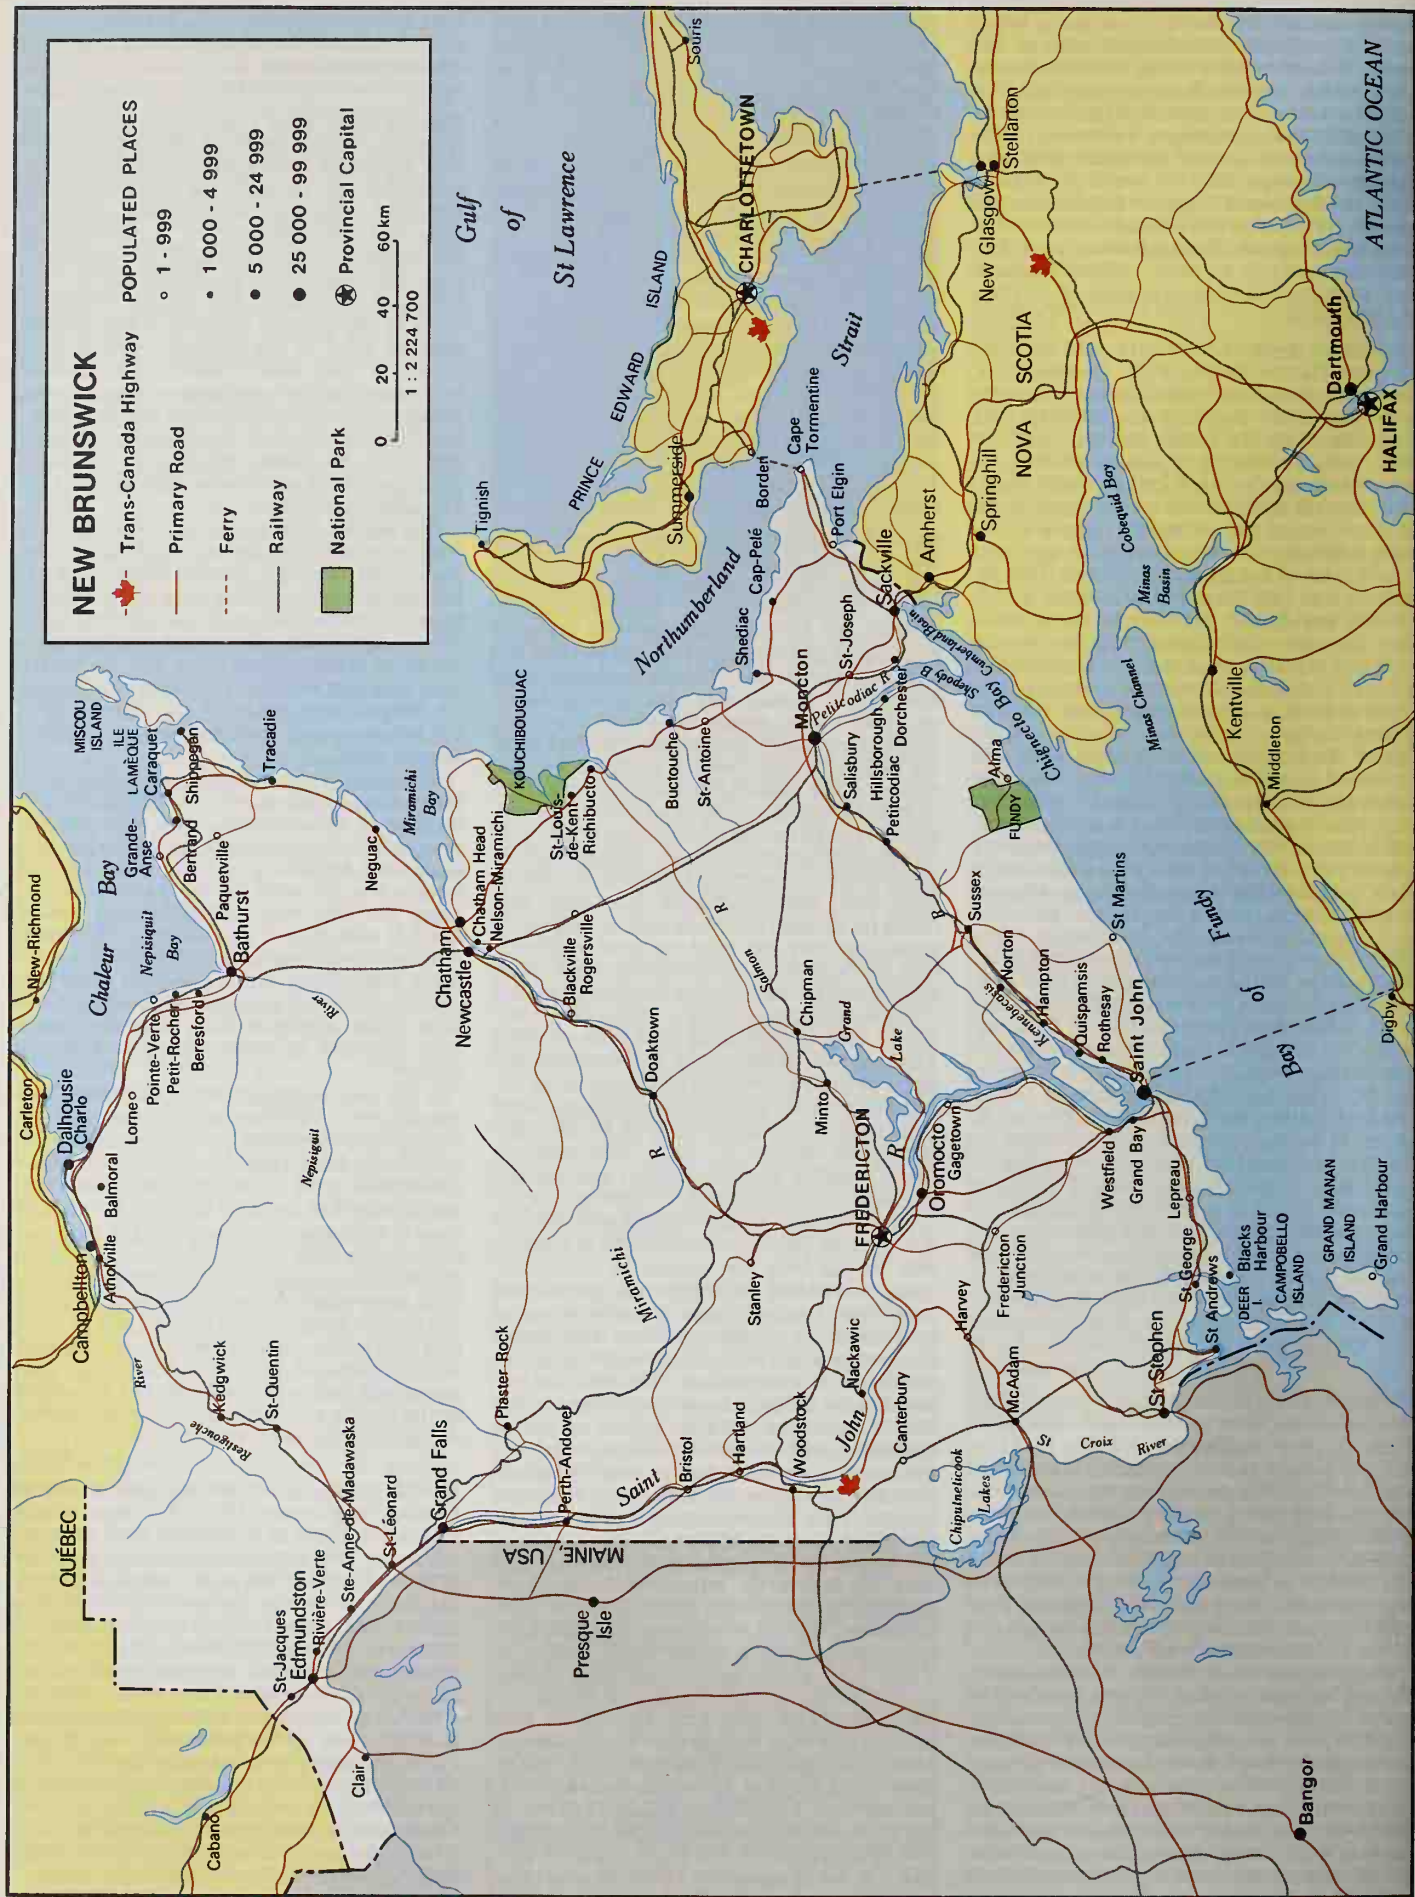

It has been suggested that unlike other contemporaneous Northeastern Iroquoians, the Neutral had developed politically beyond the confederacy level. Their powerful war chieftain Souharissen, with 10 Neutral tribes united under his rule, had far more political power than those of other groups whose chiefs had little real control over their tribesmen. The capital town Ounontisaston (9.6 km SE of present-day Brantford) was visited by the French Recollet priest Joseph de la Roche Daillon in 1626, and 14 years later by Jesuits Jean de BRÉBEUF and Joseph Marie Chaumonot. In 1650-51 the Iroquois dispersed and destroyed the Neutral as a cultural entity. See also NATIVE PEOPLE, EASTERN WOODLANDS and general articles under NATIVE PEOPLE.

WILLIAM C. NOBLE

**Neville, John**, actor, director, producer (b at London, Eng 2 May 1925). He began a distinguished career as a classical actor in Great Britain in 1947 and became associate producer of the Nottingham Playhouse Company in 1961 and its joint theatre director 1963-67. Neville came to Canada in 1972. As artistic director of the CITADEL THEATRE, Edmonton, 1973-78, he improved public support and the artistic stature and scope of the theatre. From 1978 to 1983 he served as artistic director of the NEPTUNE THEATRE, Halifax, where he again doubled subscriptions and toured productions to smaller communities. He made his critically acclaimed acting debut at the STRATFORD FESTIVAL as Don Armado in *Love's Labour's Lost* in 1983, repeating the role in 1984. Neville became the artistic director of the Stratford Festival in 1985, succeeding John HIRSCH.

ANTON WAGNER

**New, Chester William**, university teacher, historian, biographer (b at Montréal 9 Oct 1882; d at Hamilton, Ont 31 Aug 1960). Raised and educated in Hamilton, New was a graduate of U of T and McMaster. Ordained a Baptist minister, he served a brief pastorate before embarking on graduate work in history, some at Oxford and in Germany but the bulk of it at U of Chicago. His first teaching post was at Manitoba's Brandon College, then an affiliate of McMaster. In 1920 he joined the latter as professor of history and department head, a position he occupied until he retired in 1951. His colourful teaching style, renowned absentmindedness, and keen backing of intercollegiate athletics endeared him to generations of students. A part from his widely used high-school history textbooks his best-known works were *Lord Durham* and *Henry Brougham* (published posthumously). He was a fellow of the RSC.

CHARLES M. JOHNSTON

**New Brunswick** is one of 3 provinces collectively known as the "Maritimes." Joined to Nova Scotia by the narrow Chignecto Isthmus and separated from Prince Edward Island by the Northumberland Str, NB forms the land bridge linking this region to continental N America. It is bounded in the N by Québec and in the W by the US (Maine), and its history has often been influenced by the activities of these powerful neighbours. Successively part of an Algonquian cultural area, of French ACADIA, and of British Nova Scotia, it achieved separate colonial status only after the arrival of LOYALIST refugees from the American Revolution. In 1784 the British divided Nova Scotia at the Chignecto Isthmus, naming the W and N portion New Brunswick after the German duchy of Brunswick-Lunenbourg, which was also ruled at the time by King George III of England. NB was one of the 4 original provinces, its entry being essential to CONFEDERATION. Its influence declined sharply with the rise of the West and the central cities; yet it has survived a series of economic crises to develop progressive communities with enviable life-styles. The return of Acadians expelled during the SEVEN YEARS' WAR (1756-63) and the immigration of French from Québec created tensions between the 2 language groups. The trend in recent years has been towards tolerance and an increasing acceptance of duality in public institutions. NB is now the only officially bilingual province in Canada.

#### Land and Resources

The area of New Brunswick is 73 437 km<sup>2</sup>. The principal regional divisions are the watershed of the Bay of FUNDY, centering on the SAINT JOHN R valley, and the N and E shores. The Saint John R offered early access to much of the best farmland and timber resources of the province. Occupied by the descendants of Loyalists and other immigrants from Great Britain and the US, the valley has been inhabited mainly by Protestants who, until the 1960s, tended to dominate the government, and the educational and commercial institutions of the province. The residents of N and E shores, living in coastal fishing villages and interior lumbering settlements along the rivers, have been separated physically from the valley communities by uplands and belts of forest, and separated culturally by their predominantly French language and Catholic religion.

The 2 major divisions include several sub-regions. In the NW the French-speaking population of Madawaska County, looking to Québec for intellectual leadership and conscious of common interests with neighbouring Americans, talk of a "republic of Madawaska." Residents of Carleton and Victoria counties on the upper Saint John have a sense of community based on their virtual monopoly of the potato industry and strengthened by their strong com-

*Capital:* Fredericton  
*Motto:* *Spem Reduxit* ("Hope was restored")  
*Flower:* Purple violet  
*Largest Cities:* Saint John, Moncton, Fredericton, Bathurst, Edmundston, Campbellton  
*Population:* 696 000 (1981c); rank eighth, 2.86% of Canada; 50.5% urban; 47.3% rural  
     nonfarm; 2.2% farm; 9.7 per km<sup>2</sup> density; 1.8% increase from 1976-81; Jan 1984e  
     pop. 710 500  
*Languages:* 68% English; 31.4% French; 0.6% Other  
*Entered Confederation:* 1 July 1867  
*Government:* Provincial — Lieutenant-Governor, Executive Council, Legislative Assembly of  
     58 members; federal — 10 senators, 10 members of the House of Commons  
*Area:* 73 436 km<sup>2</sup>, including 1344 km<sup>2</sup> of inland water; 0.7% of Canada  
*Elevation:* Highest point — Mount Carleton (820 m); lowest point — sea level along northern  
     and eastern coasts  
*Gross Domestic Product:* \$6.6 billion (1982e)  
*Farm Cash Receipts:* \$195.1 million (1982)  
*Value of Fish Landings:* \$78.263 million (1983 prelim total); \$67.377 million (1982 total)  
*Electric Power Generated:* 11 588 106 MWh (1983)  
*Sales Tax:* 10% (1984)

mitment to evangelical religions. In the SW at the mouth of the Bay of Fundy lies Charlotte County, distinguished in part by its fisheries, including a unique sardine fishery, and by strong tourist and other ties with the US. There is another division at the head of Fundy, where Albert and Westmorland counties encompass an anglophone population conscious of its central location in a Maritime region, while the Acadian community of Westmorland and Kent counties aspires to the leadership of the French in the province. An anomaly in the regional division is the Miramichi section of Northumberland County, which as a traditionally English-speaking, mixed Catholic and Protestant area, bisects the Acadian community of the northern and eastern shores. In the N, Gloucester and to a lesser degree Restigouche counties form a heartland of Acadian culture.

**Geology** New Brunswick's rock foundation was largely formed in the Paleozoic era, 600 to 225 million years ago. It was part of a geological formation extending from the southeastern US to Newfoundland. Much of the rock in northern and western NB was created through ocean deposits of the Ordovician period (500-430 million years ago). These rocks were folded, intruded with granites, and overlain with lavas which reflected sporadic volcanic activity throughout the Paleozoic era. They contain the zinc-lead-copper deposits of the Bathurst to Newcastle area. Folding, faulted movements and volcanic activity reached a climax over 350 million years ago in what has been called the Acadian orogeny. Much of the base of the central and eastern parts of the province originated in the later Carboniferous period (ending 275 million years ago) with the rocks formed in rivers, swamps and shallow basins. These included red, green and grey sandstones, some of which are coal-bearing, and conglomerates and isolated deposits of limestone, gypsum, salt and oil-bearing shales.

**Surface** New Brunswick topography is characterized by northern uplands, rising to 820 m and mountainous in appearance, gently rolling hills in the centre and E, sharp hills on the

southern coast sloping down to tidal marshes and a lowland plain in the SE. The soils tend to be thin and acidic over the uplands, deeper but frequently poorly drained and acidic in the centre and W, and rocky in portions of the S. The best soils tend to lie in intervalle lands along the rivers. The upper Saint John is flanked by low plateaus of well-drained sandy loam with good lime content — excellent for growing potatoes. The finely textured soils of the Fundy lowlands are also suitable for agriculture. Whatever their agricultural deficiencies, NB soils do grow trees. Only 7% of the province is cleared land; 2% is covered with water; and 2% is regarded as barren wasteland, leaving almost 90% of the province under forest cover. Of this, 38% is softwood, 14% is hardwood and the remaining 48% is mixed, with softwood predominating in about half. Spruce and fir are the leading softwoods, followed in importance by cedar and white pine. Jack pine, red pine, hemlock and larch are also present. The hardwoods are led by red and sugar maples, poplar, white and yellow birch and beech in that order, with occasional ash, elm, hop hornbeam and red oak.

**Water** No part of New Brunswick is more than 180 km from the ocean, the principal means of early transportation. An extensive river system brought access well into the interior of the province, permitting early development of the timber trade and dictating patterns of settlement. The largest cities are located on the rivers, as are most of the towns and villages. Lakes are common in the S, with the largest, Grand Lk, more than 30 km in length.

**Climate** New Brunswick's climate tends to be continental, though tempered by proximity to the ocean. It is harshest in the NW where more than one-third of precipitation comes as snow, and temperatures are several degrees colder than the central interior. Coastal communities are several degrees warmer in winter and colder in summer, with annual snowfalls of only 15 to 20% of precipitation. The average frost-free period varies from about 100 days in the NW to 170 along the Fundy coast.

**Resources** The forest is the province's greatest

Near Bath in the Saint John Valley (courtesy New Brunswick Tourism).

natural resource, supporting lumbering, pulp and paper, hunting and fishing as well as the tourist industry. Second in importance are mineral deposits, which include the base metals near Bathurst in the N, potash deposits near Sussex in the S, significant coal reserves in the area of Grand Lk, oil shales in Westmorland County and recent gold discoveries along the Bay of Fundy. Third comes agriculture, with substantial potato production on the northern Saint John, and dairy and mixed farming largely in the river valleys. Fisheries rank 4th with ground fish, lobster, crab and herring taken from the Bay of Fundy, Northumberland Str and eastern shore fisheries. Both agriculture and fisheries support a substantial food-processing industry. The rivers, especially the Saint John in utilities at Mataquac, Beachwood and Grand Falls, have yielded significant portions of the province's energy needs. Still to be assessed is the energy potential of the Bay of Fundy tides which rise from 4.6 m at the entrance to 15.2 m at the head of the bay. Fish and game offer a recreational resource to resident and visiting sportsmen. Trout are caught throughout the province; bass and pickerel are available in southern lakes. In 1980, 37 837 bright salmon were taken by 20 633 licensed anglers and 96 674 licensed hunters reported a white-tailed deer kill of 18 344. Bear, ducks, geese and ruffed grouse are also hunted. A limited kill of moose is permitted. In recent years winter angling has been developed in 135 lakes and ponds. Approximately 1000 licensed trappers take furs (wildcat, beaver, fox, coyote, mink, muskrat, weasel, raccoon, otter, fisher, martin and lynx) valued at more than \$2 million.

**Conservation** Forest conservation efforts by provincial and federal governments have included forest inventories in 1958, 1968 and

1979, active suppression of forest fires, aerial attacks on the spruce budworm, replanting of forests and the maintenance of numerous game reserves. The most recent inventory reported a sharp reduction in burnt-over areas, an apparent increase in reforestation (the Department of Natural Resources reported planting 26 million seedlings on crown lands in 1980 and making available another 1.7 million for small freehold owners from provincial nurseries at Kingsclear, Madran and Kent), but an overall decline of approximately 5% in merchantable softwood. The decline was attributed to higher levels of harvest and the ravages of the spruce budworm. Shortages were also reported in hardwood available for veneer and sawlogs. The budworm, a moth whose larvae in summer months devour the needles of spruce and fir, did serious damage to provincial forests in the 1920s and then departed. Since 1952 the province has met a later outbreak with aerial spraying of pesticides which killed a portion of the budworms and their natural predators. However, the budworm's persistence as well as the potential damage to human health in the spray present the province with an acute dilemma.

In the 1970s salmon angling improved markedly with the federal ban on commercial salmon fishing. The war continues against poaching with the arming of wardens, the tagging of legally caught salmon, and jail sentences and vehicle confiscation for night hunters. Attempts to protect fish and game, and to assert an overriding provincial jurisdiction have brought wardens into conflict with Indians trying to defend traditional treaty and aboriginal fishing and hunting rights. The federal Department of Fisheries attempts to protect fishing stocks by the rotation of lobster seasons, by limiting commercial fishing licences and placing quotas on particular species, and by the division of fishing grounds.

## People

New Brunswick's initial European settlers were Acadian French who, with the use of dikes, farmed the marshlands of the Chignecto Isthmus and part of the northern shore of the Bay of Fundy. Following their expulsion (1755 onwards) their lands were taken by Protestant settlers from New England, Pennsylvania and Yorkshire, Eng. When the Acadians tried to return after the Peace of Paris in 1763, some were granted land in the Memramcook area and some found employment in fishing stations from the Gaspé to Cape Breton. When the Loyalists arrived, most of the Acadians on the lower Saint John pushed up the river to Madawaska. The Loyalist exiles, approximately 14 000 in number, penetrated the interior largely by way of the Saint John R. Essentially a cross section of society in the Thirteen Colonies, they included a very few college graduates and Anglican clergy and close to 1000 blacks, most of them slaves of wealthy Loyalists but some, perhaps a third, Loyalists in their own right. About 200 blacks later left for Sierra Leone and the remainder were joined by refugee blacks from the War of 1812. Although the Loyalists overwhelmed the perhaps 3000 residents of NB on their arrival, they too were diluted in the first half of the 19th century by immigrant waves of Scots and Irish who found employment in a burgeoning lumber industry. Forced to compete with cheap immigrant labour, older settlers frequently left. In the depression of the traditional timber and shipbuilding economy in the 1880s, it was the turn of the Irish and Scots to seek employment elsewhere. The growth of cities outside the region and the collapse of the new industrial economy in the 1920s continued to drain the population of most of its natural increase. Acadians, who were more resistant to economic pressures to leave, and were bolstered by immigration from Québec, consolidated their hold on the northern counties as railways opened new lands for colonization. The trend to urbanization changed NB from more than two-thirds rural before 1941 to predominantly urban by 1971. Then came a reversal as the officially designated urban population dropped from 62% to 53% in the decade, owing to a resumption of migration from the region as well as a residential move to the suburbs, which had been made attractive by improved services, cheaper land and lower taxes.

**Urban Centres** New Brunswick's chief metropolitan area is SAINT JOHN (pop 114 048). A leading centre of British North America in the mid-19th century, the city owed its importance to the timber trade (made accessible by its river) and to its ice-free port, which supplied the estuary and dominated shipping and shipbuilding on the Bay of Fundy. Saint John's metropolitan pretensions were flawed by its failure to secure the provincial capital or the university and undermined by NB's entry into a nation whose interests were continental rather than maritime. Saint John's current urban status is largely industrial, based on an oil refinery, pulp and paper mills, a nuclear power plant, dry dock facilities and a major container port. Second in importance as a metropolitan region is MONCTON (pop 98 354), which has long owed its importance to transportation and distribution facilities (headquarters of the Atlantic division of the CNR and a trucking centre). It is also the traditional headquarters for the Acadian media and financial institutions and in the 1960s became the site of a provincial francophone university. Ranking third, FREDERICTON (pop 64 439) gained its importance from Saint John's deficiencies — the provincial government and university. When the civil service and universities mushroomed in the 1960s and early 1970s, so did Fredericton. A neighbouring town, OROMOCTO (pop 13 648), the headquarters for CFB GAGE-

Le Village Acadien at Caraquet, NB, preserves traditional Acadian buildings (photo by Malak, Ottawa).

TOWN, reflects in its growth and decline the shifting status of the Canadian Armed Forces. BATHURST (pop 24 267), EDMUNDSTON (pop 21 901) and CAMPBELLTON (pop 15 508) emerged as largely single-industry towns when NB made the transition from sawlogs to pulp and paper manufacture. With base metal mining, a zinc reduction mill, and with a port at nearby Belledune, Bathurst is now becoming the industrial leader of the N.

**Labour Force** By occupation New Brunswick's labour force breaks down as follows: managerial and professional, 20%; clerical, 15.4%; sales, 10.4%; service, 14.3%; primary occupations, 6.1%; processing, 13.9%; construction, 10%; transportation, 4.6%; material handling, 4.3%. Service industries are the principal employers accounting for almost 50% of jobs available. Utilities at 10.8% and public administration at 8.1% make the non-goods-producing sector responsible for more than 68% of jobs. The primary industries of forestry, mining, fisheries and agriculture provide the base for most of the 14.6% of positions in manufacturing.

New Brunswick's potential labour force of persons over 15 years totalled 484 150 in 1976. The official participation rate of 54% was 7% under the national average. The rate was much higher in the 25-to-44 age brackets, approximating 88% for men and 47% for women. Participation rates were highest, approaching national levels, in the Saint John R valley and lowest (under 50%) in the northern counties of Gloucester, Northumberland and Restigouche. Participation rates correlated with difficulty in entering the labour force. Unemployment was highest in the northern counties. From 1976 to 1981 NB's unemployment rate, despite a 13.74% growth in jobs over that period averaged 12%, approximately 4% above the national level. Traditionally, young New Brunswickers have emigrated to find employment. Not since Confederation has the province held its entire natural increase and the 1960s recorded a net loss of 59% "going down the road." Emigration declined in the 1970s as the first half of the decade saw New Brunswickers return (though the second half saw a resumption of the exodus, when Alberta replaced Toronto as a principal attraction).

**Language** Of the total population of 696 400, 65% gave their mother tongue as English and 33.6% French in the census of 1981. Another 4870 cited European languages, 2055 Asian. Approximately 4000 were native Indians. Provincial language legislation is intended to provide equality between the 2 official languages. Institutional backing for the language legislation is provided by 2 parallel educational systems, including a French university with its own law school and other professional schools, and by the hiring of specially trained court interpreters, the creation of unilingual French schools wherever the lure of playground English seemed too strong, and the construction of French cultural

centres in Fredericton, Saint John and New-castle.

The children of the province's 2584 Micmac and 1438 Maliseet Indians attend regular provincial schools and receive other provincial services, including medical treatment, foster care for children, and forestry protection and roads for the 15 occupied reserves — all at federal expense. Indians are exempt from the 10% sales tax but pay other provincial taxes. The province supports Indian athletic events and has adopted a policy of affirmative action in assisting Indians to obtain jobs. The province, to date, has refused to recognize land claims of the Union of New Brunswick Indians.

**Ethnicity** The population of French origin grew dramatically after Confederation; from 44 907 or 15.72% in 1871 to 24.15% in 1901 and 33.56% in 1931. By the latter decade the figures for those of French origin and those giving French as their mother tongue (32.67%) had begun to diverge, suggesting a degree of assimilation. The gap had widened by 1961 when 38.82% gave French as their ethnic origin compared with 35.21% as their mother tongue. In 1971, following a period of declining birth rates, figures for ethnic origin dropped to 37% and for mother tongue to 34%, while only 30% reported French as the principal language in the home. By 1981 the Acadian population appeared to have stabilized, with a slight decline in these percentages in the recent census.

Other ethnic groups in 1871 included 29.27% English, 35.24% Irish and 14.31% Scots. These were highly represented in the emigration patterns of the depression of the 1880s and in subsequent rural depopulation. By 1971 only 57.6% of New Brunswickers gave their ethnic origin as British. Relative changes were also suggested by the rise of the percentage of French origin in the Roman Catholic Church from 46.8% in 1871 to 72.4% in 1961. Other New Brunswick ethnic groups in 1971 included Germans, 7350; Dutch, 4475; Scandinavians, 2985; Asians, 1400; Italians, 970; Jews, 765; Ukrainians, 525; and Poles, 450.

**Religion** In 1971, 52.2% of New Brunswickers professed adherence to the Roman Catholic Church. Of these 68.2% were of French origin inhabiting the northern and eastern shores. Of the remainder almost half resided in Saint John. Of the leading Protestant denominations, Baptists accounted for 14%; United, 13.4%; Anglican, 10.9%; Pentecostal, 2.7%; and Presbyterians, 2.1%. The Anglicans were concentrated in the lower Saint John R valley. Baptists and

Pentecostals were strong in the so-called bible belt from Victoria and Carleton E to Albert and Westmorland. The United Church, bearing both Methodist and Presbyterian traditions, was scattered throughout the English-speaking sections. Other religious groups included Salvation Army (2185), Lutheran (1880), Jewish (850), Ukrainian Catholic (700), Greek Orthodox (375), with "others" listed in the census totalling 11 885 and an identical number listed as having no religious affiliation.

### Economy

Since the early 19th century timber has dominated the New Brunswick economy. The province, like the Maritime region as a whole, underwent severe economic dislocation in the latter half of the 19th century as a declining shipbuilding industry, stagnant timber markets and increased tariffs struck hard at the outports. New railways and the rise of manufacturing towns failed to compensate for losses in the older industries. The 1920s saw a decline of the industrial towns, as their industries were closed down after takeovers by central Canadian competitors or were adversely affected by national policies and hindered from competing in national markets. By the 1930s pulp and paper mills had surpassed lumber in importance and their rise encouraged the development of hydro-electricity. Nevertheless, farm and fishing activity declined and emigration rates remained high in succeeding decades. Government campaigns for economic development in the 1960s and early 1970s, although not always successful, have seen the expansion of forest industries, the advent of a new and important mining industry, modernization of fisheries and farming, increased manufacturing based largely on local resources and the cultivation of tourism.

**Agriculture** The vicissitudes of agriculture in New Brunswick, as elsewhere in Canada, reflect a relative decline in the value of agricultural products and the abandonment of near-subsistence farming by rural people drawn to the attractions of a consumer economy. Although total production remained stationary, farm holdings declined from 31 899 in 1941 to 4551 in 1976; improved land went from 350 000 ha to 137 000 ha; and direct agricultural employment dropped from 26 834 in 1951 to an estimated 6000 in 1960. Meanwhile, the numbers employed in the processing and transportation of agricultural produce has grown to an estimated 18 000.

POTATOES, especially seed potatoes, are the province's chief agricultural export and account for 20% of the national total. Production is concentrated along the upper Saint John R valley with Carleton and Victoria counties accounting for approximately 80% of the crop and Madawaska another 15%. Dairy production is most

*New Brunswick Fashionables*, at Fredericton, hand-coloured lithograph by J.N. Giles, 1834. Fredericton was the early political and social capital of New Brunswick (courtesy Public Archives of Canada/IC-10546).

Potato fields in New Brunswick (photo by Karl Sommerer).

important in Kings, Westmorland and York counties where farmers supply the 3 major cities. Potatoes and dairy products together account for 44% of the province's farm income; beef, poultry and hogs make up another 32% and field crops 13% (fruit 7% and vegetables 6%); eggs and maple products round out the total. Producers are organized under approximately a dozen boards that market milk, turkeys, eggs, hogs, cream, chickens, apples, some forest products, and bedding plants.

**Industry** The non-goods-producing industries of New Brunswick account for 65% of the province's Gross Domestic Product, about 5% higher than the national average, and yield over 70% of the total wages and salaries. Of 289 000 jobs in 1980, 23 000 were in transportation, communication and other utilities; 8700 in finance, insurance and real estate; 60 000 in community, business and personal services, including educational and medical services; 35 000 in retail and wholesale trade, of which the annual retail value exceeds \$2 billion, and 40 000 in public administration and defence exclusive of crown corporations. Included in public administration were 4172 military personnel, chiefly located at CFB Gagetown, a training base for land forces, and at an air force base near Chatham.

The tourist industry in 1980 yielded revenues estimated at \$257 million and accounted for 12 600 "man years" of employment. To such attractions as Saint John's reversing falls, the potted-plant-shaped rocks on Albert County's Fundy coast, the tidal bore of the Bay of Fundy, and rugged forest and coastal scenery, the provincial government added highly successful recreations of historical communities: a Loyalist settlement, KINGS LANDING, near Fredericton and the Acadian Village at CARAQUET; the government has also created or drawn attention to more than 60 museums, restored fortifications and other sites of historic interest around the province. Two major national parks, Fundy near Alma and Kouchibouguac near Richibucto, are complemented by 58 provincial parks, several of which operate year-round. These encourage tourists to pause in their tours of the Maritime region and they enhance the quality of life for local residents.

Manufacturing industries are largely based on the processing of primary products produced locally. Forty-one percent of their net value of production is related to the forest industry. Food and beverage processing, notably the McCain enterprises at Florenceville and Grand Falls,

ranks 2nd in gross value of factory shipments. The Irving oil refinery in Saint John, the Brunswick Mining and Smelting in Bathurst, and the Saint John drydock are the other large producers. A \$3 billion contract for the building of patrol frigates for the Canadian navy was awarded to a Saint John firm in 1983. Significant too are chemical products, the processing of non-metallic minerals, metal fabricating and printing and publishing. Altogether in 1980 manufacturing employed 34 000 in approximately 1250 firms with an annual output valued at \$3.5 billion. Over 800 have fewer than 25 employees. Ninety percent of all firms are owned locally while only 4%, accounting for 8% of the jobs, are foreign owned.

The construction industry employed 17 000 in 1980 and represented an investment of close to \$1 billion. For most of the decade the nuclear plant at Point Lepreau was the largest project. By the end of 1981 major construction activity included the modernization of pulp and paper plants, potash developments near Sussex, a Mitel electronics plant near Buctouche and shipyard expansion at the port of Saint John.

**Mining** Mining was traditionally of scant importance in New Brunswick. The gypsum, granite and grindstones included among 19th-century exports were largely of local significance. Although coal led to a rapid development of the Grand Lk region, especially with the arrival of the railroad in 1903, that area never yielded enough to make the province self-sufficient. With coal's loss of status to oil and hydroelectricity, coal mining had come to a virtual halt by the mid-1960s. The energy crises of the early and mid-1970s led to coal's recovery through strip-mining, but by then coal was upstaged by mineral developments in the NE. The discoveries of extensive base-metal reserves in the Bathurst-Dalhousie region in the 1950s have raised the mining industry to a position of major importance. By 1981 the value of NB's mineral output exceeded half a billion dollars and directly employed 4000 men. NB's zinc production was 34% of the national total; silver 24.3%, lead 13.2%, copper 6.3% and antimony and bismuth were 92% and 78.9% respectively. Expansion continues with major potash developments near Sussex and gold discoveries near the Bay of Fundy. The growth of the mining industry has brought development into the poorest section of the province and has largely justified in economic terms the upgraded transportation, education, health and other services launched in the 1960s program of equal opportunity.

**Forestry** The forest which now covers almost 90% of the province has traditionally dominated the New Brunswick economy. Accessible rivers and a British preferential tariff led to the rapid development of the timber industry early in the 19th century as the white pine was slashed for British marine and domestic needs. Closely integrated with the timber trade was a widely diffused shipbuilding industry which both absorbed forest products and facilitated their access to markets. In the mid-19th century, forest products accounted for more than 80% of the province's exports. The timber trade had declined by the end of the century and the province lost markets from a shrinking West Indian economy, new American tariffs and fresh competition from W coast timber. These problems were only partially alleviated in the rise by the late 1920s of a vigorous pulp and paper industry. By the end of the 1970s the forest industry accounted for 14% of the jobs in the province, 38% of provincial exports and almost one-quarter of goods produced. Pulp consumed 80% of the timber harvested with the remainder going for lumber and similar products. Lumber mills tended to be small, with a majority contributing only 5% of production. Pulp mills demanding large capital outlays and a large work force have been major factors in the urban development of the province. Three pulp mills, controlled by the Irving interests, at or near Saint John, produce sulphate pulp, newsprint, tissue and materials for corrugated cardboard cartons. Mills at Newcastle and South Nelson produce sulphate pulp and pulp and paper respectively. Consolidated Bathurst's mill at Bathurst produces sulphate pulp and corrugated medium. The New Brunswick International Paper Company operates a newsprint mill at Dalhousie, and Fraser's Incorporated, a member of the Noranda group, has plants near Campbellton and Edmundston. Others include a hardwood pulp mill at Nackawic and a paper bag company at Barker's Point.

Of the 6 million ha of productive forest land, 52% is privately owned. The remaining 48% owned by the Crown has traditionally been leased to the larger firms. The 34% of woodland held in small parcels has supplied an important source of income for farmers and fishermen. The forest industry has also been the inspiration for a forest management school at Fredericton, a forestry faculty at U of New Brunswick, and for federal and provincial research laboratories in the province. The recognition of the potential limits of resources for which many are competing has led governments to abandon the leasing of crown lands in favour of long-term guarantees of timber to major producers.

**Fisheries** The fisheries of New Brunswick account for about 17% of the production of the Canadian E coast fisheries. In decline until the 1960s, the industry was revived by a modernization of methods and vessels. Additional enthusiasm was generated by expectations of a 200-mile (370 km) limit, finally asserted in 1977. Recent years have seen a decline in volume associated with a general reduction of fish stocks, although prices rose sharply in the late 1970s. The main fishing areas are the Gulf of St Lawrence, Northumberland Str and the Bay of Fundy. In 1980 the total value of the catch was \$48.7 million by 5200 fishermen operating 3100 vessels. In processed value, herring led at \$67.8 million; lobster was 2nd at \$40.8 million, and crab and cod followed with values of \$32.2 and \$13.7 million respectively. Exports accounted for almost half of the production with 64% going to the US, 18.5% to Europe and 8.2% to Central America. The fish-processing industry employed 10 000 workers in 130 plants in the province.

**Finance** Most financial institutions, such as banks and trust and insurance companies,

are local branches of central Canadian firms. Among the few exceptions are local credit unions and the Compagnie assumption mutuelle d'assurance-vie, largely an Acadian institution with its headquarters at Moncton.

**Transportation** Far from central markets and with their chief city aspiring to national port status, New Brunswickers have traditionally shown great concern about transportation. They have protested disproportionately high railway freight-rate increases, loss of regional autonomy in the federally owned Intercolonial Railway and a failure to channel Canada's winter trade through Canadian ports. In 1927 their region won a partial victory in the Maritime Freight Rates Act, which provided for statutory reductions in freight rates. In that year they created the Maritime Freight Rates Commission (now the Atlantic Provinces Transportation Commission) at Moncton, as a permanent watchdog of regional interests in transportation policy. In 1969 the Maritime Freight Rates Act was repealed in favour of one creating a regional committee to administer transportation subsidies to encourage industrial development. By then transportation had become much more complex as highway trucking surpassed the railways in the carriage of freight. Airplanes and buses carried the bulk of public passengers. The advent of containerized traffic, for which the ice-free facilities of the port of Saint John were particularly well suited, encouraged a renewed struggle for enhanced status as a national port.

Currently, New Brunswick has 2 major railways systems: the CPR which runs through the US state of Maine and whose eastern terminus is Saint John, and the CNR whose regional headquarters is Moncton and main terminus is Halifax. Passenger service operated for the 2 lines by the crown corporation VIA RAIL has been reduced to a train a day from and to central Canada, and rail-liner service between Fredericton, Saint John, Moncton and Campbellton.

Saint John, Moncton and Fredericton have major airports with sophisticated navigational aids. Other licensed public airports include Charlo, St Leonard, Edmundston, Woodstock, Bathurst, Pokemouche, Chatham and St Stephen. Service to central Canada is provided by Air Canada and Eastern Provincial Airways. The latter provides a network of flights within the province and region. There are also more than 2 dozen landing strips maintained for forest protection or private use.

SMT, an Irving-owned firm, supplies the major bus service within the province, connecting with Acadian at Amherst, Voyageur at Edmundston, and Greyhound at St Stephen. During the last 5 years, aided by federal and provincial funds, municipally owned urban transit has been maintained in Saint John, Moncton and Fredericton. There are also several local bus lines.

Saint John is the major port with year-round service for containerized and bulk traffic. Its busy season has traditionally been the winter, when the St Lawrence R is frozen over. It is served by 9 container shipping lines with access to ports in more than 100 countries. Conventional steamship services are provided monthly and bi-monthly by 22 lines to most regions of the world. Ten other ports dot the NB shoreline, of which Caraquet is an important fishing centre, Chatham-Newcastle an outlet for fish and timber exports, and Belledune the major outlet for the base-metal industry.

**Energy** New Brunswick was better off than her Maritime and New England neighbours at the end of the cheap oil era signalled by the OPEC cartel and the shortages of 1973-74 and 1979-80. The publicly owned New Brunswick Power Commission had built, with federal assistance, a major dam on the Saint John R near Fredericton which had more than doubled the

province's electrical capacity from that source. Limited coal reserves in the Grand Lk area proved accessible to strip-mining. A few New Brunswickers had not made the transition away from wood in heating their homes and for many the change back was not difficult. In 1970 the NB government had already committed the province to nuclear energy through the construction of a CANDU reactor at Point Lepreau. Nevertheless, in 1981 oil was still dominant, accounting for 72% of energy consumed, compared with 11.6% for hydro, 11% for wood, 4.5% coal and 1% coke and natural gas. Even subtracting the oil used in transportation, oil still supplied 60% of the energy for manufacturing, heating and other domestic use.

The major producers of energy are the Irving refinery at Saint John, whose capacity is approximately double the province's requirements, and the NB Power Commission, which maintains major oil-fired thermal units at Coleson Cove and Courtney Bay, and two largely coal-fired units at Grand Lk and Dalhousie. The major sources of hydro are the Mactaquac, Beachwood and Grand Falls utilities. A trade-off exists as oil-generated electricity exported to Maine virtually equals the hydroelectricity imported from Québec. The Point Lepreau nuclear reactor has recently entered production, delivering 141 000 megawatt hours daily (or about 50% of normal provincial consumption) operating at 95% capacity. Half of this is committed to sale in the US to recover costs of construction which greatly exceeded estimates. Additional options currently under consideration include a second nuclear reactor, a natural gas pipeline through the Maritimes, and an increase in hydro production by raising the levels of existing dams.

#### Government and Politics

New Brunswick's titular head of state is the **LIEUTENANT-GOVERNOR**. Appointed by the federal government and officially representing the Queen, his duties are largely ceremonial. Power resides with the premier, the leader of the party or coalition having a majority of support in the 58-seat elected legislative assembly. The premier presides over a 23-member Cabinet, each member of which normally heads a provincial department or, in one case, a crown corporation, the NB Electric Power Commission. The assembly, elected within 5-year intervals, is ordinarily sovereign within its spheres of responsibility. These spheres have been outlined in the BNA Act (CONSTITUTION ACT, 1867), subsequent amendment and interpretation; the province is also

#### Premiers of New Brunswick 1866-1984

Name	Party	Term
Peter Mitchell		1866-67
Andrew Rainsford Wetmore		1867-70
George Luther Hatheway		1871-72
George Edwin King		1872-78
John James Fraser		1878-82
Daniel Lionel Hanington		1882-83
Andrew George Blair	Liberal	1883-96
James Mitchell	Liberal	1896-97
Henry Robert Emmerson	Liberal	1897-1900
Lemuel John Tweedie	Liberal	1900-07
William Pugsley	Liberal	1907
Clifford William Robinson	Liberal	1907-08
John Douglas Hazen	Conservative	1908-11
James Kidd Flemming	Conservative	1911-14
George Johnson Clarke	Conservative	1914-17
James Alexander Murray	Conservative	1917
Walter Edward Foster	Liberal	1917-23
Peter John Veniot	Liberal	1923-25
John Babington Macaulay		
Baxter	Conservative	1925-31
Charles Dow Richards	Conservative	1931-33
Leonard Percy de Wolfe		
Tilley	Conservative	1933-35
A. Allison Dysart	Liberal	1935-40
John Babbitt McNair	Liberal	1940-52
Hugh John Flemming	Conservative	1952-60
Louis J. Robichaud	Liberal	1960-70
Richard B. Hafield	Conservative	1970-

subject to the **CANADIAN CHARTER OF RIGHTS AND FREEDOMS** which recently accompanied Canada's assertion of authority in the amendment of its own constitution. Women achieved the provincial vote in 1919, but were not entitled to run for provincial office until 1934. They currently hold 4 seats in the assembly and 3 positions in the Cabinet.

The courts of New Brunswick have been in a period of transition. The basic structure was a Supreme Court (divided between Appeals and Queen's Bench), county courts, and courts presided over by provincial magistrates. Under the BNA Act the first 2 levels were appointed and paid for by the federal government; the third by the provinces who were responsible for the "administration" of justice. In reforms of the 1960s the province assumed the costs for local courts. In 1979, with federal co-operation, the county or district courts were amalgamated with courts of Queen's Bench. Recently, through a family division of the Queen's Bench, NB has been experimenting with an integrated family and juvenile court system. Under the Official Languages Act, French and English were guaranteed judicial services in their own language. Since 1967 an ombudsman has investigated citizens' complaints against public agencies and officials.

**Local Government** As part of its so-called "equal opportunity" reforms of the 1960s, the Liberal government of Louis ROBICHAUD abolished the 15 county councils and restricted the responsibilities of the city, town and village councils largely to services for property. Municipal taxes were limited to a percentage of the actual market value of real property in each community. Provincial "equalization" payments assist the poorer municipalities. Property services for rural areas are supplied directly by the province.

**Federal Representation** In federal politics New Brunswick has traditionally had one representative in the Cabinet and 10 seats in the Senate. It now has 10 seats in the House of Commons; an actual decline of 5 seats since Confederation but a relative decline in its membership of from 8.3% to 3.6% of that body. Occasionally, it has been able to enhance that influence through co-operation with its sister provinces of NS and PEI, although these have experienced a similar decline.

#### Lieutenant-Governors of New Brunswick 1867-1984

Name	Term
Charles Hastings Doyle	1867
Francis Pym Harding	1867-68
Lemuel Allan Wilmot	1868-73
Samuel Leonard Tilley	1873-78
Edward Barron Chandler	1878-80
Robert Duncan Wilmot	1880-85
Samuel Leonard Tilley	1885-93
John Boyd	1893
John James Fraser	1893-96
Abner Reid McClellan	1896-1902
Jabez Bunting Snowball	1902-07
Lemuel John Tweedie	1907-12
Josiah Wood	1912-17
Gilbert White Ganong	1917
William Pugsley	1917-23
William Freeman Todd	1923-28
Hugh Havelock McLean	1928-35
Murray MacLaren	1935-40
William George Clark	1940-45
David Lawrence MacLaren	1945-58
J. Leonard O'Brien	1958-65
John Babbitt McNair	1965-68
Wallace Samuel Bird	1968-71
Hédard J. Robichaud	1971-82
George Francis Gillman Stanley	1982-

**Regional Government** Efforts at co-operation for internal development and external influence were formalized in the Council of Maritime Premiers in 1973. In quarterly meetings of the premiers and in agencies such as the Maritime Provinces Higher Education Commission, the 3 provinces sought to establish regional co-operation, possibly moving towards union. Although failures to agree on initial plans for energy, constitutional reform and regional development disappointed many regionalists, co-operation has been achieved in more than 40 areas of administration.

**Public Finance** In 1982 ordinary revenues totalled \$1.8 billion. Major sources included taxes on individual income (14.7%), corporate income (6.3%), sales (17.5%) and real property (9.2%). The provincial personal income tax rate of 55.5% of federal basic tax is, along with the corporate income tax, collected by the federal government for the province. The NB sales tax of 10% exempts clothing, footwear, and equipment used in manufacturing. Approximately one-quarter of total provincial revenues comes from federal equalization payments — a plan intended to help poorer provinces maintain a basic standard of services. About 10% is derived from federal payments in support of established programs, such as hospital insurance, medicare and post-secondary education. Major expenditures include health and social services (33.4%), education (23.9%), municipalities (8.4%) and service of public debt (10.7%). Expenditures for physical assets such as bridges, highways, schools and hospitals are considered capital expenditures and are financed through borrowing. In 1982 these totalled \$201 million, of which 53% went for roads and bridges and 37% for schools and hospitals.

**Health** Although New Brunswick was the first province to establish a department of health, economic difficulties saw its services lag far behind most other provinces until the late 1960s. Today the province is divided into 7 health districts with major regional hospitals at Saint John, Fredericton, Moncton and Bathurst, and 2 under construction at Campbellton and Edmundston. These are supplemented by 33 smaller institutions. Psychiatric care is offered in the home, in chronic care hospitals at Saint John and Campbellton, and in units of the regional hospitals. Hospital and other medical services are provided without premiums under the nationally integrated programs. Small user fees were introduced in 1983. A provincial plan aids people over 65 in the payment of prescription drugs. Almost 4000 senior citizens receive care in provincially subsidized nursing homes. Public health services include nursing, inspection, control of communicable diseases, maternal and child health care, home care, nutrition, tuberculosis control and a home dialysis program.

**Politics** Since 1900, when party lines had solidified, New Brunswick has had a balanced 2-party system with the Conservatives holding power 43 out of the 83 years. Third parties have fared poorly in provincial politics, despite a United Farmers' Party which won 6 seats in 1920, the CCF which captured 11% of the vote in 1944, the Parti-Acadien which made a strong showing in 2 constituencies in 1978, and the NDP which raised its share of the popular vote to 10.2% in 1982 and elected one candidate. Excepting a lone Progressive elected in 1919, third parties have done little better at the federal level.

The outstanding issues in provincial politics have involved ethnicity and regional disparity. The growth of the population of French origin from 15.7% in 1871 to 38.8% by 1961 has underlain a persistent agitation by Acadian leaders for representation and influence commensurate with numbers. Politicians have occasionally exploited tensions between the 2 linguistic groups,

but the winning party has traditionally been that which has been able to win a substantial share of support from both. The election in 1960 of the venturesome young Acadian premier, Louis J. Robichaud, in a conjunction of circumstances conducive to change, contributed to economic and linguistic reforms so rapid and fundamental as to be called revolutionary. The Acadians gained most from the program of equal opportunity, which redistributed incomes from urban centres to a poverty-stricken north, pressed ahead with projects for economic development, and proposed language services to both peoples along the lines of the federal Royal Commission on BILINGUALISM AND BICULTURALISM. Of critical importance to the program's success was the simultaneous attack on regional disparity by federal governments. Despite the opposition of prominent corporations and conservatives appalled at the pace of change, Robichaud remained in power for the decade. Nor did his successor, Conservative and Protestant Richard Hatfield, seek to reverse the trend. Indeed, so enthusiastically did his government implement changes along the lines of the program that his party made increasing inroads in Acadian constituencies, defusing the Parti-Acadien's bid for a separate Acadian province. The drive for economic development slowed by the end of the 1970s, probably less because of public criticism of spectacular failures, such as the Bricklin sports car, than because of the decline of interest by federal governments.

Recent political reforms, including strict conflict of interest laws, mandatory disclosure of financial support and public financing of political parties, has removed some of opportunity and motives for petty political corruption so common in Canadian provincial politics.

#### Education

The educational institutions of Loyalist New Brunswick began with a strong Anglican bias which stimulated the proliferation of other denominational schools and colleges. The Common Schools Act of 1871, which established free public schools, virtually excluded the Catholics. A later compromise permitted teaching by members of religious orders and religious instruction after school hours. Education, however, remained a flashpoint of tension among religious and language groups in the province.

**Administration** The educational reforms of the 1960s relieved municipalities of their responsibilities for education and sought full educational services for both French and English in their own languages. The 12 grades of elementary and high school are administered in 40 school districts by local school boards but are financed by the province. Parallel systems for each language group report to 2 deputy ministers acting for the Dept of Education and Dept of Continuing Education. While the latter assumes responsibility for community colleges, the universities and the Ranger School are under the jurisdiction of the Maritime Higher Education Commission, an agency designed by the Council of Maritime Premiers to rationalize higher education offerings and facilities throughout the region. The Fisheries School and the NB Craft School are the responsibilities of other provincial departments. Aid for post-secondary students is provided through provincially administered, partially forgivable, interest-free loans.

**Institutions** In 1981 the francophone system served 48 569 students in 156 schools under 15 school boards. The anglophone system served 100 288 students in 294 schools under 26 school boards. There were 10 community colleges with 2934 students enrolled in French-language programs and 8085 in English. Anglophone university programs served 7583 students at UNIVERSITY OF NEW BRUNSWICK (Fredericton and Saint John); at Catholic-affiliated Saint Thomas,

which shared library and sports facilities of the Fredericton campus; and at United Church-affiliated MOUNT ALLISON UNIVERSITY (Sackville). Francophone programs served 3081 students at UNIVERSITÉ DE MONCTON and affiliated centres in Edmundston and Shippegan. Recent trends have included pressure for unilingual schools and school boards by francophones, the emergence of a burgeoning French immersion program in the anglophone system (which included 8660 students in 66 schools in 1982-83) and the establishment of private schools by evangelical denominations. Traditional Anglican boarding schools are Rothesay Collegiate and Netherwood School for Girls, both at Rothesay. See NEW BRUNSWICK SCHOOL QUESTION.

#### Cultural Life

New Brunswick has traditionally produced its share of artists and scholars. Bliss CARMAN, Sir Charles G.D. ROBERTS, A.G. BAILEY, Desmond PACEY, W.S. MacNutt, Alden NOWLAN and Antonine MAILLET are a few of the literary and historical figures of international repute. Prominent artists have included John Hammond, Miller Brittain, Alex COLVILLE, Jack Humphrey and Lawren P. Harris. An early interest in science and its practical application was evident in pioneering programs in engineering and forestry at UNB and in the work of the Natural History Society of Saint John. That this tradition continues is indicated by recent reports of breakthroughs in "bionic" artificial limbs and in natural methods of insect control. Fredericton in the 1870s and Saint John by the turn of the century seemed to produce environments particularly suited to creative endeavour. From the 1920s private patrons such as J.C. Webster of Shediac and Lord Beaverbrook (formerly Max AITKEN of Newcastle) helped develop institutional bases for creativity and for popular education through museums, art galleries, playhouses and universities.

**Arts** In recent decades the universities have been centres of literary and artistic endeavour. Mount Allison is famous for its artists and musicians. UNB has developed journals of national stature in the literary *Fiddlehead* and the historical *Acadiensis*. The U of Moncton has become a centre of research in Acadian studies. Acadian choirs have gained an international reputation for excellence. New Brunswick residents have access to Theatre New Brunswick, a professional theatre company based in Fredericton but offering live theatre in the towns and cities of the province. There are 6 public art galleries. More than 250 authors belong to the NB authors' association. Although the region lacks an effective scholarly press, local publishers produce popular works of fiction, humour, folklore and family and community history.

**Communication** Daily newspapers include the Saint John *Telegraph-Journal*, the Fredericton *Gleaner* and the Moncton *Times-Transcript* (all owned by the Irving interests). Until its recent bankruptcy, the French-language *L'Évangéline* aspired to be the voice of the Acadians in the region. A senior Canadian magazine, the *Atlantic Advocate*, is published in Saint John. The province receives three major TV sources, the CBC, CTV and Radio-Québec. Cable television (which carries the major American networks, the public television channel of the U of Maine, and FM radio) is available in urban centres. Several Pay TV channels have recently begun service. The CBC radio offers 10 outlets in French and 16 in English. Approximately 400 000 telephones are operated in the province by the NB Telephone Co Ltd, a Bell-dominated company integrated with the TransCanada telephone system.

**Historic Sites** New Brunswick has 2 public archives and 3 university archives, 2 historical settlements, a national historic park, a share in 2 international historic parks, 21 museums,

13 military restorations or other historic buildings open to the public and over 1000 buildings designated of historical interest. The New Brunswick Museum in Saint John has been an exhibitor of natural history and a collector of newspapers, public records and genealogical records. Since 1967 the Provincial Archives of NB in Fredericton has been the depository of government records, collections of public and private papers and other historical and genealogical materials. Kings Landing, the restoration of a Loyalist settlement up the river from Fredericton, is a spectacular attempt to bring history alive to visitors through the activities of a 19th-century village. The Acadian Village at Caraquet is a recreation of life in another cultural tradition. *FT BEAUSÉJOUR*, a national historic park located near the NS border, is a restoration of a significant French fort of the mid-18th century. Roosevelt Summer Home and Park on Campobello Island run by a joint Canadian-American Commission includes the Franklin D. Roosevelt summer estate and neighbouring houses, and offers luxury accommodation for small conferences. Recently a second international park has been designated on Saint Croix I, the site of Champlain's first settlement in N America.

Heritage societies have been active in Fredericton, Saint John, Saint Andrews, Chatham-Newcastle and Albert County. Concerns have involved the preservation of city cores and neighbourhoods, covered bridges and buildings of historical significance.

### History

The first settlers of New Brunswick were the Micmac whose communities spread from NS and PEI to the S coast of the Gaspé peninsula. From the early 16th century they had developed contacts with the Europeans and established a trade which made them dependent on European technologies and victims of European diseases. The Micmac had long followed a pattern of seasonal migration from hunting grounds in the wooded uplands in winter to gatherings on the shore in summer for shellfishing and social congress. The Maliseet were more direct victims of European expansion. Pushed from their homes in New England, they had found refuge along the Saint John R in the 17th century.

**Exploration** When the French attempted settlement, first at the mouth of the *ST CROIX R* in 1604 and later at *PORT-ROYAL*, they were welcomed by the Micmac who taught them how to survive. After the French had shifted their interest to Québec, the Indians helped a few young men who remained, including Charles de Saint-Etienne de LA TOUR, to establish a fur trade on the Saint John R. The death of Isaac de RAZILLY in 1635, leader of a revived settlement at Port-Royal, occasioned a feudalistic struggle over trade and territory between LA TOUR, Charles de MENOU d'Aulnay and Nicolas DENYS. On d'Aulnay's death in 1650, LA TOUR regained control of the Saint John and Denys recovered a fishing and trading post at Miscou harbour and built another at Nipisiquit (Bathurst). After an extensive career in trade and fisheries along the coast of ACADIA, Denys retired to Nipisiquit in 1670 to write an historically important description of Acadia. The Saint John R valley remained Indian territory from which the French launched raids against New England in the 1690s, helping to create a deep-seated and persistent hostility to the French presence in Acadia.

**Settlement** Meanwhile, the tiny settlement begun at Port-Royal flourished, spreading around the Bay of Fundy to include the Chignecto Isthmus and Shepody on the N shore. The Acadians developed a unique society characterized by a diking technology which enabled them to farm the marshes left by the Bay of Fundy's 15 m tides. Their society was also

characterized by neglect from the French authorities, and this encouraged the development of a tightly knit and independent community. Caught in imperial struggle between British and French, most were expelled by the British in 1755 or later and scattered throughout the Thirteen Colonies. Those who returned after the Treaty of Paris in 1763 found their lands occupied by several thousand immigrants, largely from New England. Some received grants of land in the Memramcook area, some squatted on the Saint John R and some found employment with the Robin brothers, of Jersey in the Channel Islands, who in 1764 began to establish fishing stations along the coast from Gaspé to Cape Breton I. After the American Revolution, approximately 14 000 Loyalist refugees came to the N shore of the Bay of Fundy, established the city of Saint John and settled the Saint John and St Croix river valleys. A few penetrated other parts of the province. Hungry for jobs and conscious of their isolation from Halifax, they petitioned for separate colonial status, which was granted in 1784. The Loyalists in turn were inundated by Scottish and Irish immigration during the first half of the 19th century.

**Development** Napoleon's continental blockade, which in 1809 cut Britain off from traditional timber supplies from Scandinavia, led to a deliberate effort through protective timber tariffs to foster the colonial industry as a dependable source. Blessed with rivers which made accessible rich stands of spruce and pine, NB's squared-timber trade boomed for half a century. Timber became a source of development leading to new settlement and giving its own peculiar cast to the economy and to politics and society. Population grew from perhaps 25 000 to almost 200 000 by mid-century, of which approximately 85% earned their living from the forest. Indeed governments and historians have been critical of the province's excessive reliance on this single, highly volatile staple. Booms and slumps tended to bankrupt the settler reliant on timber, and many settlers were reduced to wage labour status, dependent on a few influential entrepreneurs in each region. Associated with the timber industry was wooden shipbuilding, whose production sites dotted the coast and rivers of the province and by mid-century turned out over 100 vessels a year, both for export and for the use of the merchants of Saint John.

New Brunswick industries, helped by the Crimean War and American Civil War, and by a RECIPROCITY treaty with the US in natural products, weathered the crisis of the British abandonment of the timber tariffs and navigation Acts in the late 1840s. But the conjunction of blows which afflicted NB's economy after Confederation, of which the NATIONAL POLICY of protective tariffs was but one, proved more permanently damaging. The reciprocity treaty was cancelled, timber resources became less accessible, and the wooden vessels lost in their competition with steam-driven, iron-hulled ships. New Brunswickers by the thousand left the declining ports and timber towns to find employment in the US.

Some New Brunswick entrepreneurs were quick to make the transition to a national, continental economy. Confederation brought the INTERCOLONIAL RAILWAY to NB by 1876 and the CPR reached Saint John in 1889. Merchants, lumbermen and shipbuilders tended to transfer their capital to iron foundries, textile mills, sugar refineries and other secondary industries whose growth was fostered by the tariff. But eventually the new industries, scattered through the province, were taken over by the larger and better capitalized industries of central Canada. The classic pattern emerged of takeover, failure to modernize, closure and the exploitation of the market from expanding plants in central Canada. The postwar recession of the 1920s saw

the continued decline of traditional industries, and the virtual collapse of a manufacturing sector further undercut by adverse federal policies in tariffs and transportation. Investigation of Maritime problems by a federal royal commission and attempted remedial action were largely negated as NB plunged with the rest of the world into the Depression of the 1930s. Several decades of economic stagnation reduced NB to a standard of living much lower than the national average. National policies served to increase the disparity, as the tariff (or, during WWII, federal investment) created and maintained a manufacturing sector in central Canada. Yet the revenues thus generated were hoarded within provincial boundaries. Meanwhile, Maritime governments lacked the money to maintain essential services. By 1940 NB's expenditures on education and health services were slightly over half of the national average; its illiteracy and infant mortality rates were the highest in the country. Despite the recognition of the Rowell-Sirois Report on DOMINION-PROVINCIAL RELATIONS (1940) of the need for a fairer distribution of the tax revenues from a national economy, the adjustment grants which the commissioners recommended for the poorer provinces were not adopted until the 1960s.

The nature of NB's disparity was twofold: the extreme disparity of standards of living compared with other provinces; and the internal disparity between the urban sections of the largely English S and the rural sections of the largely French N. The attack on both proceeded simultaneously. Within the province, the government moved behind a slogan of "equal opportunity" to provide greater equality in services. Acting on the recommendations of the 1963 Byrne Commission, the Robichaud administration proceeded with more than 125 pieces of legislation to alter radically the division in responsibilities between provincial and county or municipal units of government. Acting on the principle that the provincial government should maintain services to people, the government took complete responsibility for educational, medical, judicial and social assistance services. To the municipalities it left services to property such as water, sewer, fire protection and local police services. Taxes were to be assessed province wide on the actual market value of property.

Along with the rationalization in services went a determined effort at economic development. The optimism of the 1960s persuaded both federal and provincial governments that the chronic disparity of province and region could be overcome through industrialization. Federal-provincial attempts at rural development, government investments in electrical generation, mining, forestry, fishery and secondary manufacturing, the building of major highways through the N of the province, and the use of transportation subsidies to help NB products reach national markets were all part of a federal-provincial effort to push the province's standard of living closer to the national average. To a large degree such efforts have been successful. Social and educational services are now on a par with the rest of the country. A well-trained civil service has helped primary industries modernize in a transitional period when the failure to do so would have meant collapse. A favourable infrastructure and direct assistance reversed a pattern of decline in secondary industry.

Nevertheless the province's improved standard of living rests upon a fragile base. The enthusiasm for industrial development by federal governments slowed in the 1970s amid spectacular failures and the jealousies of other regions. Governments have found the maintenance of fiscal transfers less controversial — transfers which in any case return to the centre in the purchase of consumer goods. Of critical

importance are the indirect transfers which accompany such traditional welfare-state programs as old-age pensions and unemployment insurance. No less important are the direct EQUALIZATION PAYMENTS and grants for established programs, which in 1981 accounted for 35% of the ordinary revenues. As past victims and beneficiaries, New Brunswickers have a vital interest in the continuing evolution of the Canadian constitution.

**New Brunswick Research and Productivity Council (NBRPC)**, research organization established by a provincial Act as a CROWN CORPORATION in 1962. NBRPC initially encouraged university-based research in industrial and scientific technology through grants-in-aid. This phase ended in 1965 when it commenced research for provincial and other Canadian and international industrial and government clients. NBRPC gained an international reputation for expertise in computer-assisted MANUFACTURING and extractive METALLURGY (eg, through development of a specialized sulphation roast process). In 1981 a Council of Maritime Premiers Committee on Research and Development advocated a co-operative expansion with the NOVA SCOTIA RESEARCH FOUNDATION CORPORATION to serve the entire region. NBRPC is composed of members drawn from management, labour and "professional" groups, who are appointed to 3-year terms by the Lieutenant-Governor-in-Council. The chairman reports annually to the premier. Research is conducted by staff (about 90 people) under an executive director, primarily in laboratories at UNIVERSITY OF NEW BRUNSWICK, Fredericton. Additional facilities include a provincially sponsored Manufacturing Design Centre (a joint venture with a number of universities and colleges) and a forthcoming \$20-million federal-provincial MINERAL research facility at Chatham. The council provides free technical advice to many industries, especially those with few employees. Funding is through industrial and government contracts, with initial and ongoing federal grants and an annual provincial operational grant.

MARTIN K. McNICHOLL

**New Brunswick School Question** On 17 May 1871 the New Brunswick government passed the Common Schools Act to strengthen and reform the school system. At the same time, however, it abandoned an informal system of separate schools that had grown up since the 1850s. There was an outcry from New Brunswick's Roman Catholics, and various remedies were proposed or attempted: disallowance, resolutions in the Canadian House of Commons, the courts. None worked. The 1871 Act, though it violated familiar conventions, did not violate Section 93 of the BRITISH NORTH AMERICA ACT. Two cases made that clear: *Ex parte Renaud* at the NB Supreme Court, 1873, and *Maier v The Town of Portland* at the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL in London, 1874. The Jan 1875 Caraquet Riots, in which 2 people were shot and killed, showed strongly the need for accommodation on the school issue; amendments somewhat improving

the Catholic position were then made to the Act. But New Brunswick did not get real separate schools; it got an informal system, not unlike that in Nova Scotia.

P.B. WAITE

**New Caledonia** ("New Scotland"), a name given in 1806 to the central and highland plateau area of BRITISH COLUMBIA by SIMON FRASER, a partner, trader and explorer in the NORTH WEST COMPANY. Fraser had never been to Scotland, but the BC interior reminded him of his mother's descriptions of the Scottish Highlands. New Caledonia became a trading department or district for the NWC, and had its headquarters at Ft St James, built in 1806 on Stuart Lk. Nearby were Forts Fraser and George, the latter at the junction of the Nechako and Fraser rivers, from which Fraser began his celebrated exploration of the river, named after him, that drained New Caledonia to the S. Other names for the central interior appeared on maps at this time: the Americans called it Oregon; Capt George VANCOUVER called it New Hanover; and British fur trader James Colnett called it North West Georgia. However, the NWC's dominance of the FUR TRADE of the BC interior, until the 1821 merger with the HUDSON'S BAY COMPANY, assured the continuance of the name New Caledonia.

In 1858 legislation was introduced to create a crown colony to bring British law and authority to an area undergoing a GOLD RUSH and rapid population expansion. Colonial Secretary Sir Edward Bulwer-Lytton called the region New Caledonia; however, the French possessed a S Pacific colony called New Caledonia, and to avoid confusion or resentment the name was changed to British Columbia. Queen Victoria made this choice, and the new secretary of state for the colonies, the duke of Newcastle, considered it neither "very felicitous" nor "very original." The name was changed before the legislation received royal assent, and New Caledonia became British Columbia on 2 Aug 1858. Thereafter the earlier term disappeared from general use.

BARRY M. GOUGH

**New Democratic Party (NDP)**, founded in Ottawa in 1961 at a convention uniting the CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), affiliated unions of the Canadian Labour Congress (CLC) and New Party clubs, is a democratic socialist party (see SOCIAL DEMOCRACY) and a member of the Socialist International.

The party has had 3 leaders: T.C. DOUGLAS (1961-71), David LEWIS (1971-75) and Ed BROADBENT (1975). Since its birth, the NDP has polled in the federal elections an average 16.9% of the vote. While this is an increase compared to the CCF, the federal NDP has yet to become a major party. Because of the electoral system, the CCF-NDP has consistently received a smaller percentage of the seats in Parliament than its percentage vote (see PARTY SYSTEM). Federally the NDP has made the greatest impact during MINORITY GOVERNMENT situations. While the West provided the highest level of voting support, individual memberships and MPs for the party, a majority of NDP votes come from central Canada (largely Ontario). The NDP, like the CCF, has been unable to elect an MP from Québec.

Provincially the CCF-NDP has formed the governments in BC (1972-75), Saskatchewan (1944-64, 1971-82) and Manitoba (1969-77, 1981), and the Official Opposition in Alberta, Ontario, Nova Scotia and the Yukon.

In domestic affairs, the NDP is committed to a moderate form of SOCIALISM and a mixed economy. It favours government planning and public ownership (eg, CROWN CORPORATIONS, co-operatives), where necessary, to provide jobs and services. The CCF-NDP has always been a forceful exponent of such SOCIAL SECURITY measures as universal medical care, old-age pensions, workers' compensation and unemployment insur-

ance as a means to reduce class inequalities. As the official political voice of labour, the NDP has encouraged trade-union organization. In recent years, the party has favoured industrial democracy and workers' control in the factories. While the CCF was an advocate of strong, federal government powers, the NDP has been more receptive to provincial rights and the advantages of decentralization.

In foreign policy, the NDP, like the CCF, has manifested strong pacifist tendencies. While this pacifism moderated somewhat in the 1950s and early 1960s, the party currently opposes Canada's involvement in NATO and NORAD and calls for Canada to become a nuclear-free zone. The party is critical of the high rate of foreign, particularly American, ownership of Canadian industry. Largely because of NDP pressure, recent Liberal governments have introduced such nationalist measures as the National Energy Program (NEP) and the Foreign Investment Review Agency (FIRA).

While the party has always proposed an evolutionary form of socialism, a persistent minority endeavours to push the party further left. The WAFFLE, the most famous faction, disbanded in 1972 only to be replaced by another "left-caucus". The NDP remains stalled as a third party and is engaged in discussions about the appropriate role of social democracy and of KEYNESIAN ECONOMICS, a debate to which Jim Laxer contributed with his controversial 1983 report. In an effort to alleviate fears among the Canadian public of the growth of big government, the NDP has increasingly advocated more decentralist proposals.

**New Denver**, BC, Village, pop 642 (1981c), inc 1929, is located near the NE end of Slocan Lk, 48 km W, 116 km N of Nelson. Eli Carpenter, discoverer of Slocan Lk, wintered there in 1891. The site was first called Eldorado, then New Denver (1892), after Denver, Colo. The first newspaper in Slocan, called *The Ledge*, was published there by R.T. Lowery. New Denver was an early service centre for mines and the nearby towns of Three Forks, Sandon, Cody, Silverton and Slocan City. Mining declined after WWI, and by WWII 1500 relocated JAPANESE formed the bulk of the population. After the war, Japanese from other relocation centres moved here, and small-scale mining was supplemented by logging. The creation of Valhalla Wilderness Park, together with the magnificent scenery and surrounding ghost towns, give New Denver an optimistic future as a tourist centre.

WILLIAM A. SLOAN

**New France** France was a colonial power in N America from the early 16th century, the age of great European discoveries and fishing expeditions, to the early 19th century, when Napoléon Bonaparte sold Louisiana to the US. From the founding of Québec in 1608 to the ceding of Canada to Britain in 1763, France placed its stamp upon the history of the continent, much of whose lands — including ACADIA, the vast territory of Louisiana and the Mississippi Valley — lay under its control. The populations it established, especially in the St Lawrence Valley, are still full of vitality today.

France became interested in the New World later than the other Western Christian powers — England, Spain and Portugal — and after the trips made by Christopher Columbus in 1492, John CABOT in 1497 and the CORTE-REAL brothers in 1501 and 1502. In 1524 Giovanni VERRAZANO followed the eastern shore of America from Florida to Newfoundland. Jacques CARTIER then made 3 voyages of discovery for France. He took possession of the territory in the name of the

Champlain's rendering of the Québec habitation, from *Les Voyages* (1613) (courtesy National Library of Canada/Rare Book Division).

king of France by planting a cross on the shores of the Gaspé in 1534. The next year he sailed up the St Lawrence R and visited Indian settlements at Stadacona [Québec] and Hochelaga [Montréal]. He spent the winter at Stadacona, where 25 of his men died of scurvy, and returned to France in 1536. In 1541-42 he returned, establishing a short-lived colony, which he called "Charlesbourg-Royal," at the mouth of the Rivière du Cap-Rouge near Stadacona. Religion gave the impetus to his voyages, but economic motives were even more obvious. The hope of finding a NORTHWEST PASSAGE to the Indies and the fabled Kingdom of the Saguenay was constantly stressed. Cartier brought back to France some minerals from this final voyage which he thought were gold and diamonds, but were only iron pyrite and quartz (see DIAMONDS OF CANADA). After these initial disappointments France turned its attention elsewhere and ignored the distant land until the end of the century.

Meanwhile, some Frenchmen had shown sustained interest in the region's FISHERIES. There are reports of BASQUE, Breton and Norman fishermen on the GRAND BANKS as early as the first decade of the 16th century. Each year more ships — a dozen or so in the decade 1520-30, about 100 by mid-century — made fishing trips. By 1550 fishermen were drying their catch on the shores, making contact with the Indians and taking furs back to France. In the 1580s, ship owners were leaving fishing for the FUR TRADE, an activity which was to draw Frenchmen far into the continent.

In 1608 Samuel de CHAMPLAIN, considered the founder of New France, erected a *habitation* (building) at Québec. He continued Cartier's dream of finding an opening to the Indies, pursued the commercial interests of the businessmen, his sponsors, and followed the king's wishes. The settlement responded to economic demands: go out to the fur-rich areas, forge close contact with native suppliers and try to obtain the right of exploitation. The scale of the operation made it necessary to form private companies.

The colony's administration, 1608-63, was entrusted to these commercial companies, which were formed by merchants from various cities of France. Succeeding companies promised to settle and develop the French land in America in return for exclusive rights to its resources. The COMPAGNIE DES CENT-ASSOCIÉS, created by the great minister of Louis XIII, Cardinal de Richelieu, ran New France 1627-63, either directly or through subsidiary companies. It did not achieve the desired results. In 1663 the population numbered scarcely 3000 people, 1175 of them Canadian-born. Less than 1% of the granted land was being exploited. Of the 5.4 million livres' worth of possible annual resources enumerated by Champlain in 1618 — eg,

fish, mines, wood, hemp, cloth and fur — only fur yielded an appreciable return, and it was irregular and disappointing.

Nor was evangelization among the natives flourishing. During its first half-century, New France experienced an explosion of missionary fervour, as demonstrated by the number and zeal of its apostles, inspired by the Catholic Counter-Reformation (see CATHOLICISM). In 1634 the Jesuits renewed the mission of STE MARIE AMONG THE HURONS in the western wilds. VILLEMARIE, which became Montréal, was the work of mystics and the devoted. But the missionaries managed to convert very few Indians.

Various political and military events hindered colonization efforts. The alliances formed by Champlain made enemies of the Iroquois. Québec fell to the freebooting KIRKE brothers in 1629. The Iroquois nations grew belligerent as soon as the country was returned to France in 1632. Between 1648 and 1652 they destroyed HURONIA, a hub of French commercial and missionary activity. Attacks on the very heart of the colony demonstrated that the colony's survival was in doubt (see IROQUOIS WARS).

In 1663 Québec was just a commercial branch operation: the fur trade was opposed to agriculture, cross-cultural contact meant war and disease for the natives, the French population was small, and the administration of the colony by commercial exploiters was a disaster. The company relinquished control of the colony to the king. Under Louis XIV New France flourished. He made the colony a province of France, giving it a similar hierarchical administrative organization. He watched over its settlement, extended its territory and allowed its enterprises to multiply. However, he had first to guarantee the peace.

Under the marquis de Tracy, the CARIGNAN-SALIÈRES REGIMENT built forts, ravaged Iroquois villages and demonstrated French military power. The Iroquois made peace, and 400 soldiers stayed in the colony as settlers. The king also had 850 young women sent out as brides-to-be, and quick marriages and families were encouraged. When the offspring of these FILLES DU ROI came of age 20 years later, the demographic situation had changed. In 1663 there had been one woman to every 6 men; now

Paysanne in the time of New France, c1650, by Henri Beau (courtesy Public Archives of Canada/C-1248).

The habitant of New France had greater independence than his counterpart in France (courtesy Public Archives of Canada/C-866).

the sexes were roughly equal in number. The colony thereafter replenished 95% of its numbers through childbirth.

Under the authority of Jean-Baptiste Colbert, comptroller general of finances and then navy minister (see MINISTÈRE DE LA MARINE), colonial administration was entrusted to a GOUVERNEUR (for military matters and external relations) and an INTENDANT (for justice, civil administration and finances — ie, all civil aspects of colonial administration). The SOVEREIGN COUNCIL (Superior Council after 1703) acted as a court of appeal and registered the king's edicts.

The imperialism of Louis XIV, the pacification of the Iroquois and the need to rebuild the network of fur-trade treaties led to renewed EXPLORATIONS into the Great Lakes and Mississippi regions by such exceptional people as FRANÇOIS DOLLIER DE CASSON, LOUIS JOLLIET, Jacques MARQUETTE and the Cavelier de LA SALLE. But the Indian wars started again in 1682 and the colony found new heroes, such as Pierre Le Moyne d'IBERVILLE. Political, military and missionary activity, combined with economic factors, created a need for furs to be acquired from the Indian nations.

Intendant Jean TALON, with Colbert's solid backing and other favourable circumstances, started a vigorous development program. In addition to watching over agriculture and the fur trade, Talon began ventures such as shipbuilding, trade with the West Indies, commercial crops like flax and hemp, fishing industries and a brewery. But by the time he left in 1672, economic circumstances had changed and virtually nothing remained of these premature initiatives.

It is difficult to identify the major elements of this nascent society. For Acadia, familiar features are the quality of its agricultural establishments, the importance of fishing and the alternating British and French regimes. In the St Lawrence Valley, farmers, though in the majority, were still clearing the land. Craftsmen no longer had the support of major enterprises. Fur traders were being squeezed by increasingly difficult regulations and economic circumstances, yet they provided the colony's only exports. Military officers, thanks to the introduction of coin currency and the presence of opportunities to flaunt themselves, enjoyed some prestige by

The Forges St-Maurice were one of the few industries established in New France (courtesy Public Archives of Canada/C-4356).

entering into business and being in the governor's entourage. The seigneur had little revenue and took his standing from his title and the exercise of functions entirely unrelated to the land (see SEIGNEURIAL SYSTEM). Social mobility was still possible and caused categories and groups to mingle, but there were 2 worlds: the city and the country.

New France reached its greatest territorial extent at the start of the 18th century. About 250 people lived in a dozen settlements in Newfoundland, and there were about 1500 in Acadia. Several hundred lived around the mouth of the Mississippi and around the Great Lakes. People from the St Lawrence Valley lived on the shoreline of Labrador as fishermen. The Saguenay R Basin (the King's Domain) had a few trading posts. Canada had about 20 000 inhabitants, most of them farmers scattered along a ribbon of settlement between the 2 urban centres of Québec and Montréal. In the West, a series of trading posts and forts dotted the communication lines. Finally, in the 1740s, the LA VERENDRYE family carried the exploration of the continent right to the foothills of the Rockies.

Despite this expansion, New France has been described as a "colossus with feet of clay." The British American colonies were 20 times as populous and felt themselves encircled and at risk.

Through the TREATY OF UTRECHT of 1713, which ended the WAR OF THE SPANISH SUCCESSION, France yielded Newfoundland, the Acadian peninsula, Hudson Bay and supremacy in trade over the Iroquois to the English. Furthermore the early 18th century brought a major economic crisis in the colony. Its main export item was hit by a European sales slump, declining quality and less attractive returns.

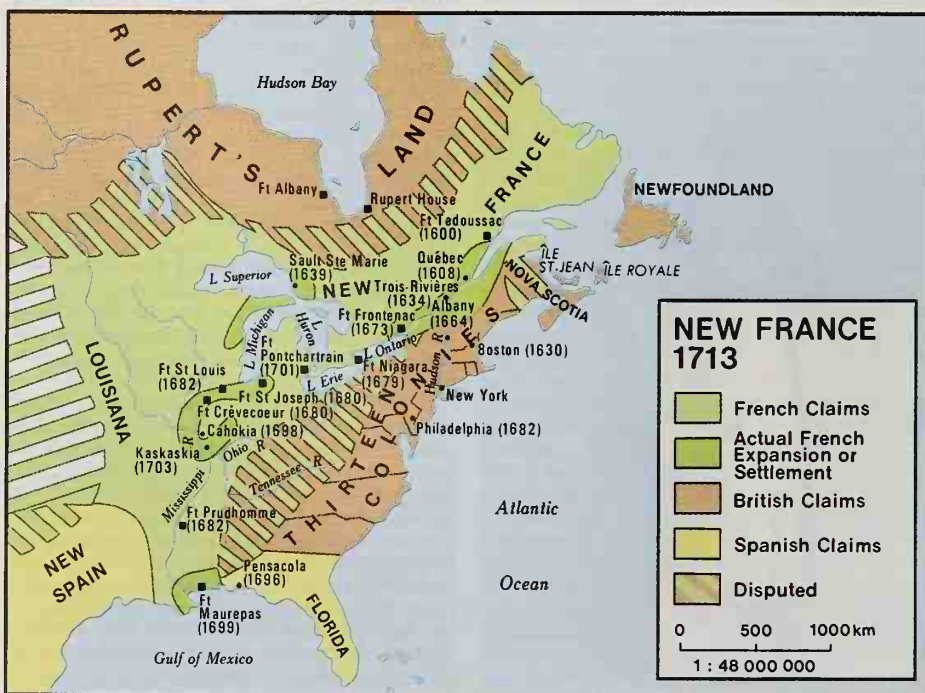

Recovery was slow, but the economy experienced an unprecedented boom during the long period of peace, 1713-44. France built an imposing fortress at LOUISBOURG to protect its fishing zones, land and commercial trade with the colony. After 1720 agricultural surpluses were exported to Île-Royale (Cape Breton I) and the French West Indies. Some 200 seigneurs lived in the territory of Canada. A high birthrate led to a rapid population increase, which in turn led to the creation of parishes. Despite the strictures of MERCANTILISM, 2 major industries were established: the FORGES SAINT-MAURICE and royal shipbuilding. In 1735 a road linked Québec City and Montréal for the first time. Yet the fur trade still accounted for 70% of the colony's exports. And peace was being used to prepare for war: 80% of the colony's budgets (which never equalled the sums spent on the king's amusements) went for military expenses. Much more was spent on constructing European-style FORTIFICATIONS than on strengthening alliances with the Indian nations.

Colonial society, influenced by the French elite that led it, modelled itself on the mother country, yet increasingly grew apart from it because of the colony's small population and very different, land-based, economic and geographic circumstances. Nobles, the middle class, military officers, seigneurs, civil administrators and traders formed a high society which was extremely sensitive to the favours of the colonial authorities. Eighty percent of the population lived on and by the land. Each generation produced new pioneers who cleared and settled land, acclimatized themselves, managed some new territory and came to know their neighbours. The acquisition of this territory in America by the descendants of Frenchmen was characterized by the importance of the land, of inheritance, of economic independence and of analysed social relationships.

But France felt that New France cost much and yielded little. The expensive but inconclusive WAR OF THE AUSTRIAN SUCCESSION, which ended in 1748, saw the destruction of French overseas trade by Britain. The SEVEN YEARS' WAR found France on the defensive against England, now an aggressive maritime power. The British colonies, with 2 million inhabitants, were pitted against a mere 70 000 French colonists, a sign of the very limited success of French colonization in N America. After some spectacular military successes, the result of strategy well adapted to the local terrain, France fell back on the defensive. On 13 Sept 1759 the troops of Gen James WOLFE defeated those of the marquis de MONTCALEM in the BATTLE OF THE PLAINS OF ABRAHAM near Québec City. Montréal fell the next year. France yielded its colony to England in the TREATY OF PARIS of 1763. It was the end, or nearly so, of French political power in America — but not of French presence. France left a great legacy to America: the Canadiens. They refused assimilation and affirmed their existence. Protected by their language, religion and institutions, concentrated in a limited geographic area, difficult to penetrate, they developed a way of life, social customs and attitudes of their own. Having become Québécois, they continued to strive to develop their nationality.

New Glasgow, NS, Town, pop 10 464 (1981c), inc 1875, is located on the East R, 15 km SE of Pictou. The industrial and service centre for Pictou, Antigonish and Guysborough counties, it is typical of those 19th-century Maritime communities that successfully shifted from mercantile to industrial enterprise, but later collapsed. The Carmichaels and McGregors, along with industrialists Graham Fraser and Thomas Cantley, spurred the town's growth. Agricultural settlement of the surrounding district by Scottish Presbyterians supported early growth. By the 1820s local timber was used for shipbuilding, the economy's mainstay until Confederation. Railway building in the late 1860s and 1870s and development of nearby coal and iron deposits spurred an industrial revolution based on the iron and steel industries. New Glasgow and neighbouring Trenton spawned Canada's first steelmaking enterprise, the NS Steel Co (1882-83). These industries flourished through WWI, then collapsed in the face of external competition and corporate mergers. The town's population peaked at 8917 in 1921, but has grown slightly since WWII as the town became a regional centre. Although still predominantly Scottish and Presbyterian, New Glasgow's ethnic base is now more diverse. Other British peoples and Acadians reside there, working nearby in pulp-and-paper and tire-manufacturing industries.

L.D. McCANN

**New Hamburg**, Ont, UP, pop 3923 (1981c), is located midway between KITCHENER and STRATFORD in the midst of a prosperous rural countryside (populated partly by Old Order Mennonite and Amish, who settled the area in the 1830s). At first called simply Hamburg, after the port of departure of many German emigrants in the 19th century, it was a result of the railway boom created by the expansion of the GRAND TRUNK RY in 1857 and of the influx of German immigrants in the mid-19th century. The sixth generation of pioneer farmers of German origin remains on the land, and the settlement today is primarily an agricultural service centre. Population growth after the 1850s was slow until after WWII. New Hamburg is known widely for its annual Ontario Mennonite Relief Sale of traditional handicrafts. In 1973 it was reorganized within the Regional Municipality of Waterloo and reverted to the status of a settlement within the Township of Wilmot. KEN McLAUGHLIN

**New Left**, an international political movement of the 1960s, mainly of youth and students, which originated in the "Ban the Bomb" movement of the late 1950s. It expanded to include issues such as the Vietnam War, Third World liberation struggles, women's liberation, education, ecology, and popular culture. Critical of the Old Left (SOCIAL DEMOCRACY and MARXISM-Leninism) and its alienating hierarchical, centralized and bureaucratic structures, the New Left proposed local control of the political process, accessibility to political and social institutions and participatory democracy. Critical as well of modern capitalism, the New Left advocated confrontations with that system by dissident intelligentsia and workers, and by the poor, blacks, natives and ethnic minorities. It included supporters of every position between nonviolent civil disobedience and libertarian socialism. In Canada, the ideas of the New Left were argued about and practised by the Student Union for Peace Action, the Canadian Union of Students, Students for a Democratic University and the Union générale des étudiants de Québec — highly decentralized organizations that were active on a regional, even local, basis. Also active in the debates were *Our Generation* and *Canadian Dimension* magazines. Among issues raised by the Canadian New Left were nuclear disarmament, community organizing, the "multiversity," American control of the economy, the composition of the working class, Québécois separatism and sexual inequality.

After the OCTOBER CRISIS (1970) the New Left fell into disarray, although it was also weakened by the incursion of government-sponsored groups (eg, The Company of Young Canadians, which was established to support, encourage and develop programs of social and economic reform); by failure to link up with working-class organizations and by the lack of a sustained program and strategy for social change. In the 1970s many adherents entered the women's liberation movement, the Parti Québécois and various Marxist-Leninist groups. Some New Left ideas are now being revived in the antinuclear movement. MYRNA KOSTASH

**New Liskeard**, Ont, Town, pop 5551 (1981c), inc 1903, located on the NW end of Lk TIMISKAMING, 157 km NW of North Bay. The history of this agrarian community at the mouth of Wabi Cr dates back to 1892 when the Ontario government first opened up the area to settlement. The agricultural potential of the Little Clay Belt, a 56 km strip of land stretching to the NW, quickly attracted farmers from "Old" Ontario. By 1896 a thriving village, first known as Liskeard (after Liskeard, Eng) but changed by postal authorities to New Liskeard to avoid confusion with Lisgar, had come into existence. New Liskeard's role as service centre to the surrounding farming community was assured by

the arrival of the Temiskaming and Northern Ontario Ry (ONTARIO NORTHLAND) in 1905, and its growth in the 20th century was shaped by the varying fortunes of agriculture. Since 1966 the town has been the site of the New Liskeard College of Agricultural Technology. MATT BRAY

**New Religious Movements**, unorthodox, splinter religions that are usually outgrowths of ancient religious traditions. The complexity of the subject and a desire for objectivity have led scholars to prefer this expression to the popular term "cult," which has become associated with the 1978 mass suicide of People's Temple members in Jonestown, Guyana, and with other dangerous practices. In the sociology of religion, "church," "sect" and "cult" have specialized meanings identifying specific types of religious movements; "cult" suggests an intellectually inclined, mystically oriented group rather like the QUAKERS. A theological definition identifies cults as groups that deviate from some traditional standard of Christian orthodoxy. Thus, Roman Catholics might argue that Baptists constitute a cult. Yet, as a result of media coverage, "cult" has come to refer to groups such as the Unification Church ("Moonies") and the International Society for Krishna Consciousness (Hare Krishna, or ISKCON).

The Jonestown tragedy distorts discussion about new religions. Few people realize that the Jonestown group was both religious and political. Jim Jones was a minister in a traditional Christian denomination, but his group was a political co-operative with strong socialist ideas. Most members of the new religions are well educated, relatively affluent young Caucasians often recruited as individuals, but the people at Jonestown were generally ill-educated, poor, black Americans often recruited as families. The social differences between the new religions and the People's Temple are so great that few meaningful comparisons can be made.

Sociologists David G. Bromley and Anson D. Shupe argue that most people react unfavourably towards the new religions because of "media hype," and that actual membership in N American new religious movements is low. Sociologist Reginald Bibby discovered that only about 1% of Canadians have even a strong interest in new religious movements (1983); more significantly, only a fraction of 1% have any actual group involvement. Daniel G. Hill, commissioned by the Ontario government to study the "cult problem," agrees, citing a Toronto magazine which claimed that the Hare Krishnas had 10 000 members in Toronto when they had only 80 full-time members. It is difficult to give accurate membership figures for most new religions. The groups and their critics both tend to exaggerate their numbers. Hare Krishna in Toronto claims about "80 full-time members" and "5000 part-time or associates who attend services" (1983). The latter figure appears impressive, but includes anyone who visits the

temple or an organized meeting, and a minority of the East Indian community who find in the movement an opportunity to continue traditional religious practices. What is perhaps most deceiving is the large number of groups, most of them relatively small. Richard Bergerson counted some 300 religious or para-religious groups in Québec, but the 1981 census indicates that over 88% of Quebecers are Roman Catholic. Nor is geographical distribution necessarily broad: most of Québec's non-Catholics are found in Montréal.

How many people belong to the more controversial new religions in Canada? Estimates in 1982 showed about 450 Hare Krishna members; 350-650 Unification Church members; 250 Children of God; about 700 full-time Scientologists and 15 000 taking Scientology courses; and over 200 000 who had been initiated into Transcendental Meditation (TM). However, if membership in new religions is small, the number of people holding nontraditional religious views and likely to have participated in the new movements is relatively high. Bibby's research indicates that 28% of Canadians have some interest in yoga; 21% in TM; 45% in astrology; and 69% in ESP. About 13% believe in reincarnation. Frederick Bird and Bill Reimer found that 32% of their sample of adult students in Montréal had participated at some time in activities organized by new religions, but they emphasize the difference between occasional participation and full membership. It may be that a market exists for new religious movements to fulfil needs that are not met by traditional churches. But by 1983 no group had fully established itself in Canadian society, although some groups, such as ISKCON and TM, have established rural communities and own property. It appears that, after sampling various groups, many people will not join any, commonly reverting to Protestant or Roman Catholic affiliations, or occasionally turning to such traditional movements as the MORMONS or the more conservative Christian churches.

When placed in historical context the new religious movements may appear less strange. Modern society is called a "secular society," in which RELIGION and the sacred play little official role. Many provinces exclude religion from the curriculum in public schools, thus suggesting an attitude that religion is essentially unimportant. Hence, when young people turn to religion in any significant way their actions are seen as odd and needing explanation.

Traditionally, society's values have been based on religious values. Before the rise of CHRISTIANITY many different religions competed for the hearts and minds of the people. Even after Christianity became accepted as the religion of Europe there were periods of religious renewal and revival that produced many new varieties of Christianity. Perhaps the best known of these periods was the 16th-century Reformation.

Many theories exist as to why new religions grow. Some people posit tension and social unrest, whereas others stress religious reactions to dead orthodoxies. But the rise of new religions is not new, and by examining past examples we can discover patterns that help us to understand the present better. Thus, although groups such as the METHODISTS and Mormons began as suspect movements and encountered strong opposition, we know today that they did not cause society to disintegrate and that over time their practices were influenced by, and helped form, social attitudes in a positive way.

**Identifying the New Religions** The popularity of new religions is constantly changing and new groups continually appear. In the mid-1960s TM was growing rapidly; in the early 1970s it was the Divine Light Mission; in the mid-1970s the Unification Church; and in the early 1980s Rajneeshism. Each movement went

Splinter religions, which usually are an outgrowth of ancient religious traditions, include the Hare Krishna (courtesy Canapress).

through a period of rapid growth and then spectacular decline. Hence, a means of identifying groups generally is more valuable than an elaborate enumeration of new religions and their particular beliefs. To identify specific groups, one must recognize the existence of central experiences that may be generally labelled "spiritual." These include dreams, visions, precognition, ESP, a sense of awe, a sense of a presence, ghosts, dread, etc. They occur in all religious traditions. Specific traditions give them explicit interpretations in their own teachings. Thus in the HINDU tradition Indian villagers see visions of Krishna, in Roman Catholicism the Virgin Mary may appear to the devoted, and in some newer groups spacemen reveal spiritual truths. In each case a system of thought is used to make sense out of strange experiences.

Three main systems of interpretation mold the teachings and practices of the new religious movements. The traditional Western systems originated with the religion of the ancient Hebrews and express themselves through JUDAISM, Christianity and ISLAM. This type of religion, which has distinctive ideas about God, creation and the nature of humanity, may be called the Abrahamic tradition because its member religions all recognize Abraham as their founding father. The second type of system is that which in its many forms has the practice of meditation or yoga at its core. It finds expression in Hinduism, BUDDHISM, Jainism and SIKHISM. The third religious type is that in which religious thought is expressed in technical and scientific language. Religions of this type are truly new religions which openly proclaim their modernity and boast of their superiority. Some are forms of gnosticism that claim both Jewish and Greek roots, but whose schools employ much modern psychology. Another manifestation of modernity can be found in the Human Potential Movement, which includes client cults in which individuals seek to transform themselves through training and participation in various groups, encounters and techniques.

Although these systems can be isolated, syncretism (the combination of differing beliefs and traditions) makes any summary of individual movements difficult. One can begin to categorize different new religions by their heritage and their rhetoric. The Unification Church is primarily Abrahamic although influenced by Korean philosophies. Hare Krishna is yogic, and Scientology is a religion of modernity. The classifications do not explain the religions, but help to identify them and assist the observer to analyze and understand their dynamics and theological patterns. The groupings should be seen as dynamic models to assist understanding, not as static analyses of beliefs. Members of new religions must be recognized to be on individual spiritual quests. A person may join the Unification Church essentially because of a vivid experience that that church appears able to explain. As the members' understanding of Unification thought grows, their essential allegiance to the group may then change from a reliance upon experience to a commitment to the beliefs of the group's development of Abrahamic concepts. In time, through study, this commitment to Abrahamic themes may lead the convert out of the group in search of a more traditional interpretation of the Abrahamic tradition.

**Why and How People Join** Social and psychological needs vary from person to person. New religions meet many of these, but so do golf clubs, traditional churches, theatrical groups, political movements and a host of other social organizations. The new religions seem to meet 2 requirements especially well: giving meaning and purpose to life, and taking "spiritual" experience seriously.

Few Canadians seem to be on a quest for life's meaning and most seem content with their im-

mediate goals. Yet most people have wondered at some time about the purpose or meaning of existence. If during one such time of conscious reflection a person meets members of a new religious movement who claim to have found the answer to his or her questions, he or she may be tempted to investigate and perhaps join that movement. Beyond merely puzzling over life's meaning, many people have "spiritual" experiences, including unusual feelings and sensations ranging from out-of-the-body experiences to ESP and mystical visions. According to Bibby, some 58% of Canadians think they have had premonitions and 51% claim to have experienced mental telepathy. Research in Britain indicates that these and other apparently inexplicable occurrences are far more common than is usually thought. Yet our secular culture regards such experiences as at best "odd" and at worst evidence of psychological illness. Naturally, few people are willing to talk openly about them. However, members of the new religions take such experiences very seriously and not only interpret them, but actually encourage people to talk about and reflect on them. By supplying meaning to everyday life and offering explanations for unusual experiences, the new religions are able to present potential converts with a comprehensive world view that is self-authenticating. Thus the new religion holds out to the convert insights and psychological supports that make membership attractive and enticing.

Recruitment generally proceeds primarily along friendship networks; members bring their friends into the groups. This theory of interaction is clearly illustrated in a classic paper by J. Loflund and R. Stark, "Becoming a World-Saver: A Theory of Conversion to a Deviant Perspective" (*American Sociological Review*, 1965). Once initial contact has been established, existing members become the candidate's new friends and friendship ties are strengthened and extended. The importance of friendship in this process becomes obvious when one considers the response of outsiders to a new religion. Usually family members or old friends warn the new or potential convert against the group. Such warnings normally strengthen rather than weaken the cause of the new religion, because they are perceived not as criticism of the religion but as uninformed criticism of one's friends. Also, most religious groups teach that the outside world is under the influence of evil powers which will do everything possible to prevent potential converts from accepting the truth.

**Brainwashing-Deprogramming Controversy** One major reason for interest in the new religions in the 1970s was the claim that "cults recruit members by brainwashing techniques." This was supported by lurid autobiographical stories along with TV and radio interviews given by people who claimed to have "escaped" from the cults through deprogramming. Theoretical support came from Flo Conway and Jim Siegleman, authors of *Snapping* (1978), in which a theory of personality change is proposed to explain why people join the new religions. The authors intended their work to include not only the Unification Church, but also all "born-again" or EVANGELICAL Christians, and to show that William Sargent's *Battle for the Mind* (1957), their theoretical base, is a study of Christian conversion generally. The assumption behind the theory is that the human mind is like a computer and that people, because they can be programmed, are not responsible for their actions.

*Snapping* and Josh Freed's *Moonwebs* (1981) — a sensational account of life among the Moonies — and other books support the practice of forcible deprogramming. This involves kidnapping members of religious groups and holding them prisoner until, through a combination of kindness, love, criticism and fear, members "break"

and renounce their membership. This practice is clearly illegal and has many implications for civil religious liberties. Deprogramming has not been restricted to members of the new religions: in the US, Roman Catholics, Anglicans, Baptists, members of feminist groups and others have been deprogrammed because their views offended other family members. In Calgary and Montréal, widespread publicity surrounded the kidnapping and attempted deprogramming of Unification Church members. The Montréal case became the basis of the 1982 film *Ticket to Heaven*. Ontario's Hill Commission, however, spoke out strongly against kidnapping, and concluded that, if cults practise mind control and brainwashing, the evidence shows that they are not very successful. Deprogramming therefore appears unnecessary.

University of Toronto psychiatrist Saul V. Levine has argued that even when the deprogramming "succeeds" it usually creates severe mental problems. For deprogramming to work, people must be convinced that they were victims who joined the religion against their will through a process of brainwashing which removed from them all responsibility for their actions. The result is that they can never be sure that they are not being trapped again by a brainwashing technique of which they are unaware. An acute sense of dependency and self-doubt is created. By contrast, people who voluntarily leave new religions after participation retain their psychological integrity and self-respect. They may consider themselves fools for joining, but they have no fear of being trapped again.

Considerable evidence exists that membership in the new religions depends on individual free choice. Strong social pressures may be exerted by some groups, but such pressures are essentially no different from those of more traditional religious groups or other voluntary associations. Moreover, most people who join new religions soon leave by choice. British sociologist Eileen Barker's study of Unification Church recruiting techniques showed that, although many people accepted invitations to the church for several weeks, at the end of a year only 4% of those contacted became members. Similar work by others indicates equally high dropout rates from all new religious movements.

**New Religions of Canadian Origin** Although not usually recognized as a new religious movement, the Latter Rain Movement, which originated in North Battleford, Sask., in 1948, may be the most influential Canadian contribution to modern religion. Essentially a PENTECOSTAL revival movement, Latter Rain spread from a Foursquare Gospel church through evangelical Christianity worldwide. Many contemporary practices of CHARISMATIC Christianity, such as "singing in tongues," gained popularity as a result of this movement, which produced hundreds of new independent evangelical churches. Most have remained essentially orthodox, but some developed unusual beliefs and practices. Today, in Canada, the most prolific of new religions are continental in nature and not essentially Canadian. Evangelical groups which attempt to recreate biblical Christianity are the most common. These are usually orthodox and generally accepted by other Christians. But a significant minority adopt social and theological beliefs that place them on the fringe of orthodoxy. Others, such as the Local Church, the Way and the Children of God, have been rejected by other Christians and have become centres of controversy.

Probably considered the most notorious is the Children of God, or "the Love Family." The group originated with David Berg, a Pentecostal evangelist, as a California "Jesus people" group in 1968. Berg's movement arrived in 1971 in Vancouver, where it grew relatively rapidly.

Berg changed his name to Moses David and claimed to receive "revelations" from God that included visions of the end of Western society. Eventually the group formed a series of colonies that went underground as a result of adverse publicity and the exposure of their allegedly perverse sexual practices. At its height the Children of God had around 8000 members. In 1983 it likely had under 2000 worldwide, with about 50 in Canada.

A uniquely Canadian movement is the Kabbalistic Philosophy. Founded in Vancouver in 1930 by Alfred J. Parker (1897-1964), it blends Eastern and Western thinking, and teaches an understanding of mind and cycles based on mathematics. Its practices include vegetarian diets and physical exercises similar to those of yoga. Another important group in BC is the Emissaries of Divine Light, based at One Hundred Mile House. It encourages highly respectable forms of living and is essentially Eastern in orientation.

In Alberta there are several fundamentalist Mormon groups. These usually assert that the Utah Church of Jesus Christ of the Latter-day Saints has deviated from true Mormon doctrine by rejecting the practice of polygamy. Like charismatic Christians they thrive on prophetic revelations and literal interpretation of the Scriptures. Although not a new religion, an important movement originating in Saskatchewan is Ex-Mormons for Jesus, an organization of fundamentalist Christians. They are similar to the Toronto-based Committee on Mind Abuse (COMA) and other anticult organizations across Canada. These groups are united by the belief that cults are bad and that action is needed to fight them. Bromley and Shupe in *The New Vigilantes* (1980) claim that in their social organization such movements are similar to the new religions.

In Québec the Apostles of Infinite Love began in the 1950s after its founder, a former Catholic priest, moved from France. He ordained a Québécois, Gaston Tremblay, as Pope Jean Grégoire XVII, and in spite of his 2-year sentence for forcible detention of 3 children, the group expanded to over 30 monasteries in Canada and the US. ### Spiritualism

Although formal spiritualism has existed for over 125 years, it should be considered within an examination of new religious movements because of a revival of interest in N America. Modern spiritualism developed in the 19th century within a spiritual and mystic resurgence based on such influences as earlier mysticism, Emanuel Swedenborg's writings, New Thought, Rosicrucianism and N American Indian SHAMANISM and spiritism. Andrew Jackson Davis and Phineas P. Quimby were especially important mid-19th-century influences. Through the work of 18th-century Austrian physician F.A. Mesmer, trance and clairvoyance had become familiar. In 1848 Margaretta and Kate Fox in Hydesville, NY, began to communicate with a spirit by rappings. Mediumistic circles soon spread throughout the US. The movement arrived in Canada by 1850 and quickly spread through the country; it was taken to Britain in 1852. The dissemination of the spiritualist system is simple: all that is required to begin a group is a person with mediumistic abilities.

There are 7 principles to which most Canadian spiritualists subscribe: the fatherhood of God (not a person but the creative universal spirit); the brotherhood of man; communication of spirits and ministry of angels; the continuous existence of the human soul; personal responsibility (including free will); compensation and retribution hereafter for all good and evil deeds done on Earth; and the eternal progress open to every human soul. There is no belief in an eter-

nal hell — every soul can progress. Some spiritualists believe in reincarnation. These principles also imply that the living have both a physical and a spiritual body. Based on these principles are 2 propositions: the survival of the individual personality, or spirit, after death, and the concern of the spirit world for the living and the ability to communicate with the living. The objective of spiritualism is scientific verification of these 2 propositions rather than simple belief that they are true. This is accomplished, spiritualists believe, at each service by spirits' communications to the living through mediums or by spiritual/psychic healing. A particular group may emphasize messages or healing; healing seems to be more important in western Canada than in Ontario, but the result is the same: verification of survival after death.

Spiritualists believe that everyone has at least one spirit "guide," who is around to aid, protect and instruct, and that mediums have special abilities, in altered states of consciousness or trance, to communicate with their guides and move spiritually into an alternative reality where time and space do not exist as we know them. The medium clairvoyantly may be able to see glimpses of the future or the past. The guides allow other spirits to contact the medium who then acts as the agent through whom messages are passed from the spirit world to the living. Early spiritualism emphasized such physical "proofs" of spirit communication as table rappings by spirits, materialization of spirits, levitation and other phenomena presumably from the spirit world. Although these sometimes occur in modern seances, they are not an important element of the current movement.

Spiritual/psychic healing differs from faith healing in that faith healing occurs in churches, is performed by clergy, normally requires some faith on the part of the sick person, and frequently claims instantaneous cures. Spiritual/psychic healing is done by laity who are often affiliated with an organized spiritualist church, and is often done in a private home. It requires no faith on the part of the patient, and rarely produces instantaneous cures. Healing requires a series of treatments. Further, spiritualist/psychic healers insist that their patients continue traditional treatments with their doctors. Healing is thus an adjunct rather than an alternative to medical therapies.

A healer believes that spirits work through him or her to send "energy" to the patient. The healer is merely an "instrument" through which the spirit world acts. A treatment is usually accomplished in 10-15 minutes by the healer's entering a semitrance and either touching the patient's body or holding the hands about 2-4 cm from the body, directing the healing energies through the hands.

Believers often organize into churches loosely structured around a mediumistic or charismatic leader, but they remain individualist in belief. The 2 kinds of groupings are religious services, held in a church, and psychic development circles, usually held in a home. The church service is composed of hymn singing, a sermon, messages from the spirit world and healing. Organization is egalitarian, with many members taking part in the service as healers, speakers or mediums. The circles are groups of about 10 who meet regularly to communicate with the spirit world, send healing energies to persons not present and develop their psychic and mediumistic abilities. The use of Ouija boards and similar mechanisms to contact spirits is discouraged because it may allow the "lower spirits" to come, and this would be harmful.

Many Canadian spiritualists attend "camps" in the US, where formal classes are held in healing, mediumship and aspects of the belief system, and a minister's or healing certificate may be obtained. Spiritualism is primarily an urban,

middle-class phenomenon. Spiritualists are not marginal to society, but participate actively in community affairs; their activities are tolerated by society and generally ignored by traditional churches. Women are equal with men and often take a lead in a spiritual activity. Children are not deliberately drawn into membership: it is necessary to keep a balance between the mystical and the real world, a distinction that might be difficult for a young child. Visitors are warmly welcomed, but no pressure is exerted to join the organization or to accept particular beliefs. Some spiritualists estimate that there are 800-1000 spiritualists in Canada in the 1980s, but only about one-third are active. Although there have been a number of important spiritualists in Canada, the most prominent was PM Mackenzie KING. J.B. TOWNSEND

**New Westminster, BC, City,** inc 1860, pop 38 550 (1981c), is located on the N bank of the FRASER R, 20 km E of Vancouver. Surveyed by the Royal Engineers and named by Queen Victoria, "The Royal City" was established in 1859 by Gov James DOUGLAS as the capital of BC. Few colonial era buildings survived a fire in 1898 but one, the Captain William Irving House (1862-64), is now the city's historic centre.

**History** New Westminster never displaced its great rival, Victoria, as the commercial metropolis of the Fraser R and Cariboo goldfields. Then, in 1868 the Legislative Council chose Victoria as the permanent capital of the recently united colonies of BC and Vancouver I. Although New Westminster secured a CPR branch line in 1886, the completion of the main line to Vancouver in 1887 further relegated it to secondary rank. Nevertheless, the city remained an important freshwater port, a major lumber producer, a salmon-canning centre, a commercial centre for the Fraser Valley and an administrative and service headquarters with such institutions as the County Court, the BC Penitentiary, the Provincial Mental Hospital and the Royal Columbian Hospital. The city also secured rail links to the US via the Great Northern Ry and Fraser River Ry Bridge (1904); to the eastern Fraser Valley via the BC Electric Ry (1910); and to eastern Canada via the CNR (1915). Population growth has been uneven. Rising during the CPR boom from 1500 (1881) to 6678 (1891), the population remained steady until it doubled to 13 199 during the boom decade 1901-11. It then rose grad-

Pattullo Bridge, New Westminster, BC (courtesy Elliott and Nicole Bernshaw/Bernshaw Photography).

ually to 42 835 in 1971 but has since declined. New Westminster has been known for such figures as John Robson, BC premier and founder of the *British Columbian* newspaper (1861-1983), and for the national success of its lacrosse teams. The city is home of the CANADIAN LACROSSE HALL OF FAME.

**Economy** Although the once-famous salmon-canning industry has gone, the forestry industry remains important, employing over 40% of the manufacturing work force in local mills producing lumber, shingles, plywood, and pulp and paper for local consumption and export. Nevertheless, the number of industrial plants has declined in the past decade; much retailing has moved to suburban municipalities, and the Fraser R Harbour Commission has transferred most of the port activity to the river's S side and to Annacis Island. Increasingly, the city is becoming a residential centre marked by apartment buildings rather than single-family dwellings, a trend which may grow with the completion of the Automated Light Rapid Transit line to Vancouver and the proposed redevelopment of the waterfront for housing and commercial purposes.

PATRICIA E. ROY

**Newcastle, NB**, Town, pop 6280 (1981c), inc 1899, is located below the juncture of the NW and SW branches of the MIRAMICHI R. The shire town of Northumberland County 1786-1967, it was probably named for Thomas Pelham-Holles, duke of Newcastle and PM of England. Two Scots, William Davidson and John Cort, settled the area in 1765, drawn by the potential of the salmon fishery. They were followed by some LOYALISTS and many Scottish and Irish immigrants. In 1825 a great fire devastated the Miramichi area and laid waste Newcastle and nearby Douglastown. Only 12 of Newcastle's 260 buildings escaped the flames. The fire put an end to the masting industry, but shipbuilding, the fisheries and lumbering became significant industries afterwards and the latter 2 are still important. Newcastle is a busy port, exporting wood pulp and wood products. The town's most famous "son" was MAX AITKEN, later Lord Beaverbrook, who became the province's greatest benefactor.

WILLIAM R. MACKINNON

**Newcombe, Howard Borden**, geneticist (b at Kentville, NS 19 Sept 1914). After studying at Acadia and McGill and wartime service in the Royal Navy, he worked with M. Demerec at Cold Spring Harbor Laboratory, NY. In 1947 he moved to the Chalk River Laboratory of ATOMIC ENERGY OF CANADA LTD. In 1949 he provided direct proof for the occurrence of spontaneous, undirected mutations in bacteria. This work eliminated the last vestiges of Lamarckism from biology and contributed greatly to the subsequent explosive development of molecular genetics. In 1957 he turned his attention to vital statistics and health records for analytical studies in demographic genetics. He pioneered computer-assisted "record linkage" techniques in epidemiology. He was a founder of the Genetics Soc of Canada and in 1963 was elected a fellow of the Royal Soc of Canada.

ROBERT H. HAYNES

**Newfie Bullet** An affectionate but ironic name informally applied to the trans-insular Newfoundland passenger railway in its latter days. A narrow-gauge train, winding 900 km around lakes and mountains from St John's to Channel-Port aux Basques (track completed 1898), it was not noted for its speed. In the late 1960s CNR replaced the subsidized passenger service with a bus service.

ROBERT D. PITT

**Newfoundland**, the youngest Canadian province, joined Confederation at midnight on 31 March 1949. Some portion of the coast of this easternmost part of Canada was assuredly one of the first parts of the continent seen by Euro-

## Newfoundland

**Capital:** St John's

**Motto:** *Quaerite Prime Regnum Dei* ("Seek ye first the Kingdom of God")

**Flower:** Pitcher plant

**Largest Cities:** St John's, Corner Brook

**Population:** 568 000 (1981c); rank ninth, 2.3% of Canada; 58.4% urban; 41.2% rural nonfarm; 0.3% farm; 1.5 per km<sup>2</sup> density; 1% increase from 1976-81; Jan 1984e pop, 579 400

**Languages:** 99.3 English; 0.3% French; 0.4% Other

**Entered Confederation:** 31 Mar 1949

**Government:** Provincial — Lieutenant-Governor, Executive Council, House of Assembly of 52 members; federal — 6 senators, 7 members of the House of Commons

**Area:** 404 517 km<sup>2</sup>, including 34 032 km<sup>2</sup> of inland water; 4.1% of Canada

**Elevation:** Highest point — Mt Carbrick, Torngat Mountains (1652 m); lowest point — sea level along coasts

**Gross Domestic Product:** \$4.698 billion (1982e)

**Farm Cash Receipts:** \$34.672 million (1982)

**Value of Fish Landings:** \$166.721 million (1983 prelim total); \$176.289 million (1982 total)

**Electric Power Generated:** 39 993 562 MWh (1983)

**Sales Tax:** 12% (1984)

peans. Tenth-century Viking explorers from Iceland and Greenland saw Labrador and most probably settled briefly in the northern part of the Island of Newfoundland. In the late 15th century the GRAND BANKS SE of Newfoundland were known to Basque, French and Portuguese fishermen. Since the time of King Henry VII of England, who on 10 Aug 1497 awarded John CABOT £10 for finding "the new isle," the Island has been referred to as Terra Nova, but more commonly in the English-speaking world as Newfoundland. The French call it Terre-Neuve; the Spanish and Portuguese still call it Terra Nova. The LABRADOR part of the province may have received its name from the Portuguese designation, "Terra del Lavradors." CAPE SPEAR, near St John's, is the easternmost point of the province and thus, excepting Greenland, of N America. From Cape Spear across the Atlantic to the nearest point in Ireland it is nearly 3000 km. Winnipeg, in mid-Canada and Miami in the southeastern US are farther away — 3100 km and 3400 km, respectively. The southern coast of the province lies astride lat 47° N, but Cape Chidley on the northernmost tip of Labrador is just N of 60° N, giving the province a total north-south extent of just over 1800 km. The land and freshwater area is 404 517 km<sup>2</sup>, of which 292 218 km<sup>2</sup> are in Labrador and 112 299 km<sup>2</sup> on the Island. Newfoundland is the seventh-largest Canadian province. Neighbouring NS, NB and PEI are smaller, and even their combined area is less than that of Newfoundland, which is slightly larger than Japan.

### Land and Resources

The province is physically divided into 2 major units of unequal area, the much larger unit being the mainland territory of Labrador to the N and the smaller unit the Island of Newfoundland to the S. Within each there are distinct variations in the physical characteristics of the environment and in the occurrence and availability of natural resources and corresponding variations in the nature and pattern of human settlement.

Distinctive subregions within each major unit can be outlined. In Labrador there are 3 such

subregions: a northern coastal region, ruggedly mountainous, deeply fjorded and growing only ground-level subarctic vegetation, with very little settlement; a southern coastal region with a rugged, barren foreshore and a forested hinterland, with light to moderate settlement; and the bulk of the vast interior, which comprises a well-forested, dissected plateau, where settlement is concentrated in a few large towns.

On the Island of Newfoundland there are 4 distinct regions, the W coast, the interior, the NE coast and the S coast. The W coast is dominated by the table-topped Long Range Mts, which rise to 722 m. They are bordered in places by a narrow, well-forested coastal plain and are frequently penetrated by glacially deepened valleys and by several large, fjordlike bays, the largest of which are the Bay of Islands and Bonne Bay. There is almost continuous settlement in the bays and coves along this coast and there is some interior settlement in the Codroy Valley to the S and around Deer Lk, which lies on a small plain within the mountain range. The interior is a plateaulike region with frequent undulations in the terrain representing the ridges and slopes of the watersheds carved out by the major stream systems; 4 large rivers, EXPLOITS, GANDER, HUMBER and Terra Nova, drain most of the area. The region supports extensive forest stands, particularly on the gentle slopes of the major watersheds. Settlements are widely separated and most of the population is concentrated in a few large towns associated with forest or mineral-resource use and with transportation services. The NE coast, with its numerous bays, islands and headlands, fronts on the Atlantic Ocean from the Great Northern Peninsula, to the AVALON PENINSULA. Inland sections of this region are generally well forested, but exposed headlands and offshore islands have low, scrubby vegetation. The region has a shoreline typical of land that was submerged by glaciation and in places rebounded after the ice caps melted. Thus, there are innumerable bays, coves, islands and fjords, which often provide excellent harbours. It is also an area that can annually expect to be blocked by arctic drift ice throughout the winter and early spring.

Settlement has developed along the shores of most of the bays and on some offshore islands. The S coast region coincides with the whole southern portion of the Island of Newfoundland. This coast also has the deeply embayed characteristics of a submerged shoreline. It is not blocked by arctic drift ice, although in some years parts of the eastern Avalon Peninsula as far S as St John's may be cut off for a few days. In inland areas the topography is generally hilly and rugged and much land is covered by shallow bogs and heathy vegetation. On the gentle slopes of the major river systems and in the interior of the Avalon Peninsula there is good forest vegetation.

**Geology** Labrador occupies the easternmost section of the Canadian Shield and comprises mostly tough, ancient Precambrian igneous and metamorphic rocks. There are some areas of softer sedimentary rocks, notably in the W in a formation called the Labrador Trough — within which lie some of the most extensive iron-ore deposits in N America. The interior region is plateaulike, on average about 450 m above sea level and greatly dissected by large, E-flowing rivers, such as the Churchill R and its tributaries, which cut through the eastern rim of the saucer-shaped Shield to discharge into the Labrador Sea. This rim is largely mountainous, especially in the N, where the Torngat Mountains rise to over 1500 m. The highest peak is Mount Caubvick at 1652 m.

The Island of Newfoundland is part of the Appalachian system and displays in its major bays, peninsulas, river systems and mountain ranges the typical SW to NE alignment. Rocks are more varied on the Island than in Labrador. Continental drifting, followed by frequent periods of crustal deformation and interspersed by long periods of erosion and deposition, have combined to produce this great variety in types and ages. The oldest rocks are Precambrian and occur in the E, in and around the Avalon and Burin peninsulas; they are mostly folded sedimentary rocks, but in a few areas later intrusions have solidified into volcanic rocks. Small remnants of gently sloping Cambrian and Ordovician sedimentary rocks occur in pockets along the coast. The most significant are in Conception Bay, where the Ordovician rocks that form Bell I contain layers of hematite iron ore with estimated reserves of billions of tonnes. The central and western portions of the Island are underlain by a great variety of Paleozoic rocks of sedimentary, igneous and metamorphic origin, within which crustal deformation has been generally severe. Long periods of erosion following periods of uplift have left a polycyclical landscape with the remnants of old erosion surfaces displayed in the plateaulike interior and on the flat-topped mountains of the Long Range. There is a mineralized belt in these Paleozoic rocks, stretching from an area on the S coast just E of Channel-Port aux Basques to the general area of western Notre Dame Bay on the NE coast, within which occur ores containing copper, lead, zinc, gold and silver. Through the years many deposits have been mined or quarried on a small scale and for brief periods. Around Buchans to the W of Red Indian Lk, significant deposits of ore have supported a large mining operation since 1928, and a large asbestos quarry has operated near Baie Verte on the NE coast since 1963. The youngest and least disturbed rocks of this Paleozoic series lie in and around the coastal plain on the W coast. These are Mississippian and Pennsylvanian and contain much limestone and gypsum, both of which are quarried. There are a few coal deposits and signs of petroleum, but nothing of commercial value has been discovered. Parallel to the E coast of the Island, under the ocean, extensive deposits of Cretaceous rock appear to stretch the length of the Grand Banks. Drilling

François, an outpost on Newfoundland's southern coast (photo by John deVisser).

from offshore rigs has proved the presence of enormous reserves of petroleum and natural gas in this area. Development will depend on the economic and technical feasibility of operations under adverse weather and iceberg conditions.

**Surface** All areas of the province show the effects of continental glaciation during the Pleistocene era, whose last stages are now dated to 7000 years ago. Moving ice sheets scoured and sculptured the surface. Most of the unconsolidated parent material beneath present-day soils consists of glacial debris or marine sediments, the latter now exposed owing to postglacial uplift. The interior regions of both Labrador and the Island are strewn with lakes and covered with moraines, and give evidence of an immense ice cap, which initially moved radially outward from a centre W of Labrador, but in the later periods of the Pleistocene broke down into smaller, separate ice caps with centres in Labrador, the W-central Island and the Avalon Peninsula. Most coastal regions are fjorded where the ice channeled down the valleys of the preglacial fluvial system. The longest and most steep-sided fjords occur in northern Labrador and around the Great Northern Peninsula of the Island, but there are few places where this scouring effect from ice movement is absent. Most bays have been deepened and are often fjordlike in character. Many places in the N of the Island and in Labrador show, because of postglacial uplift, raised shorelines and large stretches of marine sediments. The most striking and extensive marine deposits are those in the remnants of raised deltas that occur around St George's Bay and around Happy Valley-Goose Bay in Labrador at the mouth of the Churchill R. Coastal features, such as offshore islands, spits, tombolos and bay-mouth bars (*barchoix*), which are typical of a submerged shoreline, are common throughout the S and SE coastal regions.

SOILS are generally coarse and immature. In northern Labrador and in high places throughout the province, because of coolness and exposure, vegetation is either entirely lacking or is only of the subarctic, lichen tundra ground-level variety. In the interior regions where surface deposits are deep, such as on the watersheds of the Churchill, Exploits, Humber and Gander rivers, there are excellent forest stands. Extensive bogland has developed in the many hol-

lows of this glaciated landscape. The forest is made up of several of the species common to the boreal forest that stretches across northern N America. Black spruce predominates, especially in open stands and where forest has regenerated after fire. Close forest is most common and here black spruce and balsam fir are dominant, the ratio varying with the site type; balsam fir regenerates more successfully in places that have been clear-cut. Subdominants are represented by larch, pine and such typical boreal deciduous species as paper birch, aspen, alder, pin cherry and mountain ash. Many of the nonforested areas support ground-level, mossy plants, some of which are food for wildlife, and some, such as the blueberry, partridge berry and bakeapple ("cloudberry"), can be gathered for human consumption.

**Water** Through scouring and deposits, glaciation left a pockmarked landscape capable of storing vast quantities of water in thousands of lakes, ponds and bogs. Many of the ponds are shallow, but many of the lakes are in large, old valleys deepened by glacial scouring and dammed by glacial deposits. In interior Labrador hundreds of lakes have been combined by means of canals, dikes and dams, to create a 6527 km<sup>2</sup> (roughly one-third the size of Lk Ontario) reservoir behind the huge hydro development of Churchill Falls. Because of the moist climate and plentiful snowfall, the water table is high in all areas, usually lakes are full and rivers flow perennially. There is naturally some seasonal fluctuation and occasionally very wet or dry years, but there are rarely shortages of water for domestic or industrial use.

**Climate** varies considerably throughout the province. Interior Labrador has a continental climate, but the southeastern areas around the Burin and Avalon peninsulas are marine. The transitional variation makes it difficult to designate specific climatic regions, but certain generalizations can be made. The climate of northern Labrador is truly subarctic in that there is generally coolness and dryness throughout the year. Winters are very cold with mean temperatures averaging -20°C, and summers are cool, July mean temperatures averaging 5-10°C. These temperatures are recorded at sea level, and the high land in the Torngat Mts would be even colder. Precipitation is low, annually averaging only 46 cm at Cape Chidley, of which 50% falls

Mountain stream in the Torngat Mts of Labrador (photo by John Foster / Masterfile).

as snow. The winters of interior Labrador are extremely cold, with mean temperatures for Jan between  $-18^{\circ}\text{C}$  and  $-23^{\circ}\text{C}$ ; summers are warm, with mean temperatures for July of between  $13^{\circ}\text{C}$  and  $17^{\circ}\text{C}$ . The lowest temperature for the province was recorded in western Labrador at  $-51^{\circ}\text{C}$  and the highest at Goose Bay at  $38^{\circ}\text{C}$ . In coastal areas the modifying influence of the ocean reduces the temperature range between summer and winter. In southern Labrador coastal regions are cold in winter and cool in summer, and interior regions are often severely cold in winter but warm in summer. On the Island there is a similar though not so marked difference between coastal and inland regions. The mean Jan temperature at St John's is  $-3.8^{\circ}\text{C}$ , while the July mean is  $15.3^{\circ}\text{C}$ . Inland, for most locations, the midwinter mean is between  $-6^{\circ}\text{C}$  and  $-10^{\circ}\text{C}$ , and the midsummer mean is  $13^{\circ}$  to  $16^{\circ}\text{C}$ .

Precipitation varies in a NW to SE direction. Average annual precipitation around the Avalon and Burin peninsulas is over 140 cm, and the amount decreases northwestward to amounts around 40–60 cm in Labrador. Precipitation is fairly even every month, but in northern locations about half falls as snow, and in the milder SE snowfall is only about 12%. In any one year great variations may be experienced, depending largely on the paths taken by the storms that cross N America from W to E. When the path is northerly, mild winters with little snow result, but when southerly, there may be a severe, cold and snowy winter. Frequent storms mean frequent windy weather and high average velocities. Coastal waters are often hazardous for small craft. The mixing of the air masses off the Labrador Current and the Gulf Stream frequently creates fogs on the Grand Banks and in eastern and southern coastal areas, particularly in spring and early summer.

### Resources and Conservation

The economy of Newfoundland is heavily dependent on natural resources. After its discovery around 1497, the Island depended on cod fishing for nearly 400 years, until the forest and mineral resources began to be exploited.

**Forests** The variation in climate and in the nature of the terrain dictates a similar variation in the nature of vegetation and growth rates. Generally the well-drained lowlands have the best forest growth, and there are sufficient timber stands to constitute an important resource. Initially the forests were used for building, fencing, fuel and boatbuilding and for shore structures related to the fishery, which made a small dent in the forest resource near coastal settlements. Since the turn of the 20th century, the increased value of lumber and pulpwood has led to penetration and exploitation of the interior. Much timber has been cut and regrowth is generally good although loss through FOREST FIRES and insect infestation has been at times severe (see FORESTRY).

**Minerals** Minerals of economic interest occur in many areas. Those in the mineralized belt of the Island (mostly the base metals, copper, lead and zinc) are mined at Buchans, Daniel's Harbour and near Baie Verte, when market conditions permit. Elsewhere, iron ore from hematite is mined in western Labrador, asbestos is quarried at Baie Verte, gypsum near St George's, pyrophyllite (aluminum silicate) near Foxtrap, Conception Bay South, and limestone near Corner Brook. Other mineral deposits, which have been or may be mined, include fluorspar at St Lawrence, iron ore on Bell Island, gold, copper, barite, uranium and limestone in various places, and the important offshore oil and gas reserves.

**Fishery** Perhaps the greatest and most permanent resource is the fish population of the waters surrounding the province. Groundfish,

Corner Brook, Nfld, looking east from Crow Head with the Bowater pulp and paper mill in the upper right. Now one of the world's largest, the mill, which was the basis of Corner Brook's existence, began production in 1925 (photo by John deVisser).

such as cod, grey sole, flounder, redfish and turbot, are plentiful on the banks and at times in all inshore areas. Surface-dwelling fish, such as caplin, squid, herring and mackerel, thrive in some areas, and migrating salmon are caught both at sea and in the larger rivers. Trout are plentiful in lakes, ponds and rivers and lobster and crabs in the shallow southern waters.

**Hydroelectricity** Large natural reservoirs on the Labrador plateau and interior Island have presented opportunities for the large-scale development of HYDROELECTRICITY. In Labrador, over 5200 MW has been developed and there is a potential for a further 2000–5000 MW, mostly on the lower Churchill R. On the Island about 980 MW has been developed and a potential for a further 200–300 MW remains.

**Conservation** Since most of the interior of the province is relatively uninhabited, there is ample space and a suitable habitat for wildlife, some species of which constitute an important resource. There is a greater variety in Labrador than on the Island. Among large game are several species of CARIBOU, MOOSE, black BEAR and, in northern coastal areas, polar bear. There are many small, fur-bearing animals; the most important are BEAVER, FOX, LYNX, RABBIT, OTTER and MUSKRAT. Some are trapped for the value of their pelts or for food and some are hunted annually by licensed sportsmen. In many coastal areas colonies of millions of seabirds nest annually, primarily gulls, gannets, murre, kittiwakes and puffins. Sanctuaries to protect these birds have been declared at Gannet I off the Labrador coast, on Funk Island and Gull Island off the E coast of the Avalon Peninsula and at Cape St Mary's on the S coast. GROS MORNE NATIONAL PARK preserves a spectacular natural region on the W coast and TERRA NOVA NATIONAL PARK on the E coast. There are also 77 provincial parks, and an 868 km<sup>2</sup> wilderness area in the central Avalon Peninsula.

### People

A small percentage of the population is aboriginal. The Island's only indigenous people, the BEOTHUK, are now extinct. There are a few thousand INUIT and N American Indians (MONTAGNAIS-NASKAPI) living mostly in Labrador and maintaining their original languages and some of their ancient cultures. MICMAC, living mainly on the Island's S coast, in the Conne R area, are engaged in LAND CLAIM disputes with the provincial government. Elsewhere the pop-

ulation is of European origin, the majority descended from immigrants from southwestern England and southern Ireland. On the W coast of the Island there are pockets of people of French descent (mostly ACADIAN) and some SCOTS whose ancestors were Scots from Cape Breton, NS. Religious affiliation closely follows ethnic origin. Most of those of IRISH and French descent are Roman Catholic and those of English origin are Anglican, United Church, Pentecostal, Salvation Army or Seventh-Day Adventists.

Settlement by Europeans proceeded slowly and reflected the dominance of the fisheries. Early settlers paid little attention to the soil or lack of amenities and settled on the shoreline in bays and coves close to the inshore and offshore fishing grounds, primarily on the E coast. Settlement gradually spread and became permanent. The first centres developed around St John's and Conception Bay, then generally along the E and S coasts. Fish were caught in summer, cured with salt, sun dried and shipped back to Europe in the fall. Inevitably centres of trade and commerce evolved, such as St John's, Harbour Grace, Trinity and Bonaville, and economic ties with the mother country were gradually relinquished. The livelihood of the population depended almost entirely on the vicissitudes of the fishery. New arrivals were few and out-migration to more promising N American areas was constant. The number of settlers grew slowly from about 12 000 in 1763 to 202 000 in 1891.

In the late 19th and early 20th centuries some diversification in the economy created greater stability. Iron-ore mines were opened on Bell Island in Conception Bay in 1894 and pulp and paper manufacture was started at Grand Falls in 1910. In 1925 a second pulp and paper mill was built in CORNER BROOK on the W coast, and in 1928 the mining of base metals was initiated at Buchans. A transinsular railway, begun in 1881 with several spur lines, contributed to the gradual improvement in economic conditions, and in 1935 the population numbered approximately 290 000. The GREAT DEPRESSION of the early 1930s was keenly felt, but ironically WWII brought an unprecedented prosperity, mainly because of employment provided by the construction and maintenance of large defence bases at St John's, Gander, Goose Bay, Stephenville and Argentia. There was only limited postwar prosperity, and by a referendum the people voted to join the Canadian Confederation in 1949. Benefits in the form of generous welfare payments, pensions and numerous other allowances, as well as the postwar marketing boom, kept the economy buoyant throughout the 1950s. The transition to provincial status

was not painless, but most Newfoundlanders, especially the young, are proud to be part of Canada. Over 65% of the 567 681 residents of the province in 1981 were born after Confederation.

The distribution of people changed markedly through the century from 1880 to 1980. When the cod fishery was the only important occupation, nearly all settlement was coastal. Most villages were small and the few large towns owed their size to their role as centres of trade and commerce. As other resources were developed, the mining towns, such as Wabana and Buchans, and pulp and paper towns, such as Corner Brook and Grand Falls, emerged. In the 1950s the centres of Labrador City and Wabush grew rapidly with the development of the iron-ore mines in western Labrador. Incidental to this diversification in the economy a pattern of centralization evolved. Opportunity in the fishery became limited because of the shifting emphasis from numerous small-boat operators to offshore trawlers and the switch from sun-cured, salted fish to fresh-frozen fish in modern plants. A subsequent population movement resulted in the demise of many of the small "outposts" and the growth in the size and importance of centres with facilities for fish processing and with access to provincial transportation and communications networks.

In 1981 over half the population lived in incorporated towns. Only 10% of the LABOUR FORCE was engaged in primary occupations (fishing, mining, logging and farming). About 13.3% was engaged in manufacturing and processing, each largely associated with the fishery, pulp and paper, and mining industries. The majority are in professional, clerical, construction and other service-related occupations.

#### Economy

Once wholly dependent upon the fishery, the economy now includes mining and mineral processing, manufacture based on forest resources and the provision of services and government in centres of trade, commerce, transportation and communication. Transfer payments to areas of regional disparity and other federal government benefits are of paramount importance. The province is generously endowed with natural resources and given a favourable economic climate and clever management could prosper on its own merit. Periodically, development of each resource in turn has proved beneficial to both primary and secondary producers. It is anticipated that the development of offshore oil and natural gas will positively influence the province's economy, but true prosperity will occur only when all resources are developed concurrently and successfully (see REGIONAL ECONOMICS).

**Agriculture** Agriculture has been of very minor importance in Newfoundland because of the poor soil and adverse climate. Less than 0.01% of the land in the province is farmed — about half of it being confined to the northern Avalon Peninsula. Nevertheless, there are scattered pockets of fertile land and conditions are suitable for the growth of hay and pasture crops. Root crops such as potatoes, turnips and cabbage are produced in significant quantities, and in some places livestock, particularly cattle and sheep, are raised on natural pastures. Swine and poultry production is important, as is dairy farming around St John's and Corner Brook. The province is almost self-sufficient in egg production. There are about 4750 ha of land in crops and 4150 ha in pasture (1981 census). Annual yields show potatoes averaging 3 million kg on 396 ha, turnips averaging 3.2 million kg on 248 ha and cabbage averaging 1.5 million kg on 155 ha. Beets, carrots, lettuce, savory, strawberries, chard, broccoli and brussels sprouts are grown in small quantities in small market gardens. Over 1 million kg of wild blueberries are

St John's, the capital and largest city of Newfoundland, named for the presumed date of discovery on the Feast of St John the Baptist in 1497 (photo by Bill Brooks/Masterfile).

packed for export annually. There are roughly 3500 head of dairy cattle, producing 8700 kL of milk, and 2200 head of beef cattle. Nearly 20 000 pigs are raised and slaughtered annually. There are about 7400 head of sheep, nearly 475 000 layer chickens, producing 7400 dozen eggs, and nearly 500 000 broilers. Other than blueberries, all agricultural production is consumed locally and over 80% of the meat, fruit and vegetables are imported. Studies have shown that the mineral and organic soils (bogs) could provide all the food needed by the present population (except the major grains and tropical and subtropical fruits), but whether such an achievement would be economically feasible is not clear.

**Industry** The most significant industrial activities based on local raw materials are the numerous processing plants for fresh-frozen and salted codfish, the pulp and paper mills, and the particle-board mill at Donovans, near St John's. Industries using local materials, but on a much smaller scale, are small boatbuilding yards, lumber mills, door and window construction, the canning of seafood and wild berries, and some homecraft industries producing souvenirs. Large manufacturing concerns using imported materials are the phosphorus plant at Long Harbour on the Isthmus of Avalon, the steel-shipbuilding plant at Marystown, the paint-manufacturing plant at St John's and numerous small plants producing staples such as bread, biscuits, margarine, ice cream, soft drinks, beer and other items, whose reputations give them a competitive advantage over imports. The tourist industry is small but has great potential. The province offers unique scenery and excellent parks, motels, hotels and historical sites, which survive mainly through local use aided by provincial and federal funds. Remoteness from the mainland and the increasing cost of travel make progress slow and difficult.

**Mining** In recent years Newfoundland has mined, on average, about 20 million t of ore (30.2 million in 1979 and 17.8 million in 1982) valued at just under \$1 billion and employing around 4000-5000 people. Over 90% of the exported mineral product is from the twin communities of Wabush and Labrador City in western Labrador. Here, IRON ORE is quarried and concentrated (being low grade with about 20-30% iron content). Some ore is pelletized to provide a finished product that is carried S by rail to Sept-Îles, Qué, and thence through the Great Lakes-St Lawrence Waterway to smelters

and steel mills around the Great Lakes. Poor markets for iron ore in the early 1980s curtailed production and jobs were lost. The copper-lead-zinc mine at Buchans, operating since 1928, has little ore and few employees remain; at its peak it produced over 50 000 t of concentrate annually, with an average value of \$35 million. An asbestos mine at Baie Verte on the NE coast has a fluctuating output, annually producing between 13 000 t and 89 000 t. Other mining operations are small. There is a zinc mine near Daniel's Harbour on the Great Northern Peninsula and a pyrophyllite quarry at Foxtrap, Conception Bay S, that employs a few dozen people. Otherwise activity is sporadic and confined to the quarrying of limestone for cement near Corner Brook, and gypsum for plasterboard near St George's. The iron mines at Wabana on Bell Island closed in 1966 for lack of markets for that type of ore, although there are billions of tonnes in reserve. The fluorspar mine at St Lawrence on the foot of the Burin Peninsula closed from 1978 to 1984. The demand for brick for local building supports a small brickmaking industry at Milton, on Trinity Bay, where there are deposits of suitable clay and shale.

**Forestry** The principal use of the forest is for the production of newsprint. The mills at Corner Brook, Stephenville and Grand Falls together annually cut an average just short of 1 million cords, which has had a value in recent years of just over \$300 million when converted to newsprint. The market for newsprint is highly competitive, and the periodic shutdown of plants or the reduction of staff for weeks and even months is becoming commonplace. In 1981 about 4000 people were employed in logging, wood manufacturing, sawmills, and the pulp and paper industry. Use of modern machinery means fewer jobs for loggers. Wood is delivered to the mills more often by road and rail than by the spring drive on streams and major rivers. In recent years there has been serious loss of good wood because of insect infestation, particularly by the spruce budworm. For the present there is an overabundance of wood, but the infestation has alerted foresters to the need for better harvesting techniques and a planned program of reforestation. In addition to newsprint, a significant portion of the forest product is taken for fuel, lumber, poles, fencing and mining timber. There are few large sawmills but many small ones. Total annual production averages 33 million board feet, which supplies only about one-third of the provincial requirements.

**Fisheries** Before 1930 the fishing industry concentrated on the production and sale of salted and sun-cured cod. The main markets were Mediterranean and Caribbean countries.

The advent of quick-freezing and of boats capable of transporting the frozen product to market radically changed the industry. Year by year the percentage of salted cod produced and sold declined, whereas the percentage of fresh-frozen fish species such as cod, turbot, plaice and redfish increased, and the principal market shifted to the US. The fishing industry has changed constantly from that time, partly in response to innovations and the modernization of fishing techniques, but also as a result of market variations, competition and the fluctuations of supply and demand. Today, fish companies are found on all coasts, relying on the catches of their own large, deep-sea trawlers, which bring a variety of fish from the banks, and on the small catches of the still numerous, inshore fishermen. The latter use gill nets, cod traps and baited lines and operate from medium-sized boats (long-liners) or from small trap boats or even dories. Since they operate near the shore and have limited range, their catch fluctuates. A few still prepare sun-cured salt cod, for which there is a good market, but most dried salt cod is now produced mechanically by large plants. Changes in the fishery since 1930 have meant more employment on shore in the processing plants and fewer men to secure the catch. Communities with large plants have grown markedly in size and importance although, as mainly one-industry towns, their future is insecure. In many settlements along the coast fishermen augment their income seasonally by catching lobster, salmon, caplin, herring, mackerel, squid, eels, scallops and crab totalling up to 100 000 t and with a landed value of nearly \$50 million. In recent years a ready market has emerged for species or fish roe that previously were ignored; E European, Portuguese and Japanese ships annually purchase large quantities of squid, caplin and roe. On average, 500 000 metric t of fish, with a landed value of around \$170 million, are taken annually by about 32 000 fishermen. The total processed value is close to \$500 million. The offshore catch by trawlers usually amounts to two-fifths of the total and is made up mainly of cod, plaice and grey sole, redfish, turbot and herring. The inshore catch is two-thirds cod.

In 1984 many of the fishing companies were facing receivership because of heavy debts incurred during a period of poor markets, over-

production and overexpansion. An agreement was reached between the 2 levels of government and the banks whereby a new supercompany was formed through the amalgamation of all the former large companies. The success of the restructured fishery will depend largely on its ability to hold a substantial share of the US market, to secure new markets, and to achieve co-operation among fishermen, the industry and government.

**Finance** The province is served by all the major Canadian banking houses, trust companies, insurance brokers and loan companies. Most regional head offices are in St John's, but there are branches in all the larger towns in all regions. There are 13 credit unions, 20 consumer co-operatives, 13 housing co-ops and 19 producer co-ops. The CO-OPERATIVE MOVEMENT has had its ups and downs. Some fishermen's producer co-ops are very successful and a few consumer co-operative enterprises in large centres have profitable supermarket outlets. Private enterprise is encouraged, especially in resource-oriented areas, and government loans and grants are commonly used in small-business enterprises, such as fishing, sawmilling, farming and small-boat building.

**Transportation** In the early years of settlement all transportation was by boat or, in the N in winter, by dog team. The establishment of railways, roads and airports brought changes. The transinsular railway from St John's to Channel-Port aux Basques was started in the 1880s and quickly developed branch lines to Argentia in Placentia Bay, Bay de Verde in Conception Bay, Trepassay in the southern Avalon, and Bonavista. Branches were later built to Lewisporte on Bay of Exploits and to Stephenville. The line now operated by CN is narrow gauge and primitive, but it provided an essential service and fostered development across the Island throughout the first half of the 20th century. It was especially valuable to northern communities that were icebound for much of the winter. The railway is declining in importance and now carries mostly freight, and nearly all branch lines are closed or plan to close. There were also a number of small private or company-owned railways, such as the Grand Falls Central. The ultramodern Labrador and Québec North Shore Railway (LQNS) transports ore from Ungava and western Labrador, running from Schefferville, Qué, through Labrador, to Sept-Îles, Qué, on the Gulf of St Lawrence,

with an important branch line to Wabush and Labrador City.

Highway development was rudimentary up to 1949. Roads were local, narrow and generally unpaved. A continual road-building and -improving program since the 1950s has provided an Island-wide road network, which is mostly paved and includes the TRANS-CANADA HIGHWAY from St John's to Channel-Port aux Basques. Few communities are isolated. A few important offshore islands have ferry service. Several important offshore islands, eg, Random, Twillingate and Greenspond, are now linked by causeways. In Labrador there is only a short road link between the communities on the Strait of Belle Isle and an interior road from Goose Bay westward through Churchill Falls to the LQNS Railway. The Newfoundland section of another road, linking Wabush and Labrador City with the Québec highway system to give the majority of the Labrador population year-round land access to the rest of Canada, has been completed.

BUSH FLYING has been important in Newfoundland since the 1920s, and some isolated areas still rely on ski- or float-equipped small aircraft or helicopter service for mail and emergencies. The number of landing strips increases annually and many areas can now rely on regular service. There are large airports at St John's, Gander, Deer Lk, Stephenville, Goose Bay and Labrador City; national and regional airlines provide regular scheduled service to and from these points.

The strategic location of Newfoundland made it a logical point for the initial attempts to cross the Atlantic by air. The first successful flight was that made by Alcock and Brown 14-15 June 1919 from St John's to Clifton, Ireland, in a 2-motor biplane. There were many subsequent crossings from Newfoundland in the 1920s and 1930s, culminating with the ferrying of thousands of bombers from Gander to England during WWII (see FERRY COMMAND); there was also flying-boat service from Botwood, and regular transatlantic air service via Gander in the prejet era.

**Steamship Service** Steamship service supplies Labrador coastal communities throughout the summer. There is also some coastal trade by sea around the Island, restricted in winter to the S coast because of arctic drift ice. Ferry service between Channel-Port aux Basques and N Sydney, Cape Breton I, operates daily year-round; and there is a CN Marine ferry service between N Sydney, NS, and Argentia three days a week, June-Sept. Mineral products, processed fish and newsprint are exported mostly in the summer from centres near the plants such as Corner Brook, Botwood and Long Harbour, and from larger towns with fish plants. Most imported products arrive by ship through Channel-Port aux Basques, Corner Brook, St John's and Goose Bay, and are distributed throughout the province by rail and road. In the far N, SNOWMOBILES have largely replaced dog teams in providing transport for hunters and trappers.

**Energy** Energy resources in the form of hydropower are abundant, especially in Labrador. The province uses only a fraction of its potential energy. On the Island all industrial and domestic needs are met by 980 MW provided by hydro sources and 550 MW from thermal sources. Some projects to help alleviate the high cost of power on the Island include using wood waste and peat in industrial and institutional furnaces. Most of the huge amount of power generated at CHURCHILL FALLS in Labrador is exported to Québec. The resale of this power by HYDRO-QUÉBEC at enormous profits has always irked the Newfoundland government. An attempt to circumvent the contract with Hydro-Québec by enacting legislation authorizing withdrawal of water rights was declared illegal by the Supreme Court of Canada in May 1984.

A picturesque fishing village (Pouch Cove) N of St John's (photo by Richard Harrington).

### Government and Politics

The provincial legislature of Newfoundland (officially called the House of Assembly) has 52 members elected from single-member districts. As in other provinces it is modelled on the British parliamentary system. The formal head of government and representative of the Crown is the **LIEUTENANT-GOVERNOR** who is appointed by the prime minister for a period of at least 4 years. The statutory life of the House of Assembly cannot exceed 5 years. The **PREMIER** and actual head of government is usually the leader of the political party holding the majority of seats in the legislature. The **CABINET**, comprising the ministers of all government departments, is chosen by the premier from his caucus. Areas of provincial and federal jurisdiction are specified in the **CONSTITUTION ACT, 1867**. The provincial judicial system includes the Newfoundland Supreme Court, 7 district courts and 18 provincial courts. The Supreme Court is divided into a Trial Division with a chief justice and 3 associate justices, an Appeals Division with a chief justice and 3 associate justices, and a Family Court Division where cases are heard by a single justice. All these justices are federal appointees. The Supreme Court Trial Division sits in St John's but goes on circuit to areas with no local courts. Each of the 7 district courts is located in one of the 7 federal electoral districts and is federally administered. The 18 provincially funded and administered courts are located in major communities throughout the province.

#### Lieutenant-Governors of Newfoundland 1949-84

	Term
Sir Albert Walsh	1949
Sir Leonard Outerbridge	1949-57
Campbell L. Macpherson	1957-63
Fabian O'Dea	1963-69
Ewart J.A. Harnum	1969-74
Gordon A. Winter	1974-81
W.A. Paddon	1981-

**Local Government** Local government in Newfoundland bears little resemblance to that found elsewhere in Canada. The pattern of isolated coastal settlement precluded the establishment of a county or township system and generally retarded the initiation of local government. St John's, the first municipality, was incorporated as a city in 1888. Local government came much later to other large centres, and it was not until the post-WWII period that incorporation became common. Many communities have chosen to remain free from local taxes, building codes and other regulations and forgo the benefits of incorporation, such as road repair, garbage collection and street lighting. At present, out of over 800 communities, less than half have any form of local government. There are 2 cities, ST JOHN'S and CORNER BROOK, 167 municipalities administered by town councils, and 139 settlements administered by community councils or local service districts, the latter 2 usually representing groups of communities. Town and community councils have limited taxing authority and can provide few local services. Major works are often mainly financed by the provincial Department of Municipal Affairs, and the provincial government funds health, education, police, highway maintenance and other services.

**Federal Representation** The Terms of Union under which Newfoundland entered Confederation in 1949 stipulated that the province would be represented federally by 6 members of Parliament (later increased to 7) and 6 senators. Traditionally, at least one Newfoundland MP is appointed to the Cabinet. Several have made a mark in the high-profile portfolios of finance and external affairs, but in general the small

representation gives the province limited clout in national decision making.

**Public Finance** Newfoundlanders endure the highest provincial tax rates in Canada. The 1983 budget estimated that almost one-third of the province's revenue would come from retail sales tax, which is 12%, and from personal income tax. Despite this high taxation rate, the government still receives about half its revenue from federal transfer payments and equalization grants. For 1983 this amounted to almost \$1 billion. Education and health, at 24.8% and 23.5% respectively, are the areas of greatest expenditure. Provincial debt charges account for over 16%.

**Health** In the 1983-84 fiscal year the provincial government budgeted over \$400 million on health-care facilities — one-fifth of total expenditures. Under the Medical Care Act of 1969, most health-care services are free to residents of the province. The foundations of the health-care system lie in the cottage hospital system and the International Grenfell Association facilities. The cottage hospital system, initiated by the Commission Government in 1936, was designed to bring a high standard of health care to outport residents. Small hospitals were constructed in central locations around the Island, but by the early 1980s their number had been reduced in favour of larger regional hospitals. The International Grenfell Association, founded by Sir Wilfred GRENFELL in the early 1900s and centered in St Anthony, has provided essential health-care services to inhabitants of the northern areas, particularly coastal Labrador. The General Hospital in St John's is the largest and best-equipped hospital; it is part of the Health Science Centre on the Memorial University campus, which also includes a faculty of medicine and a school of nursing.

**Politics** Newfoundland's colourful political history began in 1832, with the granting of representative government. A governor and council, appointed by the British government, held most of the power. A House of Assembly was elected by the people by open ballot. Legislation had to pass both chambers. This unworkable form of government was replaced, by popular demand in 1855, with **RESPONSIBLE GOVERNMENT** based on the British parliamentary system. In 1934, following the onset of the **GREAT DEPRESSION** and while saddled with crushing debts, the "Dominion" reverted to crown colony status and was governed by a commission consisting of a British governor and 3 commissioners and 3 Newfoundlanders, all appointed by the British government. From 1832 to 1933 no enduring political party with a strongly polarized political ideology emerged. The "Liberal," "Conservative" or "People's" parties were in fact loose coalitions of individual politicians and special-interest groups. Religion, ethnicity and social status were strong factors in early politics. For example, the Catholic "Liberal" Party in the mid-1800s was dedicated to advancing the interests of Newfoundland's Irish community. Parties also coalesced around issues such as Confederation with Canada, the building of a railway and fishermen's interests versus those of the fish merchants. The campaign for Confederation that culminated successfully in 1949 was led by Joseph R. SMALLWOOD, a journalist, radio broadcaster and businessman. In 2 general referenda, Newfoundlanders voted by a narrow margin to join Canada. A lieutenant-governor was appointed and Smallwood was asked to

form an interim government. In the first general election Smallwood's Liberals took 22 seats, the Conservatives 5 and an Independent 1. The split represented not only the outports versus St John's but the confederates against the anti-confederates.

Present-day elections show that this old hostility is all but dead. Smallwood's Liberals dominated Newfoundland's politics throughout the 1950s and 1960s. Weakened by conflicts between the premier and some powerful Cabinet ministers and by adverse reactions in the press, the Liberals lost the election of 1972. The Progressive Conservative Party took office, led by Frank MOORES until 1979, when the leadership passed to Brian PECKFORD, the former minister of mines and energy in the MOORES administration. In 1982 Peckford led his party to a landslide victory, winning 44 of the legislature's 52 seats. The remaining 8 seats were held by Liberals. In the early 1980s relations between the Newfoundland government and the federal government were strained because of disputes over the ownership of offshore resources, over the sale of hydropower in Labrador and over the restructuring of the N Atlantic fishing industry. A lack of negotiation and compromise brought several issues before the Supreme Court.

### Education

**History** The first Newfoundland schools were organized by the Church of England's missionary Society for the Propagation of the Gospel in Foreign Parts (SPG), which funded a school in Bonavista in the 1720s. Later in the 18th century the SPG operated schools in St John's and in several of the larger outports. These schools were apparently open to children of all denominations. A variety of schools were organized in the early 19th century, the most significant being those operated by the Newfoundland School Society. Established in 1823 with a special concern for educating Newfoundland's poor, by the early 1840s this society had nondenominational schools in many of the Island's towns and outports. The 1836 Education Act represented the first direct government involvement with education; funds (\$2100) were distributed among the societies promoting education and nondenominational boards of education were established. By 1843 the education grant was divided between Roman Catholic and Protestant school boards. The Protestant grant eventually was distributed among several Protestant denominations, including Church of England, Methodist, Salvation Army and Pentecostal. Post-Confederation amalgamation occurred among several Protestant school systems, but government-funded, church-administered education survives today. The denominational education system was protected in the Terms of Union (1948).

**Administration** Excepting a few small private institutions, Newfoundland's 627 schools are administered by regional denominational school boards. Representatives of each denomination and of the provincial Department of Education make up a Council of Education, which is responsible for many overall policy decisions. In 1984 the government's education budget was \$529 million. In 1984 there were 8219 teachers serving 147 603 students in grades from kindergarten through grade 12 (introduced in 1983-84).

**Institutions** MEMORIAL UNIVERSITY OF NEWFOUNDLAND, founded in 1925 as Memorial University College, was made the province's only university by a special Act of the House of Assembly (1949). Located on the northern outskirts of St John's, Memorial had 13 147 full- and part-time students in attendance in 1983-84. Sir Wilfred Grenfell College, a 2-year college located at the Corner Brook campus of Memorial, was established in 1975. In many of its larger centres

#### Premiers of Newfoundland 1949-84

	Party	Term
Joseph R. Smallwood	Liberal	1949-72
Frank D. Moores	Conservative	1972-79
A. Brian Peckford	Conservative	1979-

Newfoundland has post-secondary vocational schools, including the College of Fisheries, Navigation, Marine Engineering and Electronics, and the College of Trades and Technology, both in St John's, and the Bay St George Community College on the W coast.

### Cultural Life

The ancestors of most Newfoundlanders came from SE Ireland or SW England and brought with them distinct and enduring cultures. This heritage, shaped by centuries of Newfoundland's isolated, maritime way of life, has produced a vibrant, distinctive culture, expressed in dialects, crafts, traditions, cooking, art, music and writing. Old World influences have generally been replaced by those of the New World, a gradual process accelerated by Confederation and more recently through mass communications, but much of the province's distinctiveness persists. Newfoundlanders are increasingly appreciative of their unique heritage, as shown by the many successful folk festivals and heritage societies. The various levels of government have supported efforts to preserve and enhance Newfoundland's historic culture. The provincial government, primarily through its Department of Culture, Recreation and Youth, supports a provincial museum and the provincial archives in St John's, as well as smaller museums elsewhere in the province and a network of arts and culture centres in major centres. Memorial University, through its art gallery, its extension service and the work of various faculties, has served the province well.

**Arts** Without neglecting universal concerns and techniques, many Newfoundland artists practise distinctive Newfoundland art forms and use local themes. Poets such as E.J. PRATT, painters such as David BLACKWOOD and Christopher and Mary PRATT, theatre groups such as the Mimmers Troupe (see MUMMING), novelists such as Percy Janes and journalists such as Ray Guy have drawn inspiration from their Newfoundland homes. Writers and musicians traditionally had to go outside the province for quality production and publishing; several local companies now provide these artists with excellent facilities.

**Communications** The first newspaper published in Newfoundland was the weekly St John's *Royal Gazette* (1806). By the 1830s several weekly and biweekly newspapers were established in St John's and in the major outports. They were highly politicized, reflecting and perhaps aggravating the political, religious and social tensions that periodically upset 19th-century Newfoundland. Among Newfoundland's first daily newspapers were the *Daily Ledger* (est 1859), the *Morning Chronicle* (est 1861), the *St. John's Free Press and Daily Advertiser* (est 1877) and the *St. John's Evening Telegram* (est 1879). In 1983 the province had 3 daily newspapers, the *Evening Telegram* and the *Corner Brook Western Star*, both part of the Thomson newspaper chain, and the locally owned *St. John's Daily News*. Thirteen weekly regional newspapers, all English language, are also published. Newfoundland's first public radio stations began operation in St John's in the 1920s. By the 1930s radio stations were broadcasting throughout the Island. In Apr 1949 the CBC began its Newfoundland operation and initiated FM broadcasting in 1975. The province's first TV station, CJON, was opened in 1955; originally a CBC affiliate, it became associated with the national CTV network in 1964 after the CBC opened its own St John's TV studios. Cable TV on the Island dates from 1977, although it is still unavailable outside major centres. Poor reception and limited program choice are continuing sources of frustration to the residents of more isolated areas.

**Historic Sites** Federal assistance is generous in the establishment and maintenance of his-

Map of Newfoundland (1775) based mainly upon the surveys of Captain James Cook during the 1760s (courtesy Public Archives of Canada/NMC-52301).

toric sites. Newfoundland's rich, colourful history is honoured in several National Historic Parks, including SIGNAL HILL overlooking St John's harbour, site of one of the last French-English battles in N America; Castle Hill, near Placentia, commemorating the French fishing and military presence in Newfoundland; Port aux Choix, site of ancient Dorset Eskimo and Indian cultures; and L'ANSE AUX MEADOWS, the sole confirmed Viking site in N America, which was declared a World Heritage Site by UNESCO in 1978 — the only Canadian location so honoured to date.

### History

People have lived in the area covered by the modern province since at least 7000 BC. Archaeological research suggests that the Maritime Archaic people were present from at least that time. There is much evidence of INUIT presence before the European occupation, especially in northern areas, and of N American Indians both on the Island and in Labrador. The Island Indians, the Beothuk, were periodically encountered by European settlers. The best known were 2 women, Mary March (DEMASDUIT) and SHAWNANDITHIT, who were captured and brought to St John's. They soon died, presumably of European diseases. Very little is known about Beothuk society and even less about Beothuk history.

**Exploration** At the end of the 10th century NORSE, including LEIF ERICSSON, made several voyages of exploration from Greenland to overseas lands to the W and SW, and established a temporary settlement at L'Anse aux Meadows on the Great Northern Peninsula of the Island. In 1497 John Cabot, a Venetian navigator, sailed on a voyage of discovery for Henry VII of Eng-

land and discovered new lands, which are believed to have been between NS and Labrador and included a "new isle." In 1500 the Portuguese explorer Gaspar CORTE-REAL made a more thorough exploration and named several bays and capes along the E coast of the Island. In 1535-36 Jacques CARTIER demonstrated that Newfoundland was an island by sailing through Cabot Strait as well as the Strait of Belle Isle. In the 16th century Basque, Portuguese, Spanish, French and English fished the waters around Newfoundland and Labrador. The English brought the fish home or sold it to Spain, Portugal or France. The French fished mainly in northern areas. Some Spanish ships were engaged in whaling from ports in southern Labrador, and traces of their shore operations and wrecks of their ships are being researched.

**Settlement** In 1583 Sir Humphrey GILBERT, with a charter from Elizabeth I of England to start a colony in N America, despite finding St John's harbour filled with ships from Spain and Portugal, claimed the adjacent territory for England. Following this declaration, apparently accepted by all except the French, the area came under the control of the merchants from SW England, who are often referred to as the West Country Merchants or the Merchant Adventurers. For nearly 250 years they dominated trade in the area by demanding and receiving virtually exclusive rights to the prolific offshore fishing grounds. They succeeded in persuading British monarchs and parliaments to enact laws that would discourage and even forbid permanent settlement in Newfoundland. Colonies were begun on the Avalon Peninsula by several Englishmen with direct royal permission. John GUY established settlers at Cupids (then called Cupper's Cove) in Conception Bay and later Sir William Vaughan, Lord Falkland, Sir George Calvert (Lord Baltimore) and Sir David KIRKE made similar attempts, particularly at FERRY-

LAND on the E coast. Their efforts were frustrated by the W Country Merchants, the French and the lack of protection against the prevalent piracy. In 1633, under Charles I, the First Western Charter decreed that the captain of the first British vessel arriving in a Newfoundland harbour each spring would be admiral and governor of the harbour for that season. In effect he had dictatorial powers, and in the interest of his sponsoring W Country Merchants he usually took harsh measures to discourage settlement. House burning, lashings and even hangings were common. In 1699 William III gave permission for some settlement and limited some of the powers of the fishing admirals, but improvement was slight and those who dared winter over risked losing all their possessions and even their lives. In the 17th century the French, who were already well established on the mainland, claimed Newfoundland and set up a colony at Placentia on the S of the Avalon Peninsula in the 1660s. Under Pierre le Moyne d'IBERVILLE, they destroyed most of the settlements on the E coast of the Island and claimed St John's. Under the TREATY OF UTRECHT in 1713 the French lost all the territory they had gained on the Island, but retained exclusive fishing rights on the N shore from Cape Bonavista to Point Riche.

The lot of the determined settlers improved a little during the 18th century. In 1729, because of complaints against the fishing admirals, the first naval governor, Capt Henry Osborne, was appointed to take charge during the summer fishing season. He established districts with justices of the peace and constables and to some degree counteracted the power of the W Country Merchants. Settlers still suffered; the IRISH were particularly badly treated and one governor tried to ship them all back home. Following continued complaints to the British Crown, the first civil court was established in 1791 with John Reeves as chief justice. In 1792 a supreme court of criminal judicature was created, ending the rule of the admirals and of the naval governors' courts.

During the SEVEN YEARS' WAR, 1756-63, the French reclaimed many settlements, including St John's, but British forces under Thomas Graves and William Amherst recaptured the area. By the TREATY OF PARIS, 1763, Britain regained most of the territory taken by France, but the fishing rights on the FRENCH SHORE were confirmed and France was awarded the islands of SAINT PIERRE AND MIQUELON. During the latter part of the 18th century, Britain was at war not only with France, but also with the American colonists and with Spain and Holland. Emigration to Newfoundland was still not encouraged, but ironically, because of a prosperous trade in fish and the need for fishermen, settlement proceeded virtually unhindered; by the early 19th century the population was over 40 000.

**Development** Once a significant permanent population was established, petitions for better government and local representation increased. Dr William Carson and Patrick Morris, through a campaign of pamphlets and petitions to Britain, succeeded in having representative government established in 1832. It proved unworkable, and finally RESPONSIBLE GOVERNMENT with full colonial status was achieved in 1855. Settlement proliferated throughout the 19th century. The salt-cod fishery was the principal occupation and the mainstay of the economy, and there was some logging, mining and agriculture. In the late 1800s the transinsular railway began to open up the interior, and goods and services became accessible to many parts formerly isolated in winter. Representatives of the various Newfoundland governments attended all the Confederation conferences, but they chose not to join, despite substantial support of the movement.

Joseph Smallwood signing the agreement admitting Newfoundland to Confederation. On the right, Hon A.J. Walsh, chairman of the delegation, Ottawa (courtesy Public Archives of Canada/PA-128080/NFB).

When the French fishing rights were revoked in 1904, the northern and western coasts were available for settlement. Until about 1925 the economy was based on the primary industries — fishing, mining, and pulp and paper — but debts incurred through building railways and supporting a regiment in WWI, coupled with the Great Depression after 1929, produced bankruptcy and government collapse. Newfoundland was forced to beg Britain for assistance and eventually reassumed colonial status under a COMMISSION OF GOVERNMENT headed by a British governor and staffed by 3 British and 3 Newfoundland commissioners, all British appointees. The economy recovered remarkably towards the end of the 1930s, mainly because of increasing demand for products of the sea, mines and forests, and because of increased activity in defence-based construction in anticipation of WWII. During the war many young people joined the armed forces overseas, and at home there was full employment. The US, Canada and Britain established several army bases, 2 large naval bases and 5 airports in Newfoundland. Gander was the largest and most important airport because of its role in the transatlantic FERRY COMMAND. When the Commission Government was dissolved in 1949 it had cleared all debts and left a surplus of over \$40 million. After WWII a national convention was elected to debate the question of Newfoundland's future and to make recommendations. It was decided to hold a referendum through which the people would make a choice between the Commission Government, Confederation with Canada, or a return to responsible government and Dominion status. An intensive campaign ensued between confederates, led by Joseph R. Smallwood, and anticonfederates, but after 2 referenda the confederates won by a narrow margin. Canada accepted Newfoundland at midnight on 31 March 1949 and Smallwood became premier of the first provincial government.

The next 2 decades witnessed dramatic and substantial changes in the economy and in the life-style of Newfoundlanders. The fishing industry was revolutionized as dozens of fresh-fish processing plants were established on all coasts and as they gradually all but replaced the old method of the family-run enterprise of catching, salting and sun-curing cod for sale to Caribbean and Mediterranean areas. Driggers operating offshore on the Banks, and smaller boats in the near-shore and inshore waters, could now catch a variety of species for delivery to the plants, where the fish were quick frozen for new markets, chiefly in the US. The number of fishermen declined greatly and opportunity for shore work in the plants increased. The pulp and paper mills at Corner Brook and Grand Falls substantially increased production, and mines at Buchans, St Lawrence and Wabana worked

to capacity. New industries were launched with government backing and although most failed — including the huge oil refinery at Come by Chance, a steel mill, a rubber-goods plant, a leather-products plant and a knitting mill — a few succeeded, notably the plasterboard mill and cement plant at Corner Brook, the particle-board mill near St John's and the phosphorus plant at Long Harbour, Placentia Bay. The huge iron-ore mines of western Labrador came into production in the 1950s. Since WWII many people have moved from small communities to large towns and growth centres. As chances for local employment have diminished, young people have left the province at an annual rate of about 5000. With opportunities accessible through cheap transportation by land, air and sea, they have moved on, most to central or western Canada. The population that was 289 588 in 1935 had risen to 567 681 in 1981, but growth has since slowed and there is evidence of a levelling off.

The impact of the economic recession of the late 1970s and early 1980s was keenly felt in Newfoundland, although there was no comparison with the desperate conditions of the Great Depression in the early 1930s. Unemployment insurance, old-age pensions, social assistance and other benefits of the welfare state ensured decent living and health standards. High unemployment has most severely affected the young; it is hoped that intensified vocational and technical training programs will prepare the new generation for the anticipated resurgence in the economy with offshore oil development. The Hibernia field, described as huge and possibly larger than the North Sea deposits, is still being tested; if it is developed, many small industries and servicing enterprises could profit. Decisions of the Supreme Courts of Newfoundland and of Canada in 1983 and 1984 declared that ownership of offshore resources (specifically the Hibernia oil field) was federal. On 11 Feb 1985 an agreement was signed between the Newfoundland government and the new federal Conservative administration, giving Ottawa and St John's "joint say over offshore oil and gas management" and allowing "the province to tax the resources as if they were on land."

Summers and M.E. Summers, *Geography of Newfoundland* (1965); J.A. Tuck, *Aboriginal Inhabitants of Newfoundland's Great Northern Peninsula* (nd) and *Newfoundland and Labrador Prehistory* (1976).

**Newfoundland Acts** In 1699 the first legislation regarding NEWFOUNDLAND was passed in the British Parliament. Formally An Act to Encourage the Trade to Newfoundland, it is better known in Newfoundland as King William's Act or The Newfoundland Act. Like previous ORDERS-IN-COUNCIL, the Act was more concerned about visiting fishermen than it was about the settlers. Despite population increases during the 18th century, settlers continued to be governed by FISHING ADMIRALS (captains of West Country ships) and justices of the peace or magistrates, all under the jurisdiction of the naval convoy commodore who spent the summers in Newfoundland waters supervising the fishery.

Between 1756 and 1800, European wars slowed settlement in Newfoundland and lessened the demand for some measure of self-

government. The following 3 decades saw rapid growth and a vociferous demand, headed by William Carson and Patrick Morris, for REPRESENTATIVE GOVERNMENT. This was aided by the British reform movement: it was not mere coincidence that the bill giving Newfoundland representative government was introduced into the British Parliament on the day that the Reform Bill received royal assent, 7 June 1832.

Representative government, consisting of an elected assembly and an appointed council, proved to be unworkable and was modified by the Aug 1842 Newfoundland Act, which integrated council with the assembly. In 1847 a new Act in effect revived the council and made it an upper house. But nothing short of RESPONSIBLE GOVERNMENT, as established in Nova Scotia and Canada in 1848, would satisfy the people. Following disputes between local factions and between Newfoundland and Britain, responsible government was awarded in 1855. It remained until Nov 1933 when, facing bankruptcy, Newfoundland asked Britain to suspend its constitution. The 1933 Newfoundland Act made this possible. In 1949 Newfoundland became a Canadian province and once more enjoyed the privileges and responsibilities of democratic government. F.W. ROWE

**Newfoundland Bill** The people of NEWFOUNDLAND rejected CONFEDERATION in 1867, choosing to remain a British colony until 1948, when a majority of voters indicated their willingness to join Canada. The 2 governments negotiated the Terms of Union, which, following a request from the Canadian Parliament, were incorporated by the British Parliament into the BRITISH NORTH AMERICA ACT, thus becoming part of the Canadian Constitution. Accordingly, Newfoundland (including LABRADOR) became a province on 31 Mar 1949. F.W. ROWE

**Newfoundland Loggers' Strike** began 31 Dec 1958 when hundreds of loggers employed by Anglo-Newfoundland Development Co at Grand Falls struck for wage increases and for improvements in living conditions at wood camps. The AND Co was determined not to settle with the loggers' union, the International Woodworkers of America. The IWA and its charismatic leader, H. Landon Ladd, had been invited to Newfoundland in 1956 by loggers who wanted it to replace the weak and ineffective Newfoundland Loggers' Association. The company, the NLA executive and Newfoundland's media fought the IWA's raid on the NLA membership, portraying its organizers as violent radicals. The IWA counterattacked in full-page newspaper ads and radio broadcasts. Newfoundland public opinion gradually went against the IWA while most loggers voted to have it as their union. For 6 weeks the strike was a normal labour dispute, but public opposition to the IWA reached such a pitch that on 12 Feb 1959 Prem Joseph SMALLWOOD intervened. He declared he would drive the IWA out of Newfoundland and had the legislature pass a law stripping the IWA of its legal bargaining rights. The CANADIAN LABOUR CONGRESS, the International Labour Organization and much of the Canadian media community condemned Smallwood for "his attempt to destroy free trade unionism." But in Newfoundland public support for the legislation grew when on Mar 10 a policeman was killed in a confrontation with picketers. Smallwood replaced the IWA with the government-sponsored Newfoundland Brotherhood of Wood Workers. The loggers quickly signed a contract with AND almost identical to the one proposed by the IWA, thus ending the strike. Two years later, Smallwood turned the NBWW over to the United Brotherhood of Carpenters and Joiners. The CLC suspended the UBCJ for its collusion with Smallwood, but the suspension was ineffective.

Against the will of the loggers, the UBCJ became their official bargaining agent. Smallwood and the paper companies had successfully driven the IWA from Newfoundland.

BILL GILLESPIE

**Newlove, John**, poet, editor (b at Regina 13 June 1938). Newlove is noted for his "direct and visually precise" style, in which most of the traditional signs of poetry — simile and metaphor, overt symbolism, rhyme and heightened language — seldom appear, yet which is intensely rhythmic, full of punning turns and wry modulations of tone. He has unsentimentally explored the existential roots of contemporary despair, yet alongside his evocations of loss, self-hatred and self-pity, envy and anger, his poems offer moments of compassion, ecstasy and, occasionally, even pure joy. Overemphasis on the fear and loathing in his poems ignores the rich wit, irony and humour, the affirmations to be found in the scrupulous honesty of his bare-bones poetic. In the early 1960s, Newlove left the Prairies for Vancouver where he read and studied his craft. Within a few years, his poetry of drifters in contemporary space and historical time had gained him a reputation as a major chronicler of loss and alienation. From poems concerned with personal history in *Moving in Alone* (1965), he moved to poems about Canadian history, of where "we are in truth, whose land this is and is to be," notably in the encounter with native culture in *Black Night Window* (1968), and then to poems on human history, especially the history of war and cruelty in *Lies* (1972), which won the Gov Gen's Award. He moved to Toronto in the late 1960s to work as an editor. In the 1970s, he became a free-lance editor and writer-in-residence at various institutions across the country. *The Fat Man: Selected Poems* appeared in 1977 and a long philosophical poem, *The Green Plain*, in 1981.

DOUGLAS BARBOUR

**Newman, Leonard Harold**, geneticist (b at Merrickville, Ont 31 Aug 1881; d at Ottawa 16 Jan 1978). From 1905 to 1923 Newman was secretary of the government-sponsored Canadian Seed Growers' Association, founded by J.W. Robertson to improve agriculture by encouraging farmers to breed better strains of crop plants. He took advanced training in genetics in Sweden and succeeded Charles SAUNDERS as Dominion Cerealists in 1923. Newman's duties included licensing cereal varieties for growing in Canada and he regularly attended fall fairs to talk to farmers and explain official policies. Able to identify almost any variety of wheat he might be shown, he enjoyed challenging farmers to stump him. In 1948 he retired to the family farm settled by his grandfather, one of Colonel By's officers, on the Rideau R and became an enthusiastic local historian.

DONALD J.C. PHILLIPSON

**Newman, Peter Charles**, journalist, author, newspaper and magazine editor (b at Vienna, Austria 10 May 1929). Originally named Peta Karel Neuman by his secularized Jewish parents, he came to Canada as a refugee in 1940. Envisaging a business career for his son, Newman's father enrolled him in 1944 as a "war guest" boarder at Upper Canada College where he met members of the Canadian establishment whose lives he would later document. Once he mastered English, Newman began writing, first for the University of Toronto newspaper, then for the *Financial Post* in 1951. By 1953 he was Montréal editor of the *Post*, a position he held for 3 years before returning to Toronto to be assistant editor, then Ottawa columnist, at *Maclean's*. In Ottawa, Newman produced his masterly popular political chronicle of John Diefenbaker, *Renegade in Power: The Diefenbaker Years* (1963). Five years later, he published a sim-

ilar, but less successful, study of Lester PEARSON, *The Distemper of Our Times* (1968).

The following year he became editor-in-chief at the *Toronto Star* (later publishing some of his best journalism in *Home Country: People, Places and Power Politics*, 1973) and changed his focus from politicians to members of the Canadian business establishment. In *Flame of Power* (1959), he assembled 11 profiles of the first generation of Canada's business magnates; next he explored the lives of those who currently wielded financial power in popular studies such as his 2-volume *The Canadian Establishment* (1975, 1981), *The Bronfman Dynasty* (1978) and *The Establishment Man: A Portrait of Power* (1982). His books have sold a perhaps unprecedented 1 million copies in Canada and he has had a profound effect on political reporting and business journalism, making them more personalized and evocative. He was editor of *Maclean's*, where for a decade (1971-1982) he worked to transform the magazine from a monthly to a weekly. In 1982 he resigned to work on a 2-volume history of the HUDSON'S BAY CO. ELSPETH CAMERON

**Newmarket**, Ont, Town, pop 29 753 (1981c), inc 1880, located on the Holland R with easy access to the Don and Humber rivers, 25 km N of Metro Toronto. It was a natural site for a "new market" to serve surrounding settlements as well as fur traders and Indians bound for Toronto. The informal name stuck, and the town is still a market for the produce of Holland Marsh. Lt-Gov John Graves SIMCOE invited the Society of Friends (QUAKERS) to settle the area. Led by Timothy Rogers they arrived in 1801. Their meeting house (c1810) on Yonge St, now a historic site, was the first religious building erected by settlers N of York. The families of Elisha Beman and Christopher Robinson (father of John Beverley ROBINSON) dominated early settlement. (The spot was called Beman's Corners originally.) W.L. MACKENZIE had strong support in the region, and Samuel LOUNT was one of its Reform martyrs. Tanning and office furniture were once important manufacturing concerns. Newmarket is a regional centre and residential community, the seat of the York regional government and home of Pickering College, a Quaker foundation for boys. Robert SIMPSON and a partner opened his first store in the village. K.L. MORRISON

**News Agencies** Canadian newspapers and broadcast stations depend heavily on news agencies for a regular supply of news from outside their immediate geographical area. One-third to one-half of news and editorial content comes from news agencies, also called wire services or press associations. Material has traditionally been delivered to newspapers by leased teletype circuits. Some equipment for this transmission has the capability of producing punched tapes which can be fed directly into automatic typesetters. Larger newspapers now receive agency copy more quickly through direct computer-to-computer linkups. Broadcasters can receive both print and voice reports.

Most dailies and broadcasters obtain the report of the CANADIAN PRESS (CP). United Press Canada, the major private company, has a smaller subscriber list and staff. The major domestic broadcast agencies are Broadcast News, a CP subsidiary, Standard Broadcast News, and Newsradio. TV networks use international agencies such as Visnews. Supplemental services offer alternative news reports and a wide array of interpretive and background material. Widely circulated are Southam News Service and the services of large US newspapers such as the *New York Times*, *Washington Post* and *Los Angeles Times*. The Associated Press (US), Reuters (British) and Agence France-Presse connect with the CP through exchange agreements.

PETER JOHANSEN

**Newspapers** Canada's first newspaper, John Bushnell's *Halifax Gazette*, began publication in 1752. Like most colonial newspapers in N America, it was an adjunct of a commercial printing operation. Moreover, it was dependent on the printing and patronage largesse of the colonial government. This reliance on revenues from sources other than readers — from governments, political parties and ADVERTISING — would remain a characteristic of Canadian newspapers.

There were no newspapers in NEW FRANCE, in part because of the opposition of French officialdom to the establishment of printing presses in the colony. The British Conquest, and the termination of the SEVEN YEARS' WAR in 1763, brought a trickle of printers from the American colonies. In 1764, 2 Philadelphia printers, William Brown and Thomas Gilmore, began the bilingual *Quebec Gazette* at Québec City. In 1785 Fleury Mesplet, a French printer who had spent some time in jail because of his attempts to persuade Québec to join the American Revolution, started publication of the *Montreal Gazette*. And in 1793, under the auspices of Upper Canada's first governor, a Québec printer started the *Upper Canada Gazette* at Newark [now Niagara-on-the-Lake], the first newspaper in what is now Ontario. Like the *Halifax Gazette*, these first papers — operating in colonies where populations were low — remained utterly dependent upon government patronage.

The development of legislative assemblies in British North America encouraged political factions. At the same time, particularly in Halifax, Saint John, Montréal, Kingston and York [Toronto], a merchant class, with an interest both in reading commercial intelligence and in advertising, was growing. Weekly newspapers sprouted up, allied with political movements and the various mercantile and agricultural interests. In Lower Canada, the Québec City *Mercury* (1805) and the Montréal *Herald* (1811) became mouthpieces for the province's English-speaking merchants, while *Le Canadien* (1806) and *La Minerve* (1826) spoke for the rising French Canadian professional interests. In Upper Canada, William Lyon MACKENZIE used his *Colonial Advocate* (1824) to argue the cause of Reformers in general and farmers in particular against the dominant professional and mercantile groups. In the Maritimes, newspapers such as Joseph HOWE's *Novascotian* (1824) of Halifax also worked to challenge the authority of colonial oligarchies.

**Newspapers, Politics and the State** By the early decades of the 19th century, most newspapers were allied with either the Reform (now Liberal) or Conservative Party. These early newspapers were by no means simple tools of the parties they claimed to support but rather were organs of specific leaders or factions within the parties. Thus the *Toronto Globe* (1844) was a personal organ of its publisher, the Reform politician George BROWN. The *Toronto Mail* (1872), while set up to act as spokesman for the whole Conservative Party, was quickly captured by the dominant faction led by John A. MACDONALD.

Moreover, it was not unusual for an organ to deviate from the party line. The *Mail*, for example, broke with the Macdonald Conservatives in the 1880s, forcing the party to set up the *Empire* in 1887. The relative independence of newspapers from political parties and governments varied from place to place. But in general, newspapers had more potential for independence from parties as their revenues from circulation and advertising grew. While they may not have been tools of the parties, newspapers remained closely tied into political factions well into the 20th century. The *Toronto Star* was reorganized in 1899 by a business consortium anxious to obtain an organ for the new Liberal prime minister, Wilfrid LAURIER. The Ontario Conservatives

The paper boy was a common sight on city corners in the late 19th and early 20th centuries (courtesy Ontario Archives).

purchased the *Toronto News* in 1908 to act as a party organ. During the first decade of the 20th century the *Calgary Herald* used the organizational apparatus of the Alberta Conservative Party to sell subscriptions. As late as the 1930s most major Québec newspapers were tied into patronage from the ruling provincial government.

In part, the politicization of newspapers continued because readers demanded partisanship. POLITICS was a serious matter in 19th-century Canada; newspapers were expected to have views. Thus occurred the phenomenon of the 2-newspaper town. By 1870 every town large enough to support one newspaper supported 2 — one Liberal and one Conservative. As well, newspapers have never cut themselves off completely from government patronage. Since 1867 the federal government has subsidized newspaper publishers by granting them special postal rates. Canada's first international wire service, Canadian Associated Press (1903), was subsidized by the federal government, as was the domestic news co-operative, CANADIAN PRESS, during the initial years after its founding in 1917.

The relationship between Canadian newspapers and the STATE has also had a darker side. Early publishers who were considered overly critical of government actions could and did find themselves in jail. Libel and criminal libel laws were used to silence bothersome editors. In the 20th century, state action was aimed primarily at left-wing newspapers. The COMMUNIST PARTY OF CANADA found itself proscribed and its publications banned at various times. The Québec government of Maurice DUPLESSIS (1936-39 and 1944-59) used its PADLOCK ACT to shut down what it considered to be communist newspapers. Limited CENSORSHIP was imposed by the federal government in 1970, following the kidnapping of 2 men during the OCTOBER CRISIS (see LAW AND THE PRESS).

**The Rise of Advertising** While partisanship remained, the financial dependence of newspapers on governments and political parties did decline throughout the 19th century. The reason has to do with the economics of newspaper publishing and with overall economic development. Newspapers faced high overhead costs, ie, newspapers were forced to incur the same initial outlays for equipment, typesetting and editorial matter whether they printed one copy or a run of 10 000. In the 1860s, when daily circulations were usually under 5000, these overhead costs were covered by party or government patronage. But as population expanded and literacy increased, publishers were able to spread these overhead costs over more readers. In addition, as a newspaper's circulation increased, merchants became more interested in it

as an advertising medium. With productive capacity increasing in all industries, advertising — as a means of persuading people to buy the massive volume of goods being produced — became crucial. Early advertisers were wholesalers trying to catch the attention of other merchants, but by the 1880s retail advertising, aimed at a mass market, was dominant. By 1900 consumers were flooded with newspaper advertisements calling upon them to purchase such things as soap, patent medicines or electric belts. Big-city dailies were earning between 70% and 80% of their revenues from advertising.

Technological developments in the newspaper industry, and in the economy as a whole, hastened the trend to large-circulation, advertising-based newspapers. The spread of the TELEGRAPH during the 1850s and the laying of the Atlantic cable in 1866 increased the availability of world news to newspapers, but at the same time increased their overhead costs of production. By the 1880s, high-speed web presses and stereotyping allowed newspapers to expand their circulations in order to earn more revenue to cover these costs. In 1876 the combined circulation of daily newspapers in the 9 major urban centres was 113 000. Seven years later, it had more than doubled. Railway building, from the mid-19th century onwards, put more of the population within reach of daily and weekly newspapers. By the 1890s, typesetting machines such as the linotype were allowing daily newspapers to expand their size from the standard 4-, 8- or 12-page format to 32 or 48 pages (see PRINT INDUSTRY). This greatly increased the amount of advertising space available. At the same time, the development of newsprint manufactured from wood pulp provided a cheap source of supply to newspapers. The price of newsprint plummeted from \$203/ton in 1873 to \$50/ton in 1900 (see PULP AND PAPER INDUSTRY).

**Daily Newspapers** Early newspapers were weeklies, although a few might be published 2 or 3 times a week. Canada's first daily newspaper, the Montréal *Daily Advertiser*, began in 1833, only to go bankrupt within a year. Daily publication began in earnest in the 1840s when 2 other Montréal newspapers, the *Gazette* and *Herald*, decided to publish each day during the busy commercial season of the summer. Population growth, increased literacy and urbanization hastened the transformation from weekly to daily journalism. In 1873 there were 47 dailies in Canada; by 1900 the country boasted 112 daily newspapers. The major dailies, in turn, used the mails and the railway system to blanket the countryside with their weekly editions and, by the 20th century, with special weekend supplements such as the *Toronto Star Weekly* or *Montréal Family Herald*.

Newspapers, first weeklies and later dailies, sprang up in the West as white settlement increased. Victoria's *British Colonist* began publication in 1858, the *Manitoba Free Press* (see WINNIPEG FREE PRESS) in 1874, the *Saskatchewan Herald* in 1878, and the *Edmonton Bulletin* in 1880.

The growth of a new working class in the larger cities, particularly Toronto and Montréal, encouraged new kinds of newspapers with more emphasis on local news, mass circulation, classified advertisements and (in some cases) muckraking. These newer papers, which sold for a penny a copy (a half or a third of the price of the older established dailies), included Montréal's *La Presse* (1884) and *Star* (1869); Toronto's *Telegram* (1876), *Daily News* (1881), *World* (1880) and *Star* (1892); and the *Hamilton Herald* (1889). The older established papers also increased circulation to attract the new classes of readers. In Toronto in 1872 each family bought, on average, one newspaper; by 1883 the average Toronto family was purchasing 2 newspapers each day.

However, in the province of Québec as a

whole, newspaper growth was initially hampered by a low literacy rate. In 1871 only 50% of Québec's French-speaking adults could read and write, compared to 90% for all Ontario adults. Unique to Québec though were daily newspapers devoted to religious ends, such as the ultramontane Roman Catholic *Le Nouveau Monde* (1867) and the Protestant *Daily Witness* (1860). In Québec, newspapers allied to the church, to nationalism and to the cause of French Canada flourished well into the 20th century. In 1910 nationalist Henri Bourassa founded *Le Devoir* to promote Québec interests. Papers such as *Le Devoir*, though small in terms of circulation, remained influential among the Québec intelligentsia (see FRENCH CANADIAN NATIONALISM).

Labour daily newspapers have been uncommon in Canada. The *Toronto Star* was started by striking printers in 1892, with the backing of the local trade union movement; but within a year it had gone bankrupt and passed out of labour hands. In 1948 the Winnipeg *Citizen* began publication with labour backing; starved for capital, it too went out of business in a year.

The number of daily newspapers peaked at 138 in 1913. By then, the pressures to curb competition and concentrate ownership had already begun. Within each town and city, newspapers vied with each other to expand circulation and thus capture advertising. The competition was costly. Losers merged with stronger papers or went out of business. In Toronto, for instance, the *Mail* and the *Empire* merged in 1895; the resultant *Mail and Empire* merged with the *Globe* in 1936 (see GLOBE AND MAIL). By 1949, 4 formerly independent Halifax newspapers — the *Herald*, *Chronicle*, *Mail* and *Star* — had merged into one operation with 2 daily editions. The growth of radio in the 1930s and television in the 1950s broke the print monopoly over advertising. By 1953 there were only 89 daily newspapers in the country. By 1980 that number had climbed to 117, about the same as it had been 80 years earlier. However, by 1984, only 6 Canadian cities were served by 2 or more separately owned daily newspapers. With political partisanship becoming less important to readers, the system of the 2-newspaper town had broken down (see MEDIA OWNERSHIP). THOMAS WALKOM

**Contemporary** By the early 1980s daily newspapers were a diminished but still major part of the Canadian mass-media industry. Most newspapers belonged, individually or through chains, to conglomerate enterprises with large holdings in other media or nonmedia businesses. The leading publishers were again diversifying, this time into the new screenprint medium: either online services for access on office or home computers, or videotex services for access on adapted television terminals with key pads. The *Toronto Globe and Mail*, for example, had established the Info Globe online service with a database of the newspaper's contents over several years. SOUTHAM INC, owners of the Southam chain of newspapers, and TORSTAR CORP, owners of the *Toronto Star*, had formed Infomart, a videotex marketing organization prominent in the development of the Canadian TELIDON system. *Le Soleil* of Québec City and *La Presse* of Montréal were early participants in videotex trials. The *London Free Press* was a pioneer in the use of videotex for informational advertising in shopping centres.

Screenprint was expected to start cutting into the newspapers' advertising revenue, and possibly their readership base, as the technology developed to provide flat, portable terminals and higher definition print and graphics. However, the convenience of the daily newspaper as a comprehensive source of news, general information and entertainment, with readability, portability and flexibility, appeared likely to sustain it for a long period.

Newspapers were the subject of study by the

1969-70 Senate Special Committee on Mass Media, under the chairmanship of Senator Keith DAVEY, and by the 1980-81 Royal Commission on Newspapers, whose members were chairman TOM KENT, Laurent Picard and Borden Spears. Both studies dwelt on the extent of concentration of newspaper ownership and the diminution of newspaper competition, the Kent commission stressing the conglomeration of newspapers with other types of business. Both studies maintained that freedom of the press embodied the principle of widespread dissemination of information and opinion from a diversity of sources, and that this could be injured by excessive concentration of the press. The Davey recommendation that the federal government establish a Press Ownership Review Board to curb newspaper mergers was unheeded. The Kent recommendation that newspaper owners should not also be permitted to hold radio and TV broadcasting licences in the same market was accepted in principle by the Trudeau government but given only limited application by the CRTC. Ottawa also put pressure on newspapers to belong to press councils. The Kent recommendations to reduce the worst cases of concentration and to offset the effects of conglomeration by measures to provide for journalistic independence and public accountability were not accepted. They were strongly opposed by the proprietors as an alleged interference with press freedom.

Mergers and closings of big-city dailies in the 20th century contrasted with the emergence of new dailies, as small towns grew into cities. An important new development since 1960 has been the appearance of tabloid newspapers in the larger metropolitan areas. Until their arrival, nearly all big-city dailies were newspapers, or mergers of newspapers, already estab-

lished by the turn of the century. The tabloids repeated the experience of Canada's first mass-circulation dailies in the late 19th century (*La Presse* in Montréal and the *Star* in Toronto) by appealing to the "lowbrow" audience. The pioneer of tabloids in Canada was Pierre PÉLÉADEAU, with the extraordinarily successful *Le Journal de Montréal* and *Le Journal de Québec* in the 1960s. The *Toronto Sun*, rising out of the ashes of the *Toronto Telegram* in 1971, repeated this success in English Canada — adding right-wing populism to the tabloid formula of sex, sin and sport — and expanded into a chain including sister "Suns" in Edmonton and Calgary. The other main innovation in newspaper marketing occurred at the up-scale end of the market in 1980 and succeeding years when the *Toronto Globe and Mail*, now owned by the THOMSON GROUP as part of its takeover of FP Publications, made use of the new technology of telematics to publish a national edition. This edition is transmitted via satellite for printing at plants in Atlantic, central and western Canada (see SATELLITE COMMUNICATIONS).

These various developments provided Canadians, depending on where they lived, with roughly 4 types of daily newspaper: (1) the up-scale, national daily, represented by the *Toronto Globe and Mail* in English and *Le Devoir* of Montréal in French; (2) the down-scale tabloids; (3) small-city dailies, such as the pre-1980 Thomson papers in English and the smaller Desmarais papers in French; and (4) middle-market omnibus dailies, the largest circulation group, existing as monopolies in most larger cities, competing with tabloids in others. Those dailies were typified by Southern newspapers such as the *Calgary Herald* or *Montréal Gazette* in English, and UNIMÉDIA's *Le Soleil* of Québec City in French. A tiny fifth category consisted of for-

eign-language dailies: *Corriere Canadese* in Italian in Toronto, the *Toronto Chinese Express* and the *Vancouver Chinese Voice*.

The aggregate weekly circulation of all Canadian dailies (publishing 5, 6 or 7 days a week) was more than 32 million at the time of the Kent commission, or a little over 5 million a day on a 6-day publishing schedule. Toronto, Montréal and Vancouver accounted for 44% of national circulation. Circulation per capita had kept slightly ahead of general population growth over the previous decade. A market survey showed that 80% of the adult population reported reading at least 3 or 4 issues of a daily newspaper each week. Regular newspaper reading came close to matching the proportion of the population that could get prompt newspaper delivery, with readership a little lower in French Canada than in English.

The French-language market accounted for 18% of national circulation, spread among 11 newspapers: 9 published in Québec, one in Ottawa and one in Moncton. Ninety percent of French circulation was accounted for by 3 chains: Pierre Péladeau's QUEBECOR (with about half of the chain circulation), Paul DESMARAIS's Gesca (see POWER CORP) and Jacques Francoeur's UniMédia.

In the English-language market 59% of circulation was accounted for by the Southam (32.8) and Thomson (25.9) chains, and other ownership groups brought chain circulation to 74% of the total. Concentration in this market was heightened in 1981 when Torstar Corp added a second chain of Toronto-area weeklies to the one it already owned, and again in 1982 when the MACLEAN HUNTER media group obtained control of the Toronto Sun chain.

Taking both French and English markets together, only a quarter of the number of newspapers and less than a quarter of circulation was in the hands of independents, and several of these — eg, *Toronto Star*, *London Free Press* — belonged to multimedia conglomerates. Concentration was reflected regionally by the fact that in all but 3 provinces (Ontario, Québec and NS), single chains controlled two-thirds or more of provincial circulation. Figures prepared by Statistics Canada showed the following percentages of national circulation controlled by the 4 largest owners in Canada: in 1950, 37.2%; 1955, 34.3%; 1960, 35.7%; 1965, 43.6%; 1970, 52.9%; 1975, 62.7%; 1980, 65.1%. A further concentrative factor contributing to homogeneity in Canadian JOURNALISM was the common ownership by the daily newspaper proprietors of the dominant news agency, the Canadian Press, which was also a major supplier of news to radio and TV stations.

The Kent Commission found that the economics of the newspaper industry are conducive both to reduction of competition in local markets and to concentration of ownership. Newspapers derive about 80% of their revenue from selling 50% to 60% of their space to advertisers, and only about 20% of their revenue from selling newspapers to readers. Advertisers in most markets can reach readers more cheaply through one newspaper than through 2 or more. Thus, head-to-head competition between the same type of newspapers has disappeared from most cities, and limited variety of newspapers is only possible where the market is large enough to be segmented into distinct audiences. At the same time, the high capital cost of starting or reequipping a newspaper, combined with the economies to be realized through skilled central management, have favoured chains over independents. Once a newspaper's monopoly is established in a market, or a segment of a market, a paper has proved to be more profitable than the average business. Such newspapers serve as cash incentives to develop other enterprises in a conglomerate.

The hometown nature of the daily newspaper remains its strongest characteristic. Even with the relatively recent development in Canada of market segmentation and a metropolitan pattern of journalism, the national or regional paper must retain a firm base in the metropolis where it is published. Opinion surveys show that although audiences prefer TV for national and world news, and generally find TV the most believable medium, they still read the daily newspaper for local and regional coverage. On the average, two-thirds or more of a newspaper's editorial budget is spent in-house, rather than for outside news services and features. Newspapers try to develop a sense of common interests and common causes with their readers.

National coverage in Canadian newspapers has improved in depth and scope since the 1960s, owing largely to the efforts of the Canadian Press, Southam News and the *Toronto Globe and Mail* to provide stronger Ottawa and inter-regional coverage. International news coverage by Canadian journalists, however, remains spotty and was criticized by both the Davey and Kent reports. In public-affairs coverage, which continues to be the newspaper's primary social responsibility, the press has felt increasingly bound to follow the scenarios of TV, the preferred medium of the politicians, particularly at the national level and in the larger provinces. Most studies of newspaper content have concluded that newspaper journalism continues to play a strong role in setting the agenda for public debate by establishing news priorities.

As the numbers of big-city dailies declined and the remaining newspapers tended to drop unprofitable out-of-town circulation, community newspapers enjoyed a boom. From 1971 to 1980 aggregate weekly circulation of community newspapers increased from 3.8 million to 8.8 million, or from about one-eighth to more than one-quarter of aggregate weekly circulation of the daily newspapers. During this period there was a steady trend toward concentration of ownership of community newspapers into chains, and of ownership by the proprietors of dailies. Statistics Canada reported total circulation of community papers at 10.7 million at the end of 1981. This figure includes both French and English papers, as well as bilingual papers, mainly in Québec, with a total circulation of 921 000, and ethnic weeklies with a total circulation of 666 000, an apparent decline in ethnic-paper circulation from earlier years. Many community newspapers are distributed free and rely entirely on advertising for revenue.

Advertising expenditures, on which the media are so dependent, were roughly divided as follows in 1981: daily newspapers, 24%; non-daily papers, 6%; periodicals, 15%; television, 17%; radio, 11%; other print (chiefly direct mail and catalogue), 21%; and outdoors 6.0%. Thus, daily newspapers had succeeded in retaining the largest share, but had to be considered in combination with community newspapers in order to match the combination of TV and radio. Daily newspaper revenues reached \$1.25 billion in 1980, nearly double the 1974 amount. After the 1980 concentrations and closings, revenues continued to increase tremendously.

Responding to market opportunities, daily newspapers have shown a trend in the larger cities from afternoon to morning (or all-day) publication, and to publishing Sunday editions. The dailies appear to have consolidated a place for themselves alongside the other media, helped somewhat by the fragmentation of radio and TV audiences owing to the multiplication of stations and channels, although competition for the advertising dollar remains intense. The possibility that screenprint services will take away some of the informational advertising for

which paper-print news media are strongest appears to be one of the chief threats to which newspapers will have to respond in the long run. See also MAGAZINES.

Newt, see SALAMANDER.

**Newton, Liliás**, née Torrance, portrait painter (b at Montréal 3 Nov 1896; d there 10 Jan 1980). A witty and sophisticated portrait painter, Newton studied in London, Paris and Montréal. She joined the Beaver Hall Hill group in 1920 and was elected associate member of the Royal Canadian Academy of Arts in 1923 and member in 1937 (its third woman member). A founding member of the Canadian Group of Painters (1933), she taught at the Montréal Museum of Fine Arts (1937-40). Her portraits hang in most universities and many boardrooms; pictures of 4 notable colleagues — A.Y. JACKSON, Lawren HARRIS, Edwin HOLGATE, and Arthur LISMER — are at the National Gallery. Her work is distinguished by fresh colour, vigorous composition and sharp insight. Informal portraits of her son Forbes and of friends show great charm and rapport. In 1956 she painted the official portraits of Queen Elizabeth and Prince Philip for Rideau Hall.

ANNE McDUGALL

**Newton, Margaret**, plant pathologist (b at Montréal 20 Apr 1887; d at Victoria 6 Apr 1971). She was a sister of Robert NEWTON. While still a student at McGill, Margaret Newton worked on the first scientific survey of wheat rust in Canada, following the epidemic of 1916, and joined the Winnipeg Rust Research Laboratory on its creation. Her research in association with J.H. CRAIGIE is summarized in T. JOHNSON's *Rust Research in Canada* and I.L. CONNOR's *Plant Pathology in Canada*. Newton was possibly the first Canadian woman to undertake a lifelong research career. She never married and reportedly would work until near exhaustion — and then relax by foreign travel or strenuous canoe expeditions. She retired owing to ill health, perhaps caused by 25 years of exposure to rust-disease spores. A women's residence hall at U Vic is named in her memory.

DONALD J.C. PHILLIPSON

**Newton, Robert**, plant biochemist, university president (b at Montréal 7 Feb 1899), brother of Margaret NEWTON. He was one of 5 children whose father disapproved of higher education; but all, including 2 girls, became scientists, 4 with PhD qualifications. After service in WWI (MC 1917), Newton became professor of field crops at U of A, whose president H.M. TORY became chairman of the NATIONAL RESEARCH COUNCIL in 1923. Newton's research was focused on wheat: winter hardiness, drought resistance and resistance to rust. He became Tory's chief adviser on agricultural science, served as director of the NRC's Division of Biology and Agriculture (1932-40), and succeeded Tory as chairman of the influential Grain Research Committee. His best university students were sent abroad to earn PhD degrees in the world's leading institutions and came home to constitute the core of the NRC's biology staff. Newton returned to Edmonton in 1940 and was president of his university 1941-50.

DONALD J.C. PHILLIPSON

**Niagara Escarpment**, in its Ontario portion, is 725 km long, covering 1923 km<sup>2</sup>, with a maximum height of 335 m. An escarpment may be defined as a steep rock face of great length formed by an abrupt termination of strata. The

Niagara Escarpment adds a unique visual quality to Ontario's landscape as it crosses the province from QUEENSTON, on the NIAGARA R., through HAMILTON, Milton, Orangeville, COLLINGWOOD, OWEN SOUND and Tobermory to MANITOULIN I and ST JOSEPH I. It marks part of the shore of an ancient sea centered in Michigan, which extended W from Rochester, NY, across Ontario to Michigan, then down the W side of Lk Michigan into Wisconsin. Water erosion and glaciation molded its striking features. Historically, the escarpment's waterfalls, forests and rocks provided power and building materials for a young province. In time, however, its archaeological sites, rich fauna and flora, and outstanding potential for recreation — such as hiking on the BRUCE TRAIL, skiing and nature study — created a demand for measures to preserve its scenic splendour. To resolve the complicated jurisdiction of municipalities, regions, counties and conservation authorities, the Niagara Escarpment Commission produced a plan to preserve the escarpment's ecological integrity and a unique Niagara park system of 116 units.

RAYMOND N. LOWES

Reading: William Gillard and Thomas Tooke, *The Niagara Escarpment* (1975).

**Niagara Falls, Ont, City**, pop 70 960 (1981c), inc 1904. Its fame and name are based on the resplendent NIAGARA FALLS on the NIAGARA R., but its growth has combined tourism with rail-head developments and with manufacturing (including electrochemicals and abrasives) based on readily available hydroelectric power. The earliest hotel was built in 1822, and by the 1850s several small communities had developed around the attractions of the falls and the historic battlefield of LUNDY'S LANE. The first bridge was built across the gorge in 1848 and in 1853 the GREAT WESTERN RY arrived, establishing a rail-head near the Whirlpool Rapids Bridge of today. In 1856 the towns of Clifton and Elgin were incorporated as the town of Clifton. The name was changed to Niagara Falls in 1881, and in 1904 the town was amalgamated with the adjacent

village of the same name and incorporated as a city (pop 7000). The first power companies began operation in 1905 and 1906, and Sir Adam Beck No 1 was the largest powerhouse in the world at the time of its completion in 1921. Sir Adam Beck No 2 (1.4 million MW) was opened in 1954. Both developments required massive diversions of water, through canals and tunnels, from the falls into the powerhouses.

The falls became known in Europe and the US through the paintings and descriptions of visitors in the early 19th century, but full-scale development of tourism came after the 1850s with the railway and in the 1920s and 1930s with the automobile. In the 1930s Sir Harry OAKES bought the sites of the 2 largest hotels and donated them to the Niagara Parks Commission, making possible a well-designed open

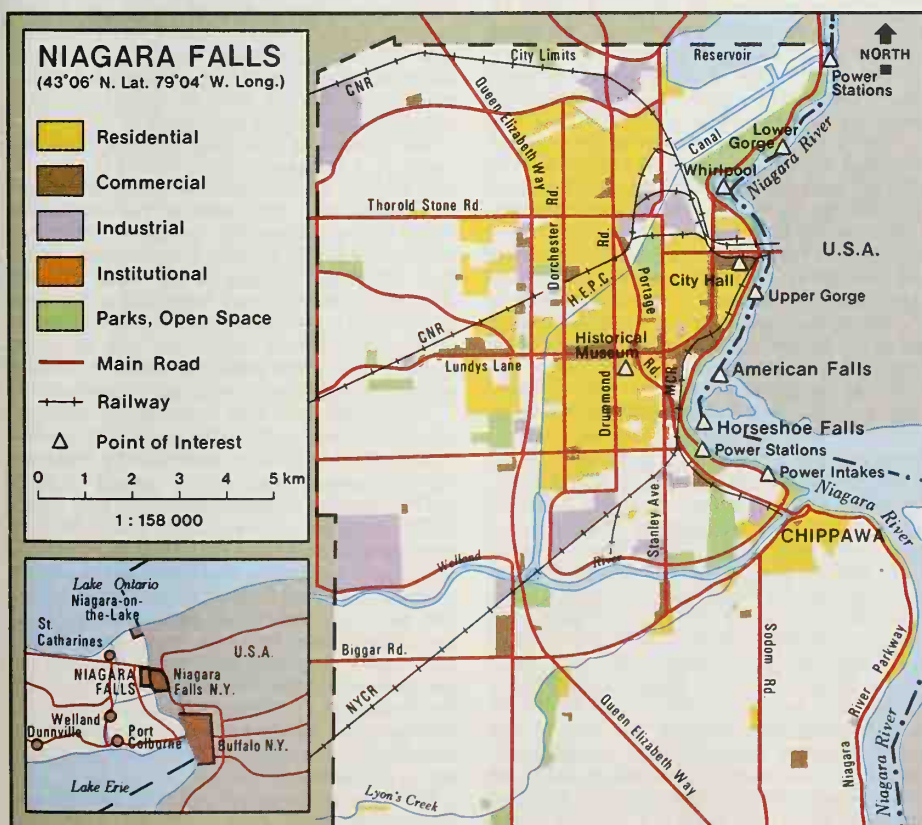

*Niagara Falls* (1799), watercolour by E. Henn. The falls have been a source of inspiration to visitors for centuries (courtesy Royal Ontario Museum).

space around the falls — in contrast to the jumbled, carnival atmosphere of earlier times. The city contains probably the longest strip of motels in the world, along Hwy 20 from the E, and scenic towers ring the falls. Annual visitors are estimated at 14 million. JOHN N. JACKSON

Reading: G. Siebel, ed, *Niagara Falls, Canada* (1967).

**Niagara Falls**, spectacular waterfall in the NIAGARA R., is the world's greatest waterfall by volume. It is split in two by Goat I. The American Falls are 64 m high and 305 m wide, with a flow of 14 million litres of water per minute. The Canadian, or Horseshoe, Falls are 54 m high and 675 m wide, with a flow of 155 million litres. The falls were formed some 10 000 years ago as retreating glaciers exposed the NIAGARA ESCARPMENT, diverting the waters of Lk ERIE, which formerly drained S, northward into Lk ONTARIO. The falls have eroded the soft shale and limestone of the escarpment some 1.2 m per year and now stand 11 km from their place of origin at present-day QUEENSTON. The falls were understandably of spiritual significance to the Indians, and "Niagara," meaning "thunder of water," is said to be the last remaining word of the NEUTRAL.

The awesome spectacle was first described by LOUIS HENNEPIN, who saw the falls in 1678, calling them "a vast and prodigious Cadence of Water." Among those who tried to describe their effect was Charles Dickens, who wrote, "I seemed to be lifted from the earth and to be looking into Heaven." With tourism, which began early in the 1800s, came daredevils who defied the falls in barrels, boats and rubber balls. The most celebrated was Blondin who performed on a tightrope over the falls (1859). Stunting was outlawed 1912. To save the area from hucksters and speculators, Ontario created Queen Victoria Park in 1887 — Canada's first provincial park. Millions of tourists visit the area every year, viewing the falls from several towers, a tunnel beneath Horseshoe Falls, an aerocar over the whirlpool, and the *Maid of the Mist*, a boat that carries sightseers to the foot of the falls. International agreements control the diversion of water for hydroelectric power. The Niagara Diversion Treaty (1950) stipulated that a minimum flow be reserved for the falls and that the rest be divided equally between Canada and the US. In Canada water is diverted from the Niagara R

Wide-angle photograph showing the American Falls on the left and Canadian Falls on the right, and the *Maid of the Mist* (photo by John deVisser).

above the falls and fed into the turbines of Sir Adam Beck Generating Stations No 1 (0.4 MW) and No 2 (1.4 MW) by canals and tunnels.

JAMES MARSH

**Niagara Historic Frontier**, stretching about 50 km along both sides of the Niagara R from Lk Ontario to Lk Erie, is dotted with HISTORIC SITES and cairns. This region was first the home of various Iroquoian and Algonquian peoples. The French arrived in the late 17th century, and tangible evidence remains at Ft Niagara (near Youngstown, NY), which surrendered to British and colonial forces in July 1759. During the AMERICAN REVOLUTION and the WAR OF 1812, Ft Niagara was the scene of considerable military activity.

On the west (Canadian) side of the river, across from Ft Niagara, stand Ft George, Ft Mississauga and Butler's Barracks, all under the

auspices of Parks Canada. Ft George, built in 1796, was structurally altered before the War of 1812. Captured by the Americans in a fierce battle on 27 May 1813, it was retaken by British troops that Dec. By war's end it was tumbling into ruins. In 1937 the Niagara Parks Commission funded Ft George's reconstruction according to the original plans of the Royal Engineers. The site was transferred to the federal government in 1969 and established 1977 as Fort George National Historic Park.

Battlefield sites such as QUEENSTON Heights, Stoney Creek and LUNDY'S LANE commemorate the people and events of the War of 1812. As well, Ft Erie, built in 1764 and now administered by the St Lawrence Parks Commission, was an active site from the time of PONTIAC to Confederation.

ROBERT ALLEN

**Niagara-on-the-Lake**, Ont, Town, pop 12 886 (1981c), located where the Niagara R enters Lk Ontario. It was settled by LOYALISTS who had served in Butler's Rangers and was named Newark and made capital of UPPER CANADA by John Graves SIMCOE. The name "Niagara" was taken when the capital moved to York, and it was changed (c1900) to the present name to avoid confusion with NIAGARA FALLS (19 km S). In May 1813 the Americans captured nearby Ft George, occupied the town that summer and burned it in Dec. Its heyday was the 1850s, when it was connected to Toronto by steamer and to Buffalo, NY, by railway. However, opening of the WELAND CANAL and removal of the county seat to ST CATHARINES arrested growth. Camp Niagara (est 1871) trained militia and regulars to 1966. Regional government merged the town and township under one name (1970). Tourism, fruit growing and yacht building are chief industries. Steamer and rail connections had ceased by 1960, victims of the automobile.

Niagara-on-the-Lake is one of the best-preserved early 19th-century towns in N America. Many impressive, neoclassical and Georgian homes still exist here: Clench House (c1824); Kirby House (c1815), once the home of William KIRBY; McFarland House and Field House (both c1800) on the Niagara Pkwy; and Willowbank (1835) in Queenston. St Andrew's Church (1831) is perhaps the finest example of Greek Revival in Ontario. Butler's Barracks (post-1815), the Niagara Apothecary (1820) and Ft George (1796-99) have been restored. The Niagara Historical Museum (1907) displays Loyalist artifacts. The SHAW FESTIVAL was held at the Court House (built 1847) before opening its own theatre in 1973. The town is a premier tourist

attraction and an architectural and historical treasure.

JOHN L. FIELD

Reading: John L. Field, ed, *Bicentennial Stories of Niagara-on-the-Lake* (1981); Peter J. Stokes, *Old Niagara on the Lake* (1971).

**Niagara Peninsula** lies between Lakes ONTARIO and ERIE and the NIAGARA R in SW Ontario. As the river is also the international boundary, the peninsula has played a frontier role since 1783. Physically, it includes 2 contrasting plains separated by the NIAGARA ESCARPMENT. The Ontario Plain, with fertile, sandy soils and a favourable climate, contains the Niagara Fruit Belt, where much of Canada's soft fruits and vines are grown. The wooded slopes of the escarpment, an abrupt rise of some 60 m, are etched deeply by gorges with falls at their head, most notably at NIAGARA FALLS, and are quarried for limestone. The Erie Plain, with bedrock closer to the surface, is less productive than its northern counterpart; the soils are poorly drained clay, and the climate is wetter, with shorter frost-free periods.

Subregions in the peninsula provide a rich variation of detail: shoreline bluffs along Lk Ontario, with ponded river estuaries behind sandbars; the shoreline of glacial Lk Iroquois across the Ontario Plain; the Short Hills embayment in the escarpment, with steep-sided slopes; a kame at Fonthill, the highest point of the peninsula; the buried St Davids Gorge, the plugged channel of an ancestral Niagara R; marsh areas, including peat bogs, on the southern plain; the slender Onondaga Escarpment inland from Lk Erie; and limestone headlands alternating with sandy bays along Lk Erie.

Settlement has responded to this diverse terrain. Indian villages followed the escarpment, and many trails became roads. Permanent settlement arose during the 1780s with the influx of LOYALISTS. NIAGARA-ON-THE-LAKE was established temporarily as the first capital of Upper Canada, QUEENSTON and Chippewa as portage terminals, and Fort George and FORT ERIE as garrisons commanding entry to the Niagara R. Immigrants first settled the Niagara R frontage and the Ontario Plain, then the Erie Plain. Townships, surveyed with 40 ha lots, had a road in front of each concession and between every other lot. Mills developed where rivers crossed the escarpment or could be dammed for water power, and services arose at several "corners" accessible from nearby communities.

The expanding economy was disrupted severely by American invasion during the WAR OF 1812, and by an aftermath of border mistrust. W.L. Mackenzie and some of his supporters found refuge across the border during the REBELLION OF 1837, and FENIAN raids were launched from the American side in the 1860s. Matters changed, however, with interlinking rail and highway bridges, the substantial introduction of American-owned industries, and development of the Lk Erie shoreline under American seasonal cottage and recreational properties.

As the Niagara R was unnavigable, the WELAND CANAL was constructed across the peninsula to provide through transport by water to the continental interior. First opened in 1829 but continually enlarged, the canal had water power available at every lock, where streams were crossed, and from hydraulic raceways. A line of new settlement was added to the peninsula: ST CATHARINES became an industrial town; Port Dalhousie and PORT COLBORNE grew as ports; and THOROLD and WELLAND were founded, together with Port Robinson and Allanburg on the main canal and Wainfleet and Dunnville on the feeder canal. Niagara-on-the-Lake lost its premier position, and its county functions were transferred successively to Dunnville, Welland and St Catharines.

Railways strengthened existing settlements. Routes constructed during the 1850s along the

Brock's Monument, Queenston Heights, commemorating the War of 1812 battle in which Sir Isaac Brock was killed (courtesy Parks Canada).

2 lakeshores, the Niagara R and the Welland Canal were augmented by 2 southern routes during the 1870s and a transverse HAMILTON-Buffalo line in the 1890s. Settlement expanded at border crossing points, especially Clifton (now Niagara Falls) at the Suspension Bridge and Victoria (Bridgeburg, now Fort Erie) at the International Bridge. Welland, at the hub of the peninsula, expanded "Where Rails and Water Meet" (its civic motto), as did Merrittton. Railways also encouraged the emergence of fruit farming, which replaced wheat and mixed farming N of the escarpment; cottage and recreational developments along the shoreline of Lk Erie; and tourism at Niagara Falls. St Catharines became a spa, and religious campgrounds were introduced at Niagara-on-the-Lake, Niagara Falls, Crystal Beach and Grimsby Beach.

The infrastructure was again strengthened through hydroelectric developments at Niagara Falls, and at DeCew Falls (St Catharines) from the Welland Canal. As generating stations, storage reservoirs and power-transmission lines were added to the landscape, towns obtained a new impetus for expansion. Major industries developed, especially along the Welland Canal in St Catharines, Thorold, Welland and Port Colborne, and at Niagara Falls and Chippawa on the Niagara R. By 1981 the Niagara region housed about 368 000 persons. The principal industries include automotive parts, chemical and electrical products, metal fabrication, primary metals, pulp and paper, shipbuilding, and food and drink, including wineries. St Catharines is the principal service centre.

An extensive interurban streetcar network connecting the towns was replaced by highway improvements, especially the QUEEN ELIZABETH WAY (opened 1939) through the fruit belt to Fort Erie in the 1930s. Outward sprawl from its own towns and sporadic growth into the peninsula from the W now present severe problems. The annual loss of agricultural land on the most productive soil in Canada is severe; external shopping centres have denuded the historic urban cores of much retailing strength; and the escarpment as a vital scenic landscape is threatened by linear developments. Conservation, urban quality and respect for the environment have become major issues, together with the economic future of old, established manufacturing industries.

JOHN N. JACKSON

Reading: John N. Jackson and John Burtiak, *Railways in the Niagara Peninsula* (1978).

**Niagara River**, 55 km long, issues from Lk ERIE and flows N over NIAGARA FALLS to Lk ONTARIO. The upper section is navigable to a series of rapids above the falls, and in fact the first ship built on the Great Lakes, La Salle's GRIFFON, was built here. The river is extremely deep, and beneath the falls flows through a spectacular gorge. Its average flow at Queenston is 5760 m<sup>3</sup>/s — greater than the Fraser, Columbia or Nelson. It is crossed by several bridges, notably the Peace (1927) at FT ERIE and the Rainbow (1941), which connects the cities of NIAGARA FALLS, Ont, and Niagara Falls, NY. JAMES MARSH

**Nichol, Barrie Phillip**, "bp Nichol," writer, sound poet, editor, teacher (b at Vancouver 30 Sept 1944). bp Nichol is recognized as one of Canada's leading experimental writers. He first achieved international recognition for concrete poetry in the 1960s and he has published and recorded his work in many different places and ways. He has performed sound poetry as one of the group The Four Horsemen and in solo concerts has explored theoretical possibilities in the Toronto Research Group; he has published a wide range of poetry and prose in books and pamphlets. In 1970 he won the Gov Gen's Award for poetry. All Nichol's writing forms a unity, but his long ongoing poem, *The Martyrology* (1972- ), is the central work. D. BARBOUR

**Nichol, Robert**, businessman, politician, militia officer (b at Dumfries, Scot c1774; d near Queenston, UC 3 May 1824). A successful merchant in Norfolk County, UC, he was elected to the House of Assembly in 1812, 1816 and 1820. During the WAR OF 1812 he served as quartermaster general of militia. Mercurial and capricious, he led the opposition in the Assembly after 1817, though often working closely with the administration and criticizing unrelentingly "the base and wicked Executive." He was an early promoter of canals, and his Assembly report on the resources of the province defined for a generation a strategy for economic development. Nichol described himself with detachment as "more of the Epicurean than Stoic" with "not sufficient stability." ROBERT L. FRASER

**Nicholls, Sir Frederic**, capitalist, business lobbyist (b in England 23 Nov 1856; d at Battle Creek, Mich 25 Oct 1921). Nicholls played a crucial role in promoting early manufacturing in Canada. Educated as an electrical engineer in Germany, he came to Canada in 1874. A Conservative in politics, he was active in creating the NATIONAL POLICY in the late 1870s. He was the founder and editor (until 1893) of the *Canadian Manufacturer*, and prominent in Toronto press, yachting and charitable organizations. Nicholls was one of the first to exploit the possibilities of electric energy in Canada. In 1891 his Toronto Incandescent Light Co first brought electric lighting to the city, and soon enjoyed a monopoly over the city's electric lighting and power needs. He went on to develop the power-generating potential of NIAGARA FALLS with the Electrical Development Co, and the manufacture of electric equipment with the Canadian General Electric Co. In 1896 he was president of the National Electric Light Assn of America. After the rise of the "people's power" movement in Ontario in the 1900s, Nicholls found much less scope for private power development. He was later involved in numerous Canadian-incorporated utility companies in South and Central America and the Caribbean. In 1917 he was appointed to the Canadian Senate.

DUNCAN McDOWALL

Reading: H.V. Nelles, *The Politics of Development* (1974).

**Nichols, Jack**, painter (b at Montréal 16 Mar 1921). Nichols taught himself to draw with the encouragement of Louis Muhlstock in Montréal and the instruction of F.H. VARLEY in Ottawa (1936-40). He was commissioned to paint for the Canadian merchant marine in 1943 and was appointed a navy war artist in 1944. He crossed the Channel on D-Day (6 June) with the British and painted the Normandy landings and actions near Brest. His subjects were always servicemen engaged in their everyday activities. Nichols followed Carl SCHAEFFER in winning the Guggenheim Fellowship for creative painting (1947-48). After the war he taught at UBC and at U of T. In his day he was famous for his melancholy, nostalgic drawings and lithographs.

JOAN MURRAY

**Nicholson, Francis**, soldier, governor of NS (b at Downholme, Eng 12 Nov 1655; d at London 5 Mar 1727/28). He led 2 unsuccessful attacks on Canada via the Hudson R and Lk CHAMPLAIN (1709 and 1711). In 1710, he captured PORT ROYAL with 500 marines and a flotilla under Commodore George Martin. He was made governor of Nova Scotia and Placentia in 1712, but spent only Aug to Oct 1714 in the new colony. He was recalled and dismissed, ostensibly for maladministration. JAMES MARSH

**Nickel** (Ni), the 24th most abundant element in the Earth's crust, comprises about 0.008% of crustal rocks. Nickel is malleable and ductile. Its high melting point (1455°C), strength and hardness make it desirable for many technical

applications. It takes a high polish and in alloys provides strength and resistance to corrosion and heat. Possibly its earliest use was as an unknown element in an ancient Chinese white metal alloy (*paktong*) used in tableware, candlesticks and other ornamental and household articles. The Swedish scientist Axel Cronstedt discovered the existence of nickel in 1751. The major contemporary use for nickel, as an alloying element in stainless steel, consumes nearly 50% of the total supply. Other major uses are in high-nickel alloys, foundry steel and electroplating. The presence of nickel and copper MINERALS near the present city of SUDBURY, Ont, was known as early as 1856, but it was not until 1883, during construction of the CANADIAN PACIFIC RAILWAY, that the significance of the discovery was recognized. By 1890 most ore bodies in the district, comprising the world's largest source of nickel, had been located.

Canada has been the world's largest producer for several decades but its share of world production has declined from 76% in 1950 to about 25% in 1984. In that year total Canadian nickel production was estimated at 174 000 t valued at \$1.25 billion. Other major producers are the USSR, New Caledonia and Australia. Principal markets for Canadian nickel are the US and western Europe. Canada's domestic market accounts for less than 2% of world consumption. The principal Canadian producers are INCO LTD and Falconbridge Ltd. Inco operated mines at Sudbury, Ont, at THOMPSON, Man, and at Shebandowan in northwestern Ontario. Falconbridge operated mines at Sudbury. All Canadian mines are based on sulphide ores. Most nickel mines in Canada are underground, but some are also open cast. After the ore is broken, it is sent to the concentrator where it is crushed and the sulphide minerals concentrated by flotation. The concentrate is smelted to produce nickel matte, which is sent to a refinery where cathodes, anodes, pellets and other products are made. See COINAGE.

R.G. TELEWIAK

**Nickinson, John**, soldier, actor-manager (b at London, Eng 2 Jan 1808; d at Cincinnati 9 Feb 1864). He stimulated the development of theatre in Toronto and was father of an acting family. He joined the 24th Regiment at age 15 and was posted to Québec C and Montréal where he performed with the garrison amateurs, notably at Montréal's Theatre Royal in 1833. Discharged in 1836, he played his first professional season in Albany, moving in 1837 to New York, where he specialized in dialect comedy. He established a pattern of playing winter seasons in New York and summers in Canada often as an actor-manager. In 1851 Nickinson put together his own company, loosely built around his acting family (Charlotte Morrison, Eliza Peters, Virginia Marlowe, Isabella Walcott and John Jr), and toured the Great Lakes and Lower Canada. Between 1853 and 1858 he successfully ran Toronto's Royal Lyceum Theatre, eventually turning it over to his son-in-law, Owen Marlowe. He acted briefly in New York before stage-managing Pike's Opera House in Cincinnati, Ohio. His daughter, Charlotte Morrison (d 1910) managed the stock company for Toronto's Grand Opera House 1874-79.

DAVID GARDNER

**Nicol, Eric**, humorist, playwright, journalist (b at Kingston, Ont 28 Dec 1919). Nicol was raised in Vancouver and has long written a column for the *Vancouver Province* which has provided a foundation for his many humorous collections, such as *Girdle Me a Globe* (1957, Leacock Medal for Humour). These works are characterized by verbal shenanigans put in service to play up the foibles of middle-class, urban family life, with occasional diversions into history as it is popularly misunderstood. Nicol is a jack-of-all-trades, having produced everything from *Van-*

couver (1970), a lively history of the city, to *A Scar is Born* (1968), an account of the unsuccess on Broadway of one of his many stage plays. He has written many radio plays and TV scripts, as well as on professional sports (eg, *The Joy of Hockey*, 1978). He frequently works in close collaboration with cartoonists.

**Nicola-Similkameen** were an enclave of Athapaskans living in the Nicola and Similkameen river valleys of S-central BC (and, marginally, N-central Washington state), surrounded by Interior Salish (see SALISH, INTERIOR). One theory regarding Nicola-Similkameen settlement in this area suggests they originated from a Chilcotin Athapaskan war party that stayed and intermarried with the Thompson and Okanagan Interior Salish in the mid-1700s. Another suggests that the Nicola-Similkameen had a long history in this area, having moved from a more northerly Athapaskan homeland many hundreds of years ago, but archaeological data have not supported this theory.

The few words of Nicola-Similkameen that have been recorded suggest that this language was related to Chilcotin, about 250 km to the N, but analysis of artifacts from archaeological excavations indicates that Nicola-Similkameen PREHISTORY is closely linked with that of the neighbouring Lillooet, Thompson and Okanagan areas. By the early 1900s few people remained who spoke the Nicola-Similkameen language, as it had become secondary to the languages of those who now occupied their territory — the Thompson and Okanagan. The Nicola-Similkameen language is now extinct. The last person who had even a partial knowledge of this language died around 1940. However, there are still some geographical place-names both in the Nicola and Similkameen river valleys that are recognized by Interior Salish as being in the Nicola-Similkameen language, and some Thompson and Okanagan people are aware of their Nicola-Similkameen ancestry.

Very little information concerning Nicola-Similkameen culture has been recorded. They, like their Interior Salish neighbours, generally lived in semi-subterranean dwellings (pit houses) during the winter and in tule-mat lodges at other times of the year. The Nicola-Similkameen subsisted primarily on lake fishing. Salmon were obtained mainly through trade, as anadromous fish were not available either in the upper Nicola R or along the entire length of the Similkameen R. The Nicola-Similkameen diet was supplemented by elk, deer and small game, as well as vegetal foods.

Thompson and Okanagan encroachment into Nicola-Similkameen territory was the result of several factors, perhaps the most important being the introduction of the HORSE to the Plateau area in the 18th century. The horse extended travel for the purposes of trade and food harvesting, with the result that Thompson and Okanagan peoples came to utilize areas occupied by the Nicola-Similkameen. By the mid-1800s the Nicola-Similkameen were under the influence of the Thompson and Okanagan. Epidemic diseases, intermarriage with the Interior Salish, and the increasing presence of non-Indians further hastened the demise of the Nicola-Similkameen in the latter half of the 19th century. See also NATIVE PEOPLE: PLATEAU and general articles under NATIVE PEOPLE.

DOROTHY KENNEDY AND RANDY BOUCHARD  
Reading: F. Boas, "Fifth Report on the Indians of British Columbia," *British Association for the Advancement of Sciences, Annual Report* (1895); G.M. Dawson, "Notes on the Shuswap People of British Columbia," *Transactions of the Royal Society of Canada* 9(2), (1891).

**Nicolet**, Qué., Town, pop 4880 (1981c), inc 1872, is situated some 3 km from the mouth of the Rivière Nicolet at the eastern end of Lac St-

Pierre. Named for Champlain's associate, Jean NICOLET, it grew slowly from its founding in the early 1700s. Although situated on a vast plain, Nicolet has taken a particular shape. Long blocked to the N by private institutional holdings and to the S by agricultural land, it grew only eastward, along the river and was thus subject to springtime flooding and often suffered from landslides. In the early 19th century it became a major agricultural town and an important crossroads for the townships of the S shore. With its economic activity based on the forest and dairy industries and retail commerce, Nicolet was increasingly the centre for back-country agricultural parishes. This was the town's golden age: several religious communities settled there and a diocese was formed in 1877. Its population at the time of the 1891 census was 2518. In the 20th century, however, Nicolet failed to establish a viable industrial structure to match the economic growth in its hinterland. DRUMMONDVILLE, VICTORIAVILLE, Plessisville, Princeville and SHERBROOKE all industrialized with the help of American and British capital. Nicolet lost the title of regional capital and its intellectual and religious roles replaced its commercial one. Today, it is a small service centre.

RICHARD CHABOT

**Nicollet de Belleborne, Jean**, interpreter, explorer (b at Cherbourg, France c1598; d at Sillery, Qué 27 Oct 1642). Like BRÛLÉ he lived among the Indians to learn their languages, spending 2 years on Allumette I with the Algonquin and later staying with the Nipissing, 1620-29. He was the first European to explore the American Northwest on a fruitless search for the MER DE L'OUEST which took him to Green Bay and the Fox and Illinois rivers. He finally settled at Trois-Rivières, Qué, where he continued to act as an interpreter for the missionaries. On a mission to save an Iroquois prisoner, his shallop was overturned and he drowned. His "memories" recounting life among the Nipissing have come down to us in the JESUIT RELATIONS. JAMES MARSH

**Nielsen, Erik Hersholt**, politician (b at Regina 24 Feb 1924). Of Anglo-Danish ancestry, Nielsen flew in 101 Squadron in WWII, winning the DFC for "courage and devotion to duty." Rejoining the RCAF, 1946-51, he served as a legal officer and earned a law degree at Dalhousie. He opened a law practice in Whitehorse in 1952 and was elected Conservative MP for the Yukon in 1957. Tenacious and combative in the House, he built a reputation based upon tough cross-examination of Liberal ministers, knowledge of parliamentary practice and loyalty to party and leader. Minister of public works in the CLARK government 1979-80, he was deputy Opposition House leader 1980-81 and Opposition House leader 1981-83. After Clark's resignation as party leader, Nielsen was interim national head of the PCs, 2 Feb-11 June 1983. Brian MULRONEY named him deputy leader of the national PC Party in 1983, deputy prime minister and president of the Privy Council in 1984, and minister of national defence in 1985. NORMAN HILLMER

**Nighthawk**, medium-sized BIRD of the goat-sucker family (Caprimulgidae) characterized by a very short, exceptionally wide bill, enhanced by a ring of projecting bristles, possibly used to capture insects in flight. Nighthawks have large eyes; small, weak feet; long, pointed wings; and soft plumage of mottled blacks, browns, greys and whites. Most active at twilight and night, they spend the day perched lengthways along a limb or fallen log, take cover in a natural cavity, or on the ground, camouflaged by their plumage. Nighthawks are known for their seemingly erratic wing beats, for regularly repeating nonvarying calls for extended periods, and for producing a booming sound with their wing feathers during steep, high-speed dives. Com-

mon nighthawk (*Chordeiles minor*), occurring throughout all but arctic Canada, prefers to deposit its 2 eggs on open ground. Whip-poor-will (*Caprimulgus vociferus*) of eastern and central Canada lays 2 eggs on the forest floor and forages near the ground. Common poorwill (*Phalaenoptilus nuttallii*) inhabits semiarid areas in southern BC and occasionally Alberta, laying 2 white eggs on bare ground, often under a shrub. This was the first bird species known to hibernate. When disturbed at the nest, these birds often hiss, snakelike, and feign injury.

PHILIP H.R. STEPNEY

**Nightshade**, common name for several PLANTS of nightshade family (Solanaceae); properly, refers only to certain species of genus *Solanum*. Seven species of *Solanum* occur in Canada, of which only *S. carolinense* (horse- or ball-nettle), found in southern Ontario, is native. The most familiar nightshade is *S. dulcamara*, climbing nightshade or European bittersweet, found across Canada. It is an attractive vine with potatolike, purple or blue flowers and glossy, poisonous, red berries. Common, deadly or black nightshade (*S. americanum*) is poisonous to humans, and to browsing animals and poultry, causing similar symptoms in each (particularly paralysis and stupefaction). It need not be fatal, depending on amount ingested and maturity of plant. Tubers of cultivated POTATO (*S. tuberosum*) are poisonous if they become green from exposure to sun and their foliage is toxic to ruminants. The family is important as a source of food, drugs and ORNAMENTAL plants, and also contains many other poisonous members: belladonna or "deadly nightshade" (*Atropa belladonna*), not native to N America, is a garden plant with black berries which are poisonous to children; thornapples (jimsonweeds or Jamestownweeds, genus *Datura*), ornamentals with showy flowers, contain poisonous alkaloids in all parts; TOMATO vines (*Lycopersicon esculentum*) are poisonous to cattle; TOBACCO (*Nicotiana*) contains the toxic alkaloid, nicotine. See POISONOUS PLANTS.

J.M. GILLET

**Nigog, Le**, arts magazine fd 1918 in Montréal by architect Fernand Préfontaine, writer Robert de Roquebrune and musician Léo-Pol Morin. It was the brainchild of Préfontaine, who held a salon for cultivated friends at his Westmount home. Some of them, like Préfontaine himself, had been so impressed by their experience of Parisian artistic life that they came home determined to do something about a Québec which they found intellectually behind the times. The resulting review, *Le Nigog* (named for an instrument used by Indians to spear salmon), sought to educate French Canadians about contemporary art and literature and attracted some 30 collaborators, including 5 Anglophones, to its team. The editors won themselves immediate enemies when they proclaimed the primacy of form over subject matter as the condition of a universal art. Regionalists were horrified: the formalist claim destroyed the serenity with which they had supported the thinking of the establishment. The torture, however, lasted only one year and 12 issues (408 pages). The venture, which had opened up new horizons to Québec youth, gave early expression in French Canada to the views of the French modernists. See LITERARY PERIODICALS IN FRENCH.

ARMAND AND BERNADETTE GUILMETTE

**Nijinsky**, champion colt by NORTHERN DANCER (b 1967). Bred in Oshawa, Ont, by E.P. TAYLOR's stables, Nijinsky was sold as a yearling and trained in Ireland. Winning 11 of his 13 races, including the Irish Sweeps Derby, he was the first horse in 35 years to win the English triple crown. Nijinsky has been second only to his father in his role as stud, siring 67 stakes winners (to 1983).

JAMES MARSH

Canadian voyageurs boarding the *Algoma* at Port Arthur, Lake Superior, on their way to Egypt, where for months they helped haul boats up the Nile (courtesy Public Archives of Canada/C-71203).

**Nile Expedition** In early 1884 British Gen Charles Gordon went to the Sudan to rescue Egyptian garrisons cut off by a Muslim uprising led by the Mahdi; but he allowed himself to become trapped in the capital, Khartoum. In Mar 1884 Britain organized a rescue expedition under Garnet WOLSELEY, who had commanded the Anglo-Canadian force sent in 1870 to put down the RED RIVER REBELLION. Wolseley believed the Nile R offered the only reliable route to Khartoum and that Canadian VOYAGEURS could help ensure passage of a large expedition. On the clear understanding that the 386 "voyageurs" (most of them in fact lumbermen) were volunteers in British pay, PM Macdonald's government did not obstruct recruitment by Gov Gen Lord Lansdowne. For 6 months the recruits helped row, paddle, pole and drag the expedition's boats up the Nile, but in vain. Two days before the expedition sighted Khartoum on 26 Jan 1885, the city had fallen to Mahdists. Gordon had been killed. The expedition failed in its main purpose, but for Canadians it was an exotic opportunity to prove themselves against others from all over the growing British Empire.

ROY MACLAREN

**Nimmons, Philip Rista**, jazz musician (b at Kamloops, BC 3 June 1923). Nimmons formed his big band, Nimmons 'N' Nine (later Nimmons 'N' Nine Plus Six), in Toronto in 1953, after classical studies at the Juilliard School, New York (clarinet), and the Royal Conservatory of Music, Toronto (composition). The band made several more albums, including recordings of Nimmons's most ambitious works, *Atlantic Suite* (1974), *Transformations* (1975) and *Invocation* (1976). Extremely popular through regular CBC broadcasts and concert tours, the band was active only sporadically by 1980. Long involved in music education, Nimmons began teaching at U of T in 1973, and has helped establish jazz programs elsewhere.

MARK MILLER

**Nine-Hour Movement**, international workers' attempt to secure shorter working days; in Canada, Jan-June 1872. Beginning in Hamilton, the demand for the 9-hour day (some workers were expected to labour as long as 12 hours) spread quickly to Toronto and Montréal, gathering support in Ontario towns from Sarnia to Perth. Echoes were heard as far E as Halifax. For the first time Canadian labour organized a unified protest movement, developed tactics of resistance, and cultivated articulate working-class leaders. Nine-Hour leagues united union and non-union workers, and in May labour representatives formed the Canadian Labor Protective and Mutual Improvement Association. Some newspapers popularized labour's causes. In Mar-Apr an unsuccessful Toronto printers'

strike reminded labour that employers were strongly antagonistic to workers' initiatives and that trade unions were actually illegal in Canada. On May 15 Hamilton's "nine-hour pioneers" defied opposition with a procession of 1500 workers. Skilled, respectable craftsmen emerged as labour leaders. James Ryan, a Great Western Railway machinist-engineer recently arrived in Canada, was Hamilton's central figure. In Toronto his counterpart was cooper John HEWITT, and in Montréal, James Black.

Although some groups won concessions, the movement was unsuccessful. Employer hostility helped its defeat, as did the waning of post-Confederation prosperity. Equally significant were divisions within the working class. Women and the unskilled figured peripherally at best, ensuring that the struggle touched certain sectors more fully than others. All this, in conjunction with the apparent failure of militant strikes and workplace action to win decisive victories for workers, fed the attempt to secure rights politically through LABOUR LAW. The Nine-Hour Movement was not an utter failure. Its struggle in 1872 indicated that labour had a public presence and that its interests, institutions and political stance reflected its unique social position and economic needs. It represented a necessary, if ambiguous, beginning in labour's capacity for self-government. The right to associate in trade unions was obtained. Working-class activists won major concessions immediately after 1872: repeal of repressive legislation, passage of laws strengthening workers' hands against employers, and franchise extension. The nine-hour pioneers gave way to the Canadian Labor Union.

BRYAN D. PALMER

**Niosi, Bert** (Bartolo), bandleader (b at London, Ont 10 Feb 1909). He was known as "Canada's King of Swing" during his residency (1932-50) at the Palais Royale dance hall in Toronto. He joined CBC radio's "Happy Gang" (1952-59) and served as musical director (conductor, arranger) for several CBC TV series, including "The Tommy Hunter Show" (1965-76). Niosi was most notably a clarinetist and alto saxophonist, but he also played trumpet and trombone with his dance band. Two brothers were also dance band and radio musicians: Joe (1906-77), a bassist, and Johnnie (1914-65), a drummer.

MARK MILLER

**Nipawin, Sask.** Town, pop 4376 (1981c), inc 1937, is located 200 km NE of Saskatoon. The town is named for a height on the SASKATCHEWAN R just upstream from the present townsite (in Cree, "place where one stands"), which commanded a wide view of plain and river and served as a popular lookout point for the Indian bands that frequented the area. Nipawin is situated at a point on the Saskatchewan R where the prairie and woodland meet. Camping, fishing and other recreational activities are popular and 2 regional parks are located in the

area. The soil to the S of the town is rich, and crops grown in the region include wheat, oats, barley, alfalfa and canola.

DON HERPERGER

**Nipigon, Lake**, 4848 km<sup>2</sup>, elev 320 m, 165 m deep, located in northwestern Ontario, 100 km NE of THUNDER BAY, drains S into Lk SUPERIOR through the Nipigon R. The name may be derived from the Ojibwa *Animi-bee-gong* ("continuous water"). In the 18th century, the Cree who occupied the area were gradually displaced by the present inhabitants, the Ojibwa. European visitors included RADISSON and DES GROSEIL- LIERS (1658), Father Allouiz (1667) and DUL- HUT, who in 1684, in response to competition from the HBC, built Ft La Tourette on the NE shore of the lake. Later posts were established by the NWC and HBC, but none grew into major settlements. With its limited population, unspoiled environment and abundant fish and wildlife, the area is ideal for outdoor recreation. The lake supports a small commercial fishery and the adjacent forests supply pulpwood for mills in Red Rock and Thunder Bay. Since 1940 water has been transferred S from the ALBANY R watershed, via the Ogoki Diversion, into Lk Nipigon, increasing its natural capacity and allowing the generation of 266 000 kW from 3 hydroelectric plants on the Nipigon R.

DAVID D. KEMP

**Nipissing, Lake**, 831 km<sup>2</sup>, elev 196 m, fifth-largest in Ontario excluding the GREAT LAKES, is located 50 km NE of GEORGIAN BAY. Its name derives from an Indian word meaning "little water." Lk Nipissing runs in an E-W direction to a length of 80 km. Because it parallels the prevailing winds, navigation is frequently treacherous. It is comparatively shallow (about 10 m in most places) and is consequently well aerated, which is conducive to healthy plant and fish life. Dozens of rivers and streams drain into Lk Nipissing, the largest being the Sturgeon R. Historically its 2 most important outlets were the Mattawa R, which links it to the OTTAWA R system, and the FRENCH R, which issues from its SW end, draining into Georgian Bay. Along this Ottawa-Nipissing Bay route travelled the early French explorers — the first being Etienne BRÛLÉ

The shore of Lake Nipissing, Ont. The lake was on the main fur-trade route (photo by John deVisser).

in 1610 — tracing a path followed by fur traders for the next 200 years. Permanent settlement around the lake dates from 1874 at Nipissing village in the SE and from 1882 at NORTH BAY when the CPR reached its NE shore. From the 1880s through to WWI Lk Nipissing was a major transportation route for settlers and lumbering, as steamships plied it regularly. Since then it has served mainly as a tourist and recreation waterway.

MATT BRAY

**Niverville, Louis de**, painter (b at Andover, Eng 7 June 1933). Self-taught, Niverville worked 1957–63 as a graphic designer for the Canadian Broadcasting Corporation in Toronto alongside Dennis BURTON and Graham COUGHTRY. The turning point in his work, when he considers he really started to paint, was in 1966–67 with a mural for Expo Theatre in Montréal. After that he developed a formidable technique, particularly with collage, to express an astonishing, visionary world often wrought from childhood memories. Niverville's work is characterized by fresh and provocative thought. He directs his dreams, orchestrating their curious juxtapositions, strange happenings and colours into his paintings.

JOAN MURRAY

**Nixon, Harry Corwin**, politician, premier of Ontario (b at St George, Ont 1 Apr 1891; d there 22 Oct 1961). He won acclaim for his political longevity, spending 42 years as an Ontario MP. Elected among the UNITED FARMERS OF ONTARIO in 1919, he eventually led that group's remnant into farmer Mitchell HEPBURN's revitalized Liberal Party and to the first Liberal victory in a quarter century (1934). Throughout Hepburn's regime, Provincial Secretary Nixon's stability helped balance the premier's mercurial temperament and after "Mitch" and his chosen successor, Gordon D. CONANT, resigned, the party chose Nixon as leader and thus premier (May 1943). An election followed 3 months later, and voters ousted the Liberals. Nixon continued to represent his rural constituency until his death.

BARBARA A. MCKENNA

**Nobbs, Percy Erskine**, architect (b at Hadlington, Scot 11 Aug 1875; d at Montréal 5 Nov 1964). As director 1903–10 and then professor of design (until 1940) at McGill School of Architecture, Nobbs was an important force in early Canadian architectural education. His training under Scottish Arts and Crafts architect Robert Lorimer led him to pioneer study of Canada's vernacular architecture, which he regarded as the key to functional, environmentally sensitive modern design. His works include notable buildings and extensions at McGill, numerous commissions in the Montréal region, and the development plan (with Frank Darling) and early academic buildings at the University of Alberta.

SUSAN WAGG

Reading: Susan Wagg, *Percy Erskine Nobbs* (1982).

**Noise**, unwanted or unmusical sounds, especially those that are random or irregular. The attitude that noise is not conducive to the well-being of sentient creatures is as old as history. The Babylonian story of the Flood, as recorded at about the time of Hammurabi (2000 BC), attributes the event to the anger of the gods over the noise of men. Egyptian priest Ipu-ner lamented, "Noise passes through the land leaving a trail of sadness." In his ethical directives to doctors, Hippocrates (400 BC) stated, "Noise must be avoided and kept well removed from the sick." Some of the sources of noise in those times may be gleaned from the history of Sybaris, a Greek colony in southern Italy (600 BC), where noisy trades, such as blacksmithing and stonemasonry, were prohibited within city walls. Impact noises were evidently the Sybarites' main concern. This was not the case in Imperial Rome where the main noise came from traffic. In that walled city of one million people, traffic con-

gestion was so great that goods vehicles were allowed on the streets only at night. The continual movement of steel-rimmed wheels on stone-paved streets created a clatter that caused Marcus Martial (80 AD) to complain: "I have Rome right beside my bed at night." In England in the days of Henry VIII, the method of maintaining "the peace, quiet, rest and tranquility of the citizens" was still primarily by prohibiting certain noisy activities at least during resting hours (9 PM to 4 AM). Carts using the streets daily within the city of London could not "have wheels shod with iron, but bare, under pain of six shillings."

One problem that inhibited noise control before the 20th century was the inability to measure noise levels. The ear is an unreliable measuring instrument, a problem further complicated by the ability to become habituated to frequent or regular background sounds. Electronic amplifiers solved the problem and made sound-level meters convenient and reasonably standardized, allowing correlations between exposure to noise levels and quantitatively measured effects on people. "Boiler-maker's ears," a loss of hearing resulting from long-term exposure to extreme noise, had long been recognized but, in the middle of this century, a more general relation was established between noise exposure and hearing loss. Subjective reactions (eg, annoyance) have yielded to ever-improved methods of measurement. Sound-level meters are calibrated in decibels (db) and have weighting networks discriminating against certain frequencies. For example, the A-weighting network, most widely used in dealing with human response, gives less weight to low frequencies because they produce less annoyance, hearing loss, etc.

Noise levels may be divided into 3 ranges according to their effects on people. Zero decibels is the approximate threshold of hearing. Levels of 0–40 db are generally judged as quiet and annoy only if they contain strong tone components. Those between 40 and 80 db may be a nuisance, depending on their nature and the conditions under which they occur. For example, the level of conversational speech at a distance of 30 cm averages about 60 db. A full orchestra may play for extended periods at 80 db and well above that for brief periods, yet we willingly pay for exposure to it. Nuisance noises generally occur outdoors in urban and suburban environments and are the subject of noise bylaws. Significant causes include car traffic, which is all-pervasive, truck and public transportation traffic (road and rail), which is more restricted, and air traffic, which is usually more localized but can have adverse effects even far from civilization. An important part of nuisance noise may come from air conditioners, lawnmowers, snowblowers, etc. These noises are annoying because they may startle and distract, and interfere with understanding speech or with rest and sleep. The limit set by bylaws for environmental noise may vary from a low of 40 db in suburban, purely residential areas at night, to a high of 75 db in a purely industrial area during the day.

Distance can be a very effective protection from environmental noise: in a uniform atmosphere, each time the distance doubles, the noise from a single source is reduced by 6 db. For example, most passenger cars travelling at 60 km per hour produce a noise level of 65 db at 15 m, 59 db at 30 m and 53 db at 60 m. Unfortunately, distance often cannot be controlled at will. Distance is the primary means of keeping air-traffic noise down in residential areas. Buildings, rock formations and forests act as noise barriers, most effective at short distances. House design can affect noise levels in the indoor environment: maximum wall attenuation (about 45 db), double windows with forced ventilation and sound-absorbing materials inside the house

all help reduce noise. Noise levels of 80–120 db are uncommon in our environment, but are common in some industries and at airports.

Noise may cause physiological damage, especially to the inner ear; duration of exposure is fundamentally important. The Canadian government (like most other Western governments) has set a limit of 90 db to the noise level to which unprotected industrial workers may be constantly exposed during a working day. Many governments set this limit at 85 db. For higher levels, permissible exposure time is lower. Exposure without protection to levels above 115 db is usually not permitted. Noise levels above 120 db are rare except near powerful sources such as jet or rocket engines. Sound may be felt at 120 db; it will cause pain in the ears at 130 db. At 160 db, or higher, combustible sound-absorbing materials may be ignited by the heat into which the sound energy is transformed. White noise, which has nearly uniform energy distribution over the audible frequency range, is often used to mask low-level noise with annoying characteristics. It may also be used to mask low-level speech from neighbouring areas, thus preventing distraction and ensuring privacy. White noise is not usually effective when the offending noise is above about 40 db. Humans are not the only animals to suffer from excessive noise. For example, in wild bird populations, noises in the 40–80 db range may interfere with nesting success. Even normally acceptable sounds may be a source of debilitating stress, eg, birds may desert their breeding territories in response to excessive playbacks of territorial songs.

In comparison with other countries, Canada has little noise abatement legislation and the legislation that exists is aimed primarily at private individuals. Such laws as do exist to regulate various kinds of noise pollution are controlled by different levels of government. Noise from traffic, industry, etc, is regulated by municipal governments. Ottawa was the first Canadian city to pass a quantitative noise bylaw (1970). Aircraft noise is controlled by the Air Services Division of the federal Department of Transport. Canadian airports that have noise abatement policies for aircraft takeoffs and landings include Montréal International, Pearson International and Winnipeg International. No regulations exist to control small plane or helicopter noise. Partial curfews (affecting flights from midnight to 7 AM) are in place at Montreal and Toronto airports. WORKERS' COMPENSATION boards have authority to investigate industrial noise.

A great deal of research has been done at the NATIONAL RESEARCH COUNCIL OF CANADA on reducing noise at the source; for example, noise in suction rolls (eg, in paper mills) may be reduced by designing quiet drilling patterns. Attempts to block sound once it is produced resulted in development of hearing protectors with liquid-filled cushions, which are used at airports around the world. Controlling noise in the community by community and road design and by legislation has received a great deal of attention, as has the transmission of sound under the complex conditions prevailing in the real world. The effects of various levels of noise on sleep characteristics have been studied for about 15 years. University of Toronto Institute of Aerospace Studies has been involved in examining AERODYNAMIC noise, both at boundary layers and in jets. At McMaster University, the chief effort in this field has been on community reaction to traffic noise.

G.J. THIESSEN

Reading: R. Murray Schafer, *The Book of Noise* (1973).

**Non-Medical Use of Drugs, Royal Commission on the** (Le Dain Commission), investigated the role governments and courts should play in prohibiting and regulating the use and distribution of drugs (particularly opiate and

marijuana but also alcohol, barbiturates, amphetamines and others) used for nonmedical purposes. The inquiry was commissioned when nonmedical drug use was in part symbolic of a more widespread controversy over life-styles and political participation, and it operated in an atmosphere of controversy. It broadened its interpretation of its mandate to include a discussion of the social values promoting drug use. Hearings were held across Canada, sometimes in camera with drug users, sometimes in coffee houses. The testimony of those affected by governmental and court actions was greatly emphasized. The inquiry produced 4 reports (1973); the final one contained extensive scientific documentation and recommended that policies should be adopted to discourage nonmedical drug use and that sanctions should be tailored to fit the crime. The inquiry did not recommend decriminalization of nonmedical drugs, although one of the 2 dissenting commissioners did. Most of the recommendations have not been legislated, but in enforcing existing legislation the courts have followed the direction advocated by the inquiry. See *DRUG USE, NON-MEDICAL*. LIOIRA SALTER

**Non-Partisan League**, an agrarian protest movement imported into Canada from N Dakota in 1915. The league became a political force in the Prairie provinces after its 1916 victory in the N Dakota state election. A number of leading urban radicals, including J.S. WOODSWORTH, William IRVINE and Salem BLAND, provided organizational assistance. The league hoped to replace the party system with a form of direct democracy where CABINET domination of the legislature would be replaced by constituency control of MLAs. Issues were to be decided on their merits rather than as a result of partisan difference. Although the league itself had disappeared as a political force by 1921, its influence continued to be felt in western Canada. Farmers, partly won over by its rhetoric, became more class conscious, and the old party system was swept away by a succession of new groups, the PROGRESSIVES, the UNITED FARMERS OF ALBERTA, SOCIAL CREDIT and the CO-OPERATIVE COMMONWEALTH FEDERATION. J.T. MORLEY

**Nonsuch** set out for HUDSON BAY from Gravesend, Eng, 3 June 1668, with Sieur DES GROSEILLIERS and a small crew and anchored off the mouth of the RUPERT R on Sept 29. A second sailing vessel, the *Eaglet*, with Pierre RADISSON aboard, was forced to turn back. The 2 French traders had persuaded Prince Rupert and several English investors to finance the voyage to prove that the vast fur resources of interior N America could be tapped via Hudson Bay. The *Nonsuch's* crew wintered in James Bay and reached England on 10 Oct 1669 with a cargo of furs that the press reported "made them some recompense for their cold confinement." The charter for the HUDSON'S BAY COMPANY was granted on 2 May 1670.

In 1968 a replica of the *Nonsuch* was built in

*Nonsuch*, replica (1968) of the ship that in 1668 carried Sieur des Groseilliers on his historic voyage into Hudson Bay. It is housed in the Manitoba Museum (courtesy Manitoba Museum of Man and Nature).

England to honour the 300th anniversary of the voyage. It was shipped to Montréal in 1970 and displayed on the Great Lakes and Pacific coast before being installed in a specially built museum in Winnipeg. The replica is considered to be the most accurate reconstruction of a 17th-century ship.

JAMES MARSH

**Noorduyn Norseman** The first bush plane of all-Canadian origin, it was designed after consultations with bush pilots and built in Montréal by R.B.C. (Bob) Noorduyn. It was a rugged, single-engined craft, with the large cabin, loading door and high wing that were prime requirements for bush aircraft. It first flew Nov 1935, and over 900 were built in all, many seeing service in the RCAF and 7 other air forces. Amphibious and capable of landing or taking off in tight spots, it became a standard workhorse of the Canadian North. In 1982, 41 were still registered in Canada; 4 are in museums. (See BUSH FLYING).

JAMES MARSH

**Nootka** ("It goes around") is the popular but erroneous name for the score of ethnically related tribes along the Pacific coast of Vancouver I and around Cape Flattery (US). Locally, "Nootka" misnames only NOOTKA SOUND and its Mowach'ath people. The island groups are also popularly termed "Westcoast" and those of the cape, "Makah," a Straits Salish word. In 1978 *Nuu-Chah-Nulth* ("All Along the Mountains"), was officially adopted by the Westcoast tribes as their name. *Aht* is another superseded anthropological designation taken from the suffix "ath" ("people of") on the tribal names. "Nitinat" refers only to the Nitinat Lake tribes.

Linguistically, Nootka is one of the 2 main divisions of the Wakashan family, the other being Kwakiutl. Its dialects (and tribes) are Northern Nootka (Ch'i:qtlis'ath, Qa'yo:kw'ath, 'l:hatis'ath, Noch'a'ath, Mowach'ath, Mach'ath), Central Nootka (Hishkwi'ath, Mano:his'ath, 'Ots'os'ath, 'A:hos'ath, Qitsama'ath, Tla'okwi'ath, Yo'lo'it'ath, 'T'okwa'ath, Ho:choqtlis'ath, Ts'isha'ath, Ho:pach'as'ath, Ho'i'ath), Nitinat (Di:ti:da:tx, Tlo'o:wis:tx, Qua:bad'owa:tx, P'a:chi:da:tx), Makah (Qwidishcha'atx) and Ozette ('Osi:atx). Speakers of Nitinat, Makah and Ozette can grasp the Northern and Central Nootka dialects, but not vice versa.

The Nootka date back at least 4000 years in their land. Territories were defined by tribe, but in total stretched from Cape Scott (N Vancouver I) to past Ozette Lk (Washington state) in the S. Relations were generally friendly with the culturally and linguistically related KWAKIUTL on the NW, but less so with the more alien Coast Salish groups to the E and S. Trade and intermarriage occurred in all directions. White contact dates from PÉREZ HERNÁNDEZ's visit in 1774, and the initial focus was the sea-otter trade. Acquisition of guns intensified warfare, with well-armed groups such as the Mowach'ath, 'A:hos'ath and Tla'okwi'ath nearly exterminating others such as the Mach'ath, 'Ots'os'ath and 'T'okwa'ath. Introduced diseases and alcohol so reduced and debilitated the Nootkans that in the second half of the 19th century colonialization was almost unopposed. Population, estimated at 30 000 at first contact, plunged to only about 2000 in the 1930s, but is now rebounding. No land surrender was signed on Vancouver I, but in the late 19th century small INDIAN RESERVES were demarcated with a total area only half that of the Cape Flattery Reservation established in the US by treaty in 1855 (see INDIAN TREATIES). Curtailment of hunting and fishing, including prohibition of the vital salmon weir traps, deprived Nootkans of their traditionally rich economic base.

Nootkans were accomplished woodworkers, outstanding products being fine cedar canoes and big multifamily houses (see HOUSE; NORTH-

WEST COAST INDIAN ART). Hunting/fishing gear and techniques were refined. Fish (particularly salmon and halibut), sea mammals and shellfish were mainstays of their diet, supplemented by fowl, deer, elk, bear and plant foods. Clothing was comparatively uncomplicated. The seasonal round involved moving by large canoes between winter concentrations in sheltered inlets and smaller summer camps scattering to the outside coast. WHALING with harpoons and floats was a cultural highlight, both economically important and prestigious. Spirit powers were believed to animate all things, and power seeking was common. Any undertaking was prepared for by secret purificatory rituals entailing bathing and scrubbing in cold waters.

Society was closely ranked, with a continuous gradation from chiefs to commoners and a slave class of war captives. Lineages were traced through both male and female connections. Property rights were keenly held, including intangibles such as names, songs and stories. Chiefs had most of the rights and were wealthy. Intensive ceremonialism occasioned frequent feasting and entertainment with song, dance, contests and theatricals (see POTLATCH). Especially elaborate celebrations were the Wolf Ritual cycle of a general secret society, girls' puberty rites and marriage. A zestful sense of life prevailed by the sea.

Historically the Mowach'ath provided the setting for the NOOTKA SOUND CONTROVERSY, 1789-94, with Chief MAQUINNA (actually Moqwi'ina) their leading participant. In 1811 Chief Wikaninish of the Tla'okwi'ath attacked the crew of the TONQUIN after provocation. In 1864 the Ahusat captured the schooner *Kingfisher*, and a punitive expedition was sent against them — the Denman naval expedition. The Bering Sea fur sealing, about 1870 to 1911, was carried out by Nootkans transported there with their canoes. In the 1980s they live mainly by fishing and logging. Traditional culture and language are weakened but a strong native identity persists. See also NATIVE PEOPLE: NORTHWEST COAST and general articles under NATIVE PEOPLE. EUGENE ARIMA

**Nootka Sound**, BC, is an inlet on VANCOUVER I's western coast, 270 km NW of VICTORIA. From a cluster of forested islands near the mouth of the sound, 3 deep inlets (Tahsis, Tlupana and Muchalat) penetrate inland. One of these reaches 65 km inland to Strathcona Provincial Park, another to the sawmilling community of Tahsis. The first inhabitants of the region were the NOOTKA, who made their living by hunting and fishing. They were the only Canadian Indians to specialize in whaling and were the first in BC to meet Europeans. The coastal environment was particularly bountiful in fish of many varieties, and the semisedentary Nootka developed an elaborate culture.

The sound was likely first explored by James Cook in 1778. Cook called the inlet King George's Sound, then Nootka, thinking this was its Indian name. Soon after, the region became a centre of trade and then of competition among Russia, England and Spain. In 1789 a Spanish force occupied the sound and built a fort; 2 months later a British force arrived and a quarrel developed. In the ensuing NOOTKA SOUND CONTROVERSY, Spain eventually agreed to a convention (1794) according to which both nations were free to navigate and fish in the Pacific, to trade and establish settlements. At first the Nootka prospered from the sea-otter fur trade that followed European explorations, but the introduction of diseases such as smallpox virtually wiped them out. The main Indian settlement at Yuquot ("windy place") is still important for the remaining Nootka, many of whom work in pulp mills at Gold River and CAMPBELL RIVER. See NORTHWEST COAST

ALAN F.J. ARTIBISE

**Nootka Sound Controversy**, involved the competing claims of Spain and Britain for control of trade and navigation on the NORTHWEST COAST and in the Pacific Ocean, 1789-94. Spain claimed the Pacific as its exclusive territory by right of the Treaty of Tordesillas (1494). Britain argued that navigation was open to any nation, and territorial claims had to be backed by effective occupation. In July 1789 Esteban MARTINEZ, Spanish commandant at NOOTKA SOUND (in present-day Vancouver I), seized several British merchant ships. John Meares, part owner of these ships, reported the seizure to his government in his *Memorial* of 30 Apr 1790. Britain demanded compensation and threatened war, but Spain declined to pay compensation and prepared for war, hoping its long-standing Bourbon ally, France, would provide assistance. France, undergoing revolution, refused. In a series of negotiations Spain was obliged to accede to British requests and compensate the British for their losses. Under the third Nootka Convention of 11 Jan 1794 Spain and Britain recognized each other's rights of trade at Nootka Sd and in other Pacific coast areas not already controlled by Spain. Subjects of either nation could erect temporary buildings at Nootka, but not permanent garrisons or factories. Neither nation could claim exclusive sovereignty. Nootka Sd was to be maintained as a free port by Spain and Britain, and to be open to other nations. On 28 Mar 1795 both countries completed their withdrawal from Nootka Sd. The controversy ended in symbolic victory for British mercantile and political interests. BARRY M. GOUGH

**NORAD (North American Air Defence Agreement)**, announced on 1 Aug 1957; renamed North American Aerospace Defence Command in 1981, it integrates the air-defence forces of the US and Canada under a joint command at Colorado Springs, Colo. The agreement has occasionally been a focus of controversy. PM John Diefenbaker and Minister of National Defence George PEAKES, just installed in office, hastily accepted the advice of the Canadian military and agreed to integrate the RCAF with the USAF for the air defence of the continent. The decision was taken without adequate preparation (the formal signing did not take place until 12 May 1958, one indication of subsequent concerns), and the government was roasted for its haste by the Liberal Opposition, who themselves would almost certainly have accepted a similar agreement had the 1957 election turned out differently.

Technically the agreement has been a success, co-ordinating 2 air forces in a difficult task and keeping Canadian airmen in touch with doctrine and policy — and keeping them flying. But because the concurrence of the 2 governments is required before formal alerts or action, there has been difficulty, most notably in 1962 during the CUBAN MISSILE CRISIS. The Americans went on standby alert as soon as the crisis was apparent, but the Diefenbaker government delayed for a period of days, angering the Kennedy administration and provoking much criticism in Canada. The matter was complicated by the fact that the BOMARC MISSILES at the 2 Canadian Bomarc bases had no nuclear warheads, another consequence of divisions in Cabinet; and the Bomarc itself was greatly resented by partisans of the CF-105 AVRO ARROW aircraft, which had been cancelled by the government 3 years earlier in a decision that some (unfairly) blamed on NORAD.

Despite arguments that the threat from Soviet manned bombers no longer exists, NORAD has been kept in place by successive governments. The renaming of the command in 1981 reflected a new emphasis on defence against guided missiles. In 1983 the Canadian component consisted of CF-101 interceptor aircraft (beginning to be

replaced by CF-18s) and, as from the beginning, a Canadian officer was the deputy commander at Colorado Springs. J. L. GRANATSTEIN *Reading: C. Gray, Canadian Defence Priorities* (1972).

**Noranda Mines Limited**, with head offices in Toronto, is a multinational, multi-product company. The company was incorporated in 1964 as an amalgamation of Geco Mines Ltd (incorporated in 1953) and Noranda Mines Limited (incorporated in 1922 to acquire mining claims in Ontario and Québec from a private syndicate). The company grew through acquisitions in mining and related industries, and today it is a diversified natural-resource company. Its principal activities are in mining, manufacturing and forest products, with its subsidiary, Noranda Sales Corporation Ltd, handling worldwide sales. Noranda Mines has properties in Canada, the US and overseas, including S America and Australia. In 1983 it had sales or operating revenue of \$3 billion (ranking 27th in Canada), assets of \$6.1 billion (ranking 14th) and 51 700 employees. Brascade Resources holds 35% and Zinor Holdings 16%.

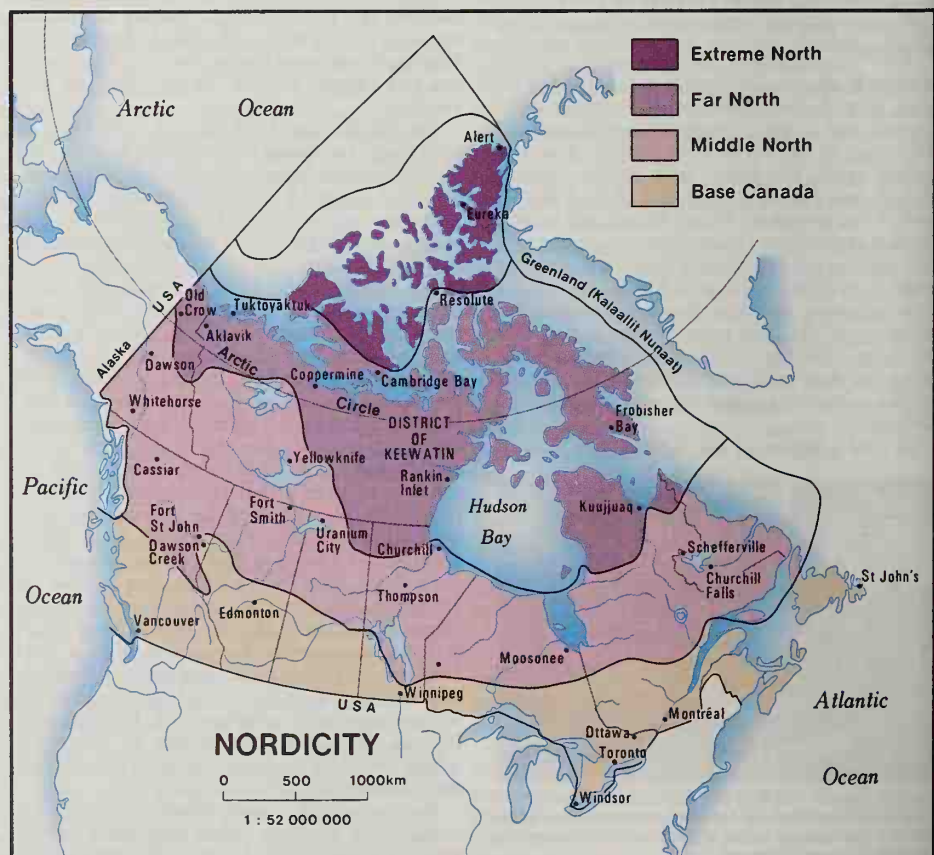

DEBORAH C. SAWYER

**Nordicity**, concept developed in Canada from the 1960s that refers to the perceived state or degree of northernness of high-latitude situations. Depending on the area under consideration, nordicity may be determined by CLIMATE, BIOGEOGRAPHY, GEOGRAPHY, psychology or other factors. The concept deals with the description and comprehension of phenomena defined as nordic (ie, in this context, occurring in any northern area of the Northern Hemisphere). How severe is the northern zone of Canada? How has this frigid periphery of N America been perceived? To understand these questions it is necessary to recognize that the NORTH has cultural as well as physical dimensions and is more than a simple collection of latitudes. Objective, calculated geographic nordicity expresses a certain image of this cold region, but there may be as many mental nordicities as there are citizens.

#### Geographic Nordicity

Definitions of the North are primarily functions of the criteria chosen to judge the situation. Originally, the Arctic was defined as a region of polar night or day, with a frozen subsoil and without trees or agriculture. The first development of the nordicity concept involved creation of an all-encompassing physical and human geography. A nordic index was devised for calculating and quantifying the number of "polar values" (called VAPO) and establishing the nordicity of a space or phenomenon. This index is based on 10 criteria, each expressed on a scale of 0-100. The criteria divide into 3 groups: one locational variable, 5 natural and 4 human factors. With reference to location, 45° N lat is assigned 0 VAPO; 90° N, 100 VAPO. Summer-heat values range from more than 150 days above 5.6°C, 0 VAPO, to 0 days, 100 VAPO. Similarly, with annual cold, 550 degree days below 0°C is assigned 0 VAPO; 6650 days, 100 VAPO. The human factors are more difficult to quantify but, for example, degree of economic activity ranges from "interregional centre with multiple services, heavy investment," assigned 0 VAPO, to "no production, none foreseen," 100 VAPO. A table outlining these variables allows an arithmetic evaluation of the nordic character of cold regions and facilitates understanding of the factors most important to this evaluation. Another useful tool is the isonord, a line on a map joining points that have equal polar values.

This evaluation process provides information for the task of fixing the southern limit of the North. Formerly, that limit was determined by a single factor, eg, an isotherm (10°C in July), a latitude (often, the ARCTIC CIRCLE), an administrative boundary (60°N lat), or a topographic feature (Hudson Str). No one factor is now considered definitive, but nordicity does increase abruptly above isonord 200, suggesting a fundamental break running across Canada. This isonord runs along the southern edge of Long Range in Newfoundland, sweeps along the lower Côte-Nord and Minganie and runs N of

the Saguenay depression in Québec and Lk of the Woods, Ont. It passes through Lk Winnipegosis, Man, and touches Montreal Lk, Sask. In Alberta, it runs N of the agricultural ecumene (ie, inhabited area) of the Peace R country to the oil and gas fields of Fort St John, BC. In BC, the CORDILLERA complicates the delimitation of the true North. Pockets of discontinuous PERMAFROST lodge in the summits of peaks in southern parts of the province; temperate conditions are found in the bottoms of northern valleys. However, considering all criteria and despite the anomalies, the boundary of the cordilleran North can be fixed between 53 and 55°. Throughout Canada, the boundary consists of a swath of land dozens of kilometres wide.

The nordicity index and the zonation it signifies can have several uses. Apart from defining the North's southern limits, it allows subdivision of the polar world into zones. Moreover, it has been used for the classification of documents, construction of a scale of workers' allowances, analysis of the evolution through time of tourist potential, estimation of the cost of services, and for a study by the Fisheries Board of Canada. This index would provide a more realistic basis for determining royalty zones in the development of northern PETROLEUM than does the simple division by latitude now used.

Canada's northern limit has been fixed by the federal government at 200 nautical miles (370 km) from shore in the Arctic Ocean. Thus the nordic political territories include parts of 7 provinces, the YT and the NWT. Including the waters within the North and the oceanic water belt, the nordic space occupies about 70% of Canada's territory. This seems a more exact estimate than the official 39%, which includes only the landmasses and fresh waters of the YT and NWT. Inside this immense zone (one-third water), the population in 1971 was less than 300 000 resident inhabitants, a demographic mass comparable to that of Alaska and Iceland. Canada's nordicity is more severe than that of Scandinavia or even Siberia, a fact that discourages settlement. The Canadian North consists of hundreds of small settlements scattered over a territory larger than Europe. A web of technical and social services keeps these isolated worlds in touch with the South.

#### Northern Zones

The idea that the North could be divided into broad East-West bands appeared repeatedly in works of the mid-19th century. For example, in 1832 Joseph Bouchette divided western Canada as follows: everything S of 56° N lat, everything between 56° and 65°, everything from 65° to the Arctic Ocean. Thematic divisions between boreal forest and TUNDRA, between subarctic and arctic, between seasonal and permanent pack ice, between regions of partial and total light, between Indian and Inuit lands, all reflect other zonal gradations. The regional subdivisions of the North include 3 major regions of about 1 million km<sup>2</sup> each, the boundaries of which do not follow lines of latitude.

**Middle North** Bounded by isonords 200 and 500 VAPO, the region has a subarctic climate, stretches from Labrador to the YT and includes many lakes and bogs. It has been the domain of pioneering thrusts, of "vertical" corridors for the extraction of MINERAL RESOURCES and the production of HYDROELECTRICITY. The Middle North includes about 90% of the North's permanent inhabitants. About 85% of the Middle North lies within provincial boundaries, a fact that receives insufficient political attention. Examples of midnordic nordicity include Churchill, Man, 450 VAPO; Dawson City, YT, 435; Yellowknife, NWT, 390; Cassiar, BC, 377; Labrador Sea, Nfld, 297; Red Lake, Ont, 220.

**Far North** spans the area between 500 and 800 VAPO. Natural factors (eg, limited summer

Nordicity Compared by Polar Value (VAPO) Criteria

Nordic Criterion	Schefferville, Qué <sup>2</sup>	Verkhnoiansk, USSR <sup>1</sup>	Keewatin, NWT <sup>2</sup>
Latitude	21	44	42
Summer heat	37	62	60

Total <sup>4</sup>	295	631	812

<sup>1</sup> Considered the pole of coldness in the Northern Hemisphere

<sup>2</sup> Interior portion

<sup>3</sup> Too much precipitation to fit concept of nordic aridity

<sup>4</sup> For comparison, the North Pole has 1000 VAPO

heat, tundra landscape) and human factors (eg, presence of Inuit and rarity of major RESOURCE exploitation) again combine to express a total zonal situation. Being partly composed of interconnected bodies of water, the Far North allows a certain amount of penetration by boat in summer. Since only about 20 000 inhabitants live in this quarter of the Canadian landmass, the ecumene of primary activity is extremely extensive. The Far North is an arctic desert that has few residential oases and is economically very weak. Its population, unlike that of the Middle North, consists mostly of indigenous people. Examples of this nordicity include Resolute, NWT, 775 VAPO; Old Crow, YT, 624; Hudson Bay (centre), 622; Aklavik, NWT, 511.

**Extreme North** This hypernorthern region, which covers less than 10% of Canada's landmass, includes heavily iced marine waters with a nordicity in the 850 VAPO range. It is a region of ice (on land, at sea and in the depths). The Extreme North is almost devoid of settlements, with the exception of a few white outposts such as Alert (NWT). Government expenditure is usually larger than private. Alert has 878 VAPO; Eureka, NWT, 857; the Barnes Ice Cap, 804.

#### Historic Nordicity

Like any region defined by natural and psychological factors (the latter heavily influencing settlement), the North has varied in size over its history. Even if, in the course of a generation, the boundaries of permafrost, sea ice and boreal forest barely change, the factors involved in settlement and abandonment of habitations, in economic development and in the creation of mental perspectives are constantly evolving. At the beginning of the Age of Discovery, Canada was considered all north because of the severe winter conditions. As Morris Zaslow has noted: "In the immediate post-Confederation period, anything beyond Lake Nipissing was termed North." In Québec and central Labrador, iron-ore exploration and hydroelectric development have caused this outland to lose some of its former polarity. According to the nordic index, in 1941 the future site of Schefferville, Qué, had 533 VAPO; 25 years later, 295. Settlement caused its denordification. Thus, in the last century, as a result of a redefinition of zones, the real Canadian North has become less widespread and the average nordicity of the country has become lower. A quantitative denordification of about 25% has occurred.

Between 1881 and 1971, the resident population of the North multiplied sevenfold (43 060-292 702). The present nordic space, especially the Middle North, has been overrun by Canadian and foreign immigrants, but this penetration has been uneven in time and space. The movement had begun by 1881 (first census year). At that time, the future province of Newfoundland/Labrador accounted for more than

half of all the whites resident in the Canadian North. By 1910, 8000-10 000 northerners (whites and Amerindians) lived in the NWT, the YT, Manitoba, Ontario and Québec, but the influx only became important in the course of the 20th century. Between 1911 and 1941 settlement patterns once again modified the regional pattern. As a result of mineral exploration and agricultural development along the pioneer fringes of western Canada, Alsama (Alta-Sask-Man) had 50% of the nordic population and became the main nordic mega-region; Manitoba stood first among the provinces. Since the mid-20th century, a strong natural increase in the indigenous population and increases in governmental administration and oil exploration have caused an increase in Canada's northern population. Thus, the YT, the NWT and Newfoundland/Labrador have experienced increased growth percentages. In 1971 Alsama was still first, followed by the territories (counted as one). BC, Ontario and Québec accounted for only 22% of the nordic population of the country.

#### Developmental Nordicity

The North has known at least 5 developmental visions since Martin FROBISHER's mining projects of the 16th century. An initial period of optimism, based on the hope of discovering a NORTHWEST PASSAGE, ended when that proved unprofitable. The resulting view, that the North was almost totally useless, led to suggestions that nordic lands should be sold or given away. A more recent political vision is of the North as an unlimited reservoir of natural resources. The final visions are an ideology of nondevelopment ("Freeze the Arctic") and one of integrated planning that respects nordic culture.

At least 2 categories of nordicities of exploitation must be identified: nordicity of use and normative nordicity. The first can be seen inductively through examination of the activities of entrepreneurs and employers who lack specialized training for work in the North. Clearly, the nordicity of use has influenced economic and political growth both in private and government frameworks. Many activities in the North seem to have been determined by southern Canadian interests, by federal jurisdiction over the territories, and by inadequate appreciation of Amerindian ethnicity. These activities have resulted in exploitation poorly adjusted to northern conditions. Normative nordicity, corresponding to the vision of an ideal and theoretical good, is based on the triple principle of cultural, ecological and regional respect for the North. Its objective is a coherent plan, not a laissez-faire philosophy. These 2 developmental nordicities are widely separated ideologically. Happily, this gulf has been somewhat diminished by a series of measures: recognition of certain Amerindian rights (eg, in the JAMES BAY AGREEMENT); development technologies that increasingly respect arctic regions (CONSTRUCTION, resource extraction, TRANSPORTATION); changes in administrative policies; educational programs that are more appropriate to northern cultures; Amerindian political activity. Thanks to an increasingly developed multidisciplinary study of all aspects of the North, a new political economy of the North with a nationalist tone and a new GEOPOLITICS encompassing Canada as a whole are developing. The process of entry of the North into Canadian affairs is far from complete. See RESOURCE MANAGEMENT.

LOUIS-EDMOND HAMELIN

Reading: Louis-Edmond Hamelin, *Nordicité canadienne* (1975, rev 1980, tr *Canadian Nordicity: It's Your North, Too*, 1979).

**Norman, E. Herbert**, diplomat, scholar (b at Karuizawa, Japan 1 Sept 1909; d at Cairo, Egypt 4 Apr 1957); he studied at U of T and Harvard, and, having joined the Dept of External Affairs, was posted to Japan, 1940-42. In 1946 he

returned there with the Allied occupation's Office of Counter Intelligence, and published extensively on Japan. His career was blighted by charges that he had been a Communist during the 1930s. The charges were true enough, but Minister of External Affairs Lester B. PEARSON affirmed his confidence in Norman, kept him in the diplomatic service, and sent him as ambassador to Egypt. When the US Senate again publicized charges that Norman was a security risk, he committed suicide. ROBERT BOTHWELL

**Norman Wells, NWT**, Settlement, pop 420 (1981c), is located on the N bank of the MACKENZIE R. 145 km S of the ARCTIC CIRCLE and 684 air km NW of YELLOWKNIFE. It was the first settlement in the NWT to be established entirely as a result of nonrenewable-resource development. During WWII an oil pipeline was built between Norman Wells and Whitehorse, YT; it was abandoned after the war. Oil and gas fields in the area produce over a million barrels of crude oil per year, and the community is a major supplier of fuel to northerly locations, as well as a transportation centre for air and river traffic. Further oil-field expansion and a pipeline link to the S began in the early 1980s. ANNELIES POOL

Norman Wells, NWT. The pipeline, dredge, trench and work camp are visible (photo by Jim Merriethew).

**Normandy Invasion** On 6 June 1944 the 3rd Canadian Infantry Division and the 2nd Canadian Armoured Brigade were part of the Allied forces which attacked the Normandy coast in Operation *Overlord*. By the end of D-Day, the Canadians had penetrated about 9 km inland. In the following weeks, under highly effective tactical air support, in which Canadians played a considerable role, the Allies thrust deeper inland while fighting the counterattacking German forces. By month's end they were strongly established in Normandy. After the Americans captured the Cherbourg Peninsula (June 26) and prepared to break out from Saint-Lô, FIRST CANADIAN ARMY, commanded by Lt-Gen H.D.G. CREER, was ordered to push SE of Caen to gain ground and wear down the enemy. They aided British forces in threatening a breakout, thereby retaining the German Panzer divisions in the east away from the American front. On July 9, British and Canadian infantry and armour seized Caen after fierce fighting. During July and most of Aug, 2nd Canadian Corps, commanded by Lt-Gen G.G. SIMONDS, attacked the German positions time and again. Falaise was captured Aug 16, and in the final attack on Trun and Chambois, Canadians and Poles joined with American troops to complete the victory. Of the 206 703 casualties suffered by the Allies, Canada lost 18 444. The German Army lost about 371 400. See WORLD WAR II. R.H. ROY

**Noronic**, Great Lakes steamer of the Canada Steamship Lines Ltd, built at Pt Arthur, Ont, in 1913. She was consumed by fire in Toronto at dockside on 17 Sept 1949. There was a tragic delay in summoning the fire department and 118 people died. JAMES MARSH

**Norpak Corporation**, see ELECTRONICS INDUSTRY.

John Norquay, Manitoba's only premier of mixed European and native ancestry (courtesy Provincial Archives of Manitoba).

**Norquay, John**, politician, premier of Manitoba (b near St Andrews, Man 8 May 1841; d at Winnipeg 5 July 1889). One of Red River's most distinguished sons, Norquay successfully moved from the fur trade and the river lot into modern business and politics after Manitoba entered Confederation. His great-grandmother was a native woman and his paternal ancestors were jacks-of-all-trades at fur-company posts. He was one of the best students in Red River schools and was successively a teacher, farmer and fur trader between 1857 and 1870, when he was elected to Manitoba's first legislature. He rose quickly to prominence in the House, was a Cabinet minister (1871-74, 1875-78), and became premier upon the retirement of R.A. DAVIS on the basis of his strong following among "old" (pre-1870) settlers and French-speaking Manitobans.

The Norquay government successfully extended Manitoba's boundaries and secured larger federal subsidies, but it eventually foundered upon Canada's railway policy. Caught between PM John A. MACDONALD's guarantee of a CPR freight monopoly and Manitoban demands for rail competition, Norquay chose to fight Ottawa in 1887 by building a railway to the US. Macdonald intervened and, by an apparent double cross, precipitated a financial scandal and the collapse of the Norquay ministry. Though he briefly led a small opposition to the new GREENWAY government, Norquay's sudden death in 1889 prevented him from restoring his reputation in Canadian public life.

Norquay was widely liked in Manitoba. His name has been kept alive not only because he was the province's only premier of mixed European and native ancestry but because of his amiable disposition and considerable talents.

GERALD FRIESEN

**Norris, Hannah Maria**, Baptist missionary (b at Canso, NS 30 Nov 1842; d at Toronto 14 Sept 1919). Though baptized a Congregationalist as a child, Hannah was raised in a strong Baptist community and eventually received adult baptism in that church. In 1869 Norris determined to go to Burma as a missionary and appealed to the Baptist women of NS to support her plans. On 18 June 1870 in Canso the first Canadian woman's missionary aid society was formed for this purpose. Other locals were set up, and in 1884 the Woman's Baptist Missionary Union of

the Maritime provinces was organized, an example followed elsewhere in Canada and by many other denominations. Norris went to Burma and eventually married the Rev W.F. Armstrong. She became committed to building a school for all nationalities in Rangoon, and travelled widely in search of funds for this project. She remained in Burma until 1919 when she returned to Canada. WENDY L. MITCHINSON

**Norris, Malcolm Frederick**, Métis leader (b at St Albert, Alta 25 May 1900; d at Calgary 5 Dec 1967). Widely recognized as one of this century's most important and charismatic MÉTIS leaders, Norris was born into one of Edmonton's founding families but rejected privilege to fight racial discrimination. A brilliant orator in English and Cree and a consummate Métis politician, he was a key figure in the Association des Métis d'Alberta et des Territoires du Nord Ouest, the Indian Assn of Alberta and the Métis Assn of Saskatchewan. Outspoken on behalf of Indians and Métis, he was active in the CCF and in the Communist Party, promoting reforms for native people. A tireless and militant democrat and protagonist in many battles with government, he warned native leaders to avoid the dependency of government funding, a warning today regarded as prophetic. MURRAY DOBBIN

**Norris, Tobias Crawford**, politician, premier of Manitoba (b at Brampton, UC 5 Sept 1861; d at Toronto 29 Oct 1936). Although his name has been virtually forgotten, Norris was a towering political figure in Manitoba early in the 20th century. Originally a homesteader, he gradually moved into professional auctioneering and was well known across western Canada. Elected an MLA in 1896, Norris led the Liberal Party in Manitoba 1910-26, serving as premier 1915-22. During his term of office his government dealt with wartime conditions and the return to peace. The Norris government has been called "the centre of reform activity in Canada" for its time. It was responsible for TEMPERANCE legislation, female suffrage, compulsory education, workman's compensation and minimum-wage legislation, as well as the establishment of a public-nursing system, rural farm credit, regulation of industrial conditions, and a mother's allowance for widowed dependent mothers. Under Norris, road construction and public-works programs were expanded at the same time that the province was brought out of debt. After his retirement from politics in 1928 he served on the Board of Ry Commissioners until his death. J.M. BUMSTED

**Norse Voyages** In mid-985 or 986 an Icelandic flotilla led by ERIC THE RED set out to colonize SW Greenland. Near summer's end BJARNI HERJOLFFSSON, a trader, belatedly sailed to join them but was blown far off course. He coasted N to the latitude of southern Greenland, then turned E to complete his intended voyage, becoming the first European of certain record to have reached the American mainland. His landfall was probably eastern or northeastern Newfoundland, from which he coasted N at least to the termination of Labrador. The more southerly lands he found were well forested. About the turn of the century Eric's eldest son, LEIF ERICSSON, decided to exploit Bjarni's discovery. Sailing to the region of Bjarni's landfall, he wintered in a protected harbour while his men cut a cargo of vines, valued as fasteners in shipbuilding, and timber. His camp was the genesis of the legendary *Vinland*, which historians have variously located from Florida to Hudson Bay.

About 1004 a colonizing venture consisting of 160 people in 4 ships, with domestic animals, including cattle, sailed from Greenland under Icelander Thorfinnr KARLSEFNI. The flotilla evidently crossed Davis Str at its narrowest point to

Baffin I, then coasted southwards. Landings were made and the regions named according to their nature: *Helluland* ("rocky land") accurately describes the mountainous Baffin I and Labrador coasts S nearly to Nain, whereas *Markland* ("wooded land") correctly describes the balance of the Labrador coast.

The expedition may have been seeking Leif's Vinland but, if so, was unsure of its location. A camp was established at *Straumfiord* (Str of Belle Isle), probably at Epaves Bay on the northern tip of Newfoundland (see L'ANSE AUX MEADOWS) where traces of sod-walled structures believed to be of Norse provenance have been excavated. The expedition wintered there, but in the spring several parties set off to look for Vinland or some comparable settlement site. One, commanded by Thorvaldr Ericsson, reconnoitred W along the N shore of the Gulf of St Lawrence, perhaps as far as Sept-Îles. Most members of the expedition, under Karlsefni, sailed southwards along the W coast of Newfoundland and located a promising settlement site which they called Hop, probably near present-day St Paul's Bay. Here the cattle were put out to pasture and houses were built. Early the following spring the settlement was visited by INUIT. A conflict, for which the Norse were evidently responsible, ensued and several settlers were killed. The remainder returned to Straumfiord. That summer Karlsefni again explored southwards and again met and fought with natives, apparently Indians. Meanwhile Ericsson reconnoitred the Labrador coast N to Lk Melville, where he fought with Inuit and was himself killed. By early autumn, about 1006, the Norse had concluded that they could not maintain a settlement in the new lands and the survivors began departing for Greenland and Iceland.

Documentation of this early period, eg, in the medieval *Greenlanders' Saga* and *Eirik the Red's Saga*, is surprisingly full, but after about 1007 only fragmentary references are to be found. Nevertheless, we know that as late as 1349 Greenlanders were still voyaging to Markland for timber; and the archaeological work of T.E. Lee in Ungava indicates a major Norse presence there, perhaps as late as the mid-14th century. It is unreasonable to believe that the continuity of the Norse voyages and discoveries was ever seriously sundered or that they were unknown to the N European maritime community. The Greenland and Iceland Norse deserve full recognition, not only for having made the first known European exploration of Canada, but for having lit the way for the great age of western exploration which began in the 15th century.

FARLEY MOWAT

Reading: Helge Ingstad, *Westward to Vinland* (1969); Farley Mowat, *Westviking* (1965).

**North**, in strictly geographic terms, refers to the immense hinterland of Canada that lies beyond the narrow strip of the country in which most Canadians live and work, but generally refers to the NORTHWEST TERRITORIES and the YUKON TERRITORY. The North is a varied land, with mighty rivers, forested plains, "great" lakes that extend from the Mackenzie Valley to the edge of the Canadian SHIELD, an inland sea (Hudson Bay), the beaches, bars and islands of the arctic coast and the arctic seas themselves, in winter covered by ice and snow, in summer by floating fields of ice. Immense flocks of birds migrate to the Arctic each summer; other wildlife include whales, walrus, narwhals, seals and caribou — the staple of the native peoples.

Biologists divide the North into 2 great regions, called "biomes," comprising the boreal forest and the TUNDRA. The boreal forest, characterized by spruce trees and MUSKEG, is a broad band of coniferous forest extending across Canada from Newfoundland to Alaska. The tundra,

Polaris Mine, Little Cornwallis Island, NWT. It is natural to think of developing the North and extracting its resources, but large-scale economic development may have serious repercussions for the native population (photo by Karl-Heinz Rauch).

which reaches from the boreal forest northward to the Arctic Ocean and comprises 20% of Canada's landmass, is treeless and is sometimes called "the barrens," although it includes landscapes as varied and beautiful as any in Canada — plains, mountains, hills, valleys, rivers, lakes and sea coasts.

The tundra and the boreal forest meet along the TREELINE, a transitional zone usually many kilometres wide. This biologically important boundary, which separates forest and tundra, also separates the traditional lands of the Indians and the INUIT. The treeline may also be viewed as the southern limit of the Arctic, the boundary between the Arctic and the Subarctic. Arctic or subarctic, however, the region is one of great climatic contrasts. In midsummer it is never dark, but in midwinter the only daylight is a combined sunset and sunrise. Although summer can be pleasantly warm, with temperatures in excess of 20°C, the season is short and the weather often raw and damp. Both rainfall and snowfall are light. Because, in the true Arctic, precipitation is as low as that in the driest parts of the Canadian prairies, the Arctic may be described as semidesert. It is remarkable, therefore, that the land surface in summer is predominantly wet and swampy and dotted with innumerable shallow ponds, fens and water-filled frost cracks. In southern Canada the ground freezes in the winter, but downward from the surface, and thaws completely again in the spring. In the subarctic and arctic regions, frost has penetrated below the maximum depth of summer thaw and a layer of frozen ground called PERMAFROST remains permanently beneath the surface. The seasonally thawed active layer of the soil holds the water, like a sponge, from rain and melting snow, which cannot drain through the frozen ground. The combination of climate and topography in the northern biomes have produced unique plant and animal populations. The species that thrive in the North are tough, in order to survive, but they are also vulnerable. Because of the fragility of this region, it would not be difficult to cause irreparable injury to the environment and to the peoples who depend upon it.

**Peoples of the North** It is not always easy to remember, on a flight over the unbroken boreal forest, the tundra or the sea ice, that the Canadian North has been inhabited for many thousands of years. The populations that have oc-

cupied this great area were never large, but their skills as travellers and hunters made it possible for them to make use of virtually all of the land without altering the environment. Because of extremely slow rates of plant growth and decay, signs of ancient occupation — old house remains, tent rings, fire-cracked rocks — are visible almost everywhere and it is not difficult for archaeologists to find, on or close to the surface, a wealth of artifacts and other evidence revealing the richness, diversity and breadth of aboriginal society.

The Inuit (formerly known as Eskimos) occupy the shores of the Arctic Ocean and of Hudson Bay. Although the Inuit speak closely related dialects of the same language, regionally there are differences among them reflected in technology and social organization that even today complicate anthropological generalizations. The Inuit themselves perceive important differences between their various groups; the Inuvialuit of the Mackenzie Delta see themselves as distinct from the COPPER INUIT, their neighbours to the E and the Copper Inuit — or Qurdlurturmiut — emphasize that they are unlike the NERSILIK, the Aivilim or the IGLOOLIK, who live still farther E. And within each of these broad groups finer divisions and distinctions exist, reflecting different patterns of land use and of changes in dialect and hunting techniques.

The Indians of the Mackenzie Valley are part of the Athapaskan group and regard themselves, notwithstanding dialectical variation in their languages, as "the people," the DENE. The Indians of the Yukon are largely Athapaskan, yet these northern Indians are by no means all the same, for they speak several languages — KUTCHIN (sometimes called Loucheux), NAHANI, TAGISH, HARESKIN, SLAVEY, DOGRIB and CHIPEWYAN.

The native peoples came originally from Asia, crossing the land bridge over the Bering Strait during the last ice age (see BERINGIA; PREHISTORY). The Athapaskan Indians arrived 10 000 to 15 000 years ago, eventually to occupy large tracts of land, including the Mackenzie Valley and the Yukon. The Inuit arrived about 5000 years ago, spreading throughout the Arctic, including all the coastal areas, practically all of the islands of the Arctic Archipelago to the Ungava Peninsula and as far E as the Gulf of St Lawrence and Newfoundland. The Dene were established in the forestlands of northern Canada and the Inuit inhabited the northern rim of the New World at least 5000 years before Martin FROBISHER made his landfall off Baffin Island in 1576 or Samuel HEARNE reached the Arctic coast in 1772.

Although for both the Inuit and the Dene the dog team was the usual means of travel and the

caribou the principal source of food and most important source of winter clothing, each of these peoples had its own way of hunting, of raising children and of regarding the environment and the spiritual powers they believed were integral to their world. Their respective knowledge of the land and of its life constitute distinctive ethnoscientific traditions.

During the past 160 years, the MÉTIS have also been categorized as northern native peoples. The first MÉTIS who moved into the North in the early 19th century settled around Great Slave Lake; they trace their ancestry to the unions between French COUREURS DE BOIS and Indian women in the early days of the fur trade. In the aftermath of the NORTH-WEST REBELLION of 1885, many MÉTIS moved north and settled in the Mackenzie Valley. Other MÉTIS, sometimes called "country-born," are the descendants of unions between Hudson's Bay Company men — mainly of Scottish origin — and Dene women. The children of these unions usually intermarried with the original Dene inhabitants, so close family ties exist between the MÉTIS and the Dene.

**Future of the North** The issues that concern the North today result from the presence of the white man, whose advent was spearheaded by the explorers seeking to extend the fur-trade empire. The explorers were followed by clergy, who were followed by representatives of government. The pattern of historical development in every region of Canada was reflected in the North, with one difference. The opening of the prairies by the construction of the CPR was followed by agricultural settlement, the establishment of many centres of white population and widespread diffusion of European language and culture. In the North, however, where agricultural settlement is out of the question it is nonrenewable resources, eg, gold, silver, lead, zinc, copper and oil and natural gas, that have spurred economic development. These industries do not promote widespread white settlement, but rather "instant" towns, eg, Faro in the Yukon and Pine Point in the NWT, with imported labour forces. A large part of the white population is transient; even government employees are likely to regard their service in the North as a tour of duty limited to a few years. The native people therefore constitute, in the NWT, a majority of permanent residents, and in the Yukon a very substantial minority. These facts bear significantly on the future of the North, for they make possible what was not possible when the West was opened up — the preservation of the great herds of migratory animals, the development of the native economy, and the establishment of political institutions that fully recognize the special place of the native peoples.

The northern economy is mixed. The people living there have traditionally depended on renewable resources, eg, hunting, trapping and fishing for employment. The mining industry largely employs white people, as does the oil and gas industry, although the latter has also sought to employ native people. The federal and the territorial governments are now the largest employers of both white and native people. The North is perceived as Canada's last frontier. It is natural to think of developing it, of subduing the land, and extracting its resources to fuel Canada's industry. Because many people are committed to the view that the economic future of the North depends solely on large-scale industrial development, policies concerning the North have often weakened or destroyed that sector of the economy based on renewable resources and those who earned a living by hunting, trapping and fishing have been regarded as unemployed. These policies have brought serious pressures to bear on the native population, many of whom, if they continue to live on the renewable resources, may experience rel-

ative poverty and suffer the loss of a productive way of life. If they relinquish traditional ways of life, which are considered culturally important and a source of self-respect, then the devaluation of that way of life can have widespread and dismaying consequences.

The Inuit, the Dene and the MÉTIS say the North is their homeland; they do not oppose industrial development in the North; they believe, however, that they are entitled to a measure of control over the pace of such development and a share in the wealth it may create. In their view, these goals will only be achieved if new political institutions that truly reflect the interests of the native peoples are established in the North. This implies a new set of political and economic priorities for northern development. It depends on the recognition of native LAND CLAIMS, for it is through their claims that the native people seek to preserve their languages, their art, their culture, their values — their very identity.

Development of the North need not be defined exclusively in terms of large-scale, capital-intensive technology. The possibilities of the renewable resource sector need not be ignored, eg, the fish and mammal resources of the NWT can provide sufficient protein for a human population in that region 2 to 4 times the present size. Development might also include a greatly expanded program of wildlife management and a carefully regulated harvest, with active involvement of native people. At the same time there is no reason why native people cannot enjoy access to the economy of the dominant society.

The Dene, the Inuit and the MÉTIS are advancing proposals for new political arrangements in the Yukon and the NWT. Whatever the outcome of these proposals, they are evidence of a renewed determination — and a new capacity — on the part of native people in the North to defend what they believe is their right to a future of their own.

Canadians share a mass culture with the US but it is Canada that has a distinct northern geography and special concern for the North (see NORDICITY). Canada's achievements in the development of the North are in many ways unsurpassed, eg, the exploration and mapping of the Arctic by land and sea, the development of fur-collecting posts, the mining industry's discovery of uranium off the shores of Great Bear Lake in the 1930s and its extraction of iron ore from the arctic islands in the 1980s. The Canadian oil and gas industry and its engineers lead the world in the development of technology for the recovery of oil and gas in arctic waters. Progress tends to be equated only with industrial and technological advancement. Ultimately the form that northern development takes — political, social and economic — will reflect the beliefs that Canadians hold about the kind of society they want to build. In the North, however, the questions that lie beneath the surface of our national life cannot be avoided. For many Canadians these questions make the North not simply a geographical area but a state of consciousness.

T.R. BERGER

**North Bay, Ont.** City, pop 51 268 (1981c), inc 1925, located on a northern bay of Lk NIPISSING, at the junction of Hwys 11 and 17, some 360 km N of Toronto and 340 km NW of Ottawa. Traditional "Gateway to the North," the city is administrative seat for the Dist of Nipissing. North Bay lies roughly along the "Nipissing Route" where the FUR TRADE portage of La Vase connected the waters of Trout Lk and the Ottawa and Mattawa rivers with Lk Nipissing, the French R and Georgian Bay. Its development awaited the slow progression of settlement up the Ottawa Valley and from southern Ontario which was initiated by the arrival of the CPR (1882). Later rail connections were made to Toronto (1886) and to the resource areas north-

ward (1904). Town status was achieved in 1891, and by 1914 North Bay was a regional supply centre and key rail point. It did not "boom" in the manner of many northern centres, but it also avoided the "bust" cycle so intimately associated with such resource-based growth. The city's geographically advantageous position has aided a variety of economic endeavours. It remains a major fur centre, and its wild fur auctions are among the largest in the world. Wood and wood products remain important. Recently, a variety of processing and general manufactures have supplemented traditional industries. North Bay also benefits from income generated by a military base and, more so, from an important tourist industry focused on scenic Lk Nipissing and the "Near North" regions. North Bay's population is largely of British origin (about 60%) with a strong French Canadian presence (about 25%) and notable elements of Dutch, Italian, Scandinavian and German stock — all enjoying the convenience of a prosperous urban life with proximity to the "Near North."

PETER KRATS

Reading: W.K.P. Kennedy, *North Bay: Past, Present Prospective* (1961).

**North Cape**, also called North Pt, is the northern extremity of PEI, dividing NORTHUMBERLAND STR from the Gulf of St Lawrence proper. From the shoreline a low cliff of PEI's characteristic red sandstone leads to shallow water, with irregular reefs extending N and E to North Point Reef 8 km offshore. North Point Light, beamed from a 19 m white octagonal tower, and a light and whistle buoy 2.8 km N of the cape are important aids to navigation. Principal occupations are fishing and agriculture. Silver fox farms were also common here until the demise of the industry in the late 1930s.

P.C. SMITH

**North Pole** Earth's northernmost geographic point, located at the northern end of the Earth's axis. The pole lies in the Arctic Ocean more than 7200 km N of ELLESMERE ISLAND, at a point where the Arctic Ocean is 4087 m deep and usually covered with drifting pack ice. The pole experiences 6 months of complete sunlight and 6 months of total darkness each year; from it, all directions are south. Because the Earth's surface areas near the N and S poles receive the sun's rays at the most slanted angle, they absorb the least heat. Centrifugal force causes Earth to bulge outwards at the equator; hence, it is slightly flattened at the poles. However, during the International Geophysical Year (1957-58) it was found that Earth is very slightly pear shaped, with the North Pole at the smaller end. This bulge (about 15 m high) covers millions of square kilometres around the pole.

The North Pole did not become a goal of ARCTIC EXPLORATION until fairly late; the few early expeditions that tried to reach it were looking for a polar route to the East rather than for the pole itself. Sir Edward PARRY left Spitzbergen to try to reach the pole in 1827 and attained 82°45'; further expeditions, American and British, took place in the 1860s and 1870s. It is widely accepted today that the pole was first reached by the American explorer Robert E. Peary, who started from Ellesmere I on 1 Mar 1909. With Peary on his final dash were his dog driver Matthew Henson and 4 Inuit. It is claimed that they arrived at the pole on Apr 6 and remained there 30 hours. A competing claim was made by F.A. Cook, a former traveller with Peary, who said he had reached the pole on 21 Apr 1908 and had remained there 2 days. The controversy still con-

tinues, but Peary's claim seems the more valid and has been accepted by the US Congress and geographical institutions in many countries. In 1926 Richard E. Byrd and Floyd Bennett made the first airplane flight over the pole; in the same year, it was reached by dirigible by the international team of Roald AMUNDSEN, Lincoln Ellsworth and Umberto Nobile. The pole was visited by the US nuclear submarine *Nautilus* in 1958.

Since 1907 various Canadians have invoked what is known as the "sector principle" as a possible legal basis to a claim for sovereignty in the polar region. By this claim Canada would have jurisdiction over a wedge-shaped segment between the line of longitude 60° W of Greenwich (N from a point on the meridian that is near Ellesmere I) and the meridian 141° W of Greenwich (forming the border between the YT and Alaska); these meridians converge (as do all meridians of the Northern Hemisphere) at the North Pole. The theory has not received general acceptance as a legal basis for a claim. See GEOMAGNETIC POLE.

**North-South Institute**, a nonprofit corporation est (1976) to undertake professional research on relations between industrialized and developing countries. The institute organizes seminars and conferences and publishes reports on research projects, eg, the effect of Canada's trade and industrial policies on the Third World. In 1980 the institute began an independent evaluation of the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY. The institute has received major funding from the Donner Canadian Foundation, the International Development Research Centre and CIDA. Headquartered in Ottawa, it is governed by a board of directors.

GREGORY WIRICK

**North Vancouver, BC**, City (pop 33 952, 1981c) and Dist (pop 65 367), is located in southwestern BC, adjacent to the city of VANCOUVER. Situated on the N shore of Burrard Inlet, N Vancouver extends from the Capilano R on the W to beyond Deep Cove on the E. The north shore mountains — such as Crown, Grouse, Seymour, Hollyburn and, highest and most famous, the Lions — form a scenic backdrop. The city of Vancouver is surrounded by the Dist of North Vancouver (area 17 819 ha) except at the waterfront. Elevations in the area range from sea level to 1400 m. The district (inc 1891) is governed by a mayor and 6 aldermen, as is the city (inc 1907), which is centered on Lonsdale Avenue.

**History** The rich forests on the N shore of Burrard Inlet first attracted settlers to the area. In 1862 T.W. Graham and Co acquired a 194 ha timber stand in what is now North Vancouver, and timber was soon shipped from the quickly erected Pioneer Mills. A small waterfront mill town developed into the largest settlement on the inlet. An American, Sewell P. Moody, bought Pioneer Mills in 1872 and gave his name to the settlement of Moodyville. In 1886 the N shore became North Vancouver after Vancouver was incorporated. The Second Narrows Bridge, completed 1925, provided a fixed link with Vancouver; Lion's Gate Bridge (1938) provided a second link.

**Economy** North Vancouver is an important shipping port for lumber, ore and grain, and has numerous manufacturing establishments and shipyards — the RCMP schooner ST ROCH was built here 1928. The Burrard Dry Dock Co is one of the largest shipyards in Canada. The extension of the Pacific Great Eastern Ry (now BC Ry) from Squamish in the 1950s increased the city's importance as a transshipment point. Tourists are attracted by the facilities for fishing, sailing, skiing and mountain climbing in the area's 75

parks. In Capilano Canyon Park, the famous Capilano Suspension Bridge, 70 m above the river, stretches 137 m across the canyon. Cleve-land Dam, north of the park, releases most of the water for Greater Vancouver consumption from Capilano Lk. In the eastern part of the Dist is Mt Seymour Provincial Park.

**Cityscape** North Vancouver is a popular residential and tourist area. Attractions include the park and Tilford Gardens, the Grouse Mt Sky-ride, the Capilano Salmon Hatchery, Capilano College and many museums and art galleries.

ALAN F.J. ARTIBISE

**North West Company**, a major force in the FUR TRADE from the 1780s to 1821. Managed primarily by Highland scots who migrated to Montréal after 1760, or came as LOYALISTS escaping the American Revolution, it also drew heavily on Canadian labour and experience. The name first described Montréal traders who in 1776 pooled resources to reduce competition among themselves and to resist inland advances of the HUDSON'S BAY COMPANY. In 1779 a new temporary organization took the name. Its 16 shares were held by 9 partnerships including business leaders SIMON MCTAVISH, Isaac Todd and James McGill, and several experienced winterers in the Indian country. A 1780 reorganization joined MCTAVISH, the FROBISHER brothers, the MCGILLS and the ELLICES, with PETER POND as their agent in the Athabasca country.

Pond's inland encounter with opposition trader Jean-Etienne Waddens and the latter's murder in Mar 1782, along with increased American and HBC competition, clarified the need for a more unified, formal and permanent organization. In the winter of 1783-84, the NWC therefore became an enduring multiple partnership controlled by the Frobishers and Simon MCTAVISH, with annual trade valued at about £100 000. A powerful rival remained, however. Gregory, McLeod and Co backed John Ross and other traders not included in the NWC, and intense rivalry ensued 1784-87. Pond was again linked with murder — that of Ross in Athabasca. Coalition was again the answer, and in mid-1787 the NOR'WESTERS and Gregory, McLeod amalgamated. Dominated by the Montréal firm of MCTAVISH, Frobisher, and Co, dynamic entrepreneurs thus came together — men such as the MCGILLIVRAYS and, from the ranks of their former rivals, Roderick MCKENZIE and Alexander MACKENZIE. While MCTAVISH and Frobisher handled Montréal affairs, Alexander Mackenzie led inland expansion. The Athabasca trade was reorganized with a new base, Ft Chipewyan on

Lk Athabasca. A far-flung system of canoe brigades, provisioned by PEMMICAN from the plains, furnished transport and brought out up to 20 000 MADE BEAVER annually. It also gave Mackenzie the support needed to explore the Mackenzie R to its mouth in 1789.

During 1790-91, MCTAVISH attempted unsuccessfully to have Britain end the HBC monopoly. Later efforts to lease transit rights from the HBC through its depots on Hudson Bay were rebuffed as well. The only remaining option was to intensify direct rivalry with the "English," who were extending their own network of inland posts. Through the 1790s the Nor'Westers prevailed. Their control of over two-thirds of the Canadian fur trade by 1795 was complemented by Mackenzie's reaching the Pacific overland in July 1793. Potential rivals in Montréal were muted by a 1792 agreement to co-operate.

In 1794 JAY'S TREATY settled the boundary between US and British territory, challenging the Montréalers' access to Detroit, Lk Michigan, the depot of Grand Portage on Lk Superior and the SW trade beyond. Reorganization in 1795 accommodated Montréal interests who, displaced from the south, sought a place in the northern trade. But NWC winterers, notably Alexander Mackenzie, were aggrieved at their standing in the company. In 1797, Forsyth, Richardson, and Co, which had remained outside the 1795 agreement, began to back the winterers, and in 1798 formed the New North West or XY COMPANY. Joined by Alexander Mackenzie in 1800 (after his NWC commitment ended), the XY Co opposed the NWC from the Great Lakes to Athabasca. Simon MCTAVISH's death, however, enabled reconciliation and the merger of the firms in Nov 1804.

Meanwhile, NWC-HBC confrontations increased. NWC acquisition of Québec's King's Posts extended the company's activities as far as Lk Mistassini, inland from Hudson Bay. During 1803-06, the Nor'Westers maintained a base on James Bay, and although this enterprise proved unprofitable, rivalry intensified elsewhere. In EXPLORATION, the NWC kept the upper hand, with Duncan MCGILLIVRAY, David THOMPSON and Simon FRASER crossing the Rocky Mts and the latter 2 reaching the Pacific. When Thompson reached the Columbia R mouth in July 1811, he encountered a new post which had been erected by the American John Jacob ASTOR's PACIFIC FUR COMPANY. Isolated from its source of support by the WAR OF 1812, Astoria was sold to the Nor'Westers in Oct 1813. The fort was returned to the Americans by the TREATY OF GHENT. Two new NWC western trade districts proved profitable for some years, but hopes to develop a China trade and a liaison with the EAST INDIA COMPANY bore little fruit.

One factor limiting such developments was a deteriorating situation east of the Rockies. The HBC posed trade challenges and, with the Earl of SELKIRK, was planning an agricultural colony in an area pivotal to the Nor'Westers' transportation and provisioning networks. NWC attempts to block the plan by buying up HBC stock in London and by discouraging prospective colonists in Scotland failed. The stage was thus set for a series of bitter and costly clashes at RED RIVER COLONY, Ft William and elsewhere. The SEVEN OAKS INCIDENT, 19 June 1816, was the worst event in a conflict neither side could win. In 1815-19, repeated clashes and seizures of men and goods in Athabasca exacerbated bad feeling. In June 1819, 7 NWC partners and numerous men were seized by a HBC force under William Williams, the new governor in chief of RUPERT'S LAND, at the Grand Rapids of the Saskatchewan R. Both the prestige of the Nor'Westers and their business that year were thus impaired, despite successes in impeding the inland activities of HBC officers John Clarke and Colin Robertson.

Armorial bearings of the North West Company (courtesy Picture Division/Public Archives of Canada).

By 1820, strong forces were building towards a resolution of the conflict. NWC partners, concerned about their future, varied in their support for William McGillivray's aggressive measures against the HBC. Splits between the wintering partners and the Montréal agents deepened. Their partnership agreement would expire in 1821, and clearly its terms would need radical revision. Britain was drawn into the broader NWC-HBC struggle, as each company lobbied for official support. The COLONIAL OFFICE wished the restoration of peace and a settlement of the serious territorial and legal issues which reached beyond the conflict and were aggravated by it. In 1821 a parliamentary Act granted exclusive trade to the HBC and to William and Simon McGillivray and Edward Ellice of the NWC, in an effort to placate all parties by devising coalition, not amalgamation. A Deed Poll designated 53 field officers, 32 NWC and 21 HBC, as shareholding chief factors and chief traders, under the charge of HBC governors William Williams and George SIMPSON, the latter a newcomer. The name, charter and privileges of the old HBC provided a stable foundation for the new firm, while the Nor'Westers' skills and experience contributed a scope and dynamism that served the company well. JENNIFER S.H. BROWN

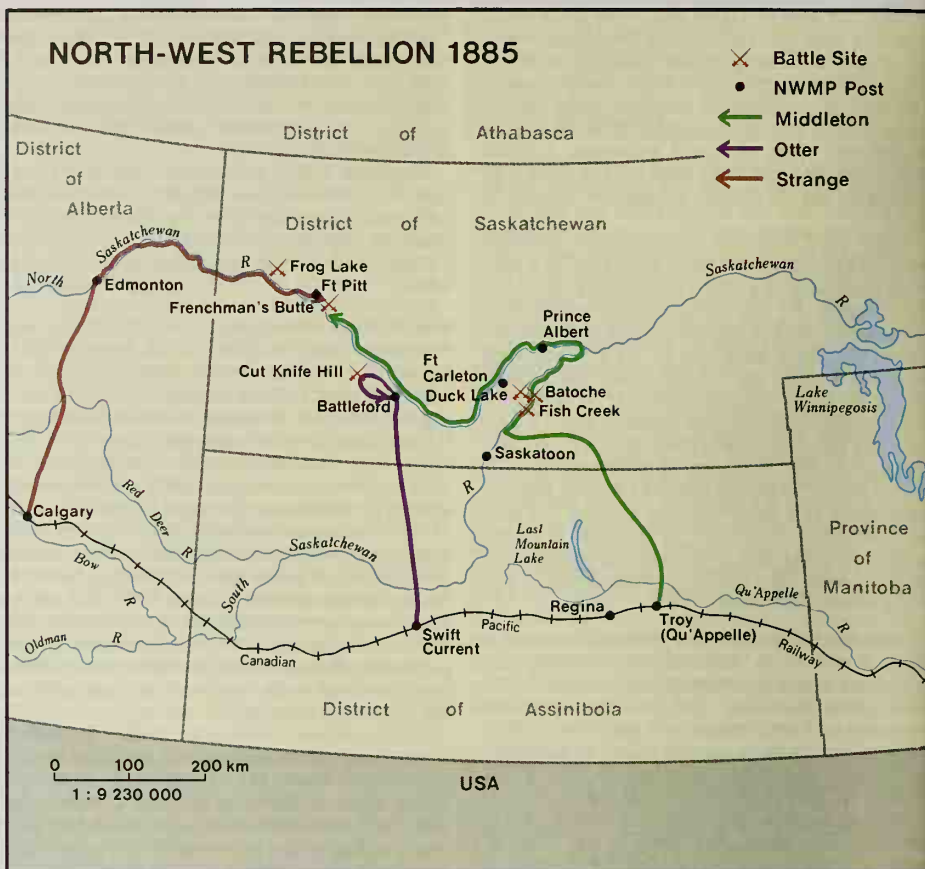

*Reading:* Jennifer S.H. Brown, *Strangers in Blood* (1980); M.W. Campbell, *The North West Company* (1957); E.E. Rich, *The Fur Trade and the Northwest to 1857* (1967); W. Stewart Wallace, ed, *Documents Relating to the North West Company* (1934).

**North-West Mounted Police**, a paramilitary police force est Aug 1873 to maintain law and order, and to be a visible symbol of Canadian sovereignty, in the newly acquired North-West Territories (including present-day Alberta and Saskatchewan). The NWMP helped Indians make the transition to INDIAN RESERVES after treaties were signed and assisted incoming settlers. "Royal" was added to its name in 1904, and in 1919 the RNWMP merged with the Dominion Police to form the ROYAL CANADIAN MOUNTED POLICE.

**North-West Rebellion** began 26 Mar 1885 at DUCK LAKE, NWT (now in Saskatchewan), with a skirmish between MÉTIS and the NORTH-WEST MOUNTED POLICE. There had long been unrest in the North-West, arising from the federal government's indifference to the grievances of the population since the RED RIVER REBELLION. Of greatest concern was recognition of the legal rights to land occupied for up to 15 years but not yet surveyed. Petitions requesting redress of grievances had been presented to Ottawa as early as 1878. When the discontented voices went unheeded, many people spoke of violence. The Métis called Louis RIEL back from exile in Montana in June 1884. As tensions mounted during the severe winter of 1885, the possibility of a peaceful settlement waned; after Duck Lake, negotiation was impossible.

The Canadian government reacted with as much speed as possible, considering that the CPR N of Lk Superior was not completed. CPR

The governor general's bodyguard at Humboldt [Sask], 1885 (courtesy Public Archives of Canada/C-751).

manager William VAN HORNE quickly arranged for Canadian troops to be transported across the gaps, enabling them to reach Qu'Appelle by Apr 10. Indians under BIG BEAR had already killed or captured some whites and Métis at Frog Lake on Apr 2. Maj-Gen Frederick MIDDLETON, commander of the Canadian militia, intended to send a 3-pronged attack from the CPR line N towards the settlements. Maj-Gen T.B. Strange was dispatched to Calgary, and was to progress N towards Edmonton. Lt-Col William OTTER was to move N from Swift Current towards Battleford, where NWMP officers warned of the threat the area's Cree presented to the civilian population. Middleton himself was to move N from Qu'Appelle towards Batoche. On Apr 24 at FISH CREEK, the Métis and Middleton's forces fought an indecisive battle, and on May 2 at Cut Knife Hill, Otter withdrew in the face of stiff resistance from POUNDMAKER's Cree. Only at BATOCHE, May 9-12, were government forces able to win decisively; this battle broke Métis resistance. Riel was taken into custody May 15, and Métis leader Gabriel DUMONT escaped to the US. Big Bear remained at large until July 2, after encountering and retreating from government forces on May 28 at Frenchman's Butte. Most of the Indian and Métis leaders were imprisoned and were later granted amnesty. Riel was hanged in Regina on 16 Nov 1885.

The long-term strategy of the Métis and Indians who joined Riel had not initially included military resistance. Riel hoped to win concessions from the Canadian government through negotiation, essentially the same strategy that he had used successfully during the 1869-70 Red River Rebellion. Dumont disagreed, believing that the Métis and Indians could successfully wage a guerrilla campaign against the more cumbersome columns of the advancing North-West Field Force and Canadian militia. Historians have suggested that other settlers in the North-West might have joined the Métis if Dumont had been allowed to exploit the early

victories. However, few whites were willing to support the use of violence.

The North-West Rebellion cost the Canadian government some \$5 million; 38 government troops and 72 Métis and Indians were dead. Riel and 11 Indians were hanged. Both Big Bear and Poundmaker were sentenced to 3 years in prison. The rebellion focused national attention on western grievances, and some concessions were subsequently granted to the white population. Its most significant effect, however, was that it caused increased strain between English and French Canada.

WALTER HILDEBRANDT  
*Reading:* R.C. Macleod and Bob Beal, *Prairie Fire* (1984); Desmond Morton, *The Last War Drum* (1972); G.F.G. Stanley, *The Birth of Western Canada* (1936).

**North-West Schools Question**, a conflict between church and state for control of education in the North-West Territories (now Saskatchewan and Alberta). In 1875 the federal NORTH-WEST TERRITORIES ACT introduced the principle of SEPARATE SCHOOLS for Protestant (mostly anglophone) and Roman Catholic (mostly francophone) religious minorities in the region. In 1884 the first local school legislation created 2 denominational school systems under one Board of Education with autonomous Protestant and Catholic sections. As the Protestant majority grew, legislative and administrative measures by 1892 had transformed denominational schools into a system of state-controlled "national" or public schools, with a few separate schools in which the religious influence became minimal. In 1894 Catholic appeals to the federal government for more control over education failed.

The issue was revived in 1904-05 during negotiations for provincial autonomy for Alberta and Saskatchewan. Early in 1905, amidst national controversy, Minister of the Interior Clifford SIFTON resigned in protest against a vague school clause in the AUTONOMY BILLS. Deep feelings, especially in Ontario and Québec, severely tested Canadian unity and threatened

to split the Liberal Party. A compromise clause proposed by Sifton after his resignation was accepted by PM Laurier to avoid the impending split; the clause, which became part of the new provinces' constitutions, preserved the educational conditions of 1892 as expressed in the territorial school law of 1901. With the bishop of St Albert, Emile Legal, unwilling to follow his metropolitan, Adélard Langevin of St-Boniface, into opposition, and with the Liberals in firm control of the first elections in the new provinces, the question quickly disappeared as a national issue. *See also* MANITOBA SCHOOLS QUESTION; NEW BRUNSWICK SCHOOL QUESTION; ONTARIO SCHOOLS QUESTION; SEPARATE SCHOOL. M.R. LUPUL

**North-West Territories Act** The original Act of 1875 established permanent institutions of government for the Territories, as well as amending and consolidating the diverse legislation pertaining to the region. Under the Temporary Government Act of 1869, renewed annually, the region formerly known as "Rupert's Land and the North-Western Territory," acquired from the HUDSON'S BAY COMPANY in 1870, was governed by an appointed lieutenant-governor and council. The 1875 Act provided for the gradual addition of elected members to the council as the increase in the population warranted it; when there were 21 elected members, the appointive members would be dropped. The Act also covered real estate, wills, rights of married women, the administration of justice and the prohibition of intoxicants. Perhaps most controversial was section 11, intended to establish and guarantee Protestant and Roman Catholic schools; debate over the resulting NORTH-WEST SCHOOLS QUESTION climaxed during passage of the AUTONOMY BILLS of 1905.

By amendment in 1877 French and English were given equal status in the government and courts of the region. In 1891 the Territorial legislature was empowered to "regulate its proceedings" and promptly discarded the official use of French.

In 1888 the federal government established a legislative assembly of 25, elective except for 3 nonvoting legal advisers. In 1891 the assembly was made wholly elective, and in 1897 a full Cabinet government was granted. Although eventually given the forms and many of the responsibilities of provincial government, the local government was never given control of public lands and natural resources, or a wide tax base; nor was adequate compensation provided by Ottawa to meet the demands for local services. This fueled the autonomy movement leading to provincial status for Alberta and Saskatchewan in 1905.

In 1912 the Act (now the Northwest Territories Act) was amended to take into account the region's more restricted size and population, and government by appointed officials was restored. In 1951 elective members were added to the council, and by 1966 they constituted a majority of the council. That year 2 federal constituencies were created. The following year the commissioner and Territorial administration were moved from Ottawa to Yellowknife, and by 1970 the government once again had powers superficially similar to those of provincial governments. In 1975 the assembly was made fully elective, and it chose some of its members to sit on the executive council; but the commissioner and 2 appointed assistants who also sat on the council continued to have great influence on local government policy, and were ultimately responsible to Ottawa, not to the elected assembly. DAVID J. HALL

**Northcott, Ronald Charles**, curler (b at Innisfail, Alta 31 Dec 1935). Northcott began curling in Vulcan, Alta, in 1950 and was vice-skip on the 1953 Alberta High School champions. He joined the Calgary Curling Club in 1958, and

between 1961 and 1978 competed in 9 Alberta championships. Northcott represented Alberta at 6 Canadian championships (Briers) and won Canadian and world championships in 1966, 1968 and 1969; he was also all-star Brier skip in each of those years. Voted Calgary's athlete of the year in 1966 and 1968, he received the Order of Canada in 1976. RAY KINGSMITH

**Northern Dancer**, racehorse (b at Oshawa, Ont 27 May 1961). Bred at E.P. TAYLOR's National Stud Farm, Northern Dancer was unsold as a yearling, but as a 2-year-old won the Remsen Stakes, NY, the Flamingo and Florida Derbies, and the Summer Stakes, Coronation Futurity and Carleton Stakes in Canada. Northern Dancer was the first Canadian-bred horse to win the Kentucky Derby (1964) and went on to win the Preakness, finish third in the Belmont and win the QUEEN'S PLATE. Known for his stamina, Northern Dancer was also very fast — only Secretariat has bettered his Kentucky Derby record of 2 minutes flat for the 1 1/4 mile course. Retired to stud, Northern Dancer has become the leading sire of stakes winners in this century, including Epsom Derby winners NJUISKY and The Minstrel. JAMES MARSH

**Northern Georgia Strait Coast Salish** At the time of European contact in the 1790s, the people inhabiting the coast of BC in the northern Strait of GEORGIA area were the Pentlatch, the Comox and the Sechelt. Their languages are identified by these same names and belong to the Coast Salish division of the Salishan language family. In the early 1800s the Pentlatch, who lived along the E coast of Vancouver I from the vicinity of Kye Bay in the N to the approximate area of Parksville in the S suffered greatly from disease and from Indian raiding parties from the W coast of the island. Gradually the Pentlatch became absorbed by their northern neighbours, the Comox. The last speaker of the Pentlatch language died in 1940 and today no one is identified as Pentlatch.

The Comox of Vancouver I were also the victims of tribal hostilities in the early 1800s. Their northern neighbours, the Lekwiltok, began to expand vigorously southward, displacing the Island Comox from their territory that had previously extended from around Salmon R to Kye Bay (*see* KWAKWILTOK). The remaining Island Comox descendants live on the Comox Indian Reserve, with a population of about 100. Through intermarriage, the people living at Comox adopted both the ceremonials and the language (called Kwakwaka) of the Lekwiltok. The Island Comox dialect of the Comox language is almost completely lost.

The Comox-speaking Coast Salish people along the eastern shore of the northern Georgia Strait fared better. Sometimes referred to as Mainland Comox, they are composed of the Homalco, Klahoose and Sliammon, living in the area from Bute Inlet in the N to Stillwater in the S. Formerly the Homalco and Klahoose occupied the protected waters of Bute and Toba inlets, respectively, as well as the adjacent islands. By the late 1800s, when INDIAN RESERVES were established, their main villages were located at Church House near the entrance to Bute Inlet, the present home of about 10 Homalco, and at Squirrel Cove on Cortes I, the home of about 30 Klahoose. Since most Homalco and Klahoose people, along with the Sliammon, live on the reserve at the mouth of Sliammon Cr (N of Powell River), formerly a traditional Sliammon village and now a modern village of about 450, the term Sliammon is commonly used to designate all 3 of these groups. The Sechelt Indians, who traditionally occupied Jervis Inlet, both sides of the Sechelt Pen and the adjacent islands, number 500 and live on reserves adjacent to the town of Sechelt.

Like other northwest coast Indians, the north-

ern Georgia Strait Coast Salish had access to a wealth of natural resources, including the 5 species of PACIFIC SALMON, rockfish, seals, shellfish, deer, mountain goats, bear and migratory birds. Vegetable foods provided the necessary complement to fish and meat. An inventory of a traditional HOUSE would indicate that the giant western red cedar was the most versatile of plant materials. Its strong, easily split wood was used for making house planks, dugout CANOES, boxes, barbecuing sticks, drying racks and bowls. Its inner bark was pounded until soft and used for mats, ropes, clothing and ceremonial costumes (*see* NORTHWEST COAST INDIAN ART). The art of cedar-root basketry is still practised by some women. *See also* NATIVE PEOPLE: NORTHWEST COAST and general articles under NATIVE PEOPLE.

**Northern Lights**, or aurora borealis, dynamic displays of multicoloured luminosity appearing in the day or night sky in high latitudes in the Northern Hemisphere. At any instant of time, the auroras are arrayed along a band (the auroral oval) with the North GEOMAGNETIC POLE near its centre. The band is normally about 500-1000 km wide, its average position in Canada being over Yellowknife, NWT, to the West, and Grande rivière de la Baleine, Qué, to the East. During intense activity the oval may expand as far S as Miami, Florida (Aug 1972), and beyond. The luminosity can fluctuate violently, particularly near local midnight when explosive bursts of activity called substorms are triggered. Auroras originate in the ionosphere, the upper atmosphere, 100-300 km above the Earth's surface. They are caused primarily by energized electrons (1-20 kilo-electron volts) which are accelerated towards the ionosphere from a region 5000-10 000 km above the Earth's surface. These energetic electrons bombard the upper atmosphere and "excite" atmospheric constituent particles (primarily oxygen and nitrogen). When these particles return to less excited states, they give off light. Green or red light comes from excited atomic oxygen; purple light from excited molecular nitrogen.

Current theory states that the energy driving auroras is obtained from the solar wind, a gas composed primarily of protons and electrons, blowing away from the SUN at supersonic velocities of 300-1000 km/s (*see* PHYSICS). The solar magnetic field is embedded in the gas and is pulled by the wind deep into interplanetary space. The wind interacts with the Earth's magnetic field, distorting it to form the magnetosphere (ie, the comet-shaped cavity, blunt end towards the sun, carved in the interplanetary medium by the Earth's magnetic field). The magnetosphere is broken at each pole by a cleft region. Some solar-wind plasma, slowed and heated by interaction with the magnetosphere, enters the cleft region and penetrates directly to the ionosphere causing the dayside auroras. However, most of the particles leaking into the magnetosphere are trapped behind the Earth, and through processes analogous to convection end up flowing towards the Earth. Some of these particles are accelerated into the nightside ionosphere causing brilliant auroras. The amount of energy leaking into the magnetosphere is regulated predominantly by the strength of the interplanetary magnetic field and its direction in relation to the Earth's magnetic field lines at the outer boundary of the magnetosphere. Activity also varies with sunspot and solar-flare occurrence. Parallel phenomena in the Southern Hemisphere are known as the aurora australis.

Auroras are the visible portion of the dissipation of the energy which has entered the magnetosphere from the solar wind. This energy is also dissipated through ohmic heating

(ie, heat generated by electric current flow through a resistor). This process involves giant currents, sometimes in excess of one million amperes, which flow through the resistive ionosphere in the region of luminous auroras. These currents create magnetic fields which can make compass needles show direction incorrectly and which can cause surges in power lines resulting in electric-power outages.

The northern lights have haunted the imaginations of spectators for centuries. To the Inuit, the *arsamiit* are the sky people enjoying a ball game. Some Indians view the lights as ancestral spirits dancing before the Great Spirit. CEN-TAUR (Cleft Energetics, Transport and Ultra-violet Radiation) is a joint Canada-US research project studying auroras and related phenomena. GORDON ROSTOKER

**Northern Railway of Canada** The railway was designed to link the 3 lakes for which it was originally named — the Ontario, Simcoe and Huron Railway. It opened May 1853 when the locomotive *Toronto* (made in Toronto) hauled the first steam train in present-day Ontario from Toronto to Mitchell's Corners (present-day Aurora). The line was soon extended to Bradford and Allandale and by 1855 the entire stretch to COLLINGWOOD was completed, including a branch to Lk SIMCOE. The railway made Collingwood a prosperous transshipment point from the mid-western US and tapped the rich timber reserves of Simcoe County. It was largely responsible for the hegemony TORONTO managed to establish over the northern hinterland, but was a financial failure itself. On the verge of bankruptcy, it was reorganized 1858 as the Northern Railway of Canada. Branches were built from Collingwood to Meaford (1872), Allandale to Gravenhurst (1875), and eventually to Huntsville and North Bay. The railway merged with the Hamilton and North Western Ry (1879) and was taken over by the GRAND TRUNK RAILWAY in 1888, eventually becoming part of the CN system. JAMES MARSH

**Northern Review**, literary magazine appearing irregularly, 1945-56, edited by John SUTHERLAND. It represented the end of the era when Montréal was the leading centre of modern Canadian poetry in English. It arose from the merger of the earlier rivals, *Preview* and *First Statement*. *Preview* was founded in Mar 1942 by a group including Patrick Anderson, the journal's driving spirit, and F.R. SCOTT; later P.K. PAGE and A.M. KLEIN joined the editorial group. *Preview's* orientation was cosmopolitan; its members looked largely towards the English poets of the 1930s for inspiration. *First Statement* was founded in Sept 1942 by Sutherland, who was soon joined by Irving LAYTON and Louis DUDEK. Its writers attacked the "colonialism" of *Preview* and advocated a poetry related to local conditions and ways of speech; this meant that in practice they looked to American models, notably Ezra Pound and William Carlos Williams. *First Statement* Press also published poetry chapbooks, and when the rival magazines submerged their differences and united in *Northern Review*, the press continued, publishing books by Layton, Anderson, Anne WILKINSON and Raymond SOUSTER. The group that originally embarked on *Northern Review* included Scott, Klein, Layton, Anderson, Page, A.J.M. SMITH, Dorothy LIVESAY and Ralph Gustafson, but in 1947 several members of the board resigned over a controversial review Sutherland published without consulting his associates. In 1948 Layton left, and the review became largely an expression of Sutherland's increasingly conservative attitude, though it still attracted good writers, including Mavis GALLANT, Brian MOORE, Marshall MCLUHAN and George WOODCOCK. It came to an end with Sutherland's death in 1956. GEORGE WOODCOCK

**Northern Telecom Limited**, see ELECTRONICS INDUSTRY.

**Northumberland Strait** is a tidal water body between PEI and the coast of eastern NB and northern NS, extending 225 km WNW to ESE from Cap-Lumière, NB, to Cape George, NS, with a width of 4-17 km. It is 68 m deep at its eastern end but less than 20 m over a large central area. Preglacial and glacial valleys eroded into red sandstone and siltstone lead from both ends into the floor of the Gulf of ST LAWRENCE. The retreat of glacial ice from the strait and surrounding area about 13 000 years ago was followed by flooding by the sea. Soon after, isostatic uplift excluded the sea from the central area, which became an isthmus joining opposite coasts. By 5000 years ago, the rising sea level had flooded this link, establishing the present strait, which has been slowly deepening. A generally shallow depth causes strong tidal currents, water turbulence and a high concentration of suspended red silt and clay, which led early French colonists to name the strait "la mer rouge." Shallowness is also largely responsible for the warmest summer water temperature in eastern Canada (July 16°C) and a consequent concentration of summer tourist activity, as well as a prolific shellfish and lobster fishery. Equable climate and extensive tillable soils form the basis for mixed agriculture and vegetable growing (particularly potatoes) on both coasts. The strait is crossed by 2 ferries — Cape Tormentine, NB, to Borden, PEI, and Caribou, NS, to Wood I, PEI.

The strait's coastal areas were settled by ACADIAN French from the early 16th century, and by English, LOYALISTS and SCOTS in the 18th century. The principal coastal towns are CHARLOTTETOWN and SUMMERSIDE, PEI; PICTOU, NS; and SHEDIAC and Richibucto, NB. The strait was named for HMS *Northumberland*, flagship of Admiral Colville. I.A. BROOKES

**Northwest Coast**, the name given by 18th-century navigators and traders to the great arc of Pacific coast and offshore islands stretching from present-day northern California to an ill-defined point along the Alaska coast at Prince William Sound or even Cook Inlet. Modern anthropologists identify the native culture of the NW Coast as that, within rough limits, between Yakutat Bay, SE Alaska, and Trinidad Bay or Cape Mendocino, Calif. Along this narrow coastal belt the Indians developed high levels of civilization based upon the sea's plentiful resources. Warmed by the N Pacific Current and deluged along most of its length by heavy annual precipitation, the NW Coast produced dense coniferous forests and abundant vegetation.

The NW Coast was one of the last temperate ocean frontiers to be explored and settled by Europeans. Despite the attractions of the N Pacific as the western end of a possible NORTHWEST PASSAGE, the region remained isolated. Distance, the limitations of shipbuilding technology and Spain's jealous control over most of the N and S American littoral prevented intrusion by all but the most hardy. Apocryphal voyages by Lorenzo Ferrer Maldonado (1588), Juan de FUCA (1592) and Bartholomew de Fonte (1640) confused cartographers, who prepared charts bearing no resemblance to reality. In 1579 Francis DRAKE may have reached 48° N lat before returning southward to the approximate latitude of present-day San Francisco and then crossing the Pacific, but his exact northernmost location remains a matter of conjecture. In 1602 Sebastian Vizcaino discovered Monterey Bay for Spain and sailed to about 43° N lat. Until the 18th century, however, Spain was occupied with its earlier conquests and remained content to claim rather than to explore the coastline. Although one Spanish transpacific galleon crashed at present-day Nehalem Bay, Ore, in the latter 17th cen-

tury, none of its crew survived to carry word back to Mexico.

During the 18th century interest grew in the unexplored N Pacific. Russian expansion into Siberia resulted in expeditions by Vitus BERING to Bering Str (1728) and in 1741 by Bering and Aleksei Chirikov to the NW Coast around 55° N lat. Rumours of this activity impelled the Spanish Crown to order voyages northwards from Mexico. In 1774 Juan Pérez Hernandez reached about 55° N. He touched at the Queen Charlotte Is and at Nootka Sd (Vancouver I) but did not land to take possession for Spain. In 1775 a new expedition under Bruno de Hezeta and Juan Francisco de la BODEGA Y QUADRA sailed northwards to investigate the Russian presence. Bodega y Quadra reached about 58°30' N lat and discovered Bucareli Bay, Prince of Wales I. Spain dispatched another major expedition in 1779, but government secrecy prevented information on the NW Coast from reaching the public.

The challenge to Spain came from Britain rather than Russia. In 1777-78, James Cook crossed the Pacific via Hawaii to the NW Coast. Cook was to search for a Northwest Passage and to explore the unknown coastline. He spent nearly a month at Nootka Sd before continuing northward to Alaska and the Aleutian Is. Later in Macau and Canton, Cook's men discovered a potentially lucrative trade in the sea-otter pelts they had obtained on the NW Coast. The publication of Cook's voyage abruptly ended the coast's isolation. After 1785 commercial expeditions from London, Bombay, Calcutta, Macau and American ports such as Boston opened the maritime FUR TRADE. By 1792 there were at least 21 trading vessels on the coast. Trading captains included George Dixon, John Meares and Charles William Barkley. The trade in sea-otter pelts had begun in 1786; it reached its apogee in the 1790s before declining after 1812.

The Spaniards were ignorant about the burgeoning maritime fur trade until 1788, when they renewed their own voyages to check Russian encroachments southward from Alaska. Esteban José MARTINEZ discovered 6 Russian posts in Alaska and, after hearing from the traders that Russian ships would soon occupy Nootka Sd, he persuaded the Mexican viceroy to authorize a voyage to occupy the sound for Spain. In 1789 Martinez arrived there and found British and American vessels. His seizure of the British vessels sparked the NOOTKA SOUND CONTROVERSY, a clash of imperial interests which almost precipitated a European conflict. However, 3 Nootka Conventions provided for a peaceful sharing of the northern ports and resources. Spain withdrew in 1795, abandoning the fur trade to the British and Americans. Meanwhile, scientific expeditions of the Comte de Lapérouse (1786, France), George VANCOUVER (1791-94, Britain), Alejandro MALASPINA (1791, Spain) and the SUTIL AND MEXICANA (1792, Spain) explored the resources and indigenous inhabitants of the NW Coast.

The major impact of the maritime fur trade was to introduce the coastal Indians to firearms, metal tools and manufactured items. The European traders employed some violence and also introduced alcohol and diseases, but the nature of the fur harvest meant that they did not create permanent shore bases. Even before the beginning of the 19th century, however, some observers noted a decline in the number of sea otters and predicted the demise of the trade. This fact, combined with resistance from the Chinese (the major market) reduced the coast's appeal.

The coast's isolation was not to return. In July 1793, Alexander MACKENZIE of the NORTH WEST COMPANY arrived overland down the Bella Coola R to Pacific tidewater. In 1808 Simon FRASER descended the river that was to carry his name, and in 1811 David THOMPSON reached the mouth of the Columbia R. There he discovered that

American traders from John Jacob Astor's PACIFIC FUR COMPANY had arrived by sea to construct Astoria. With the amalgamation in 1821 of the NWC and the HUDSON'S BAY COMPANY, the European presence ceased to be transitory. In 1821 Russia claimed the coast southwards to 51° N lat as its territory, but British and American protests led to the 1824 settlement of the ALASKA BOUNDARY at 54°40'. To compete with the maritime fur traders, the HBC built a string of permanent forts. After negotiation of the OREGON TREATY in 1846, the HBC's far western interests centered on Vancouver I., which became a colony in 1849. Although there was subsequent competition between the fur traders and settlers, the latter won out. With the emergence of colonies and boundary agreements separating the Russian, British, American and Spanish (later Mexican) spheres, the Northwest Coast as a concept ceased to exist except as a historical memory. See SPANISH EXPLORATION.

**Northwest Coast Indian Art** More than 3000 years ago Indians of the BC coast (and adjacent areas of Washington and southeastern Alaska) developed artistic traditions that are heralded throughout the world for their imaginative and stylistic qualities. Objects made in these traditions are so highly formalized and distinctive that once some of the basic principles have been grasped, they can be easily identified. The "form line" is the primary design element on which Northwest Coast art depends; it is the positive delineating force of the painting, relief or engraving. Formlines are continuous, flowing, curvilinear lines that turn, swell and diminish in a prescribed manner. They are used for figure outlines, internal design elements, and in abstract compositions.

While native people in general do not make a distinction between what is art and what is not, nor do they have a term which corresponds to the English word "art," Northwest Coast Indian people consider recognition of meaning and form traditions to be most important. Throughout the region, special objects were made originally for the purpose of displaying certain inherited privileges and rights of their owners. Although ways of reckoning kinship vary between groups, people claiming common descent also claim rights to ancestrally derived territories, spirit powers, names, songs, dances, crests and other "properties" that both contain and display their family's wealth and identity.

**Potlatches** are events of great pomp and formality arranged to celebrate the handing down of names, rights and privileges from one generation to the next. These privileges, together with the associated artifacts, are publicly displayed and their transfer committed to the collective memory of the potlatching community. Another defining feature of the POTLATCH is the distribution of wealth objects (and money in more recent times) by the host group to the guests, who include people from other villages and tribes. Acceptance of gifts constitutes validation by the guests that the host group is transferring its inheritance in the approved manner.

**Crests**, or heraldic art, are objects associated with the potlatch. A crest itself is a concept, usually but not always referring to animals (both natural and imaginary, eg, thunderbirds), which is given a conventionalized representation. Details of the crest images vary widely, according to personal and stylistic preferences. Not all animal representations in Northwest Coast art are crests. Common crest-bearing artifacts are totem poles, painted housefronts and screens (room dividers), ceremonial robes and head-

Haida argillite dish, 27 x 22 cm, attributed to Charles Edenshaw. Haida carvers began working argillite early in the 19th century (courtesy UBC Museum of Anthropology).

dresses, staffs, feast dishes, spoons and ladles. Crests are jealously guarded possessions — they are a legacy from the ancestors, acquired in myth time from supernatural animals or images of supernaturals, to be held in perpetuity by their descendants. To display a crest of another group is an insult to the integrity and identity of that group.

**Winter Dances** (now held throughout the year) are elaborately staged performances featuring masked dancers and ingenious mechanical devices that create illusions of death and resurrection and other astounding manifestations of supernatural power and presences. In this context, animal representations, most notably MASKS, are related to but conceptually distinct from the potlatch proper. During these initiation rituals, encounters with supernatural powers occur, either as spirit possession or theatrical simulation (the distinction is not always clear to observers).

**Shamanic Art** Scholars believe that the winter dances developed out of an ancient guardian spirit complex, most highly developed among shamans (mystic healers). The visionary experience is described as the appearance of an animal spirit helper or guardian in a dream or trance. From them, the dreamer drew knowledge and special powers. Northwest Coast shamans used special objects, often made of wood, ivory or bone, in which their spirit helpers were com-

Haida rattle (pre-1880), wood, 25.3 x 12.6 cm (courtesy UBC Museum of Anthropology).

memorated. These objects include amulets, soul catchers (carved tubular objects believed to be containers for lost souls) and Janus-faced globular shaman's rattles, which are among some of the great masterworks of Northwest Coast art (see SHAMAN).

#### Artists

Northwest Coast societies were unique in aboriginal Canada in that they sustained a group of professional male artists who were largely freed from the general food quest by the support of wealthy patrons who commissioned works for potlatches and winter dances. It appears that while most men made objects for personal and family use, the specialists were responsible for the exceptional art objects preserved and treasured in museums. Such artists were trained from youth as apprentices by master artists who, in most cases, were their uncles or fathers. As well as making the objects, they were responsible for the stagecraft involved in ritual use. While all women wove (basketry and textiles), some women past their child-rearing years specialized as did their male counterparts.

Tlingit basket, spruce root, 16 x 14.3 cm (courtesy UBC Museum of Anthropology).

**Women's Art** In weaving, all of the techniques found elsewhere in N America were used, except true loom (heddle) weaving. The Inland Tlingit excelled in false embroidery; the Haida in "self-designed" twined spruce-root hats; the Coast Salish in cherry-bark imbrication on coiled baskets; and the Nootka (Westcoast) women in twined cedar-bark hats with onion-shaped tops, overlaid with strands of beargrass woven in conventionalized whale-hunting scenes.

An exceptional formline weaving technique was developed in the north, becoming a specialty of the Chilkat Tlingit in the 19th century. Chilkat blankets are the highest-valued examples of the weaver's art, worn by chiefs as far south as the Southern Kwakiutl. The warps are shredded cedar bark twisted with mountain goats' wool; the wefts are pure wool. The warps were hung from a horizontal bar and the double weft strands were twined across them. Designs were made in formline crest designs, copied from patterned boards painted by men (see CHILKAT BLANKET).

The Coast Salish made twill-plaited blankets in geometric designs out of goat wool, cattail fluff and (reportedly) the hair of a small fluffy dog, extinct since early contact times. With the introduction of domestic sheep around 1850 and of Scottish knitting techniques, Coast Salish women began producing knitted Cowichan sweaters, which have since become a successful cottage industry. Basketmaking has continued with some vitality among the Coast Salish and Westcoast women, and is being revived among the Tsimshian and Haida. Woven blankets were replaced by Hudson's Bay Co woolen blankets

— both for dancing and as potlatch gifts. Crest designs were sewn on woolen blankets in buttons, shells, and applique.

**Men's Art** Men worked a variety of materials — wood, stone, horn, copper, bone, antler, leather, ivory and abalone shells since aboriginal times; silver, gold and bronze in historic times, and works on paper and canvas in recent years. Knives, adzes, chisels, gouges and awls were made of stone, shell and beaver teeth, and hafted with sculptural forms. Metal was especially sought after from Europeans, and in the 19th century native paints were replaced by Western products.

Containers — bowls, dishes, boxes, chests, ladders, canoes — are a specialty. Boxes are made by a kerfing technique in which a single board is steamed and bent in 3 corner folds with a bottom and fourth corner attached by pegs. Stone, wooden and shell dishes and bowls are carved in animal shapes.

#### Styles

A series of conventions in Northwest Coast art permits the parts of animals to represent the entire creatures — eg, a raven's beak, beaver's teeth, whale's flukes. Two animals frequently share a single body, or a single animal is split at the face or along the backbone to create 2 bilaterally symmetrical profiles; animal parts are rearranged from their biological locations; some are placed inside other animals, or intertwined with them. All these conventions create great formal and iconographic complexities.

Most obviously in the winter dances, but also widely recognizable in other Northwest Coast iconography, is the theme of transformation or metamorphosis between beings of the land, sea and sky, and ultimately between the domains of the living and the dead. A special type of transformation mask has double faces operated by strings so that an outer (usually animal) face opens to reveal a human face within. Masks frequently have movable eyes, jaws and other parts.

Three major styles have been identified — Northern, Central and Southern, corresponding to the major cultural divisions used by anthropologists.

Tsimshian soul catcher (c1890), wood, 16 x 7 x 3 cm. Northwest Coast shamans used these objects to commemorate their spirit helpers (courtesy UBC Museum of Anthropology).

**The Northern Province**, composed of Tlingit, Haida, Tsimshian, Niska, Gitksan and Northern Kwakiutl, exhibits a defining style of 2-dimensional painting, engraving and shallow relief carving based on a formline aesthetic. Formline compositions in the 19th century were most highly developed on housefronts, screens and chiefs' chests. The works of individual 19th-century masters of the formline aesthetic are being identified according to art historical principles by modern scholars.

Formline painting was based on a 3-colour scheme of primary black lines (aboriginally, charcoal and lignite), secondary red lines (ochres) and tertiary blue-green elements (copper minerals). Pigments were mixed with a medium derived from dried salmon eggs and paintbrushes were made of porcupine hairs. Designs were rendered freehand, although templates were frequently used for the recurring ovoid shapes.

A northern painting style was highly developed at contact, in which painted designs extended to the limits of the field (varying according to the object being decorated). All of the constituent elements in these designs harmonize according to a subtle and sophisticated aesthetic.

Sculpted formlines also occur as surface decoration on northern sculpture, including totem poles, headdresses, masks, rattles, canoes, canoe paddles, staffs, and various forms of bowls, dishes and boxes. Early in the 19th century, Haida carvers began working a soft, black shale (argillite) in order to make curios for sailors and traders, and later for settlers and tourists. Argillite carvings are still made in the Queen Charlotte Is, although the technical mastery of the early pieces has not yet been recovered in modern times.

**The Central Province** By 1880, elements of northern formline painting had been incorporated by the Southern Kwakiutl and Westcoast people, who adapted them to a prehistoric Old Wakashan style encountered by Captain James Cook a century earlier. The Westcoast people developed a new and distinctive combination of formlines, geometric and naturalistic elements. The Kwakiutl continued to evolve an exuberant, colourful and flamboyant manner all their own. In the early 20th century they added orange, yellow and green paint to the repertoire. The BELLA COOLA borrowed many stylistic and ceremonial elements from their Kwakiutl neighbours, creating a style easily recognized by the heavy and bulbous features of its masks, and the typical use of a medium blue paint.

**The Southern Province** Painting and relief carving in the Coast Salish area is geometric — circles, chevrons, crescents, rows of dots, triangles and T-shapes. In recent years, scholars have noticed that these elements revealed a negative (recessed) formline-type design which is considered by some to be possibly ancestral to the northern formline tradition. Strong, simplified human and animal sculptures — house pots, coffins, grave posts, and a single-mask type, the protruding-eye Sxayxway — were also made. The Southern tradition barely survived into the 20th century, although it too is enjoying a revival since the 1970s.

#### European Contact

After millennia of what appears to be continuous development, native artistic traditions and society were severely disrupted by European contact which, from the native point of view, amounted to an invasion. Although in the first century of white intrusion, native art and culture flourished under the stimulus of money, the FUR TRADE, new metal tools and other aspects of European technology, the native population became decimated and demoralized by alcoholism and disease, by white schools for native children, by political and religious suppression

*The Raven and the First Men* (1980), contemporary yellow cedar Haida sculpture by Bill Reid, 210 x 180 cm (courtesy UBC Museum of Anthropology).

of the potlatch and by other forms of colonial oppression. By 1910 the traditional social structure and belief system was in such severe dislocation that white observers predicted its complete collapse and the inevitable assimilation of a remnant population into Canadian society. Except for a handful of Southern Kwakiutl artists who maintained their skills through traditional apprentice training, the great artistic tradition developed over 3000 years degenerated into souvenir production for infrequent tourists. It looked like the end of one of humankind's most distinctive cultural achievements.

**The Contemporary Revival** In 1958 Haida carver BILL REID and Nimpkish carver Douglas Cranmer began recreating traditional Haida houses and totem poles for UBC Museum of Anthropology. Reid has since become the acknowledged leader of the Northwest Coast artistic revival. In 1980 there were an estimated 200 men (and a few women) seriously engaged in artistic production in all the former styles. A sizable collector's market has developed around their work, and some experts believe that certain new pieces achieve the technical skill of 19th-century masters. By 1984 native artists, eg, Charlie EDENSHAW, Robert Davidson, Joe David, Norman Tait and Douglas Cranmer, were becoming cultural leaders, using their skills as artists to fan the dying embers of traditional custom and belief. Map of the "North and Polar Regions," 1598, showing W. Barents's explorations (Davis Strait is seen in the upper-left portion). The 300-year search for a route through these northern waters was a long chapter of frustration in the history of exploration (courtesy Public Archives of Canada/NMC-21063).

**Northwest Passage** The search for a water route through the Arctic, N of the Canadian mainland, to the supposed wealth of the Far East was a chapter of frustrations in the history of exploration in Canada. For over 300 years, after it was realized that N America blocked the route to the Orient, expeditions probed the inhospitable sea and land environments seeking a commercial route to the Pacific. Martin FROBISHER (1576) and later John DAVIS (1585) reported the barren obstacle of Baffin I, but noted ice-blocked westward-leading passages N and S of the large island. Exploration in the early 17th century was sidetracked into the broad opening of Hudson Str, but no sea routes were found W of Hudson Bay.

In 1819 Edward PARRY, in command of ships of the British navy, explored the opening N of Baffin I and W of Lancaster Sd to Melville I. This route through Viscount Melville Sd is the widest passage through the arctic islands, but Parry reported it blocked by eastward-moving heavy ice floes even in Aug. After 1829 John Ross confirmed the extension of Boothia Peninsula N from the mainland, which blocked any sea route through that part of the central Arctic, but he missed the narrow opening through Bellot Str. The many expeditions after 1845 in search of the lost Sir John FRANKLIN finally defined the coastal outlines of most of the arctic islands and reported an uncertain ice-free period for ships of only 1-2 months in Aug and Sept. In 1854 Robert MCCLURE became the first person to traverse a route from W to E, partly by sledge over the sea ice from Banks I to near Devon I. As a result of the natural environmental information accumulated, commercial shipping had no further interest in the passage. The Hudson's Bay Company continued to use part of the water route to its trading posts around Hudson Bay. Otto SVERDRUP confirmed that there was no sea passage through the group of islands NW of Lancaster and Viscount Melville sounds 1898-1902.

The Northwest Passage was finally traversed 1903-06 by Norwegian adventurer Roald AMUNDSEN in his tiny ship, *Gjoa*. He travelled W and S of Lancaster Sd through Peel Sd and along the western Arctic coast through Queen Maud and Coronation gulfs. His western exit from the Arctic was simply a feasible route out of the area rather than a planned attempt to traverse the

Northwest Passage. The first W to E passage by the RCMP vessel *ST ROCH* under Henry LARSEN followed a similar route through the relatively shallow channels along the mainland coast 1940-42. Larsen left the central Arctic through Bellot Str and travelled N and E of Baffin I. During the summer of 1944 the *St Roch* became the first to traverse the passage from E to W in a single year, using a new route W of Lancaster Sd, S through Prince of Wales Str between Banks and Victoria islands, and along the northern Alaska coast. Finally, in 1954, the first ship to achieve the passage from W to E in a single year was the Canadian government icebreaker *Labrador*. In 1969 the American oil tanker *Manhattan*, with the assistance of the Canadian icebreaker *John A. Macdonald*, traversed the Northwest Passage from E to W. See ARCTIC EXPLORATION J. LEWIS ROBINSON Reading: L.H. Neatby, *In Quest of The North West Passage* (1958).

**Northwest Territories (NWT)** The name was originally applied to the territory acquired in 1870 from the HBC and Great Britain — RUPERT'S LAND and the North-Western Territory — which lay NW of central Canada. In 1880 Great Britain also transferred to Canada the arctic islands, N of the mainland, thereby adding to the territories. Large portions of NWT were subsequently removed to create the provinces of Manitoba (1870), Saskatchewan (1905) and Alberta (1905); the Yukon Territory (1898); and to add to the areas of Manitoba (1880, 1912), Ontario (1912) and Québec (1912). Even so, today's NWT constitutes the largest political subdivision within Canada (34.1% of the national area) and the northernmost landmass extending to within 800 km of the North Pole. Its enormous distances, northern location and sparse population impart distinctive characteristics.

#### Land and Resources

The NWT includes a mainland portion lying W of Hudson Bay-Foxe Basin and S of the BEAUFORT SEA and other arctic marine waters to the E. North of the mainland the Arctic Archipelago includes a great number of islands of varying

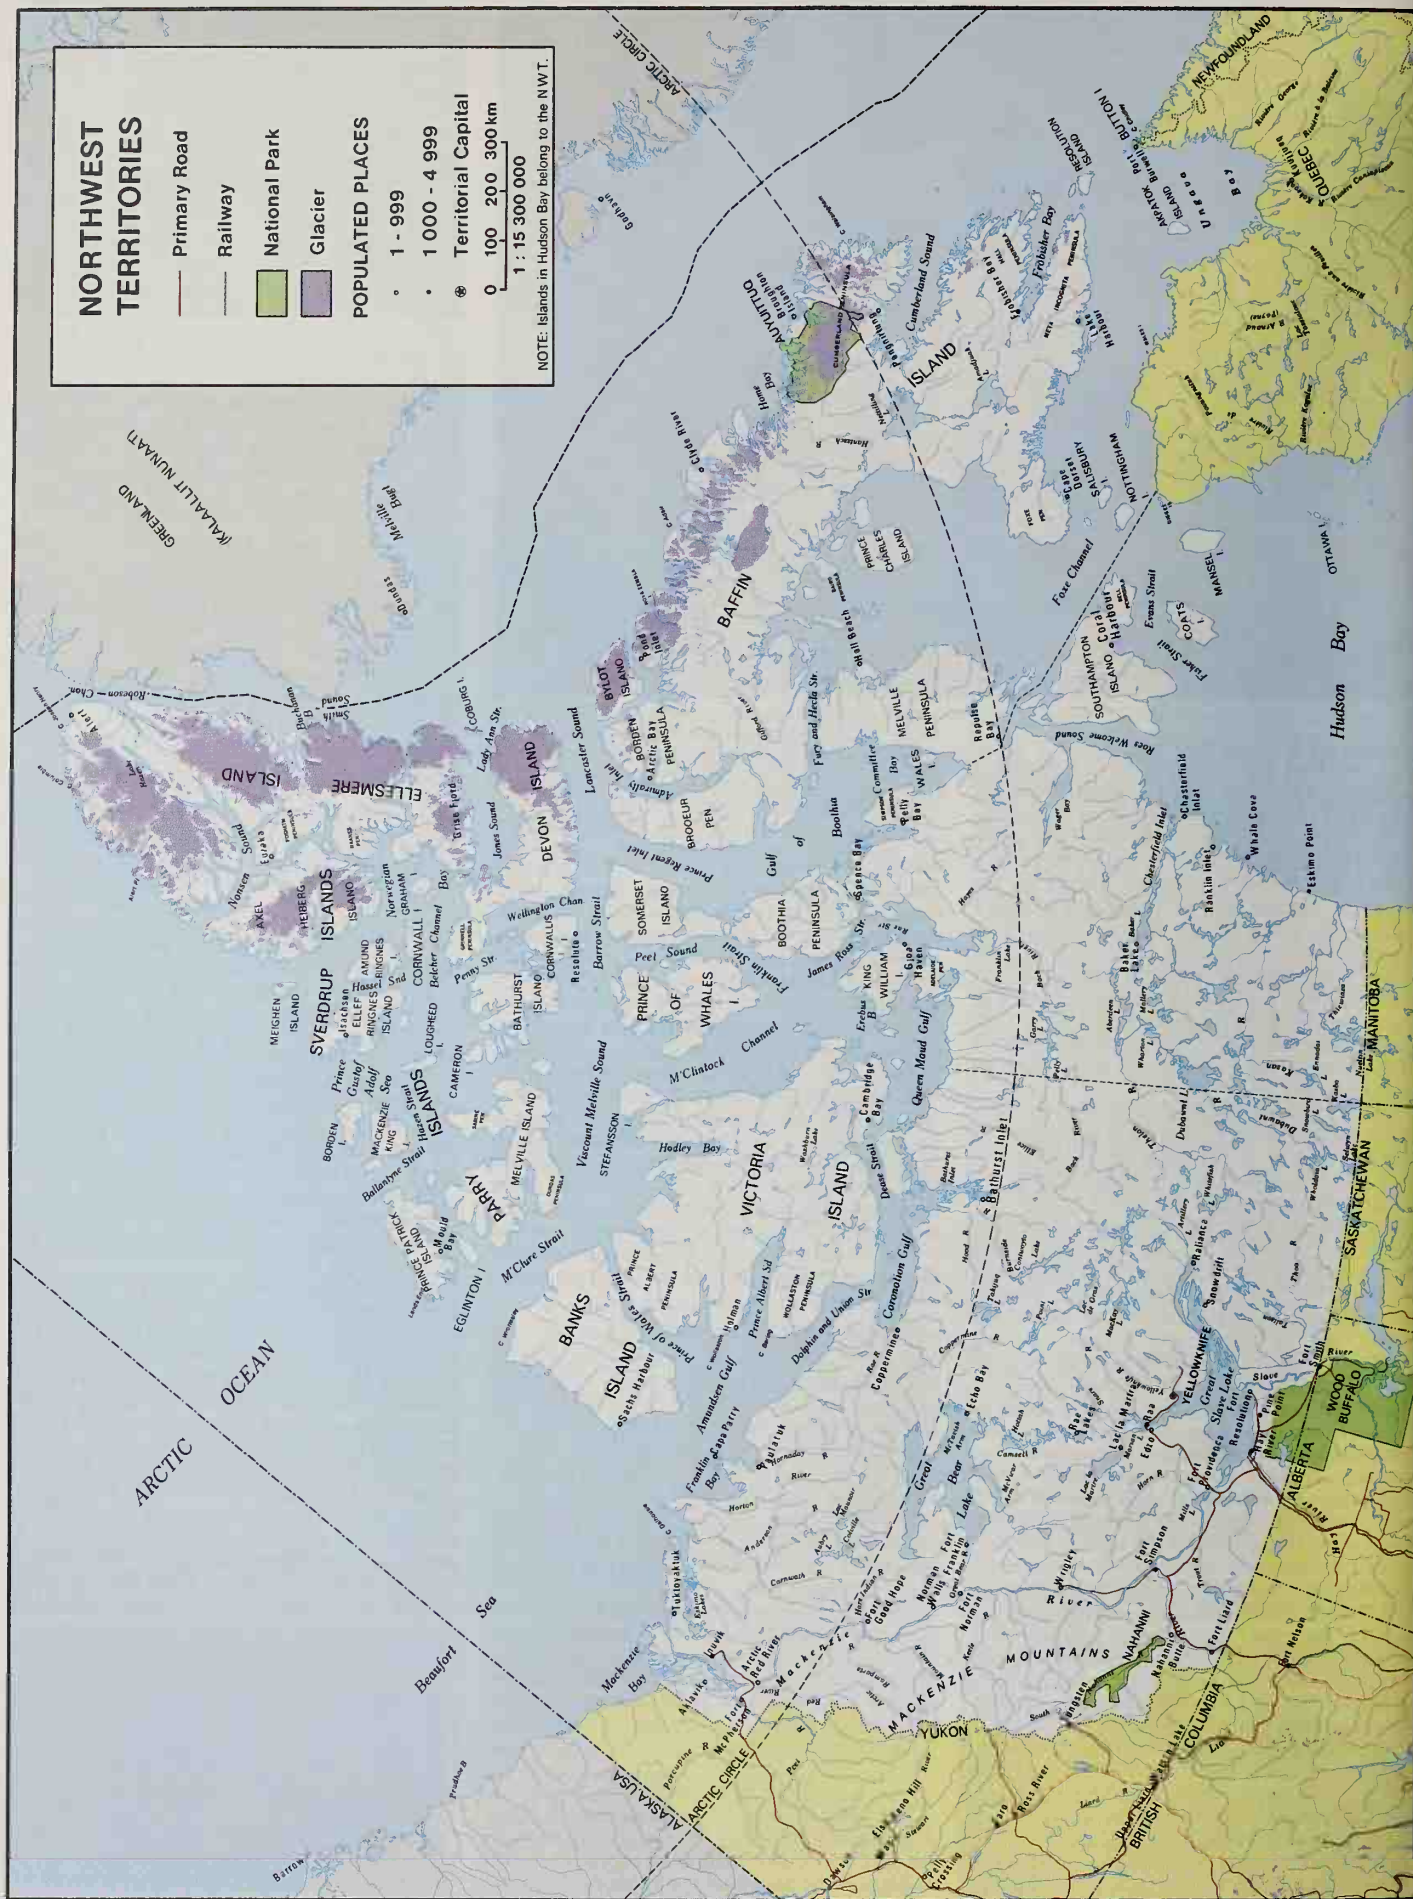

size and complexity. The more westerly part of the mainland forms the Mackenzie Valley area, a subarctic region contrasting with the arctic mainland area that lies E and N of the TREELINE and is sometimes known as the barren lands. This vegetation division corresponds to a cultural division of the native peoples, with the Inuit occupying the Arctic and the Indians, or Dene, the Subarctic. The greater economic development and larger population of the subarctic Mackenzie Valley also set it apart from the arctic mainland.

**Arctic Archipelago** Although 60°N is the southern boundary of the NWT, all islands in James and Hudson bays and in HUDSON STRAIT, as well as those farther N, are included within the territories. Eighteen of the islands are larger than Canada's smallest province and the largest, BAFFIN I is more than twice the size of Great Britain. Islands lying N of the straits W from LANCASTER SOUND are known as the QUEEN ELIZABETH IS. Geologically, the islands of the Archipelago range from ancient Precambrian (Baffin I, eastern DEVON I and SE ELLSMERE I) through progressively younger formations to the NW. The eastern islands are mountainous and average 1800-2100 m, with Mt Barbeau (2616 m) in northernmost Ellesmere I the highest peak in the Archipelago. Permanent ice caps cover much of the eastern islands, and magnificent fjords occur in the coastal section. Canada's (and the world's) first arctic national park was established on eastern Baffin I in 1972 (AUYUITTUQ NATIONAL PARK). The central islands are plateaulike, while those in the NW and SW are mainly low-land plains. Severe climate and PERMAFROST result in very poor soil development. Vegetation is tundra, varying from low bush to grass, but it may be totally lacking in some sectors.

Ice covers all the surrounding seas for much of the year, and never disappears from around the northwesternmost islands, severely limiting navigation. Long, cold winters are characteristic of all the NWT. The SE sector of the Archipelago is not as cold, however, because of its proximity to the open waters of the N Atlantic, and with its higher elevation, it receives higher precipitation than elsewhere in the Arctic, which overall is among the driest areas of Canada. The Archipelago differs from the other 2 regions of the NWT in that summers remain cool, averaging only 4°C in July over most of the area because of the surrounding cold waters. The great contrast between the long days of summer and the short (even non-existent) days of winter reflects the high latitude.

Marine biotic resources (whales, seals, fish) supplemented by caribou have traditionally supported the INUIT, with trapping (white fox) in the first half of the 20th century. Commercial whaling by the whites almost exterminated the whales by c1910, though limited hunting by natives continues, eg, in the Mackenzie Delta. Seal skins and fox pelts still provide some income for the Inuit. The greatest postwar resource development has been in minerals, with 2 lead-zinc mines now in production in the Archipelago: Nanisivik at Strathcona Sound in N Baffin I, and Polarix on Little Cornwallis I. More widespread activity has resulted from the search for oil and natural gas in the NW Queen Elizabeth Is. Proved reserves of natural gas now are sufficient that the companies have sought permission to construct a plant on MELVILLE I to ship liquefied natural gas by tanker to E Canada (Arctic Pilot Project) and ultimately to construct a pipeline to southern Canada. Exploratory drilling for oil continues, especially offshore in the Beaufort Sea. This greatly increased resource development has aroused great concern for the fragile arctic ENVIRONMENT among both the native peoples and conservationists. The Lancaster Sound area and Polar Bear Pass on BATHURST I are especially sensitive areas.

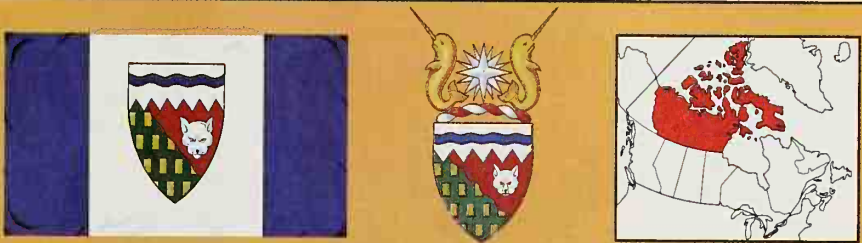

**Arctic Mainland** The Canadian SHIELD makes up the arctic mainland. Pleistocene ice sheets polished its surface, stripping away surface material down to the bedrock. In places boulders and meltwater-sorted sands and gravels remain from the melting ice. Overall it is a gently undulating rocky surface of low elevation, with a bewildering maze of rivers and irregular lakes. As in the Archipelago, true soil is generally absent. Vegetation is also the tundra type, usually including considerable shrubs. In sheltered places, as along inland water courses, stunted trees may extend out from the forested lands on the S and W. Climatically as well as in location the arctic mainland lies between the Arctic Archipelago and the Mackenzie Valley, with more severe winter temperatures and higher summer temperatures than the former because of its continental location. BAKER LK, for example, W of Hudson Bay, has a mean daily temperature of  $-33.0^{\circ}\text{C}$  in January and  $11.0^{\circ}\text{C}$  in July, with a mean total precipitation of 235 mm.

The greatest single natural resource of the region for the native peoples has been the migratory barren land CARIBOU, which swarmed in enormous herds to summer in this region. Some large herds remain, but the numbers have declined disastrously in this century because of overhunting, wolf kills and disease. The decline has had serious repercussions for local residents here and in the Mackenzie Valley, resulting in the disappearance of the Caribou Eskimos who formerly lived in the Barren Lands. In 1927 the Thelon Game Sanctuary was established along the THELON R W of Baker Lake to protect MUSK-OXEN, which are also found near Bathurst Inlet and in the Arctic Archipelago. As in the Arctic Archipelago, marine biotic resources and trapping still provide some support for the Inuit, but most now are permanent residents in settlements and seek other sources of income. A nickel mine at RANKIN INLET, in operation from 1957 to 1962, provided some employment before closing. In 1981 an Inuit-run corporation co-operated in the opening of a new gold mine at Cullaton Lk, 1300 km N of Winnipeg. Some residents from western settlements are employed in the oil and gas search, while exploration for new minerals continues, particularly for uranium near Baker Lake. There has been some development in recent years of tourist facilities for fishermen, bird watchers and photographers. Concerns have been voiced about the impact of large-scale resource development on the local environment, on the traditional native way of life and on native LAND CLAIMS.

**Mackenzie Valley Area** Geologically this area ranges from the Canadian Shield on its eastern margin, through younger Palaeozoic and Mesozoic sedimentary formations in sequence to the W. GREAT BEAR LK (31 300 km<sup>2</sup>) and GREAT SLAVE LK (28 600 km<sup>2</sup>) lie along the contact line of the Shield, which here often exceeds 300 m of relief. Much of the Mackenzie Valley area consists of the narrowing northward extent of the level continental Interior Plains, with occasional level-bedded hill areas a few hundred metres above the general surface. In the W it rises abruptly into the mountainous terrain of the rugged Cordillera region with peaks of over 1500 m. The area is integrated by the MACKENZIE R and its tributaries, whose total drainage area (1.8 million km<sup>2</sup>) and system length (4241 km) are the largest and longest in Canada.

Only the northernmost part of the area falls within the continuous permafrost zone, unlike the other two regions of the NWT. Almost all falls within the discontinuous zone where permafrost is widespread if not universal. The Mackenzie Valley area lies within the subarctic boreal forest zone, where spruce, pine, birch, larch and poplar are common. Extensive areas of poor drainage occur, especially on the plains, as a result of permafrost and continental gla-

### Northwest Territories

**Capital:** Yellowknife  
**Motto:** None  
**Flower:** Mountain avens  
**Largest Urban Centres:** Yellowknife, Inuvik, Fort Smith, Hay River, Frobisher Bay, Fort Simpson  
**Population:** 46 000 (1981c); rank eleventh, 0.19% of Canada; 47.9% urban; 52% rural  
 nonfarm; 0.2% farm; 0.01 per km<sup>2</sup> density; 6.9% increase from 1976-81; Jan 1984e pop. 49 000  
**Languages:** 63.6% English; 1.4% French; 35% Other (1981)  
**Entered Confederation:** 15 July 1870  
**Government:** Territorial — Commissioner, Executive Committee, Legislative Council of 24 members; federal — one senator, 2 members of the House of Commons; the Minister of Indian Affairs and Northern Development is responsible for directing the Commissioner in the administration of the territory  
**Area:** 3 379 684 km<sup>2</sup>, including 133 294 km<sup>2</sup> of inland water; 34.1% of Canada  
**Elevation:** Highest point — Mount Sir James MacBrien (2762 m); lowest point — sea level at Arctic shore  
**Gross Domestic Product:** \$1.2 billion (Yukon and NWT) (1982e)  
**Value of Mineral Production:** \$467.2 million (1981); \$503.065 million (1982); \$561 million (1983 prelim total)  
**Electric Power Generated:** 432 879 MWh (1983)  
**Sales Tax:** None (1984)

ciation. These result in string bogs and muskeg. Temperature ranges are greater in the Mackenzie Valley than in the other 2 regions, at Fort Good Hope a maximum of  $35^{\circ}\text{C}$  has been recorded and until recently Fort Good Hope's  $-61.7^{\circ}\text{C}$  was the lowest recorded temperature in Canada. In January the average mean temperature is approximately  $-30^{\circ}\text{C}$  and somewhat milder temperatures can occur briefly throughout the winter. More importantly the summers are normally warmer in the Mackenzie Valley, with July's mean usually  $16^{\circ}\text{C}$  in the Mackenzie Valley. Precipitation, including snowfall, is significantly higher than for most of the Arctic.

Hunting, fishing and trapping have been traditional activities for the native Indian population, and the FUR TRADE supported the earliest white presence. Moose, caribou, bear, beaver, fox, muskrat and migratory birds continue to be important, but the major resource base since the 1930s has been minerals. Though radium and uranium production from Port Radium on Great Bear Lk has now ended, silver continues to be produced in the area. Gold is mined at YELLOWKNIFE, lead-zinc at Pine Point on the S side of Great Slave Lk, and tungsten at Tungsten near the Yukon border. Oil continues to be produced in the Mackenzie Valley at NORMAN WELLS, Canada's pioneer (1921) northern oilfield, though the focus of recent oil and gas search has now moved northwards. A commercial fishery operates at Hay River on Great Slave Lk. Limited commercial use has been made of the forests because of remoteness from major markets and slow natural growth rates.

The potential hydro power resources of the NWT have been estimated at about 15 000 MW, of which 10 200 MW are within the Mackenzie Valley area. The series of rapids on the SLAVE R near the Alberta boundary has attracted attention for possible hydroelectric power generation (up to 2000 MW), but such a project would have serious repercussions for wildlife. WOOD BUFFALO NATIONAL PARK, straddling the Alberta boundary, is Canada's largest national park (over 44 000

km<sup>2</sup>). It was established in 1922 to protect the only herd of wood bison in the wild state, and also contains several thousand plains buffalo and the summer nesting grounds of the nearly extinct whooping cranes. Concern for environmental disruption by large development projects in the Mackenzie Valley and the Arctic was demonstrated forcefully in the 1970s, when the Berger enquiry into a possible MACKENZIE VALLEY PIPELINE resulted in its delay until native land claims and environmental issues were resolved.

#### People

A northward extension of the fur trade led to the first white presence in the NWT in the late 18th and early 19th centuries as posts were established down the Mackenzie Valley. Missions arrived in the latter part of the 19th century, and the RCMP and other representatives of the federal government in the present century. Mineral and transportation developments in the 1930s marked the beginning of a more significant white influx. In the arctic regions, the remoteness made access more difficult, and fur trade posts were not established there until the 20th century. Permanent settlements were not established in the Queen Elizabeth Is until after WWII.

#### Urban Centres

There are 64 communities in the Northwest Territories. The most populous of the small urban centres are located in the Mackenzie Valley area. Yellowknife is the largest city (pop 10 500). It began as a gold-mining centre and became territorial capital in 1967. Fort Smith (pop 2380) was the major administrative centre within the territories until 1967 and is still important as a regional centre. Hay River (pop 3140) is a transportation and fishing centre. Pine Point (pop 1570), a mining town based on lead and zinc production, lies just S of Great Slave Lake. Rae-Edzo (pop 1510), the largest Dene community in the NWT, is an administrative centre for the Dogrib people. Fort Simpson (pop 1040), once the center of the fur trade, is located at the

Pond Inlet on northern Baffin Island (photo by Karl-Heinz Raach).

confluence of the Liard and Mackenzie rivers. Inuvik (pop 3620) is the major administrative and transportation centre for the western Arctic, as is Frobisher Bay (pop 2610) for the eastern Arctic, located on Baffin I. Rankin Inlet (pop 1200) is the regional administrative centre for the Keewatin. Also in the Keewatin, Eskimo Point (pop 1110) was an Inuit summer camp until the 1900s and still relies largely on hunting and fishing. Baker Lake (pop 990) is the only inland Inuit community. Cambridge Bay (pop 860) is the only territorial regional headquarters for the Kitikmeot region. Coppermine (pop 850) residents derive employment from oil, gas and mine exploration and development. Most other settlements consist of only a few hundred.

#### Ethnicity

Native people represent 58% of the population, whereas white residents account for 42%. Almost all of the latter group are found in the Mackenzie Valley, mainly in the larger settlements. The 34% of the population speaking languages other than English or French is a reflection of the multiplicity of native cultures that prevails in the NWT. About two-thirds of Canada's 23 000 Inuit live in the NWT, entirely in the arctic regions where they constitute the majority of population. The numerous different Indian cultural groups of the Mackenzie Valley area, included within the Dene or Athapascan linguistic group, total about 10 525. The Métis (approximately 2600) usually have been included in the latter figure, but are stressing their own separate identity as a fourth major ethnic element in the NWT. All 3 native groups are increasingly active politically.

**Growth Rate** Because of the relatively small total population, external policy and economic conditions have significant impact. Population growth has been erratic since 1966, reflecting the administrative transfer from Ottawa to Yellowknife, and the fluctuating interest in mineral resource development. The birthrate remains one of the highest in Canada however (in 1980, 26.5 per 1000 population), creating pressure for employment.

#### Economy

Primary resource extraction always has been the foundation of the NWT economy. Furs, the original base, are now of much less importance. Commercial whaling disappeared early in this century. From the 1930s minerals have become the most important economic base for the NWT, with all other economic activities except service, far behind.

**Agriculture** Agriculture is of negligible significance in the NWT. The warm summers of the Mackenzie Valley have encouraged speculation on its potential for agriculture, and there have been impressive crop tests recorded at favourably located experimentation stations. However, unpredictable frosts, summer drought and limited good soils create serious obstacles, and improved transportation service often makes it cheaper to bring in agricultural products from the S. Only a few market gardens operate in the Hay River valley.

**Mining** In 1983 metal mining production in the NWT was valued at \$517 million: 55% from zinc, 7% from lead, 31% from gold, 6% from silver and 1% from tungsten. Though only 1% of the total value is contributed by tungsten, the NWT provides almost 100% of Canada's production of that mineral. Mining employs about 2000 people, or about 15% of the work force of the territories, and provides significant employment in related service activities, such as mining exploration. Except for the production of gold bullion, no smelting of minerals occurs in the territories, however, as concentrates are shipped elsewhere.

Modern Inuit village at Lake Harbour, southern Baffin Island (photo by Fred Breummer).

The only producing oilfield in the NWT continues to be that at Norman Wells, and the oil is also refined locally. Production of approximately 3000 barrels daily from 50 wells has recently increased, with an \$800-million expansion, to 25 000 barrels a day, which is piped S to Alberta. A small gas field at Pointed Mountain in the SW near the NWT-Yukon-BC border pipes gas southward. The ongoing search for additional sources of oil and natural gas reflects Canada's hopes for national self-sufficiency in these fuels and for greater employment opportunities for northerners. In 1980 government revenues from all oil and gas sources in the North totalled \$12 million. As of 1980 over \$800 million had been invested in oil and gas exploration in the Arctic Archipelago over some 21 years of exploration activity. In addition to the 2 main arctic exploration areas (Beaufort Sea and NW Queen Elizabeth Is), the search now includes DAVIS STRAIT and NW Baffin Bay and Lancaster Sound.

**Hunting and Trapping** Hunting and trapping are more important in the daily lives of NWT residents than statistics might suggest. Although a large percentage of the 9158 residents holding general hunting licences are only part-time hunters and trappers, many of the people living in smaller communities earn most of their living by hunting, trapping and fishing. In addition to the fur value obtained (\$2.8 million in 1982-83), the meat is a major item in the local diet. Since 1974 the territorial government has assisted those wishing to make a living off the land through the establishment of outpost camps. There are 54 permanent camps and about the same number of temporary sites at present, with a population of approximately 1200.

**Fishing and Forestry** The commercial fishery operates both summer and winter on Great Slave Lk. The annual limit is set at 1.7 million kgs but the catch is usually well under this. Whitefish and lake trout are the most important catch. Smaller quantities are also produced by other subarctic lakes, though Great Bear Lk is restricted to sport fishing. Arctic char supports some commercial fishery in such arctic communities as Cambridge Bay, Pelly Bay, Paulatuk and Rankin Inlet. Some 59 510 m<sup>3</sup> of timber was cut in the Mackenzie Valley in 1981; lumber accounted for 45 720 m<sup>3</sup>, fuel wood 5710 m<sup>3</sup> and roundwood 8080 m<sup>3</sup>.

**Tourism** Tourism provides increasing economic benefits to the NWT, with visitors arriving by road via the Mackenzie Highway and the Dempster Highway in the W. Fly-in sport fishing lodges and wilderness camps are served out of Yellowknife, Frobisher Bay, etc. The 3 national parks in the NWT attract visitors despite their distance from southern Canada: Auyuittuq is administered from Pangnirtung, Wood Buffalo from Ft Smith and Nahanni from Ft Simpson. In 1979 Nahanni was declared a "world heritage site" by the United Nations.

**Arts and Crafts** A vigorous arts and crafts program among the native people has been developed within the past 2 decades and now generates several million dollars annually. More than one-sixth of the native population is engaged seasonally in this activity. Inuit prints and sculpture have established an international reputation and are a major source of employment in Cape Dorset, Holman Island, Baker Lake and other communities. Most are handled through local co-operatives, which now number 40 in the NWT with a membership of almost 4000. They operate a variety of services, including motels, restaurants and retail stores and are the largest employers of native people in the North.

### Transportation

Transportation in the NWT must cope with enormous distances, severe climatic conditions and the small, scattered population. It is remarkable that the NWT is so well served, and the high costs can be appreciated. Commercial water transportation still operates during the summer on the Mackenzie. A modern diesel tug and barge fleet is based at Hay River, with a secondary base at the mouth of the Mackenzie at Tuktoyaktuk, the only reliably sheltered harbour on the shallow western coast. The coastal communities from Tuktoyaktuk eastwards as far as the Boothia Peninsula are served by tug and dual-purpose barge, though often the short ice-free season may restrict such service to a single call. Eastern Arctic communities are served by vessels operating out of Churchill, Montréal and Halifax, with regular annual visits as far N as Resolute but including some icebreaker escorted trips to Winter Harbour on Melville Peninsula.

Since WWII a limited road network has been extended northwards into the Mackenzie Valley. Highways are mainly all-weather gravel roads and include several important river ferry links. The total length is about 2200 km. The Mackenzie and Yellowknife highways now link Hay River and Yellowknife to the road system of NW Alberta. Extensions from Hay River tie in Pine Point and Ft Smith. A northward extension down the Mackenzie Valley was stopped at Wrigley, N of Fort Simpson, because of the opposition of the local people, but the Liard Highway opened in 1984, tying Ft Simpson to the ALASKA HIGHWAY. Inuvik and other Mackenzie Delta communities are now linked to Dawson, YT, by the Dempster Highway, making it almost possible to reach the shores of the Arctic Ocean by road. "Winter roads" exist seasonally over frozen lakes to some isolated communities and mines. The Great Slave Lk Ry, a

Airport at Spence Bay, NWT. Much of the North relies on air transport for supplies (photo by Sherman Hines/Masterfile).

branch of the CNR, extends 696 km N from Grimshaw, Alta, to Hay River and is the only railway in the NWT. A spur eastwards serves Pine Point and permits shipment south of lead-zinc concentrates, the primary reason for its construction in 1964. The railway also led to Hay River's development as the major river transportation centre because of its trans-shipment advantages, thus displacing the earlier all-water Slave R route via Ft McMurray, Alta. Aircraft often are the only practical method of transportation in the NWT, particularly in the Arctic. There are 184 airfields in the territories (serving most NWT communities with populations over 100), 14 of which are operated by Transport Canada as licensed airports. Regularly scheduled airline service is provided from southern Canadian cities into the larger communities as far N as Resolute. The main southern airports serving the NWT are Edmonton to the Mackenzie Valley area and to Resolute, Montréal to the Eastern Arctic and to Resolute, and Winnipeg to Yellowknife, Rankin Inlet and Frobisher Bay. An east-west service links Yellowknife and Frobisher Bay by way of Rankin Inlet. Almost all communities, including the northernmost arctic settlements, now have local air service available, while nonscheduled charter aircraft bush planes operate from the larger centres to any point in the territories, even to the North Pole.

### Energy

Heating is a major cost for northerners, given the long, severe winters and the transportation costs. Energy needs for most settlements are provided by fuel oil and thermal power generation. In most of the territories hydro power is nonexistent. The Northern Canada Power Commission provides over 90% of all power in Canada's northern territories. In the NWT its installed capacity is 157 MW, with 111 MW thermal and 46 MW hydro, just the reverse of the relative proportions in the YT. At the present time hydro plants operate only N and S of Great Slave Lk: along the Snare R (23 600 kW) for the Yellowknife area, and at Twin Gorges on the Taltson R (20 800 kW) for the Pine Point area.

### Government and Politics

From 1905 until after WWII the government of the NWT was carried on by the appointed commissioner and council, composed entirely of senior civil servants based in Ottawa. Beginning in 1951, elected members were added gradually

to the previously all-appointed council until it became a fully elected body in 1975. Until 1964 the commissioner was a part-time senior federal official with other major responsibilities. In 1964 the first full-time commissioner was appointed to a separate territorial office. In 1967 the seat of territorial government was moved to Yellowknife and the commissioner relocated there with the nucleus of what has become a territorial public service. The federal Northwest Territories Act contains the written constitution and defines the powers of the territorial government. The territorial council consists of 24 elected members, one of whom it chooses to preside as Speaker. A unique feature of the council currently is that the majority of members are native people: 8 Inuit, 5 Dene, 1 Métis and 10 non-natives.

### Northwest Territories

Lieutenant-Governors	Term
William McDougall	1869-70
Adams George Archibald	1870-72
Francis Godschall Johnson	1872
Alexander Morris	1872-76
David Laird	1876-81
Edgar Dewdney	1881-88
Joseph Royal	1888-93
Charles Herbert Mackintosh	1893-98
Malcolm Colin Cameron	1898
Amédée Emmanuel Forget	1898-1904
(office abolished in 1905)	

Commissioners	Term
Part-time commissioners only, Ottawa residents	1905-63
Bent Gestur Sivertz	1963-67
Stuart Milton Hodgson (first NWT resident commissioner)	1967-79
John Havelock Parker	1979-

The chief executive officer for the territories is the commissioner, appointed by the federal government, who is required to administer the territories under instructions from the minister of Indian affairs and northern development. The commissioner and government leader serve as chairman and deputy chairman of an executive committee, of which 8 members are nominated by majority of the territorial council — true only for the Ninth Assembly which ended in 1983. The role of the commissioner is changing as elected executive members assume increasing departmental and executive functions. Each member of the executive committee is responsible for one or more territorial government departments. The NWT elects 2 members to the Canadian Parliament and also has one representative in the Senate.

**Judiciary** The territorial judiciary consists of a supreme court judge based in Yellowknife, 4 territorial judges (3 in Yellowknife and 1 in Hay River), 15 judicial officers located in Yellowknife and Hay River, and 102 justices of the peace (53 of native origin) living in various communities. Judges and justices of the peace are appointed by the commissioner. The judge of the supreme court of the NWT is ex officio judge in the YT, and vice versa. Court sessions are held in Yellowknife and on regular court circuits throughout the territories.

**Local Government** For administrative purposes the NWT is divided into 5 regions: Ft Smith Region (based on Ft Smith), Inuvik Region (Inuvik), Keewatin Region (Rankin Inlet), Kitikmeot Region (Cambridge Bay) and Baffin Region (Frobisher Bay, including all of the Queen Elizabeth Is). Decentralization and devolution recently have been increasing the importance of the regions. The fostering of development of local government to provide local decision making has been hampered by the small size of many of these communities and by

their remoteness and limited local economic resources. At present there are 36 incorporated municipalities in the NWT, of which 7 are tax-based: the city of Yellowknife; the towns of Inuvik, Hay River, Frobisher Bay, Ft Smith, Pine Point; and the village of Ft Simpson. There are 29 hamlets, 15 settlements and 12 unorganized communities.

**Health** Until the Northern Health Services was established by the federal government in 1954, health services in the territories were provided principally by church agencies. Since then they have been broadened to make available facilities that are similar to those elsewhere in Canada. The territorial government has been assuming more responsibility in recent years. Modern hospitals are located in Yellowknife, Hay River, Ft Smith, Ft Simpson, Inuvik and Frobisher Bay, with lesser facilities including 39 nursing stations scattered over the territories. Dental care is available in Yellowknife and Hay River, and from government-employed full-time dentists and dental therapists located throughout the NWT.

Icebreaker *Canmar Kigoriak* works the southern Beaufort Sea year-round (courtesy Dome Petroleum Limited).

**Politics** Although candidates for the 2 NWT seats in the federal Parliament represent traditional political parties, this is not true for the territorial legislature. Two major issues occupy territorial residents currently: native land claims and political status. Though the Dene signed treaties with the federal government in the past, they dispute that land title was involved and, except for one at Hay River, reserves do not exist. The Dene, along with the Inuit and the Métis, are urgently seeking land claims settlement. The issue is sometimes further complicated by overlapping claims between the native groups.

The federal government quickly accepted and implemented many of the recommendations of the 1966 Carrothers Commission on the development of government in the NWT. It is on record as supporting the move towards full responsible government. At present however it retains control of territorial resource revenues and the territorial government is dependent on the federal for the bulk of its finances. Whether resource revenues in future will be transferred or shared is a controversial issue. The 1980 Drury Commission endorsed the existing government and recommended that greater authority be transferred to it and to the communities. A further political issue is whether the territories will evolve into full provinces as residents wish, or into something else because of the particular

problems (including huge costs). In a 1982 plebiscite a majority voted in favour of dividing the NWT. In Feb 1985 the new Conservative government endorsed the plan to divide the NWT into 2 independent jurisdictions — "Nunavut" in the east, comprised of a primarily Inuit population, and a western territory comprised of Dene, Métis, some Inuit, and whites. Nevertheless some difficult issues remained to be resolved before the plan could be implemented by its timetabled date of 1987.

#### Education

Until the end of WWII education was provided mainly by church missions, with students usually housed in nearby residences in a few larger centres. Beginning in 1959, a massive development program was initiated by the federal government and was transferred to the territorial government in 1969. Some 70 government-operated schools now exist, with over 700 teachers and 12 000 students enrolled (compared with 6000 in 1962). A complete range of modern facilities are available up to the completion of secondary schooling, and the NWT has developed its own curriculum. Vocational training in the territories is supplied by a central facility at Ft Smith and by extension services throughout the NWT. A wide variety of adult vocational training programs are available, particularly geared to the needs of the area. Special efforts are made to encourage active local native participation in education programs, through further decentralization and local input to programs, through increased use of native languages and the use of local classroom assistants.

#### Cultural Life

Interest in native cultures in the NWT has developed with government encouragement. In addition to assistance to arts and crafts programs, the knowledge of elderly native peoples is being tapped for the schools and being recorded for the future. Native cultural programs are active. The ARCTIC WINTER GAMES, held every 2 years since 1970, include a variety of traditional native games as well as more widely known sports, drawing competitors from the NWT, Yukon and Alaska. The Prince of Wales Northern Heritage Centre with its museum and archives is a major centre of public information and research in the NWT. Other community museums, historical societies and heritage groups operate within the territories. The Territorial Library is based in Hay River and provides circulation from 30 points over the North.

#### Communications

Eight weekly newspapers are published regularly in the NWT and a general publisher is located in Yellowknife. In 1958 the CBC established a Northern Service to meet the special needs of northerners, native and non-native. Radio broadcasts are made in 10 native languages and dialects, as well as in English and French, and include local community as well as network programs. Relay transmitter stations and microwave systems help offset the great distances. Satellite channels now make it possible to transmit radio and TV programs into the most remote northern communities; all of the more than 60 centres with populations over 150 receive radio and TV. A second, commercial service offering as great a variety of programs as anywhere on the continent began in 1982. Two TV stations are located in Yellowknife and one in Frobisher Bay. Telephone and telegraph services link nearly all communities and those few without service generally have HF or VHF radios for emergency use.

#### Historic Sites

Active archaeological surveys are providing greater knowledge about the early native peoples in the Subarctic and the Arctic. Such surveys have also provided decisive evidence re-

cently of Viking presence in the Eastern Arctic. Many historic sites are associated with the fur trade in the Subarctic, and with exploration for the NORTHWEST PASSAGE and the lost Franklin Expedition in the Arctic. These sites are now protected by law against vandalism and looting.

### History

A variety of aboriginal cultures existed in the area before the arrival of the whites, based upon the nomadic hunting and fishing economies of the Inuit in the Arctic, and of the Dene in the Subarctic. Within the latter Athapaskan linguistic family, some 7 dialectal groups existed: Chipewyan, Yellowknife, Slave, Dogrib, Hare, Nahanni and Kutchin.

**Exploration** The first known white explorers to visit today's NWT were the Vikings, who sailed to the Eastern Arctic from their Greenland settlements (c1000 AD). In 1576 Martin FROBISHER was the first of a series of European explorers seeking the Northwest Passage, but by the early 16th century the severe ice conditions and the limitations of the ships checked much farther advance. In 1770-71 Samuel HEARNE of the HBC made a remarkable overland trip from Churchill through the arctic mainland to the COPPERMINE, but though the company used the Hudson Bay route, its interests were farther inland on the continent. Alexander MACKENZIE of the NWC pushed N from Ft Chipewyan on Lk Athabasca in 1789 to discover and follow the Mackenzie R to its mouth. Fur trade posts were soon established along his route and in tributary areas, and were subsequently taken over by the HBC. Later exploration in the Arctic Archipelago focused on a renewed search for a Northwest Passage in the first part of the 19th century, and on attempts to reach the geographic North Pole in the latter part. The disappearance of Sir John FRANKLIN's 1845 expedition led to the addition of much map information by the search expeditions and included the traverse of the elusive passage in 1853 by M'Clure (though the first traverse by ship was in 1903-04 by AMUNDSEN). Later British and American expeditions proceeding up the E coast of Ellesmere I explored much of the eastern Queen Elizabeth Is. The Norwegian explorer Otto SVERDRUP discovered most of the remaining islands to the NW at the turn of the 20th century, with Vilhjalmur STEFANSSON completing the final discoveries in 1913-18.

**Settlement** The fur trade posts provided the only nuclei of white settlement in the NWT until relatively recently. Missions were established near the posts along the Mackenzie in the latter part of the 19th century. Federal presence was represented in these small settlements after the turn of the century by the RCMP, by Royal Canadian Corps of Signals radio stations and by other agencies. Strategic water transportation sites, such as Ft Smith and Tuktoyaktuk, provided other attractions for limited settlement. Because of its easier accessibility and more varied resources, more incomers trickled into the Mackenzie Valley than the Arctic. Beginning in the 1930s mineral exploration aided by the bush pilots and their improved aircraft resulted in a significant influx of newcomers, even into the Arctic mainland. However, actual mine development and a new economic base for settlement were again restricted to the Mackenzie Valley.

**Development** In recent decades major change and development in the NWT have resulted from international and national political events, widespread social change, large-scale resource demands and the availability of improved technology. As early as WWII the impact of international hostilities was felt in Mackenzie Valley settlements through the Canol Project and in the southern part of the Eastern Arctic through the North East Staging Route airports. The Cold War caused Dew Line radar

stations to be built across the Arctic and contributed to the introduction of the first permanent settlements in the Queen Elizabeth Is as part of the Joint Arctic Weather Stations project. The federal government assumed increased responsibility with the creation (1953) of the Department of Northern Affairs and National Resources (now the Department of Indian Affairs and Northern Development). Major improvements were made in health services, housing, education facilities and communications to bring them more into line with those of southern Canada. More recently much of this responsibility has been delegated to the territorial government. Government services are now more numerous throughout northern settlements and occasionally provide the greatest source of local employment. As a result, most northern residents now live in permanent settlements for most of the year. The voracious world demand for minerals and fuels along with improvements in mining and transportation technology have made northern resources economically attractive, and resource development is necessary to provide employment; but there is also a responsibility to protect the environment for native people who wish to continue their traditional way of life and to protect wilderness habitats for future generations.

*Reading:* T. R. Berger, *Northern Frontier, Northern Homeland* (1976); L.-E. Hamelin, *Canadian Nordicity: It's Your North, Too* (1979); D.H. Pimlott, et al, eds, *Arctic Alternatives* (1973); K.J. Rea, *The Political Economy of the Canadian North* (1968); W.C. Wonders, ed, *The North* (1972); M. Zaslow, *The Opening of the Canadian North, 1870-1914* (1971), and ed, *A Century of Canada's Arctic Islands, 1880-1980* (1981).

**Norway House, Man**, consists of 2 closely related communities along Little Playgreen Lk and the E channel of the Nelson R, 30 km N of Lk Winnipeg and 460 km N of Winnipeg. The Norway House Indian Reserve, pop 1812 (1981c), with Rossville as its centre, is under the jurisdiction of the federal Dept of Indian and Northern Affairs, as well as an elected band chief and council. The nonreserve community (pop 626), under the provincial Dept of Northern Affairs, has a mayor and 6 councillors.

Located at the junction of several water routes, screened by a rocky shoulder from Little Playgreen Lk, Norway House was a hub of the HUDSON'S BAY COMPANY's fur-trade and supply lines, and an administrative centre for Rupert's Land. Three HBC posts were built in the area 1801-26, the last being at the site of the present community. Named after Norwegian axemen who were hired to open land communications from YORK FACTORY, Norway House was known for its fishing, hunting and for the production of YORK BOATS. Settlers from the RED RIVER COLONY found temporary refuge here in 1815 and 1816-17 after they were attacked by forces of the rival North

Situated north of Lk Winnipeg, Norway House (shown 1925) quickly became the centre of the Hudson's Bay Co's transport system. The brigades from every part of the Northern Department stopped at Norway House on their way to and from York Factory. The neat wooden buildings ranged in a square are typical of 19th-century trading-post architecture (courtesy Province of Manitoba Archives).

West Co. Rev James EVANS, a Methodist, established a mission nearby in 1840 with 2 Indian associates. The original HBC warehouse, gateway and powder magazine have been preserved, and Norway House is still an active HBC centre. Commercial fishing, services and trapping are the mainstays of the local economy.

D.M. LYON

**Norwegians** Some 500 years before Columbus landed on a Caribbean island, displaced Norsemen discovered and attempted a settlement on Canada's shores (see NORSE VOYAGES; ICELANDERS). Nordic sagas helped Helge Ingstad, a Norwegian explorer and writer, to discover an ancient Norse site at L'ANSE AUX MEADOWS on the northern tip of Newfoundland in the 1960s — the earliest known site of European settlement in America. Norwegians were active in Canadian waters again at the end of the 19th century, with Fridtjof Nansen as the pioneer of major Norwegian expeditions. Otto SVERDRUP charted many of the arctic islands and discovered AXEL HEIBERG, AMUND RINGNES and ELLEF RINGNES islands — all named for his Norwegian sponsors. Norwegian Roald AMUNDSEN navigated the last unsailed link in the NORTHWEST PASSAGE. It was not until 1930 that Norway recognized Canadian sovereignty in the Arctic. Henry A. LARSEN, of Norwegian birth, was the first Canadian to travel the Northwest Passage.

Permanent Norwegian migration to N America began in 1825 when the first shipload of Norwegians arrived in New York. In the next 75 years some 500 000 Norwegians landed at Québec, for this was the shortest corridor to the central American states. In spite of efforts by Canada, very few remained because of Canada's restrictive land policies at that time. Not until the turn of the century did Norwegians accept Canada as a land of the second chance.

**Migration and Settlement** Major settlements by Norwegians in the Canadian West occurred between 1886 and 1929, a span of time that can be roughly divided into 3 periods of 15 years each. In the first period, from 1886 to the turn of the century, the building of the CPR and the opening up of the West to homesteaders brought Norwegian settlers, and a Norwegian colony was established in Calgary in connection with the Eau Claire Lumber Mill. Second, from 1900 to 1914, there was a great influx of Norwegians from both the US and Norway (18 790 from Norway). Third, from 1914 to 1929, 21 574 Norwegians arrived from Norway. The 1931 census reported 93 243 people of Norwegian descent in Canada. Of these, 39 241 were born in Canada, 32 551 in Norway and 21 451 in the US. The GREAT DEPRESSION and WWII reduced the flow of Norwegian immigrants to 1376 from 1930 to 1945. From 1945 to 1959, 9196 arrived, but between 1960 and 1975 only 4615. Currently, the number of immigrants from Norway is very low and shows signs of decreasing.

**Social and Cultural Life** In Canada, Norwegians established their own ethnic and religious associations. Because Norwegian settlements in Canada began as extensions of their experiences in America, their major social organizations were generally continental institutions. This is still true of the Sons of Norway lodges, which were originally established in Minneapolis in 1895.

The ethnic paper *Norrana*, founded in 1910 in Winnipeg, is still published in Vancouver and has some 4000 subscribers. According to the 1981 census, there are now only 19 695 Canadians that claim Norwegian as their mother tongue.

In 1941, of Norwegians in Canada, 84.7% adhered to the Lutheran Church, 5.4% the United Church of Canada, 2.6% the Anglican, 1.5% the Presbyterian and 5.8% miscellaneous groups. In 1967 the Evangelical Lutheran

Church, of Norwegian background, became an autonomous Canadian synod. Those of Norwegian background are a diminishing minority because of continuing church mergers.

Because most of the early immigrants were literate and Lutheran, they placed high value on a Christian education for their children. Most Norwegian settlements not only promoted local summer parochial schools but conducted confirmation classes beyond the regular Sunday school. The Norwegian Lutherans established Camrose Lutheran College in 1911, Outlook College in 1915. Then, in co-operation with other Lutheran synods, they founded the Canadian Lutheran Bible Institute in 1932 and Luther Theological Seminary in 1939.

**Maintaining Group Identity** Over the years, assimilation was promoted by the numerical superiority and dominance of an Anglo-Canadian culture, the levelling influence of the public school system, the decreasing migration from Norway, the readiness of Norwegians to speak English and to marry into other groups, their readiness to accept Canadian citizenship and their above-average educational status, which opened doors to advancement in urbanized society. Nevertheless, a distinctive cultural identity is still maintained in the homes of Norwegian Canadians where traditions are centered on festivals and foods. Ethnic clubs and societies promote charter tours to Norway so that recent generations may become aware of their distinctive heritage. Norwegian ethnicity, far from dying out, has recently reasserted itself. Language classes in Norwegian are again popular, and even the third and fourth generations are discovering the distinctiveness of their roots.

Well-known Canadians of Norwegian descent include skier Anne HEGGTVIET and figure skater Karen MAGNUSSEN.

GULBRAND LOKEN

*Reading:* Gulbrand Loken, *From Fjord to Frontier: A History of the Norwegians in Canada* (1980).

**Nor'Wester**, shortened version of North-Wester (variously spelled); historically, a NORTH WEST COMPANY agent, WINTERING PARTNER or servant; a trader or *engagé* who winters in the hinterland; or a veteran of these experiences. In the plural the term may refer to the NWC itself. A native or resident of the Northwest Territories, usually non-Indian, may be called a Nor'Wester, but in the literature of the FUR TRADE the term is usually associated with the NWC and its members.

JEAN MORRISON

**Notary** In common law provinces persons admitted to the Bar are sworn as notaries public. Other persons may be so commissioned by the LIEUTENANT-GOVERNOR upon the recommendation of the ATTORNEY GENERAL. A notary may draw and issue deeds, contracts and other commercial instruments and is a commissioner for taking affidavits. In Qué the legal profession is divided into "notaires" and "avocats." Notaires draft or receive acts and contracts that need authentication, an important aspect of Qué CIVIL LAW. They are not involved in matters where a dispute exists between the parties as to law or facts.

K.G. McSHANE

**Notley, Walter Grant**, political leader (b at Didsbury, Alta 19 Jan 1939; d near High Prairie, Alta 19 Oct 1984). He was raised on a farm and shortly after graduating from U of A (1961) was hired as provincial secretary of the newly formed provincial New Democratic Party. In 1968 he was elected Alberta leader of the party, which at that time held no seats in the legislature. After 3 unsuccessful attempts to win a seat, he won the new riding of Spirit River-Fairview in 1971, holding it for the rest of his life. He was a one-man caucus for 11 years and won respect for his parliamentary skills and knowledge of the issues. He became Leader of the Official Opposition in Alberta after the NDP

elected a second member in 1982. Although proud of his Alberta heritage, Notley had a broader perspective as well, serving on the national executive of his party. When the Alberta government reduced oil shipments to central Canada in protest against the National Energy Program, Notley was the only Alberta legislator to oppose the move. He participated actively in the constitutional debate of 1980-81, criticizing the extreme views of both the federal and Alberta governments. Notley died in an aircraft accident.

GARTH STEVENSON

**Notman, William**, photographer (b at Paisley, Scot 8 Mar 1826; d at Montréal 25 Nov 1891). He immigrated to Canada in 1856 and found employment with a Montréal wholesale dry-goods company. He had learned the daguerreotype process in Scotland and set up a photographic studio in Montréal. He rapidly gained prominence because of his superb portraits, the basis of attracting customers from all classes — from royalty to tradesmen. In 1858 he was commissioned by the Grand Trunk Ry to photograph the construction of Montréal's remarkable Victoria Bridge.

Notman's staff (55 in the 1870s) included apprentice photographers. He established 14 branch studios in eastern Canada and the US, all managed by his trainees. Notman won many medals for his work in exhibitions at home and abroad. To meet the demand for landscapes and other views, he sent his photographers across Canada, recording the construction of the CPR, the rise of the western cities, the life of the plains and coastal Indians, the lumber trade of the Ottawa Valley, East Coast fishing, rural activities and the bustle of the cities. Notman also became famous for the composite photographs of the snowshoe and curling clubs produced by his studio. These large creations were made up of 300 or more individual photographs, cut out and pasted onto a painted background.

Always community minded, Notman was involved in art associations, church societies, sports clubs and other Montréal organizations. He was also a backer of the Windsor Hotel and co-partner in large holdings in Longueuil, where he had a summer home. Of his 7 children, all 3 boys became photographers. William McFarlane NOTMAN, his eldest son, took over the business at his death. The Notman collection, containing over 400 000 photographs, plus office records and family correspondence, forms part of the collections of the Norman Photographic Archives housed in the McCord Museum of McGill University.

STANLEY G. TRIGGS

**Notman, William McFarlane**, photographer (b at Montréal 1 Nov 1857; d there 1 May 1913). At age 15 he started to work for his father, photographer William NOTMAN, and was made a partner in the business at about age 25. His portraits — of rural people at daily tasks and of well-dressed urban notables — are sensitive and powerful, and his skill in portraying the Canadian landscape was outstanding. Notman made 8 trips to western Canada 1884-1909 to photograph along the CPR line, documenting the early growth of towns and capturing dramatic views of the Rockies and Selkirks. He accompanied the 1901 royal tour of the duke and duchess of York from Québec C to Victoria. Notman also photographed extensively in Murray Bay, Tadoussac, Lac St-Jean and the Eastern Townships. In 1908 he made a steamer voyage around Newfoundland, photographing the ports of call.

STANLEY G. TRIGGS

**Notre Dame Bay**, 6000 km<sup>2</sup>, is a large inlet of the Atlantic Ocean on the NE coast of Newfoundland. It contains many islands and its shores are indented by numerous coves and smaller embayments. One of Newfoundland's main rivers, the EXPLOITS, flows into the bay, carrying

large quantities of timber from the interior as far as the pulp and paper mills at GRAND FALLS. The principal activity on the bay is fishing, with important commercial catches of cod, capelin and lobster. LEWISPORT, a busy commercial port on the Bay of Exploits, is also the headquarters of the highly successful bluefin-tuna sportfishing on Notre Dame Bay. New World and FOGO are the largest islands in the bay, and FUNK 1, 60 km E of Fogo, is one of Newfoundland's primary bird sanctuaries.

P.C. SMITH

**Notre-Dame Church**, Place d'Armes, Montréal, built as a parish church, 1823-29, by the congregation of St-Sulpice, is the earliest surviving example of a Gothic revival church in Canada. This daring and innovative design on a scale then unequalled in N America was by James O'Donnell, an Irish architect who had emigrated to New York. It was carried out in the face of strong criticism from the architecturally conservative Abbé Jérôme DEMERS of Québec City, who decried the "protestantism" of its Gothic style and rectangular plan (without apse or transepts).

CHRISTINA CAMERON

**Notre Dame de Lourdes**, Man, Village, pop 627 (1981c), inc 1963, is situated on the NE slope of the Pembina Hills, 130 km SW of Winnipeg. French Canadians homesteaded in the area 1881, followed by French and Swiss immigrants 1890-91. The main settlement began under Dom Paul Benoît of the Chanoines Réguliers de l'Immaculée-Conception who surveyed the Roman Catholic mission of Notre Dame de Lourdes 1890. He returned 1891 with settlers and fellow priests, who established a church, a monastery and schools for boys and for aspirants to the priesthood. Over the next 4 years, 5 groups of settlers and priests followed, including the Chanoines des Cinq Plaies du Sauveur who began a convent 1895. The clerics from Notre Dame served in surrounding parishes and the Chanoines developed new convents. Dom Benoît left the parish 1910 and many of his companions became secular priests. The Chanoines remained at Notre Dame until 1948. Today the village is primarily a service and commercial centre.

D.M. LYON

**Nottaway, Rivière**, 776 km (via Rivière Bell to head of Rivière Mégiscane), rises in W-central Québec and flows N via Lacs Parent and Quévilon into Lac Matagami. Here it is joined by its chief headstream, Rivière Waswanipi, and then drains NW through Lac Soscumica. Eventually, it empties into SE JAMES BAY at Rupert Bay where a trading post was established. Its drainage basin covers 65 800 km<sup>2</sup> and it has a mean discharge of 1130 m<sup>3</sup>/s. This powerful river's name is Indian (possibly Algonquin) in origin and has been variously translated as "the enemy" or "the river of the enemy."

DAVID EVANS

**NOVA, AN ALBERTA CORPORATION**, with head offices in Calgary, is a Canadian energy company with 1983 sales or operating revenues of \$3.8 billion (ranking 18th in Canada), assets of \$6.8 billion (ranking 11th) and 8600 employees. Ownership of the corporation is widely distributed with over 90% Canadian ownership. Originally known as The Alberta Gas Trunk Line Company Limited, the company was established in 1954 to build, own and operate Alberta's natural gas gathering and transmission facilities. In the early 1970s the company broadened its base, and today it is involved in natural gas transmission, resource development, petrochemicals and manufacturing. It was renamed Nova, An Alberta Corporation in 1980. The group of companies currently operating under the NOVA banner includes Husky Oil Ltd, Foot-hills Pipe Lines (Yukon) Ltd, and Nova-cor Chemicals Ltd. NOVA also has energy-related enterprises in the US, Italy, New Zealand and elsewhere.

**Nova Scotia, 1714-84** Confirmed as British by the TREATY OF UTRECHT in 1713, the peninsula of NOVA SCOTIA was neglected until 1749 — a period of "phantom rule" and "counterfeit suzerainty." Since the only English inhabitants were the garrison and a few merchants at Annapolis, and fishermen and a handful of troops at Canso, the elective assembly prescribed by the governors' commissions was impracticable. The main body of inhabitants, the ACADIANS, had been given a year to take an unqualified oath of allegiance, but although they persistently refused, they were not forced to leave; instead they flourished, increasing from nearly 2000 in 1710 to more than 12 000 by 1750.

Determined to remove the danger posed by the presence of the French at LOUISBOURG on Île Royale (Cape Breton I), Gov William Shirley of Massachusetts and New England troops, with a British naval force, captured the fortress in 1745. Much to their chagrin, it was returned to the French by the Treaty of Aix-la-Chapelle in 1748. The British government decided, however, to establish a counterpoise to Louisbourg, and in June 1749 Edward CORNWALLIS with some 2500 settlers founded HALIFAX and made it the provincial capital. Over the next few years a considerable number of "foreign Protestants," largely German, also arrived, many of whom founded LUNenburg in 1753.

On the eve of the SEVEN YEARS' WAR Gov Charles LAWRENCE sought to remove the danger presented by the French at FT BEAUSÉJOUR and by the French missionary, Abbé Jean-Louis Le Loutre, who was promoting anti-British sentiment among Acadians and MICMAC. Beauséjour fell to Lawrence's forces in June 1755, and within the next few months, after the Acadians had rejected a final ultimatum to take the oath, he deported 6000 on his own initiative. After the war some 2000 Acadians returned and re-settled in the province, many in the new township of Clare. Cape Breton and PEI were annexed to Nova Scotia after the war, but the latter was separated permanently in 1769 and the former temporarily 1784-1820.

Because New Englanders in Halifax kept insisting on the "rights of Englishmen," Lawrence, on instructions from Britain, reluctantly summoned an elective assembly which met in Halifax on 2 Oct 1758, the first in what is now Canada. To fill the lands formerly occupied by the Acadians, he also issued proclamations inviting settlers. Between 1760 and 1763 alone no fewer than 4500 New Englanders entered the province. About the same time 500 Ulstermen arrived, mostly under the auspices of the adventurer Col Alexander McNutt; they were followed in 1772 and 1773 by some 1000 York-shiremen who settled on the Isthmus of Chignecto and in 1773 by nearly 200 Scots who settled at PICTOU (see HECTOR). But it was the New Englanders who laid the enduring foundations of Nova Scotia, making it, in a very real sense, a "new New England." A population of about 8000 in 1763 increased to more than 17 000 in 1775, well over half of them New Englanders.

Yet the New Englanders were unable to establish some of their customary modes of self-government. Instead of town meetings they were forced to accept the undemocratic English system of local government by courts of sessions and grand juries. These institutions remained until 1879 because the province was under the rule of a Halifax merchant-official oligarchy, which dominated the COUNCIL OF TWELVE and manipulated the Assembly to serve its own interests. For a dozen years prior to 1775 this group under the leadership of Joshua MAUGER, latterly a British MP, plundered the province, secured the recall of 3 governors and defeated the well-intentioned, but inept, attempts of Gov Francis Legge to disclose their abuses.

During the AMERICAN REVOLUTION many of the

province's New Englanders undoubtedly sympathized with the Americans; certainly they were as willing to trade with Massachusetts as with the British forces. But outside strongly British Halifax, Nova Scotians showed no desire to become involved, and John Bartlet BREBNER's description of them as the "neutral Yankees of Nova Scotia" is exceedingly apt. If nothing else, their existence at scattered intervals along the edges of a narrow peninsula separated by rough terrain prevented concerted, united action on their part. Except for the short-lived, ineffectual "Eddy rebellion" at Ft Cumberland, Nova Scotia remained quiet. By 1782 LOYALISTS began to arrive, the first of a large influx, which affected the province markedly and led in 1784 to the creation of New Brunswick and Cape Breton as separate provinces. J. MURRAY BECK

**Nova Scotia** juts out into the N Atlantic, some say like a giant lobster-shaped pier; others call it the wharf of N America; its tourist literature describes it as "Canada's ocean playground." Nothing has influenced Nova Scotia and its people more than the sea. Because the province is nowhere more than 130 km wide, no part of it is far from the sea. With its fine harbours located near major sea-lanes, it has served as a military and naval bastion in many wars. Halifax, in truth, was the warden of the north.

Today the sea retains its significance, having made Nova Scotia the big fisherman of the N Atlantic, outrivalling its nearest competitors, Newfoundland and New England. Its serrated, 10 427-km shoreline embraces the rugged headlands, tranquil harbours and ocean beaches so attractive to tourists. One of its 3809 coastal islands, SABLE ISLAND — 193 km offshore and once "the Graveyard of the Atlantic" — may have rich deposits of gas and oil under the surrounding waters. Many other islands and much coastal land have been purchased by outsiders in the last decade or two. Once regarded as the boondocks, Nova Scotia is seen increasingly as a place where the good life can be lived even with a below-average per-capita income. Nova Scotians generally are beginning to insist that material development does no harm to the pleasant living they now enjoy.

#### Land and Resources

**Main Regions** The chief physical feature of Nova Scotia is the Atlantic Upland, which shows itself in 5 fragments, separated in places by extensive lowlands. Of these fragments, the largest is the Southern Upland, which occupies the southern and central part of the province. Starting at the rugged Atlantic coast, marked by many inlets, islands, coves and bays, it rises at the rate of 2.75 m/km to an altitude of 180-210 m in the interior. Its northern border constitutes the South Mountain. The second fragment is the North Mountain, a range of trap rock which runs parallel to the South Mountain for 190 km along the Bay of FUNDY from Cape Blomidon on Minas Basin to Brier Island. Between the 2 ranges lie the fertile valleys of the Annapolis and Cornwallis rivers, the celebrated apple-

growing region of Nova Scotia. The third fragment consists of the flat-topped Cobequid Mountain, rising to 300 m and extending 120 km across Cumberland County; the fourth has its beginnings in the eastern highlands of Pictou County and extends in a long narrowing projection through Antigonish County to Cape George. The fifth fragment, on northern CAPE BRETON ISLAND, is a wild, wooded plateau, which at one point rises to a height of more than 520 m above sea level. It largely accounts for the highly scenic character of CAPE BRETON HIGHLANDS NATIONAL PARK, especially as viewed from the Cabot Trail, which runs through it. In contrast, the southern part of Cape Breton I is largely lowland.

**Geology** The deep drainage channels that have been cut through the uplands have exposed the roots of the mountains and laid bare rocks which are among the oldest of the Earth's crust and are representative of most of the geological time scale. Peninsular Nova Scotia consists of Paleozoic cover pierced by a granite backbone which, because it is highly resistant to change, occupies the higher elevations. The North Mountain resulted from volcanic action in Triassic times, and the Annapolis and Cornwallis valleys were carved out in the same period. Practically all the industrial minerals, including gypsum, limestone, sandstone, salt and barites, occur in rocks of the Mississippian age. The coal deposits of the province are to be found in the several groups of Pennsylvanian rocks, especially the Pictou, Stellarton and Morien groups.

**Surface** Only 10% (about 538 000 ha) of Nova Scotia is agricultural land. That with the greatest potential for farming is situated in the lowlands where the soils have developed on deep tills; the uplands usually have shallow, stony soils. The most extensive lowlands, and hence the best agricultural land, are to be found along the Bay of Fundy and Northumberland Str. The tremendously high tides of the Bay of Fundy have created large areas of marshland, which, by means of dikes begun in Acadian times, have been converted into valuable agricultural lands.

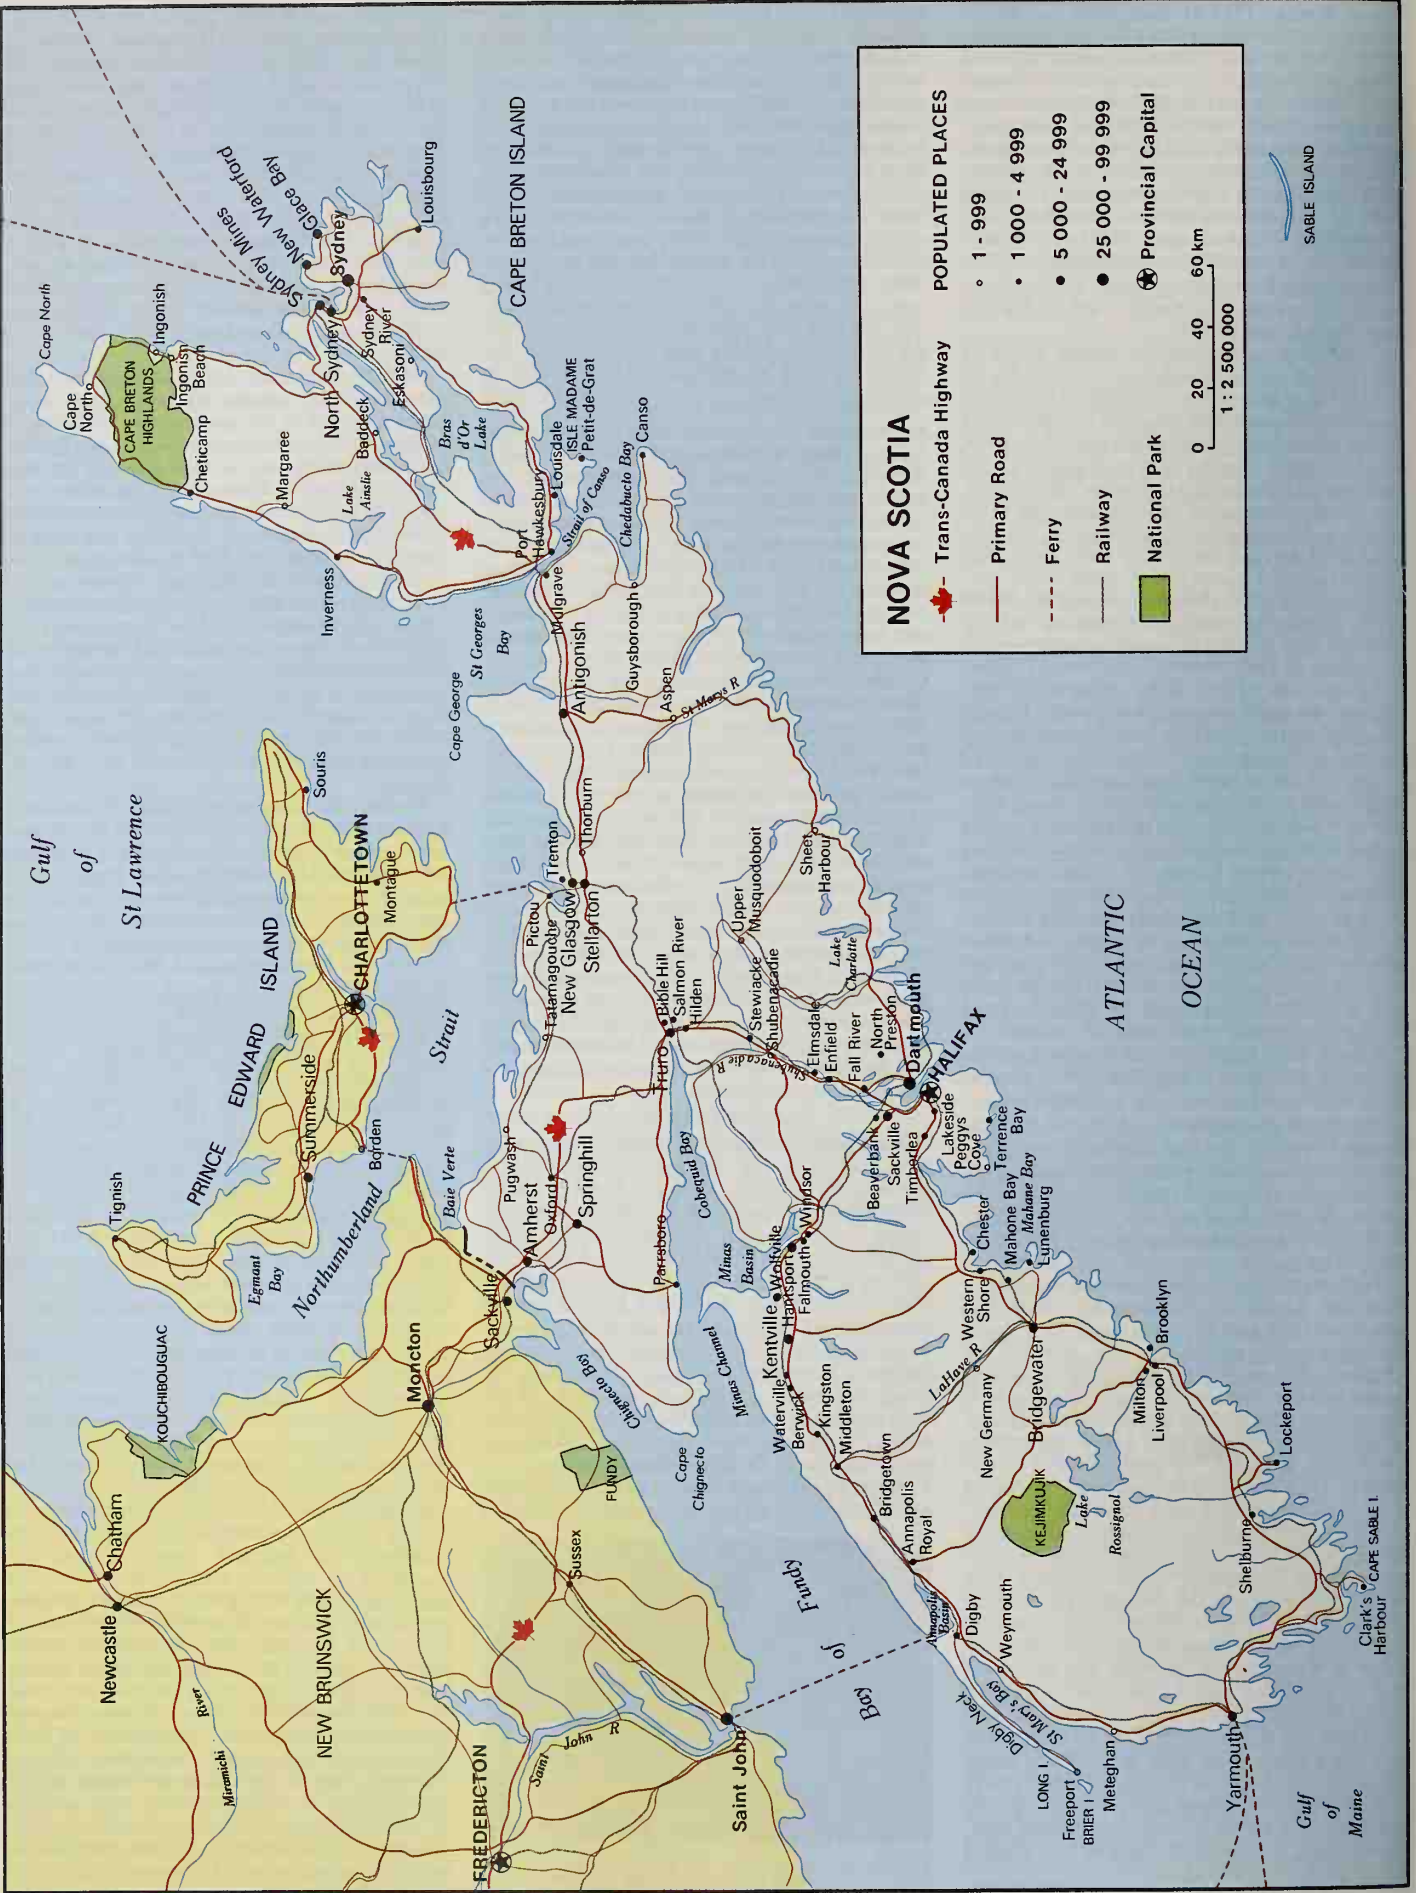

Originally, most of the province was covered by forest, but little of the virgin forest remains, except in the plateau of NE Cape Breton I. Because of the acid soil and the slow growing season, secondary growth has tended to be coniferous, but hardwoods continue to exist in sufficient abundance to produce a colourful display in the autumn. In swampy areas and rocky barrens, mosses, lichens, ferns, scrub heath and similar growths are common. Wild flowers grow in profusion, among which the mayflower, pitcher plant, white water lily and several varieties of violets stand out for their beauty. Widely found throughout the province are herbaceous plants such as Clintonia, cranberries, blueberries and many species of goldenrod. The European cuckooflower has become common in the Annapolis Valley, while the ragwort has spread over eastern Nova Scotia.

**Water** Over 3000 lakes have been impounded by the irregularly high and low terrain, especially in the Southern Upland region, and hundreds of streams and small rivers have eroded their way through it. Because of the general direction of the watersheds, the rivers cannot be long, but with moderately heavy precipitation, normally no shortage of water occurs. The province's largest lake, the 930 km<sup>2</sup> BRAS D'OR, was created when the sea invaded the area between the upland and lowland areas of Cape Breton; saline and tideless, it is widely used for recreation. On the peninsula the largest lake is Lk Rossignol in the SE central area, a focus of both lumbering and recreational activities. Though short, the rivers have had considerable significance historically and economically. The Sackville and Shubenacadie, used extensively by

Clark's Harbour on the western side of Cape Sable Island, NS. The island is connected to the southwestern tip of NS by a causeway (photo by Janis Kraulis).

the Indians, were important in early transportation; some, such as the Mersey, continue to play a significant role in lumber and pulpwood production; others, such as the Margaree and St Mary's, have become celebrated as salmon streams; several have afforded the means to construct hydroelectric power plants, however small. The high tides of the Bay of Fundy are a remarkable phenomenon. The bay, 77 km at its mouth, narrows to 56 km where it divides into Minas Basin and Chignecto Bay. For about 240 km the water is forced forward to reach a height of 15-18 m above low-tide level in its narrowest extremities. The high tides facilitate the loading of gypsum, lumber and the like by freighters, which at low tide rest on mud flats.

**Climate** Although systems moving eastward from the interior of the continent dominate the province's weather, they are only part of a complex process which at times makes the meteorologist's task a nightmare. These systems often react with low pressure systems coming from the S and moving northeastward along the coast, and the whole is affected by the proximity of the Labrador Current and the Gulf Stream. Generally the water has a moderating influence upon the climate, particularly along the Atlantic coast where the average Jan temperature is about -4°C and the summer mean temperatures are in the high teens Celsius.

The influence of the sea is felt in other ways. Ice brought down by the Labrador Current leads to a late spring marked by cold winds, rain and mist. In summer, especially in June and July, the mingling of the warm Gulf Stream and the cold Labrador Current produces a great deal of sea fog, which often drifts over the coastal areas. Autumns are consistently fine, clear and long. The coastal areas are both milder and wetter than the rest of the province. Yarmouth has about 160 frost-free days a year compared with 100 in parts of the interior. Rain may vary from 140 cm in coastal areas to 100 cm inland. Snowfall ranges from 160 cm to 245 cm.

**Resources** The natural resources of Nova Scotia are somewhat limited. Today those which sustained the early settlers remain vital to the provincial economy. The FISHERY remains most important. The province is plentifully supplied with both metallurgical and thermal COAL, and recently the latter has been given prominence in the province's overall energy strategy. The potential for offshore OIL AND NATURAL GAS along the southern coast remains largely unknown, but it appeared by 1982 that the Venture gas field off Sable I was sufficiently large to warrant the consideration of bringing it into production.

**Conservation** Natural resources are conserved in a variety of ways. The adoption in 1977 of the 200-nautical-mile (370 km) offshore fishing zone and recognition of the federal government's right to regulate the fishery has permitted it to take the action needed to restore badly depleted fishery stocks. To preserve and promote the inland salmon and trout fisheries, the provincial government provides water control, restocking of lakes and research. At Shubenacadie it maintains a wildlife park and a bird hatchery. But its major effort is directed towards protection and renewal of the forests. Part of its protection service is provided by fire towers and an aerial patrol service aimed at early detection of fires. The Dept of Lands and Forests provides seedlings for planting on crown lands and also supplies them to individuals and companies for private reforestation. Recently it has also entered into a program with the federal government designed to improve the yield of the forests through modern management practices. But it has been powerless to prevent the ravaging of large areas of the Cape Breton Highlands by the spruce budworm, in part, perhaps, because of strong public resistance to the use of chemical sprays.

## Nova Scotia

**Capital:** Halifax

**Motto:** Munit Haec et Altera Vincit ("One defends and the other conquers")

**Flower:** Mayflower

**Largest Cities:** Halifax, Dartmouth, Sydney, Glace Bay, Truro, New Glasgow, Amherst

**Population:** 847 000 (1981c); rank seventh, 3.48% of Canada; 54.9% urban; 42.9% rural nonfarm; 2.1% farm; 15.9 per km<sup>2</sup> density; 7.4% increase from 1971 and 2.3% from 1976; 1.4% increase 1976-81; Jan 1984e pop, 866 100

**Languages:** 96% English; 2.9% French; 1.1% Other

**Entered Confederation:** 1 July 1867

**Government:** Provincial — Lieutenant-Governor, Executive Council, House of Assembly of 52 members; federal — 10 senators, 12 members of the House of Commons

**Area:** 55 491 km<sup>2</sup>, including 2650 km<sup>2</sup> of inland water; 0.06% of Canada

**Elevation:** Highest point — Cape Breton (532 m); lowest point — sea level

**Gross Domestic Product:** \$8.3 billion (1982e)

**Farm Cash Receipts:** \$233.1 million (1982)

**Value of Fish Landings:** \$270.804 million (1983 prelim total); \$259.511 million (1982 total)

**Electric Power Generated:** 6 167 610 MWh (1983)

**Sales Tax:** 10% (1984)

## People

**Settlement and Immigration** The French who established the first successful settlement of Europeans in the province at PORT-ROYAL in 1605 named it ACADIA, from the name assigned to the coast by VERRAZZANO. Lasting British settlement did not occur until the founding of HALIFAX in 1749 by Edward CORNWALLIS. Over the next 3 years about 2500 foreign Protestants, mostly German, arrived and were largely settled at LUNenburg. Between 1760 and 1768 up to 8000 New Englanders, the pre-Loyalists, came as settlers, together with several hundred emigrants from northern Ireland. About 1000 Yorkshiresmen who arrived between 1772 and 1774 settled at the Isthmus of Chignecto and the first Scots reached Pictou in 1773 aboard the HECTOR. The AMERICAN REVOLUTION brought about 20 000 LOYALISTS, disbanded soldiers and REFUGEES to Nova Scotia as permanent settlers. Some BLACKS came with the pre-Loyalists and Loyalists, some from Jamaica in 1796, and although many did not stay, a few hundred were left to be joined by the 2000 who arrived following the WAR OF 1812. Between 1815 and 1851 about 55 000 Scots, Irish, English and Welsh established themselves in the province, and after the expansion of the coal and steel industries — beginning in the 1890s — newcomers arrived from the British Isles and continental Europe to settle mostly in Cape Breton.

**Ethnicity, Mother Tongue and Religion** In 1981 the total population was 847 442, an increase of 7.4% over the previous 10 years and 2.3% over the previous 5, but a continuing decline in the percentage of the national total. About 72% of the people in 1981 were of only British and about 8% of only French descent, and a further 8% had some British or French in their background; the remainder were European, Asian, African or American Indian in origin. The mother tongue of 93.5% was English; of 4.3%, French. Most Acadians are in Digby and Yarmouth counties on the mainland, and in Inverness and Richmond counties on Cape Breton I. Nevertheless, many Acadians have moved elsewhere, especially to Halifax, and a

speedy loss of their mother tongue has often occurred. Legislation enacted in 1981 provides for Acadian children to be taught in French wherever the numbers make it practicable. But most Acadian parents want their children to be fluent in English as well as French. In 1981, 36.9% of the population was Roman Catholic; among Protestants, United Church adherents constituted 20.2%, Anglicans 15.6%, Baptists 12.1%, Presbyterians 4.6% and Lutherans 1.5%.

**Labour Force** In 1981 the total number of males in the labour force was 210 525, a participation rate of 70.3%; 8.2% were unemployed. The participation rate of women was 38.1%; 11.1% were without work. In contrast with past experience the percentage of unemployment in recent years has usually been only slightly above the national average and occasionally a little lower. A continuing problem of Nova Scotian labour is that wages generally lag considerably behind the Canadian average.

**Urban-Rural Living** As in the rest of Canada, a marked shift from rural to urban living has occurred in recent decades. From 1941 to 1961 the proportion of rural dwellers declined from 54.6% to 43.4%, with a corresponding increase in urban dwellers. But in the late 1960s the process slowed down somewhat since in 1971 rural dwellers had fallen to 42.0%, and by 1976 the process had actually reversed because rural dwellers had increased to 44.2%.

In 1981 Halifax County had one-third of the provincial population, and the people in metropolitan Halifax, the largest urban centre in Atlantic Canada, numbered 277 727: 114 594 in the city of Halifax, 62 277 in the city of Dartmouth and 100 856 in the growing suburbs. The second-largest urban centre, SYDNEY and the 6 surrounding TOWNS, GLACE BAY, New Waterford, SYDNEY MINES, Dominion, North Sydney and LOUISBOURG, had a population of about 78 000 in 1981. That centre's future is unclear because of uncertainties surrounding the Sydney steel plant and the heavy-water plant at Glace Bay. The third urban area, encompassing the Pictou County TOWNS of NEW GLASGOW, Stellarton, Trenton, WESTVILLE and PICTOU, has a population of

Sydney, NS, noted since 1900 for its huge steel mill, the largest and most modern in Canada at the time of its construction (photo by John deVisser).

about 50 000 if the surrounding suburban and rural area is included. Although it no longer has the benefits of a coal-mining industry, it has been assisted materially by a relatively new paper plant and a tire-manufacturing factory.

#### Economy

The per capita income of Nova Scotians has seldom risen much above 80% of the national average. Limited natural resources and the great distance from central Canada are partly responsible, but greater blame has been attached to national transportation policies and, more especially, to the protective tariff or NATIONAL POLICY. The few provincial industries fostered by the NP have recently deteriorated and many of the early secondary industries have disappeared, unable to compete with central Canadian rivals. Nova Scotia has therefore had to rely mainly upon primary industries.

**Agriculture** Although the Micmac relied on hunting for their food, fishing captains in the early 16th century are believed to have cultivated vegetable gardens to feed their crews. At the same time the French were growing grain at Port-Royal and in 1609 they erected the first water-powered gristmill in N America. To secure salt for curing fish, they also built dikes along tidal marshes and later used them to begin a dikeland agriculture. The Marshlands Reclamation Commission in recent times has preserved and extended this system of dikes.

About 538 000 ha, 10% of the land, is agricultural. The largest cultivated areas are found in the Annapolis Valley and in some parts of northern Nova Scotia. But subsistence living on family farms has been common throughout wide areas of the province. Near the coast farming and fishing are often combined, as are farming and lumbering inland. Recent years have shown a trend towards larger, fewer farms, with a smaller total area, and a decrease in farm population.

The total value of agriculture to the provincial economy is estimated at about \$219 million (1981), and the annual gross farm income runs in the area of \$132 million derived from 16 specialized commodities. The largest single sector is DAIRYING, which supplies fluid milk for home use as well as for dairy-product manufacturing. The production of eggs, chickens and turkeys has also thrived in recent years; indeed, dairy and poultry products bring a greater return than do the fruits, vegetables and greenhouse products for which the province is better known. Beef and hog production, another expanding sector, yields about \$25 million annually. The

county fair is an important institution, and the one at Windsor, established in 1765, is the oldest of its type in N America.

**Industry** In the late 1970s Nova Scotia had over 700 manufacturing plants employing about 43 000 people (14.6% of the labour force). Most of the plants are relatively small, and the great majority of them are based on primary products such as pulpwood, fruit and vegetables. Over 60 of the industries have been established since the 1960s, largely as a result of incentives provided by the provincial and federal governments. At least half the manufactured products are destined for export, 70% to the US. Many newer industries involve investment from the US, Britain and Germany, and a few make no use of the province's natural resources. Of these, the 2 heavy-water plants at Glace Bay and the Str of Canso have uncertain futures, but Michelin of Canada successfully operates tire-producing plants at Granton, Bridgewater and Waterville, making extensive use of Nova Scotian labour.

As a province abounding in recreational and cultural opportunities and possessing more historic sites than any province except Québec, Nova Scotia has become a favourite of tourists in the June-Oct season. The number of tourists and the gross value of the industry have grown more than 30% in each of the past 2 decades. In 1981 the money expended by tourists exceeded \$500 million for the first time; the total number of visitors was over 1.7 million; and about 27 000 people were employed in the tourist industry.

Although several major Canadian banks had their origin in Halifax, their head offices are now located in central Canada; only the BANK OF NOVA SCOTIA still holds its annual meetings in Halifax. Many large Canadian corporations do, however, locate their regional offices in Halifax. That more Nova Scotians work in business, trade, finance and transportation than in resource and manufacturing industries is sometimes attributed to the continuation of a historical pattern among people whose ancestors were sea traders. Office buildings, hotels and stores are more prominent than factories and over 70% of the province's employed work in the service industries.

**Mining** The value of mineral commodities has increased steadily and reached about \$240 million in 1981. Coal, SALT, GYPSUM and other construction materials are the principal products in an industry employing about 5000 people. By far the most important mineral is coal; in 1981 the reserves were estimated at 3 billion t, half of it estimated to be recoverable, and 925 million t being within 64 m of the surface. Nova Scotia coal has had a chequered history. The rapid increase in production following the es-

tablishment of the Whitney Syndicate and the development of the steel industry were primarily responsible for the province's prosperity in the early 20th century. After WWI conditions in the coal areas were often troubled, and in the late 1950s the market contracted greatly in the face of competition from petroleum and natural gas. Production declined from about 6.6 million t in 1950 to about 2 million in 1971. But coal has made a striking comeback; following large increases in petroleum prices by the OPEC cartel, the province has determined to reduce the dependency on foreign oil by replacing it with thermal coal. The province is also producing a considerable amount of metallurgical coal, over 1 million t in 1977. The near exhaustion of earlier mines in Cumberland, Pictou and Inverness counties means that practically all the coal is now mined in Cape Breton County.

Gypsum and salt, found largely in Hants and Cumberland counties, are the most valuable minerals after coal. Gypsum, quarried more extensively here than in any other province, is sent to the US for processing. Nova Scotia also has the largest barite deposits in Canada as well as large deposits of sand, gravel and other construction materials. Production difficulties during 1982 brought about the closure of a small lead-zinc mine which had recently been opened at Gay's River.

The quest for energy sources has led to offshore exploration for gas and oil, especially on the Scotian Shelf in the neighbourhood of Sable I where substantial quantities of gas have been discovered. In March 1982 Prem John BUCHANAN signed a 42-year agreement with the federal government giving Nova Scotia the same benefits from its offshore resources that Alberta receives from its land-based oil and gas.

**Forestry** Lumbering has always been important in Nova Scotia's economy (see TIMBER TRADE HISTORY). In the 19th century much of the prosperity came from wooden ships and from the planking, deals and other lumber they carried overseas. Today more than 4.3 million ha, about 78.5% of the total area, is still forested, and over 74% of that is in the hands of small woodlot owners. The PULP AND PAPER INDUSTRY has now far outstripped the sawn-lumber industry in importance and value. Of approximately 1.3 million cords of pulpwood harvested annually, only a small proportion (64 298 cords in 1981) are exported. The most common softwood, balsam fir, is used not only for pulpwood, but also as the basis of a second industry — the export of Christmas trees. Lumber production annually ranges up to 200 million board feet; in 1981 it was 170.9 million board feet. The most important commercial hardwoods are yellow birch, red maple and sugar maple; the last also forms the basis of an industry for woodlot owners, especially in the N, through the production of maple syrup and allied products.

**Fisheries** Nova Scotia is second to BC in the value of its fishery, which first attracted Europeans to its shores. Salt and dried fish for export to Latin America was once the staple of the market, but quick-frozen and filleted fish altogether dominate the modern market. Since WWII, schooners with dories have given way to druggers that fish the entire year. In 1980 more than 11 000 fishermen and about 5000 shore-based workers were participating in the industry; about 6200 fishing craft, large and small, were supplying 81 processing plants throughout the province.

In a highly diversified industry, inshore fishermen account for about 70% of the total. No less valuable than groundfish such as haddock and cod are molluscs and crustaceans such as scallops and lobsters. The groundfish are caught both by offshore trawlers and druggers and by inshore boats including long-liners. Lobsters are

taken largely inshore by Cape Island boats; scallops by both offshore and inshore druggers; herring by seiners. In 1971 the swordfish industry ceased because of fear of MERCURY contamination.

With the agreement of other fishing nations Canada declared a 200-mile fishing limit in 1977, assuming the right to regulate most fishing banks on its continental shelf with the aim of letting the fish stocks recover from depletion by large, foreign factory ships. Although fish landings rose to a historic high value of about \$250 million in 1981, the industry was beset by problems. The offshore industry had long complained that the inshore fishermen, through a powerful lobby and a sympathetic minister, had been favoured at its expense. All the fishermen objected to overregulation by the federal authority, especially to a recent sector management plan, which discouraged flexibility. The new 200-mile limit had attracted hundreds of newcomers with deleterious results. Forced to operate under a quota system, large fish plants and druggers with heavy overheads found it costly to operate at less than full capacity. Processors experienced difficulties because of sales by inshore fishermen to foreign trawlers. An additional problem was that of having to sell a high-cost product of sometimes poor quality during a recession.

A long-standing dispute between Canada and the US over the ownership of Georges Bank, one of the world's richest fishing areas, was settled by the World Court in 1984. Although Canada received only one-sixth of the disputed territory, it was the most valuable portion and Nova Scotia fishermen suffered much less serious harm than the New Englanders.

**Transportation** In early Nova Scotia the sea was the only highway, but in the late 1760s road building began. Today, about 26 000 km of highways extend to every community in the province. Politics in the latter 19th century was largely railway politics; practically all the province's 1900 km of railway were built between 1854 and 1914, partly as government works and partly privately. In the last 3 decades, however, a steady decline in railway services has occurred. In 1983 the only passenger trains in operation were provided by VIA from Halifax through the Annapolis Valley to Yarmouth, from Halifax to Amherst and on to Montréal,

and from Halifax to Sydney. Freight services provided by the railways diminish year by year as permission is granted to discontinue operations on little-used trackage. Public transportation by road is provided by Acadian Lines and smaller bus companies, while a large part of the freight is moved by truck.

The attempt to build up a deep-water, bulk-cargo superport in the Strait of Canso has failed for the moment, but Halifax, a full day closer to Europe than any other American mainland port, continues to maintain pre-eminence in cargo handling. In the late 1960s a large container terminal was built on a 24 ha site in S Halifax and in the early 1980s a second was built at Fairview Cove in Bedford Basin at the north end of Halifax Harbour. Halifax is competing with Saint John and Montréal to have the container firms use its services, and time will tell if its facilities have been overdeveloped.

Seagoing car ferries connect southwestern Nova Scotia with New Brunswick (via Digby and Saint John) and with New England (via Yarmouth and Bar Harbor, Maine; and perhaps only temporarily via Yarmouth and Portland, Maine). In addition, car ferries run to Newfoundland (from North Sydney) and to PEI (from Caribou, near Pictou). Air Canada provides passenger and air-cargo services to major Canadian and international centres through Halifax International Airport; it also uses regional airports at Yarmouth and Sydney. Eastern Provincial Airways (EPA) acts as a regional carrier and also flies directly from Halifax to Toronto; Canadian Pacific Airways (CPA) flies directly from Halifax to Montréal.

**Energy** Before 1973 the generation of electric energy was in the hands of the Nova Scotia Power Commission, a government agency established in 1919, and the Nova Scotia Light and Power Company, a private utility. In 1973 they were united in a crown corporation, the Nova Scotia Power Corp. Per capita energy consumption in 1980 was about 87% of the national average, the smaller usage attributable in part to the relatively underdeveloped industrial base. In 1950 about 70% of the province's energy needs were met by hydroelectric power and indigenous coal. Convinced that cheap oil would continue to be available and that nuclear energy would be less expensive than that derived from coal, governments allowed a situation to develop in which, by 1978, over 70% of the electricity was produced from oil. Because of major

increases in oil costs, Nova Scotia had the most expensive energy in Canada, excepting PEI.

In 1979 the Energy Planning Board was established under the new Dept of Mines and Energy to devise an energy strategy. This strategy aimed at the development of the few remaining hydroelectric opportunities; the opening of new coal mines and the expansion of existing ones so as to permit oil-fired generating plants to be phased out; and the completion on the Annapolis R in 1984 of the first tidal plant in N America, using the largest turbine ever built for hydroelectric development.

But the government's main concern remains with offshore gas and oil development. The government has authorized NS Resources Ltd, a provincial crown corporation, to take an equity position in energy projects. The substantial drilling programs projected following the federal-provincial agreement of 2 Mar 1982 seem to indicate that the focus of energy activity on the Atlantic coast has shifted to Nova Scotia from Newfoundland, which by 1984 had no agreement with Ottawa.

### Government and Politics

**Basic Structure** Although some of the Nova Scotia constitution still rests on the prerogative, especially on the commissions and instructions of the pre-Confederation governor, in practice this does not differentiate it from other provinces. Legally, provincial executive power is vested in the LIEUTENANT-GOVERNOR, practically it is exercised by the Executive Council, which has increased in size from an 18th-century COUNCIL OF TWELVE to 23 members (1983). Beginning in 1838 the legislative power was vested in a general assembly consisting of a lieutenant-governor, legislative council and legislative assembly. In 1928, however, Nova Scotia abolished its council and left Québec as the only province with a bicameral legislature. The Fifty-Second General Assembly elected in 1981 was unique in that for the first time all of its 52 members were chosen by single-member constituencies. Universal suffrage for males and females over 21 came into effect in 1920; the voting age was reduced to 19 in 1970 and to 18 in 1973.

The senior court, the Supreme Court of Nova Scotia, is a provincially constituted court whose judges are appointed by the provincial Cabinet. In the early 1960s it was divided into trial and appellate divisions; in 1982 the latter consisted of the chief justice of Nova Scotia and 4 other judges; the former of the chief justice of the Trial

Nova Scotian fishing village of Prospect (photo by Jim Merrithew).

### Lieutenant-Governors of Nova Scotia 1867-1984

	Term
Charles Hastings Doyle	1867-73
Joseph Howe	1873
Adams George Archibald	1873-83
Matthew Henry Richey	1883-88
Archibald Woodbury McLelan	1888-90
Malachy Bowes Daly	1890-1900
Alfred Gilpin Jones	1900-06
Duncan Cameron Fraser	1906-10
James Drummond McGregor	1910-15
David MacKeen	1915-16
MacCallum Grant	1916-25
James Robson Douglas	1925
James Cranswick Tory	1925-30
Frank Stanfield	1930-31
Walter Harold Covert	1931-37
Robert Irwin	1937-40
Frederick Francis Mathers	1940-42
Henry Ernest Kendall	1942-47
John Alexander Douglas McCurdy	1947-52
Alistair Fraser	1952-58
Edward Chester Plow	1958-63
Henry Poole MacKeen	1963-68
Victor deBedia Oland	1968-73
Clarence L. Gosse	1973-78
John Elvin Schaffner	1978-84
Alan Rockwell Abraham	1984-

Division and 7 other judges. In 1982 the County Court, constituted and appointed in the same way, had 8 judges, but legislation not proclaimed provides for the appointment of 2 additional judges and the naming of a chief county court judge to exercise general supervisory power. Because much of the criminal business, although not the trial of the most serious offences, is dealt with in the Provincial Magistrates' Court (a completely provincial court), the number of its judges has increased substantially in recent years; since 1980 one of them has exercised some supervisory powers as chief judge.

**Municipal Government** Local government is carried on in 3 cities, 39 towns and 24 rural municipalities. Although the last generally conform to the county boundaries, 6 counties have 2 rural municipalities each. Despite several attempts made to amalgamate or alter these units, they have remained practically untouched since 1879. The only substantive changes in the status of the units since 1923 have been the incorporation of Dartmouth as a city in 1961 and Bedford as a town in 1980; and the reversion to their rural municipalities of the towns of Port Hood, Wedgeport, Joggins and Inverness. Smaller communities may organize themselves under the Village Service Act to secure services not provided by their rural municipality. Over the past 3 or 4 decades many responsibilities of the municipalities have been shifted to the provincial government, but the latter is well aware that it lays rough hands on the municipal government only at great peril to itself.

**Federal Representation** As was constitutionally provided in 1867, Nova Scotia's membership in the Senate is 10, but its representation in the House of Commons has fallen from 21 in the 1870s to 11 in 1984, with a corresponding decrease in clout in federal politics. It has been suggested that the voters' propensity to support the old-line parties through thick and thin has harmed the province's bargaining position. It has also been argued, but no less strongly denied, that Nova Scotia's leverage would be substantially greater in a union of MARITIME PROVINCES.

**Public Finance** Until Confederation most government revenues came through import duties (see CUSTOMS AND EXCISE), which could readily be adjusted as circumstances warranted. After 1867 payments from Ottawa became by far the largest source. Not until the turn of the century did the province have its first million-dollar budget and coal royalties rank ahead of the federal subsidy as the chief producer of revenue. Principally because of the expanding coal and steel industry, the decade before WWI was the only period in which the provincial exchequer has been in a genuinely healthy condition since Confederation. Since 1918 the province has almost always been strapped for money and, in common with the other have-not provinces, has had to make all sorts of demands upon the milch cow at Ottawa. In the 1960s Nova Scotia was a leader in pressing upon the federal authorities the principle of full equalization.

By 1976 the province had its first billion-dollar budget. In the year ending 31 Mar 1982 expenditures had risen to \$2.12 billion and revenues to \$1.89 billion. Of the expenditures, 25.4% went to health, 25.9% to education, 11.4% to servicing the public debt, 9.4% to social welfare and 6.5% to municipal affairs. Of the revenues, 47.8% came in various forms from Ottawa, 21.8% from personal and corporation taxes, 18.0% from sales taxes, 3.5% from liquor sales and 1.5% from motor-vehicle revenue. Because of financial difficulties, the sales tax was increased from 8 to 10% in 1982, the corporate tax by 2 points to 15% and the personal income tax by 4 points to 56.5% of the federal tax.

**Health** The Dept of Public Health administers an extensive program with its divisions of

dental health, nursing service, public-health engineering, nutrition, tuberculosis, hospitals and nursing homes, child and maternal health, communicable disease control, industrial health and emergency health services. In 1959 the province entered the national hospital insurance plan and in 1968 the medical-care insurance plan. To ensure greater administrative efficiency these two plans were merged under the Health Services and Insurance Commission in 1973. To the free services already provided, dental care for children up to 7 was introduced in 1974 and shortly afterwards prescription drugs for those 65 and over. The province's share of the cost is obtained in large measure from a sales tax levied under the Health Services Tax. Medical research is carried on primarily by the Faculty of Medicine at DALHOUSIE UNIVERSITY, which, because of a shortage of funding from national agencies, has established the Research and Development FOUNDATION.

**Politics** The first genuine political parties appeared in the election of 1836 when Tories (Conservatives) battled Reformers (Liberals), who had come into existence almost overnight under the guidance of Joseph HOWE. Until 1867 the parties contended fairly equally, but the Confederation issue upset the rough balance in favour of the anti-Confederates (Liberals). Until 1956 the Conservatives won only 3 elections and were in office only 12 of the 89 years. Since WWII, however, a lessening in traditional voting, combined with divisions within the Liberal Party and the influence of John DIEFENBAKER and Robert STANFIELD, have combined to narrow differences in electoral strength and to make the parties genuinely competitive. It has been very difficult to supplant established Nova Scotian premiers, and W.S. FIELDING, George Murray, Angus L. MACDONALD and Stanfield maintained their political ascendancy over lengthy periods. But to describe Conservative Stanfield as less liberal or more conservative than Liberals Fielding, Murray and Macdonald would be a deception, since the old-line parties pragmatically base their programs and platforms on electoral needs, not on ideological considerations.

The traditionalism of the political culture has complicated the difficulties of third parties. In 1920 factors arising largely out of WWI permitted the Farmer-Labour group to make the best third-party showing ever — 11 members and 32.3% of the popular vote, compared to the Conservatives' 3 members and 23.3%. Since 1941 the CCF-NDP has at times elected one federal member and up to 4 provincial assemblymen. In 1945, when the Conservatives failed to elect anyone, the 2 CCF members constituted the offi-

cial opposition in the Assembly. Before 1981 all the CCF-NDP victories were in the urban part of Cape Breton County, but that year the NDP leader won a seat in metropolitan Halifax, where the total party vote almost equaled that of the Liberals. That year its province-wide vote was 18.1%, the highest on record. In 1984 Prem John Buchanan won his third and most decisive victory when the Conservatives won 42 seats, the Liberals 6, the NDP 3 and the Cape Breton Labour Party 1.

## Education

**Administration** Provincial aid to education was first provided by the "forgotten school act" of 1808, but because of the fear of direct taxation, it was not until the 1865 Act, which provided for compulsory assessment, that a free, universally operative system of common-school education came into being. Although the legislature has always refused to give legal recognition to separate schools, even before Confederation the Catholic schools in Halifax were treated as part of the public system if they followed that system's course of study and observed its regulations. Later the same recognition was granted to Catholic schools in the larger towns of Cape Breton and eastern Nova Scotia. Recently, with the enlargement of Halifax's boundaries and the consolidation of schools resulting from declining enrolments, the separate system has been substantially eroded in Halifax. From 1864 to 1950 the policymaking function was vested in a council of public instruction, which was basically the provincial Cabinet; in 1950 the province got its first minister of education.

In addition to school consolidation, 2 other basic changes have been made in the public system since WWII. Following the Pottier Report, an Act of 1946 established a foundation program providing for a basic level of educational services financed partly by the provincial government and partly by municipal taxes equalized across the province. Based upon the Walker Report on Public Education Finance, an Act of 1982 provided for the reduction of the existing 74 school boards to 21, on the ground that the change would create an administrative situation in which sufficient students, funds, professional staff and specialist expertise would permit a far wider and more enriched program. Although it was left to the municipal units to enter into this arrangement voluntarily, all but the town of Hantsport acquiesced.

**Institutions** The religious denominations gave an early impetus to higher education and at one time in the 19th century Dalhousie alone of the 7 colleges was nondenominational. It has been contended that the province suffers from a surfeit of universities, but strong religious sentiment, if nothing else, has prevented consolidation. The exception has been that Pine Hill Divinity Hall, formerly a Presbyterian and later a United Church institution, became the Atlantic School of Theology in 1971, the country's first ecumenical college, in which the Roman Catholic, Anglican and United churches participate. Institutions providing regular university programs in Halifax are Dalhousie, SAINT MARY'S, MOUNT SAINT VINCENT and the UNIVERSITY OF KING'S COLLEGE; outside Halifax are ACADIA in Wolfville, SAINT FRANCIS XAVIER in Antigonish and UNIVERSITY COLLEGE OF CAPE BRETON at Sydney. UNIVERSITÉ SAINTE-ANNE at Church Point is the only francophone college in the province. Institutions providing specialized training in Halifax are the TECHNICAL UNIVERSITY OF NOVA SCOTIA and the NOVA SCOTIA COLLEGE OF ART AND DESIGN; in Truro are the NOVA SCOTIA AGRICULTURAL COLLEGE and the Nova Scotia Teachers' College. The Atlantic Institute of Education in Halifax was eliminated in 1982 for financial reasons. Training in the new high technology of fishing is

Premiers of Nova Scotia 1867-1984

	Party	Term
Hiram Blanchard	Liberal	1867

offered at the Nova Scotia Fisheries Training Centre; technical education for mariners is provided by the Nova Scotia Nautical Institute and by the CANADIAN COAST GUARD College at Sydney. A program of post-secondary education for candidates for business and industry is offered by 14 regional vocational schools, 3 modern institutes of technology similar to community colleges, and the apprenticeship program of the provincial Dept of Labour.

### Cultural Life

Until the last few decades Nova Scotia's geographical position had kept it removed from some of the main currents of national life. But improvements in travel and the strong impact of nationwide COMMUNICATIONS have eroded some features of the traditional life-style and introduced greater modernity.

**Arts** In recent years especially, the Nova Scotia government has taken steps both to preserve the province's heritage and to support artistic and cultural forms and activities. In 1975 it established the Art Gallery of Nova Scotia as an agency of the province for the acquisition, preservation and exhibition of works of art, but financial considerations have so far prevented the construction of a suitable building for exhibition purposes. The next year it provided that a building reflecting the cultural, social, economic, political or architectural history of the province might be designated a Registered Historic Property. In 1978, a third Act established the Cultural Foundation to accept, raise and administer funds for the promotion and encouragement of cultural affairs.

All 3 levels of government have supported Halifax's NEPTUNE THEATRE, which has established a national reputation although it performs in inadequate quarters. Despite assistance from the CANADA COUNCIL and the province, the Atlantic Symphony Orchestra, based in Halifax but performing throughout the Atlantic provinces, collapsed for financial reasons in 1982. Since that time it has been revived on a smaller scale as Symphony Nova Scotia. Scottish culture is particularly vigorous in eastern Nova Scotia; Saint Francis Xavier offers courses in Celtic studies, while the Gaelic College at St Ann's, Cape Breton, fosters piping, singing, dancing and handicrafts, and annually hosts the Gaelic Mod, a festival of Highland folk arts. Recently, art galleries and craft shops have proliferated, run by both natives and newcomers, with estimated sales approximating \$20 million annually.

**Communications** The newspaper circulating widely throughout the province is the morning *Halifax Chronicle-Herald*; its afternoon edition, the *Mail-Star*, is largely limited to the Halifax area. These papers have sometimes been criticized for their blandness and the Davey Committee (1970) accused them of "lazy, uncaring journalism." The daily serving Cape Breton in particular is the *Sydney Post-Record*, and county weeklies abound. Radio service is provided by CBC and a large number of private stations; television, by CBC and the stations of the Atlantic Television network (ATV) affiliated with CTV. Considerable production for radio and television emanates from the Halifax program unit of the CBC. CABLE-TELEVISION stations transmit mainly the signal from the American networks, which is received via Bangor, Maine (see *NEWSPAPERS*; *BROADCASTING*).

**Preservation of the Past** Through the efforts of the federal and provincial governments, the Royal Nova Scotia Historical Society, and a plethora of local heritage and historical societies, the province's storied past is exhibited to the public in various ways. Standing out among the national historic parks are a restored LOUISBOURG; a replica of Champlain's Habitation Port-Royal; and the HALIFAX CITADEL (in the process of rehabilitation). The provincial government has

restored numerous old houses that are representative of earlier eras, including Uniacke House, home of Richard John UNIACKE, near Halifax; Perkins's House, home of Simeon PERKINS, at Liverpool; and "Clifton," home of Thomas Chandler HALIBURTON, at Windsor. Scores of HISTORIC SITES have been marked with plaques on the advice of the Historic Sites and Monuments Board of Canada, the Nova Scotia Historic Sites and Advisory Council, and the Royal Nova Scotia Historical Society. The Nova Scotia Museum provides displays on provincial history. The Public Archives of Nova Scotia building, opened in 1980, is unexcelled in any province and is a veritable treasure house of paintings, documents and manuscripts.

### History

**Discovery and Early Settlement** The early inhabitants of Nova Scotia were the MICMAC, a branch of the Algonquian language group. Some evidence of their numbers and their migrations with the hunt can be gauged from shell heaps discovered in various parts of the province. With the coming of Europeans they almost invariably established better relations with the French than with the English. In recent years they have presented LAND CLAIMS similar to those of Indians in other provinces, but their bargaining power is weak because they constitute only 0.6% of the population.

Long before John CABOT made a landfall in 1497 (probably on Cape Breton I), NORSE adventurers may have reached Nova Scotia; scores of other explorers and fishermen plied its coasts before de MONTS and CHAMPLAIN established Port-Royal in 1605, the first agricultural settlement by Europeans on land which is now Canadian, and the beginnings of Acadia. King James I of England granted New Scotland (called Nova Scotia in its Latin charter) to Sir William Alexander in 1621, and endowed the province with an Order of Baronets and a coat of arms in 1626. Two settlements were set up by Scots 3 years later, but both were unsuccessful.

Three times in the 17th century — by Samuel Argall in 1613, Robert Sedgewick in 1654 and Sir William Phips in 1690 — the French settlements were captured by the English, each time to be returned. The small group of French settlers that were left after the conquest of 1613, together with 300 sent by the Company of New

France in 1632 and 60 brought out by Grandfontaine in 1671, constitute the ancestors of the Acadian people today. The fourth capture of Port-Royal (renamed Annapolis Royal) by Francis Nicholson in 1710 was to be the last, since in 1713, by the TREATY OF UTRECHT, Acadia, but not Île Royale (Cape Breton I) or Île Saint-Jean (PEI) passed to British hands. Until 1749, however, it was little more than a "counterfeit suzerainty" (see NOVA SCOTIA, 1714-84). The founding of Halifax that year, followed by the arrival of the pre-Loyalists and later by about 20 000 Loyalists (including some 3000 blacks) and disbanded troops, marked the beginnings of British Nova Scotia. An immediate result (1784) was the formation of the new colonies of New Brunswick and Cape Breton from territory that had been part of Nova Scotia, the latter since the TREATY OF PARIS, 1763.

**The 19th Century** Many Loyalists had been men of wealth and influence who, because of their sacrifices, expected privileged treatment. Although not unsympathetic at the outset, Gov John PARR eventually had a cooling off with them because of their unending demands for office and their frequent clashes with the pre-Loyalists. But time was on their side, for Parr's successor, Loyalist John Wentworth, used his 16 years as governor (1792-1808) to establish a Loyalist ascendancy in the higher levels of government. As a result, the Loyalists no longer needed to press their claims vigorously and, partly through intermarriage, distinct Loyalist influence disappeared within a relatively short time.

Always a strong defender of the prerogative, Wentworth became increasingly so and in the early 1800s he became embroiled with a so-called "country party," an undisciplined grouping led by William Cottnam Tonge. Eventually, Wentworth got the better of Tonge by rejecting his election as Speaker of the Assembly and dismissing him from his position as naval officer of Halifax. But despite his best efforts the Assembly gained substantial control over the disposition of road moneys, something most country assemblymen regarded as their principal *raison d'être*. Since the military governors who followed chose not to disturb these arrangements, relative political calm prevailed until the mid-1830s, in marked contrast with the situation in the Canadas.

The Napoleonic Wars brought prosperity to Nova Scotia, especially to the lumbering and SHIPBUILDING industries. The War of 1812 also added to the province's well-being; indeed, more than one Halifax fortune was accumulated through PRIVATEERING in these years. But peace, accompanied by poor harvests several years in a row, brought recession in its wake, and recovery did not begin until the mid-1820s, partly promoted by William Huskisson's trade Acts of 1825. Nevertheless, a new wave of IMMIGRATION followed the war and by mid-century the newcomers totalled about 55 000. Some 2000 blacks arrived shortly after the war and in 1818-19 about 200 WELSH. But the bulk were Irish or Scottish, the former largely remaining in Halifax and the latter going to Cape Breton I and the northeastern part of the peninsula. From the early part of the century a slow but steady intellectual awakening had been making itself felt, first in trade, next in literary activity, and finally reaching its zenith in politics in the 1830s. One manifestation was the celebrated Brandy Dispute of 1830 in which almost the entire province turned upon the Council of Twelve for daring to assert a power relating to money bills which had long lain in abeyance.

The movement for RESPONSIBLE GOVERNMENT got under way in earnest in 1836 when, mainly through the efforts of Joseph Howe and his *Novascotian*, a majority of reforming assemblymen was elected to the legislature. Their struggle was against an interrelated merchant-

House near Wolfville, NS, a quiet university town that has many descendants of the original New England settlers (photo by Sherman Hines/Masterfile).

Lunenburg, NS, dockyards with town in background (photo by Ted Grant / Masterfile).

official oligarchy, largely from Halifax, which through the Council of Twelve dominated the business, political and ecclesiastical life of the province in its own interest. The Halifax group, even more than its Upper Canadian counterpart, was a FAMILY COMPACT. Howe was a conservative reformer, and his followers could later echo his words, that they had achieved their ends without a blow struck or a pane of glass broken. Howe's moderation is shown in his willingness to enter into an ill-starred coalition with the Tories, 1840-43, in the hope of attaining his objectives gradually. The Reformers finally achieved success when, in the election of 1847, they won 29 seats to their opponents' 22. On 2 Feb 1848 James B. Uniacke became premier and formed the first ministry operating under responsible government in the British Empire overseas.

Two positive accomplishments marked the next 17 years. Under the leadership of Howe, Nova Scotia entered the railway era and by 1858 the government-owned Nova Scotia Railway was operating lines from Halifax to Windsor and Truro. Charles TUPPER took the lead in the enactment of the school Acts of 1864 and 1865, which required the opening of schools elsewhere without payment of fees and introduced the disliked compulsory assessment which would make free schools possible. Otherwise, these were years of issueless, bitterly partisan politics. Following a bitter clash between Howe and the Irish, the Catholics deserted the Liberals and sectarian politics prevailed for a short period after 1857, the only instance of its kind in Nova Scotia history.

Starting in 1865 the CONFEDERATION question left a mark on the province. Contrary to general belief, Howe did not initiate the movement against the Quebec Resolutions. Rather it began in western Nova Scotia and among the Halifax merchants on economic grounds; people relying on seaborne traffic eastward and southward did not relish setting up new links with a remote, unknown interior. To Howe it seemed obvious that colonial union should at least wait until railway communication had been established with the PROVINCE OF CANADA and monstrous that it should be effected on the basis of a resolution adopted by a 3-year-old assembly that had been elected when union was not an issue. A delegation under him could not prevent the BRITISH

NORTH AMERICA ACT from being enacted, but in Sept 1867 Nova Scotia's voters returned 18 anti-Confederates out of 19 to the House of Commons and 36 out of 38 to the provincial House of Assembly (see REPEAL MOVEMENT). Finally, convinced that repeal was impossible, Howe accepted "better terms" and entered the federal Cabinet in Jan 1869. Until his death in 1873 he devoted himself to preventing the "slumbering volcano" of Nova Scotia from erupting. Not until the federal election of 1874 and the entrance of 2 Nova Scotian Liberals into Alexander MACKENZIE's Cabinet did the anti-Confederates finally "accept the situation"; the stage had been set for them to become the provincial wing of a national party. But bitterness did not die easily and as late as 1927 some Nova Scotians still flew flags at half-mast on July 1.

Obviously, Tupper had set Nova Scotia's financial needs too low in the Confederation bargain, for even with Howe's better terms the province found it difficult to maintain existing services, much less to continue the expansion of the railway system. By 1867 the branch from Truro to Pictou had been built as a government undertaking, and by 1869 the Dominion government had completed the INTERCOLONIAL RAILWAY as part of the Confederation bargain. After an increase in the province's debt allowance in 1873 the provincial government provided subsidies for building the Western Counties Railway from Annapolis to Yarmouth, the Nictaux and Atlantic from Middleton to Lunenburg, the Eastern Extension from New Glasgow to the Str of Canso, and several lines on Cape Breton I. But because of the province's straitened financial circumstances, none of them would be completed either easily or quickly. Numerous pleas for aid having been rejected or unanswered by Ottawa, Prem W.S. Fielding campaigned on the repeal of Confederation in the election of 1886 and took 29 of 38 seats. But it all came to naught when the Conservatives won 14 of Nova Scotia's 21 federal seats the following year.

**The 20th Century** Nonetheless, Fielding, a cautious financier, quickly established his pre-eminence in provincial politics. By 1893 he had persuaded Henry M. Whitney of Boston to embark on coal mining in Cape Breton County and soon the Whitney Syndicate had laid the foundation of a substantial coal and steel industry. George Murray succeeded Fielding in 1896 in circumstances so auspicious that he held on to the premiership for an unequalled 26 years. Greatly expanded coal royalties and an in-

creased federal subsidy in 1907 overcame Nova Scotia's financial difficulties for the first time since Confederation and enabled Murray to complete with ease the province's last major railway, the Halifax and Southwestern from Halifax to Yarmouth, and to make the first cautious advance into the social-service state. The economy of Nova Scotia was stimulated by an increased demand for iron, steel, fish and lumber during WWI. But war's end brought recession which lasted long after recovery had begun outside the Maritimes. That Farmer-Labourites could win 11 seats in politically conservative Nova Scotia in the provincial election of 1920 indicates the depth of the malaise.

Hitherto the major demands on Ottawa had been to relieve the provincial government of its financial burden. But in the early 1920s came the realization that it was the deleterious effects of national economic policies relating to transportation and the tariff which were preventing Nova Scotia from sharing fully in the benefits of Confederation. A MARITIME RIGHTS movement which began in 1922 was quickly taken over by the Conservatives and used to overthrow a 43-year-old Liberal government in 1925. A federal royal commission headed by Sir Andrew Rae Duncan recommended more favourable freight rates and increased federal grants for the Maritimes, but failed to consider the greatest grievance, the protective tariff. Liberal Angus L. Macdonald appointed the Jones Commission to rectify the omission on his becoming premier in 1933.

Macdonald, the third of Nova Scotia's outstanding political leaders after Confederation, headed what was probably the strongest of all Nova Scotian Cabinets and conducted a highly progressive government before he entered the federal Cabinet in 1940. Again Nova Scotia enjoyed good times during WWII and Halifax became the major port for shipping munitions and other supplies to Western Europe. The Macdonald who returned to Halifax from Ottawa adopted a much more conservative stance than in prewar days. Following his death, Nova Scotia's voters conducted a mild political revolution in 1956 by returning the Conservatives for the first time since Confederation under noncrisis conditions: Robert Stanfield then became the fourth premier to establish political dominance over the province.

Since the mid-1950s economic development has been the primary concern of provincial politicians. Industrial Estates Limited (IEL), est 1957, was the chosen instrument of the Stanfield government, and its early successes led to a belief in the early 1960s that Nova Scotia might be coming into its own. But the serious losses incurred by Clairtone (see ELECTRONICS INDUSTRY) and Deuterium of Canada (see NUCLEAR ENERGY) injected a note of pessimism. The same period was marked by serious difficulties in the coal and steel industries, almost the only ones of substance to be developed in the province as a result of the protective tariff. The apparently permanent collapse of the coal market led in 1967 to the establishment of the Cape Breton Development Corporation (Devco), a federal CROWN CORPORATION with provincial involvement, aimed at developing alternatives for miners as the coal industry was phased out. In 1967, to prevent the closing of Dosco's steel plant at Sydney, the Nova Scotia government took it over and operated it as a crown corporation, the Sydney Steel Corporation (Sysco); to date it has added massively to the provincial debt and its future is far from certain. In contrast, coal has made a comeback as a substitute for oil in energy production.

Recently, there have been 2 philosophies concerning provincial development. Ought it to be confined to industries making use of the province's natural resources? Or, despite past failures, should continued efforts be made to establish

secondary industries which may be altogether unrelated to those resources? Whatever the answer, Nova Scotians are insisting more and more that their pleasant way of life should not be sacrificed to material considerations.

**Nova Scotia Agricultural College**, Truro, NS, opened in 1905 to provide agricultural education and training for the Atlantic provinces. It amalgamated the School of Agriculture (fd Truro, 1885) with the School of Horticulture (fd Wolfville, 1893). The college offers technical and vocational courses, pre-professional studies in agricultural engineering and veterinary medicine, and an agricultural science degree. The college approaches agricultural studies from various directions and emphasizes direct involvement with the organized industry. Graduates have occupied prominent positions in agricultural services both in Canada and abroad.

**Nova Scotia College of Art and Design**, Halifax, was established 1887. It offers instruction in fine art, crafts, art education, communication design and environmental planning. It achieved university status in 1969, and is the only degree-granting art school in Canada. Four-year programs lead to the bachelor of fine arts degree (in fine art or art education), bachelor of design (in communication design or environmental planning) or bachelor of arts (in art education). Master's degrees are offered in fine arts and art education. The college also offers diplomas in fine art and graphic design. The college is noted for its publishing ventures on source material in contemporary art. In 1978 it completed an innovative move to a campus within Halifax's restored waterfront. LOIS KERNAGHAN

**Nova Scotia Research Foundation Corporation** (NSRFC), research organization established as a CROWN CORPORATION in 1946 in response to H.M. TORY's recommendation that a provincial board be established to co-operate with universities and the NATIONAL RESEARCH COUNCIL in seeking solutions to problems of economic development and rehabilitation. NSRFC's advisory role to industry resulted in incorporation in 1975. In 1981 a proposal was made to extend the corporation's role to other parts of the Maritimes, in collaboration with the NEW BRUNSWICK RESEARCH AND PRODUCTIVITY COUNCIL. The corporation supports economic development in NS and elsewhere by means of technical advice and

through research conducted in 7 divisions at a laboratory in Dartmouth. NSRFC has established a world reputation for research in OCEAN technology. More recent expertise involves BIOTECHNOLOGY and COAL desulphurization. Developments of NSRFC's Engineering Physics Division and Centre for Ocean Technology include underwater data-acquisition systems, rare-earth magnetic couplers and multi-pass fluid rotary unions. With DALHOUSIE UNIVERSITY and TECHNICAL UNIVERSITY OF NOVA SCOTIA the council has established the Applied Microelectronics Institute to develop microelectronic marine products. A wholly owned council subsidiary, Nova Magnetics Ltd, will be sold to the private sector, when development of magnetically coupled blower technology becomes economically viable. NSRFC is governed by a board of scientists and industrialists, the chairman serving as president of the corporation. Total staff is about 128 people. Two-thirds of funding comes from sales and contracts to industrial and government clients; the remainder from grants. See OCEAN INDUSTRY. MARTIN K. McNICHOLL

**Novel in English** In its first phase, from the earliest fiction writing in Canada to WWI, the novel acquired a truly Canadian voice. But the pre-Confederation period was a time far more of development than of achievement. Novels were written and published, but few had literary merit and few could be called distinctively Canadian in their subject matter or point of view. This was to be expected. The country itself was taking shape, and with it a society and a culture for the novelist to represent, analyse and judge. Colonial uncertainty is reflected in the derivativeness and poor quality of fiction in this period; yet some novels did contribute to the establishment of a tradition, and a few achieved lasting significance.

FRANCES BROOKE's *History of Emily Montague* (1769) is usually described, somewhat misleadingly, as the first Canadian novel. The author lived only briefly in the colony of Québec, and much of her novel is sentimental romance of the kind common in England. Brooke does, however, give some serious attention to French-English relations, the colony's future relations with Britain and the potential threat posed by the American colonies, issues that were to be prominent in later Canadian novels. Her interest in the landscape also anticipates the continuing use of Canada as an exotic setting for fiction by British novelists (eg. Frederick Marryat and R.M. Ballantyne) and by Canadians themselves.

Of more importance to the Canadian quality of Canadian fiction was the publication, in newspapers and magazines, of sketches (sometimes loosely linked as a series) and serialized novels (see SHORT FICTION; LITERARY MAGAZINES); some of the early work of Susanna MOODIE and Rosanna LEPROHON appeared in these forms. Many writers continued merely to imitate British models, but there were 2 notable exceptions: Thomas McCulloch and Thomas Chandler HALIBURTON. McCulloch's "Letters of Mephobosheth Stepsure" (in the *Acadian Recorder*, 1821-23), a satirically comic depiction of his Pictou, NS, neighbours, can still delight modern readers (see HUMOROUS WRITING). McCulloch's work undoubtedly influenced Haliburton, the first Canadian fiction writer to achieve an international reputation. Haliburton's "Clockmaker" sketches of 1835-36 appeared in book form as *The Clockmaker; or The Sayings and Doings of Samuel Slick, of Slickville* (1836), which was instantly popular in N America and Britain. Sam Slick remains one of the great creations of the comic imagination, and served Haliburton well as a vehicle for serious investigation of his own Nova Scotia and of the growing crudity and materialism of the US. *The Old Judge* (1849) is the best of Haliburton's many other works of fiction. Haliburton for a

time rivalled Charles Dickens in popularity, and he was the one major writer of fiction to appear in the pre-Confederation period; he remains important in the Canadian literary tradition.

Two other novelists of this period retain an interest for later readers. Rosanna Leprohon's "The Manor House of De Villera" (1859-60) and *Antoinette de Mirecourt* (1864) do not avoid sentimentality and melodrama, yet in their presentation of Québec society after the British conquest they reveal a skill and a sensitivity still not fully appreciated; and although John RICHARDSON tried his hand without success at the novel of manners, when he made use of Canadian history in *Wacousta* (1832) and its sequel *The Canadian Brothers* (1840) the results revealed a powerful (if undisciplined) imagination. Both novels are marred by sentiment and melodrama, and exhibit the pervasive influence of Sir Walter Scott on writers of historical novels (with some influence as well from the American writer James Fenimore Cooper). Despite these detractors, Richardson's ability to present violent action, and his attempt to define the developing Canadian character, ensure him at least a minor place in the history of the Canadian novel.

The nationalistic and optimistic spirit following CONFEDERATION is reflected in the increasing variety and quality of Canadian novels. Several writers achieved international popularity, if not lasting literary merit; among them were May Agnes Fleming, Basil King and Margaret Marshall Saunders, whose *Beautiful Joe* (1894), a sentimental story of a dog, is reported to have sold more than one million copies in 14 languages. James DE MILLE was also a popular writer, but in *A Strange Manuscript Found in a Copper Cylinder* (1888) he produced an unusual, disturbing and still-fascinating novel. Popular novelists of this sort may seldom have written good novels; nevertheless, they demonstrate that Canadian writers were gaining an increasing confidence that they could write for audiences outside Canada.

Historical novels were also popular and often skillfully written. Charles G.D. ROBERTS produced several, as did Gilbert PARKER, but these and other novelists were seldom able to present more than the surface of the historical periods they dealt with. William KIRBY's *The Golden Dog* (1877) does penetrate the surface in its attempt to recreate and analyse the society of NEW FRANCE before its fall. Kirby may be guilty of transforming this society to produce a unifying national myth of French-English harmony, yet his knowledge and sympathy make his novel, despite its length and frequent clumsiness, live in a way that others do not.

An increased interest in representing the regions of Canada is also characteristic of the post-Confederation novel; for example, *Anne of Green Gables* (1908) and its successors by L.M. MONTGOMERY are set in Prince Edward Island; *Duncan Polite* (1905) and others by Marian Keith (Mary Esther MacGregor) in Scottish communities in southern Ontario; *The Way of the Sea* (1903) and *Doctor Luke of the Labrador* (1904) by Norman DUNCAN and *The Harbour Master* (1913) by Theodore Goodridge Roberts are set in Newfoundland and Labrador.

The opening up of Canada's West and North was also a frequent subject. Sometimes the treatments were mainly superficial and popular, as in novels by Gilbert Parker, Agnes Laut and Robert Service. More valuable work was done by Ralph Connor (C.W. GORDON) in *The Sky Pilot* (1899) and *The Foreigner* (1909), and by Nellie MCCLUNG in *Sowing Seeds in Danny* (1908). While their portraits of the developing West are not free of sentimentality and obtrusive didacticism, they do show some movement towards the realistic presentation of a sense of place, a movement even more pronounced in Martin

Allerdale Grainger's *Woodsmen of the West* (1908), a good novel set in BC.

Didacticism and a moralizing tone were prominent in many novels. Two writers who made serious and important attempts to combine entertainment with intellectual substance, Agnes Maule Machar (social justice, Christianity) and Lily Dougall (religious themes), had limited artistic success for this reason. The major novels of the post-Confederation period largely overcame this difficulty, achieving moral seriousness without preaching to the reader. To various degrees and in various ways they also integrated historical, regional, social, intellectual and international concerns.

Francis William Grey's one novel, *The Curé of St. Philippe* (1899), is both a subtly comic novel and a shrewd analysis of education, religion, politics and French-English relations in a small Québec town of the period. Robert Barr wrote many works, including an important collection of detective fiction, *The Triumphs of Eugène Valmont* (1906), but his most successful Canadian novel, *The Measure of the Rule* (1907), is a satiric criticism of teacher training and educational theorizing, with some attention paid to the shortcomings of Toronto society at the turn of the century.

By the beginning of the 20th century the Canadian novel had moved beyond its formative period, as is evident in the best works of that period's major novelists, Sara Jeannette DUNCAN and Stephen LEACOCK. Duncan's novels, written after her successful career as a journalist, are the product of an informed and sensitive intelligence with a wide range of serious interests. *A Daughter of Today* (1894) is, until its awkward conclusion, a compelling study of the "new Woman" and the artistic temperament. *An American Girl in London* (1891), one of her "international" novels, is a comedy dealing with the differences between American and British social customs. *Cousin Cinderella* (1908), a less lively comedy, returns to this theme and adds to it by introducing the question of where Canadians stand in this relationship. *The Imperialist* (1904) is set in southern Ontario, yet international themes are again prominent, presented as they impinge upon the consciousness of a Canadian town, whose society Duncan depicts and analyses with wit and skill. Duncan resided in India for almost 30 years after 1890, and her novels set there become increasingly dark in tone, from *The Simple Adventures of a Memsahib* (1893) to later works such as *His Honour*, and *A Lady* (1896) and *Set in Authority* (1906), which are critical of the British establishment in India and increasingly sympathetic towards the native population and its aspirations. Duncan continued to write until the 1920s, but the quality of her work after 1910 is uneven.

Leacock began his literary career by parodying, with exuberance and an underlying note of surrealist violence, the various forms, styles and aberrations of conventional fiction. *Literary Lapses* (1910), *Nonsense Novels* (1911) and later *Frenzied Fiction* (1918) give Leacock a well-deserved international reputation as one of the great humorists in the English language. He was to write much more in this vein, often successfully, but never again did he reach the consistently high quality of this early work. Leacock's major achievements are *Sunshine Sketches of a Little Town* (1912) and *Arcadian Adventures with the Idle Rich* (1914). In the first we find a humorous presentation of the foibles and follies of the residents of a small Ontario community, with understated satire and criticism directed at social pretension, materialism, urbanization and politics. The second book is overtly satiric, as its title suggests, much less filled with sunshine. The idle rich and their hangers-on have no redeeming qualities, and Leacock offers no consolation to his readers poised on the brink of a world war

that was to have far-reaching consequences for Canada.

DAVID JACKEL

#### Novel in English, WWI-1959

At the end of WWI, the self-confidence engendered by Canada's role in the war brought an upsurge of NATIONALISM which included a renewed interest in a national literature. Between 1920 and 1940, 700 works of fiction were published by Canadians. While the popular genres of mystery, adventure and romance continued to flourish, Canadian writers showed themselves to be aware of the progress made in fiction by such writers as Dreiser, Joyce and Woolf. The first important development in Canada after the war was the advent of realism, heralded in Prairie fiction. Novels recorded the life of the homesteader with increasing fidelity to experience; writers tended less and less to romanticize or idealize either landscape or life. The prolific Arthur STRINGER bridges the earlier and later periods of the Prairie novel, stylistically as well as chronologically, with his Alberta trilogy *The Prairie Wife* (1915), *The Prairie Mother* (1920) and *The Prairie Child* (1922). Robert Stead's *Neighbours* (1922) and *The Smoking Flax* (1924) most obviously demonstrate the move toward realism, although plot lines and occasional melodramatic incidents continue the romantic trend.

With Stead's *Grain* (1926), and with the publication in 1925 of the first novels of Martha Ostenso and Frederick Philip GROVE, realism in Prairie fiction was firmly established. Ostenso's *Wild Geese* vividly depicts the harshness of life in a homesteading community, but its central figure is the romantic villain Caleb Gare, whose lust to possess the land causes him to enslave his family and eventually destroys him. Grove followed his first novel, *Settlers of the Marsh*, with 3 more Prairie novels: *Our Daily Bread* (1928), *The Yoke of Life* (1930) and *Fruits of the Earth* (1933). Although his patriarchal heroes often succeed in their struggle against nature, they are inevitably brought to see that their success is ephemeral.

The strong regional consciousness of these authors characterized much Canadian fiction, as writers portrayed the impact of environment on character and on human relationships (see REGIONALISM IN LITERATURE). While realism was developing, the popular romantic tradition continued in Prairie fiction, presenting a more optimistic view of pioneer life, as in Laura Goodman Salverson's *The Viking Heart* (1923), a novel about Icelandic settlers. Frederick Niven, after writing several successful novels about his native Scotland, traced the historical development of the Prairies in an accurate and entertaining trilogy: *The Flying Years* (1935), *Mine Inheritance* (1940) and *The Transplanted* (1944). The romantic tradition continued with W.O. MITCHELL's *Who Has Seen the Wind* (1947), the story of a child growing up on the Prairies. The wind provides the central, unifying symbol of the boy's attempt to comprehend the spiritual world.

Thomas RADDALL's historical novels of Nova Scotia are among the best popular fiction. *His Majesty's Yankees* (1942) and *The Nymph and the Lamp* (1950) are lively, exciting and historically accurate. But the outstanding popular success of the period was MAZO DE LA ROCHE's *Jalna* series (1927-60). Set in rural Ontario, the series continued through 16 sentimental novels characterized by lively dialogue, dramatic incidents and memorable characters. The *Jalna* books continue to be read throughout the world.

Meanwhile, other Ontario writers were, like their Prairie contemporaries, producing realistic fiction. Raymond KNISTER, author of some of the best and most experimental short stories of the 1920s and some of Canada's earliest modernist poetry, wrote what is possibly the first realistic novel of rural Ontario, *White Narcissus* (1929). Knister used elements of the landscape as sym-

bols reflecting the emotions of his protagonist, whose journey from city back to farm becomes a journey of self-discovery.

With the novels of Morley CALLAGHAN, urban realism became firmly established. Callaghan's early novels, *Strange Fugitive* (1928), *It's Never Over* (1930) and *A Broken Journey* (1932), incorporate deterministic elements: characters often appear to be victims of forces beyond their control. Callaghan writes in a deceptively simple, economical style which changed very little when he turned to a more Christian outlook in his next 3 novels: *Such is My Beloved* (1934), portraying a priest's loving attempt to save 2 prostitutes; *They Shall Inherit the Earth* (1935), a father-son conflict set against the backdrop of the Great Depression; and *More Joy in Heaven* (1937), the story of a reformed bank robber misunderstood by society. In these novels the saint figure stands in opposition to society, as it does in the later *The Loved and the Lost* (1951), in which Callaghan's style softens and he effectively uses myth and symbol.

The optimism following WWI disappeared with the onset of the GREAT DEPRESSION. Fewer novels were published and fewer read. Some novelists attempted to record the disillusionment of the time and the best fictional record of social protest is West Coast journalist Irene Baird's *Waste Heritage* (1939), a documentary novel of Vancouver and Victoria in 1938. The desperation of the time in the urban areas of eastern Canada is reflected in Callaghan's early novels and stories. Hugh GARNER's *Cabbagetown* (1950) is a later account of growing up in a Depression slum in Toronto. Sinclair ROSS's first novel, *As For Me and My House* (1941), and some of his earlier short stories give the best fictional record of the Prairies of the Depression years.

With *As For Me and My House*, the atmosphere of a particular time and place and its influence on the human spirit received a newly sophisticated and imaginative treatment. In this novel of a minister and his wife trapped in a puritanical Prairie town, Ross exploits the setting and its impact on the psyche to voice such modern concerns as alienation, the failure of communication, the problem of the imagination and the search for meaning in an incomprehensible universe. The outer world mirrors the inner state. In the next decade, Ernest BUCKLER wrote *The Mountain and the Valley* (1952), set in the Annapolis Valley of Nova Scotia. Buckler's complex symbolism and sensuous, richly textured language create a pastoral world through which he voices his themes of isolation and the problem of the imagination.

Hugh MACLENNAN, the best-known Canadian novelist of the 1940s and 1950s, began writing as a post-Depression surge of nationalism swept Canada. In 1941, with the publication of *Barometer Rising*, MacLennan began chronicling the Canadian psyche. Set in 1917, with its focal point the HALIFAX EXPLOSION, this novel explores Canada's developing national spirit. MacLennan's second novel, *Two Solitudes* (1945), deals with the English-French relations in Canada through 2 generations, from WWI to the beginning of WWII. When *The Precipice* (1948), less overtly Canadian, was less successful, MacLennan returned to his role as spokesman for the national spirit. *Each Man's Son* (1951), set in a Nova Scotia mining town, dramatizes the Calvinistic puritanism which is seen to pervade much of Canadian life. *The Watch that Ends the Night* (1959), which has received the most critical acclaim, is more expansive. The age-old love triangle is acted out in a Canadian milieu, involving an introspective man, a spiritually strong artistic woman and a larger-than-life man of action. In this work, as in his earlier novels, MacLennan excels in description and narration, while his weaknesses are lengthy explanations and stilted dialogue.

WWII became the subject for a number of novels. Among the best are Hugh Garner's *Storm Below* (1949), a story of 6 days on a Canadian corvette; Earle BIRNEY's *Turvey* (1949), a humorous look at army life; Colin McDougall's *Execution* (1958), an appallingly realistic account of Canadian combatants on the Italian front; and David Walker's *The Pillar* (1952), based on his experiences as a prisoner of war. Walker, who immigrated to Canada after the war, produced a variety of successful novels, many of which, including the broadly humorous *Geordie* (1950), are set in his native Scotland. His first novel with a Canadian setting, *Where the High Winds Blow* (1960), is a well-written romance and adventure story of the opening up of the North, with an entrepreneurial hero who is equally at home in northern wilderness and southern civilization.

The immigrant experience continued to be a major theme. Joining Walker, Grove, Salverson and Niven was Henry KREISEL, the Jewish-Austrian author of *The Rich Man* (1948), the story of an immigrant to Toronto who pretends to be wealthy when he visits his family in Vienna; and the more complex *Betrayal* (1964). John Marlyn's *Under the Ribs of Death* (1957) describes the struggle for material success of a Hungarian immigrant's son. Brian MOORE, who spent 14 years in Canada before moving to the US, wrote a moving, intense novel of a Belfast spinster, *The Lonely Passion of Judith Hearne* (1956), and a perceptive and entertaining novel of an Irish immigrant in Montréal, *The Luck of Ginger Coffey* (1960). Malcolm LOWRY, the most celebrated of our temporary residents, completed *Under the Volcano* (1947) and wrote *October Ferry to Gabriola* (1970) in Canada. *Under the Volcano* is brilliant, a complex novel which uses cinematic techniques, cabalistic and theosophical symbolism, myth and unusual metaphors to tell of the last 12 hours in the life of an alcoholic.

The Jewish immigrant experience was told by a number of voices. Mordecai RICHLER's *Son of a Smaller Hero* (1955) and *The Apprenticeship of Duddy Kravitz* (1959) portray the third generation of a family of Jewish immigrants in Montréal. Kravitz is a picaresque hero whose story is told in an exuberantly written social satire employing broadly humorous dialogue. Adele WISEMAN's *The Sacrifice* (1956) is the tragic story of a Jewish-Ukrainian immigrant's attempt to cope with a new world and yet to live according to his own tradition. His own tragedy is mitigated by the hope of a good future for his grandson.

While realism and regionalism became increasingly sophisticated, several fine experimental writers moved further from the traditional use of the elements of the novel to produce symbolic, lyrical, fragmented narrative. Howard O'HAGAN's *Tay John* (1939) is based on an Indian legend of a golden-haired child who emerges from the grave of a pregnant woman and is last seen disappearing into the earth. The novel begins with the legend and blends mythical with realistic narrative in an episodic structure. In the 1940s F.P. Grove turned from realism to more innovative techniques. *Master of the Mill* (1944) is a futuristic novel dealing with the complexities of industrial society and the problems of automation. The narrative method is complex, involving flashbacks of the protagonist, a manuscript written by another character and the recollections of others. In *Consider Her Ways* (1947), Grove based his story of the ant world on scientific fact and used his ant characters to satirize humanity.

Elizabeth SMART's remarkable lyrical novel, *By Grand Central Station I Sat Down and Wept* (1945), was first published in England and received scant attention in Canada until a N American edition appeared in 1975. The novel explores the dualities of experience, especially the pain and

pleasure of love, through paradoxical structures. The plot is minimal; the setting takes on the texture of imagery and becomes an adjunct to emotional expression. Sheila WATSON's *The Double Hook* (1959) also explores the dualities of experience. Watson describes her characters as "figures in a ground from which they could not be separated." The novel is a mythical and allegorical exploration of the interconnections between good and evil, and of the redemption of a community to love. Poet A.M. KLEIN turned to fiction to tell the story of the return of the Jews to the Promised Land. In *The Second Scroll* (1951), he presents a pattern of Jewish exile and return parallel to that in the First Scroll (the Torah) to recount the Jews' return to Israel after WWII. Like the Torah, *The Second Scroll* includes glosses, which take the form of poetry, drama, a prayer and an excerpt from a letter. The novel's central religious theme demonstrates man losing and finding God, and grapples with the problem of the existence of evil.

Ethel Wilson's 4 novels and 2 novelettes, published in less than 10 years, are among the best crafted and most subtly expressed of Canadian fictional works. Wilson's strong sense of place links her to realistic writers. Her style is marked by clarity, economy, deceptive simplicity, unobtrusive imagery and the acute observation of people. Her complex world view includes an awareness of life's ironies, of the interplay of chance and Providence. John Donne's "No man is an island," the epigraph to her first novel, *Hetty Dorval* (1947), is central to Wilson's view of life. *Swamp Angel* (1954), possibly Wilson's best novel, presents in Maggie Lloyd a convincing character who leaves an impossible marriage to forge a new life for herself.

Among the novelists of note whose careers in fiction began in the 1950s and continued through the 1980s is Robertson DAVIES, who first made his mark as a dramatist and journalist. The satire central to his Samuel Marchbank essays characterizes his Salterton trilogy, *Tempest-Tost* (1951), *Leaven of Malice* (1954) and *A Mixture of Frailties* (1958), in which snobishness, materialism and hypocrisy are satirized.

The hero took on various guises through the 40 years of fiction writing following WWI. In accord with the shift in action from the external to the internal world, the strong, confident, at times patriarchal or even epic hero of some early novels of the period (eg, Abe Spalding of Grove's *Fruits of the Earth*) soon gave way to the more introspective, less confident protagonist (eg, Philip Bentley, the uncertain, guilt-ridden minister of Ross's *As For Me and My House*; David Canaan, the frustrated artist of Buckler's *The Mountain and the Valley*; and the intellectual George Stewart of MacLennan's *The Watch that Ends the Night*). The antihero who ruthlessly manipulates others makes an occasional appearance, as in Richler's Duddy Kravitz. Yet a further shift in the concept of the hero can be noted in Wilson's Maggie Lloyd. Self-reliant and courageous, but sensitive and loving, Maggie is the forerunner of the strong female characters created by the outstanding women writers of the 1960s and 1970s.

Some of the literary trends and techniques which began in the 1940s and 1950s came to fruition only in the 1960s and 1970s, and many of the writers continue to write some of the best-known and most highly regarded novels. Canadian novelists who began their careers in the 1960s and 1970s looked back to such writers as Ross, Grove and Wilson for examples of the possibilities for artistic response to their own particular place and time. Post-modernists have their forerunners in Watson, Smart and Lowry.

LORRAINE McMULLEN

#### Novel in English, 1959-1980s

The years following 1959 marked the flowering of the novel in Canada, for in these years, as

writers began to explore more fully the formal possibilities of the genre, they at last won public recognition both inside and outside Canada. Canadian novels became Book of the Month Club selections in the US; major American and British magazines published Canadian fiction; the size of press runs often increased tenfold; and translations abounded of novels by Leonard COHEN, Margaret ATWOOD, Robertson DAVIES and many others. At home, Canada also managed to generate commercially viable popular fiction. Much of this intensified activity was the result of the long campaign to create a literary community in Canada, a campaign that grew out of the economic and cultural nationalism of the period. Government support of the arts (see CANADA COUNCIL) played major roles in the financial and psychological development of a cultural climate that made Canadian literature blossom. New SMALL PRESSES proliferated, often established to champion experimental or noncommercial novels that would otherwise perhaps be unpublishable.

Since the novel form is usually closely tied to the social background of its time and place of production, the changes occurring during the 25 years after 1960 in Canada played their part in the changes appearing in the fiction of the period. The 1960s were years of relative plenty that seemed to free young people from worry about immediate need and allowed them to turn their attention to broader social concerns. These were the years of confrontational politics and of the challenging of accepted norms. The retrenchment in later years of conservative middle-class values in the face of economic recession was likely a predictable response to the anti-establishment, iconoclastic counterculture of the 1960s. Many of the writers of the 1970s and 1980s, however, were "formed," intellectually and ideologically, by those earlier years. Many, such as Atwood, Timothy FINDLEY and Rudy WIEBE, saw their role as that of a conscience or even a voice for the oppressed. In 1981 Canadian writers actively participated in Amnesty International's "Writer and Human Rights" Congress in Toronto. But the oppressed to whom novelists gave a voice were not necessarily victims of external political tyranny; they often suffered more local oppression, by what could be called bourgeois values. For many Canadian novelists, like John METCALF (*General Ludd*, 1980) and Michael Charters, metaphors of madness acted as the focus for attacks on the social and psychological labels which serve to control misfits who transgress the often unacknowledged norms of middle-class behaviour.

These themes were not, of course, unique to Canadian writers. Novels from Canada shared with those of other Western nations a concern for those staples of the novelistic tradition, social analysis and psychological investigation, along with a new emphasis on the role and status of women. *Bildungsroman* (stories of growing up) continued to be written, by novelists such as Clark BLAISE (*Lunar Attractions*, 1979), Keith Mailard, Alice MUNRO (*Lives of Girls and Women*, 1971) and Alden NOWLAN (*Various Persons Named Kevin O'Brien*, 1973) among others. Canadian fiction increasingly showed signs of breaking away from the conventions of realism. Reflexivity (the concern within a work to speak of the creative process itself) became prominent. This may have been a result of the increasing desire of writers — many of them academics — to deal openly with the technical aspects of their art; or it may have arisen from an increasing engagement with structuralism in linguistics, anthropology and theories of communication, including those of Harold INNIS and Marshall McLuhan.

While taking part in the international literary trends, the Canadian novel also revealed a continuity with its own past, with its regional roots

and its tradition of treating minority groups as more than just local colour — obvious reflections of the geographic and ethnic diversity of the country. Writers who had established their reputations earlier continued to publish (eg, Hugh MacLennan, *Voices in Time*, 1980; Morley Callaghan, *A Time for Judas*, 1983). However, most important during these years was the emergence of a number of significant new voices. This phenomenon was remarkable in both its quantity and its quality.

Regional writing in Canada had never been provincial, although it had tended to balance the natural novelistic attraction toward the exotic. After 1959 many Canadian writers — among them Margaret Laurence, David Knight, Audrey Thomas and David Godfrey — used as settings Africa and Europe, but they did so either as analogues that enabled them to comment implicitly upon their own culture, or as the source of new perspectives that allowed them to see Canada more clearly. Writers who anchored their works in a specifically Canadian geography followed the tradition, established and continued by Prairie writers, of making the landscape both real and symbolic, both local and universal. Canadian fiction in general was spatially oriented around 2 opposing *topoi*: the city and the country. Urban novels by Juan Butler (*Cabbagetown Diary*, 1970), John Buell (*The Pyx*, 1959), Hugh Garner and others were frequently both realistic accounts of the corroding violence and alienation of the modern city and symbolic representations of the infernal "Unreal City" of T.S. Eliot's "The Waste Land."

At the other extreme were the idyllic or nostalgic descriptions of small towns and their rural environs. More often, however, these small communities became symbolic microcosms, this time of a limited and limiting society: Alice Munro's Jubilee, Robertson Davies's Deptford, Matt Cohen's Salem, Margaret Laurence's Manawaka. The land — in the form of the family farm — continued to be regarded ambivalently, as both man's essential roots and his major burden. Frequently the land was connected more to a temporal than to a spatial dimension: it was here that characters either searched for their collective or individual past or rejected its haunting authority. The Canadian wilderness also became the subject, as well as the setting, of fiction in modes ranging from the metaphorical to the ecological.

There was a similar double interpretive pull (toward the symbolic and toward the documentary) in the portrayal of minority groups in Canadian fiction. During these years, there was a greater interest in native Indian and Inuit literature, particularly in memoirs and collections of myths and folktales. Middle-class white Canadian novelists such as W.O. Mitchell, Wayland Drew and James Houston evinced an increased respect for native culture and a desire to learn from it. Many immigrant groups became the foci of attention of Canadian novelists: Jewish (Adele Wiseman, Jack Ludwig, Mordecai Richler), Japanese (Joy Kogawa), Mennonite (Rudy Wiebe), West Indian (Austin Clarke, Harold Sonny Ladoo), and so on. These novels often consisted of commentaries on social problems experienced by immigrants to Canada, frequently mixed with suggestions that the newcomers could also be seen as symbolic of the alien and the separate in each individual.

Both of these interpretations were also to be found in the gay literature of Jane Rule (*The Young in One Another's Arms*, 1977) and Scott Symons. Leonard Cohen's *Beautiful Losers* (1966) was perhaps the archetype of the challenge to sexual mores of the 1960s, and with that challenge came the questioning of sexual roles in general. Although men such as Ian McLachlan and David Helwig also wrote of these issues, feminism as an ideology tended to be the do-

main of female writers. Canadian writing by women about women partook of the general radicalization of the time, of the desire to right the balance, as feminist literature everywhere was attempting to do. In English Canada there was little of the more abstract Québécois interest in defining a new female discourse. Instead, an awareness of feminist issues became part of the overt themes of fiction whose aim ranged from objective documentation of the condition of women to virulent attack on the causes of repression. While remaining engaged or committed, the feminist novels of writers like Constance Beresford-Howe (*The Book of Eve*, 1973), Marian Engel (*Joanne*, 1975), Carol Shields (*Small Ceremonies*, 1976) and Doris Anderson (*Two Women*, 1975) allowed for a variety of tones and styles, from the thoughtful and worried through to the angry and strident.

Given the didactic stance behind many of these novels, it is not surprising to find certain formal, as well as thematic, constants. In an attempt to redress the balance of characterization in a traditionally male literary form, feminist novelists tended either to idealize women characters or to present them as pure victims of masculine domination. Male characters, as a result, were often caricatured or else had their roles reduced to the skeletal ones usually reserved for women in novels that have men as heroes. The major themes of these novels centered on the experience of women, especially in relation to power structures (on all levels). There was an intense awareness of the relationship between bonding and bondage, ie, between a woman's need for connection with others and her equally strong need for freedom and independence, a theme that made feminist novels political in the broadest sense.

However, the concern with power and victimization was not restricted to this one context. Following the lead of Québec writers of the 1960s, English Canadian novelists too became more politicized. Some focused on specific events (the October Crisis of 1970) or situations (federalism versus separatism). Others — David Lewis Stein, Margaret Atwood and many more — investigated the tension between social or political structures and the individual psyche. Again the stylistic and tonal range was great — from the irony of Richard Wright to the bitter satire of Leo Simpson to the sometimes ponderous earnestness of Peter Such — as *homo canadensis* confronted the forces of corporate, consumer, industrial and technological society. Ian McLachlan and Timothy Findley included in this kind of investigation a study of the role of art in such a society and the ideological implications of its involvement or its alienation.

Many novels in Canada — those by Robert Harlow, Graeme Gibson, Helen Weinzwieg, David Adams Richards and Ray Smith — could be seen as part of the general literary movement that has been labeled "postmodernism," for they too exhibited an increased self-consciousness about the creative processes. This immanent concern for their reception and interpretation prevented them from being merely introverted and precious. Their self-representation in form became a means of investigating the politics of how and why we read, as well as a way of focusing on the literary materials themselves: language and narrative. This increased interest in form may be due to the number of poets who turned to writing fiction during these years: Cohen, Atwood, Gwendolyn MacEwen and Michael Ondaatje among others. Another possibility suggests itself in the role of the university in Canadian letters during these years: many of the novelists were either professors (Graham Petrie, Anthony Brennan, Tom Marshall, Robert Kroetsch, etc) or writers-in-residence. Besides increasing formal awareness and experimentation, this institutionalization also

produced many academic novels, ranging from satiric cuts at the intellectual community to rather boring *romans à clef*.

Postmodernist, reflexive fiction in Canada appeared to organize itself around 2 new formal traditions: the written chronicle and the oral tale. On the one hand, there was almost an obsession with the written product of history as something fixed and fixing. Munro, Ondaatje, Kroetsch, Findley and others frequently used photographic images to signal this thematic pole. On the other hand, they looked to metaphors of music, film and tape recording to express the opposite pole, that of the storytelling process. Often other oral traditions were called upon: African (David Godfrey, in *The New Ancestors*, 1970), Indian (Rudy Wiebe, in *The Temptations of Big Bear*, 1973), and Irish (Jack Hodgins, in *The Resurrection of Joseph Bourne*, 1979). Perhaps these 2 poles reflected the legacy of Marshall McLuhan, for whom oral cultures were collective, simultaneous, auditory and oriented toward the present, while written cultures were individual, signed, linear, visual and under the control of the past. Yet even those novels positively stressing an oral tradition themselves only existed as written, individual, signed works. It was this consciousness of the oral-written tension that marked the peculiarly Canadian brand of literary post modernism, which had as a by-product a reawakening of interest in myth and fantasy.

Contemporaneous with these self-conscious experimental novels was a more generally accessible body of popular fiction. Publishers such as McClelland and Stewart retained their commitment to "serious" fiction, but the economic situation demanded as well that local mass-market sales (traditionally American) be somehow diverted to Canada. Just as Canadians came to realize that good comic novels and fine children's books were being produced right at home, they became aware too of the local popular fiction.

POPULAR LITERATURE is generally regarded as light entertainment and therefore as literature which confirms rather than challenges the reader's beliefs, usually by relying on more or less preformulated verbal and narrative structures. Often, following (or hoping to entice) television and movie scripts, popular novels provided information about a sector of contemporary society (from the drug dealing of William Devereil's novels to the pig farming of Aritha Van Herk's). Frequently, this format was combined with the conventions of the thriller. Canadian novelists, however, also produced other forms of popular literature, from the detective story to historical fiction to soft-core pornographic melodrama, and the quality of the writing varied considerably. Forms of popular fiction were also incorporated into more serious post modernist novels. This could be seen either as a cultural democratization of the high/low art split, or just as a source of parodic satire. Some novels used the gothic romance (Atwood's *Lady Oracle*, 1976) or the western (Kroetsch's *The Studhorse Man*, 1969), while others turned to comic books or Hollywood movies (*Beautiful Losers*).

Since 1959 Canada has been able not only to enjoy the consolidation of the renown of successful writers of earlier decades, but to continue with ease the process of forming an ever-growing literary canon. In the 1960s were firmly established the reputations of Margaret Laurence, Robertson Davies and Mordecai Richler; in the 1970s those of Alice Munro, Rudy Wiebe, Jack Hodgins, Timothy Findley and Margaret Atwood. The fact that such a short list as this is embarrassingly insufficient is ample testimony to the variety, richness and high quality of recent Canadian fiction.

LINDA HUTCHEON

Reading: M. Atwood, *Survival* (1972); F. Davey, *From There to Here* (1974); M. Fee and R. Cawker, *Canadian Fiction* (1976); N. Frye, *The Bush Garden* (1971); W.H. New, *Articulating West* (1972) and, ed., *Fiction in the Seventies* (Special Issue of *Canadian Literature* 92, spring 1982); G. Woodcock, ed., *The Sixties* (1969) and, ed., *The Canadian Novel in the Twentieth Century* (1975).

**Novel in French** Although the Québec novel was born in the turbulent days preceding the REBELLIONS OF 1837, it bore no trace of those events. Instead, it fictionalized real-life incidents (François-Réal Angers, *Les Révélations du crime ou Cambray et ses complices*, July 1837; tr *The Canadian Brigand*, 1867) or claimed kinship with Victor Hugo while borrowing heavily from the heritage of anecdotes, tales and legends (Philippe AUBERT DE GASPÉ, Jr., *L'Influence d'un livre*, 1837). With *Les Fiancés de 1812* (1844) by Joseph DOUTRE, the novel became resolutely Canadian and adventure oriented. The first part of *Une de perdue, deux de trouvées* (1849-51) by Georges Boucher de Boucherville was along these lines and led the way for the serialized novel which was developed by Henri-Émile Chevalier ("La Jolie Fille du faubourg Québec," 1854). The French authors of such serials (Alexandre Dumas, père, Eugène Sue, Frédéric Soulié) continued to be read, but the adventure story gave way to the rustic novel. *La Terre paternelle* (1846) by Patrice Lacombe had the shape of a long short story and a clear message: one must not give up the family land or leave it for the city. Pierre-Joseph-Olivier CHAUVEAU (*Charles Guérin*) fell first under the influence of Honoré de Balzac (1846) and then turned to the theme of settling the land. Antoine GÉRIN-LAJOIE developed this theme in *Jean Rivard, le défricheur* (1862; tr *Jean Rivard*, 1977) and *Jean Rivard, économiste* (1864), in which his hero, who had left college in order to homestead, established a new parish in just a few years. Rivard became a role model whose example was preached, off and on, until the middle of the 20th century. The historical novel emphasized the moral grandeur of the vanquished of 1760 (Philippe AUBERT DE GASPÉ, Sr., *Les Anciens Canadiens*, 1863; tr *Canadians of Old*, 1890), who, having fallen heroically before their opponents, nonetheless preserved their French soul, language and traditions. In *Jacques et Marie* (1865-66), Napoléon BOURASSA paid homage to the courage of the deportees of 1755 from ACADIA (lovers lose track of each other and then, after long periods of wandering, are reunited).

The best novels of the late 19th century (1866-95) are historical. Though Québécois read a great deal of Walter Scott and James Fenimore Cooper, authors such as Joseph Marmette (*François de Bienville*, 1870) and Laure Conan (the pseudonym of Félicité ANGERS) were more strongly influenced by François-Xavier GARNEAU, whose *Histoire du Canada* (tr *History of Canada*, 1860) began to appear in 1845, and by puritanical, conservative literary critic Henri-Raymond CASGRAIN. Marmette knew the historical material well but constructed his novels awkwardly, whereas Conan, the first female Québec novelist, knew better than previous writers how to develop complex characterizations (*A L'Oeuvre et à l'épreuve*, 1891, tr *The Master Motive*, 1909; *L'Oublié*, 1900). She undoubtedly owed her success to the experience she gained with *Angéline de Montbrun* (1881-82; tr 1975), considered to have been the first psychological novel written in Québec. Jules-Paul TARDIVEL moved forward in history rather than back: his nationalistic *Pour la patrie* (1895; tr 1975) was set in 1945, at a moment when French Canadians, after difficult political struggles, were finally about to win their own French and Catholic state.

At the turn of the century, rustic novels were revived, at first in rather weary form by Ernest Choquette (*Claude Paysan*, 1899; *La Terre*, 1916) but then more confidently by Damase Potvin

(*Restons chez nous*, 1908). However, it was a Frenchman, Louis HÉMON, who brought the genre to full flower. Readers were deeply moved by his MARIA CHAPDELAINE (tr 1973), which appeared in a French newspaper in 1914 and then in book form in Québec in 1916. In 1921, in France, this novel began its long international career: today, it is still the best known of all Québec works. Though it is criticized for its myopic view of Québec as a land of tillers of the soil where nothing has changed or should ever change, the impressionistic realism of *Maria Chapdelaine* nonetheless forced writers to modernize their style and to observe their fellow citizens with more care. At about the same time (1918), *La Scouine* appeared discreetly — only 60 copies, privately printed. Albert Laberge divided his stark, unrelievedly sombre tale of a Québec farmer into 33 remarkably concise tableaux, all written in a style reminiscent of Émile Zola. This novel was rediscovered in 1958 and was translated as *Bitter Bread* in 1977. The rustic novel reached its culmination in 1938 with *Trente Arpents* (tr *Thirty Acres*, 1940) by Ringuet (pseudonym of Philippe PANNETON). Here the land, which in the 19th century had been viewed as society's salvation, no longer supported its master: these were the days of economic crisis, INDUSTRIALIZATION was occurring and rural people were being drawn to the city. Novels celebrating the cult of the soil were no longer written in Québec, except for the excellent *Le Survenant* (1945; tr *The Outlander*, 1950) by Germaine GUÉVREMONT, a kind of poetic revival of the genre.

The historical novel knew a similar kind of evolution into the 20th century. Robert Laroque de Roquebrune published *Les Habits rouges* (1923), a tale of the early revolutionary events of 1837, and *D'un océan à l'autre* (1924), a history of Canada's expansion westward in the days of Louis RIEL (1869-85). Alain Grandbois produced a book with a unique style, *Né à Québec...* (1933; tr *Born in Quebec*, 1964), a poetic prose account of the life of explorer Louis JOLLIET that displayed the gifts of this future poet to their best advantage. Léo-Paul DESROSIERs somewhat more prosaically recounted the early 19th-century FUR TRADE battles; his *Les Engagés du grand portage* (tr *The Making of Nicholas Montour*, 1978) was the most beautifully realized of all Québec historical novels. Even so, although Desrosiers was praised for his technique, reservations were expressed about the too neat, antithetical opposition of his characters, Nicolas Montour, totally unscrupulous adventurer, and Louison Turenne, the flawlessly honest voyageur. This was the last of the tradition; the few historical novels that occasionally appeared thereafter were decidedly mediocre.

The historical novel had been the favoured art form of literary nationalism. Almost invariably, authors stressed the moral virtue of French Canadian and Acadian characters and the treacherous nature of Anglo-Saxon ones. Sometimes a few of the latter had redeeming qualities, or were even thoroughly good, but they rarely, if ever, triumphed over their Canadian counterparts. The rustic novels offered a more subtle version of the same approach. This accounts for the survival, well into the 20th century, of the Tardivel-style nationalistic novel. It takes a more refined form in *L'Appel de la race* (1922) by Lionel GROULX, a more poetic form in *Menaud, maître-draveur* (1937; tr *Master of the River*, 1976) of Félix-Antoine SAVARD. *L'Appel de la race* is set against the background of the Franco-Ontarians' struggle for the right to French-language education: the race that thought itself superior was pitted against the race that was superior, both in the public drama and within the family, for the father had had the misfortune to marry an Anglophone. The original version of *Menaud, maître-draveur* was a highly coloured

epic in the Claudelian manner. Strangers come to the land of Maria Chapdelaine intending to seize its riches for themselves; Menaud, an old craftsman, undertakes the defence of his people, but the combat is illusory for the strangers remain invisible, a kind of gangrenous presence silently devouring an entire people. Menaud goes mad and his madness is a warning: death is on its way. And so it was, but it was only the death of a certain kind of nationalism.

The psychological novel slowly developed as characters began to escape the usual stereotypes. Its progress can be traced from *Angéline de Montbrun* to *Un Homme et son pèché* (1933) by Claude-Henri GRIGNON. A great reader of Balzac, Grignon drew, in all simplicity, the portrait of an avare peasant. Radio and then television turned Séraphin Poudrier into a new stereotype and he became the best-known fictional character in Québec. Rex Desmarchais, who read Maurice Barrès and Paul Bourget, pushed character analysis a step further (*L'Initiatrice*, 1932; *Le Feu intérieur*, 1933), but his novels were weak and it was only when the work of French writer François Mauriac began influencing authors in the 1940s that good psychological novels began to appear. Even so, Desmarchais helped break ground that encouraged his successors to be more daring. They were able to free themselves from the narrow morality which had so hindered the development of the Québec novel and demand that their works be judged purely on aesthetic grounds. The novel of social criticism had great difficulty establishing itself, and for the same reason: only morality tales won the approval of the religious-literary institution, only conformist novels won that of the ecclesiastical-political establishment. In 1934, for example, a bishop condemned Jean-Charles HARVEY's *Les Demi-Civilisés* (tr *Sackcloth for Banner*, 1938). The novel was poorly structured and badly written, but it had the luck to criticize hypocrisy at an opportune moment and it sold well. The great works in this field did not appear for another decade.

In 1938 the Québec novel was 100 years old. It was the expression of a people who had maintained their rural mentality despite the urbanization of the past 20 years and it had just produced its greatest examples of the 3 genres that its authors and readers collectively endorsed: the rustic novel (*Trente Arpents*, 1938), the historical novel (*Les Engagés du grand portage*, 1938) and the nationalistic novel (*Menaud, maître-draveur*, 1937). WWII would stimulate the move to the cities and exposure to the outside world; the individual would escape somewhat from the supervision of the authorities; and writers from the traditional ideologies, especially nationalism, freer than in earlier days, would move farther away from the traditional ideologies. The novel changed its orientation, and came to know the city and the individual. RENÉ DIONNE

#### Novel in French, 1940-60

Some 300 narrative works (novels, personal accounts, collections of stories) were published in Québec between 1940 and 1960 — a total equal to the production of the entire preceding century and large enough to contain a respectable number of enduring works. In fiction, this 20-year period saw significant diversification of subject matter, notable improvement in technique and much greater psychological depth. The long tradition of the novel of the soil came to a beautiful end with the publication of Germaine Guévremont's *Le Survenant* and *Marie-Didace* (1945, 1947; tr together as *Monk's Reach*, 1950). These books presented the day-to-day life of the people of Chenal du Moine at the turn of the century in a serene and realistic way, free of moralizing overtones. Yet they are more properly classified with the 1930s, kindred spirits to Ringuet's *Trente Arpents* (1938), whereas Ringuet

himself, after the *Héritage* stories (1946), turned his attention to city dwellers with *Fausse Monnaie* (1947) and *Le Poids du jour* (1949).

The WWII years, which followed the GREAT DEPRESSION and increasing industrialization, changed the country's social and demographic realities to produce an urban world soon reflected in the mirror of fiction. Roger Lemelin pioneered with his vivid, satirical account of life in a working-class Québec City neighbourhood, *Au pied de la pente douce* (1944; tr *The Town Below*, 1948). His very similar *Les Plouffe* (1948; tr *The Plouffe Family*, 1950) was followed by the uneven *Fantaisies sur les péchés capitaux* (1949) and then, in an abrupt change of pace, by the extravagant adventures of *Pierre le magnifique* (1952; tr *In Quest of Splendour*, 1955).

International acclaim greeted Gabrielle Roy's great novel of urban life, *Bonheur d'occasion* (1945; tr *The Tin Flute*, 1947) in which the moving story of Florentine and her poverty-stricken family was deftly set against the backdrop of Montréal's Saint-Henri district in early 1940 and a world at war. Roy excelled in her presentation of physical and social space but she was most interested in the psychological development of the individual and her grasp of it was deep and sure. Her subsequent works displayed her talents to the full — in the semiautobiographical *La Petite Poule d'eau* (1950; tr *Where Nests the Water Hen*, 1951), *Rue Deschambault* (1955; tr *Street of Riches*, 1957), and *Alexandre Chenevert* (1954; tr *The Cashier*, 1955), her touching story of a Montréal bank clerk tortured by metaphysical anguish and physical illness, who nonetheless arrives at a certain kind of personal peace and happiness.

The novel of psychological introspection first appeared during this period. In *Ils posséderont la terre* (1941), Robert CHARBONNEAU tried to maintain the autonomy of his adolescent characters even as he wrote about their lives and destinies, thereby respecting the principle he later developed in his essay *Connaissance du personnage* (1944), one of the era's few published theories on the art of the novel. The austerity and discipline of his first novel were admirable, but its excessive detachment was not — a defect even more pronounced in his next novel, *Fontile* (1945), and not fully corrected in *Les Désirs et les jours* (1948), the last in the trilogy.

The author of the psychological novel commonly uses every technique at his command to explore the nuances of his characters. André Giroux, in *Au-delà des visages* (1948), ingeniously examined one incident from a variety of viewpoints, which allowed him to develop every facet of his protagonist's deepest spiritual being. Some writers try to compensate for limited imagination with efficiency of narrative technique but, as Giroux's second novel, *Le Gouffre a toujours soif* (1953) and his collection of short stories, *Malgré tout la joie* (1959), both show, what really matters is to touch the core of the human condition.

A similar balance between technique and depth of comprehension exists in the works of some authors who wrote well but little and enjoyed only brief celebrity in the 1950s. In Robert Elie's *La Fin des songes* (1950; tr *Farewell My Dreams*, 1955) and *Il Suffit d'un jour* (1957), the basic elements of the human drama are obsession with the meaning of life, inevitable solitude and the lack of communication between people. In Jean Filiatrault's *Terres stériles* (1953), *Châmes* (1955) and *Le Refuge impossible* (1957), love is just a mask for hatred in the troubled family relationships (filial, maternal, conjugal, fraternal, etc) of complex-ridden individuals. In *Les Témoins* (1954) and *Les Inutiles* (1956) by Eugène Cloutier, on the other hand, apparently gratuitous (but perhaps simply critical) fantasy replaces the agonized expression of the great problems of mankind, humanity's social maladjustment and fundamental absurdity.

Other novelists, more moralizing and deliberately abstract, had begun to write satirical tales that often verged on being essays instead. The characters in François Hertel's trilogy, *Mon-des chimériques* (1940), Anatole Laplante, *curieux homme* (1944) and *Journal d'Anatole Laplante* (1947), mirror their author: free, cynical, without illusions, and garrulous, they study the trivia and important events of life with equal parts perception and irreverence. Pierre Bailargeon puts a great deal of himself, including his crisp and lively style, into the biting arguments of *Les Méditations de Claude Perrin* (1945) and *Commerce* (1947), and into the introverted but incisive protagonist of *La Neige et le feu* (1948). Jean Simard draws on his own life for the ironic sketches of *Félix, livre d'enfant pour adultes* (1947) and *Hôtel de la reine* (1949). His *Mon fils pourtant heureux* (1956) was a more introspective work, its satire darker. In *Les Sentiers de la nuit* (1959), Simard seemed more objective but in fact, under cover of a well-executed caricature of Anglo-Saxon puritanism, he symbolically attacked French Canadian Jansenism as well, handling the most serious of subjects — God, religion, suffering and death — in a touchingly humorous way.

The most important psychological novelist is unquestionably André LANGEVIN. He led the way in incorporating the universal themes of existentialism made famous in France by Sartre, Camus and others. His trilogy of novels on the theme of man's essential solitude argues that the only possible relationship between human beings leads inevitably to despair: it consists of the evil they inflict or themselves suffer, no matter how they try to avoid it. His characters, stripped of all transcendence, grapple with meaningless suffering in a strictly contingent universe. The randomness of their lives drives them to choose between extremes: either they seek the escape of suicide, like Jean Cherteffe in *Évadé de la nuit* (1951) or, however feeble or illusory their weapons, they try to fight their fate, like Alain Dubois in *Poussière sur la ville* (1953; tr *Dust over the City*, 1955) or Pierre Dupas in *Le Temps des hommes* (1956). In the first of these novels, Langevin failed to integrate his rigid metaphysical doctrine with the flesh-and-blood story of his protagonist. The other 2 works, however, each drawing in its own way on rich resources of time and space, achieve a high degree of aesthetic success.

These books seemed to drain Langevin, for he withdrew into silence until the publication of *L'Élan d'Amérique* (1972), which was followed in 1974 by *Une Chaîne dans le parc*. Yves THÉRIAULT, on the other hand, has become more productive over the years. The novel is only part of this author's infinite variety: he has also written hundreds of scripts for radio and television and numerous popular stories and novels for adolescents. Although 6 years elapsed between his highly original stories, *Contes pour un homme seul* (1944), and his first novel, *La Fille laide* (1950), his output thereafter was abundant — and, at times, of uneven quality. Among his best works during the 1940–60 period are *Le Dompteur d'ours* (1951), *Aaron* (1954) and *Agaguk* (1958; tr 1963). Thériault has used his works to promote a wide variety of causes. The graphic presentation of man's unbridled instincts has inherent shock value: it preaches the authenticity of vigorous primitivism. The acts of sex and violent death in particular are of great value, both for the way they bring out the individuality of each character and for the role they play in the emancipation of the oppressed: all kinds of "little people" (Indians, Inuit, Jews), fighting the established structures, moral, religious, social and ethnic, that prevent their full growth as human beings. One must complement the discussion of these outstanding writers with at least a mention of some of the others who have also made

their contribution to the postwar Québec novel: Jean-Jules Richard, *Neuf jours de haine* (1948); Françoise Loranger, *Mathieu* (1949); Louis Dantin, *Les Enfances de Fanny* (1951); Roger Viau, *Au milieu, la montagne* (1951); Jean Vaillancourt, *Les Canadiens errants* (1954); René Ouvrard, *La Veuve* (1955); Maurice Gagnon, *L'Échance* (1956); and Claire France, *Les Enfants qui s'aiment* (1956; tr *Children in Love*, 1959). Pierre Gélinas wrote *Les Vivants, les morts et les autres* (1959), one of very few novels depicting the labour movement. Several novelists first appeared in this period but did not come into their own until the 1960s. Anne HÉBERT is one, notable for her *Les Chambres du bois* (1958; tr *The Silent Rooms*, 1974), a dream-novel that perhaps crosses the line into poetry, and especially for *Le Torrent* (1950; tr *The Torrent*, 1973), a collection of stories of many levels that reflects the whole spiritual adventure of the French Canadian people. Claire Martin polished her skills in a collection of elegantly biting short stories, *Avec ou sans amour* (1958), before tackling the novel with *Doux-amer* (1960), while Marie-Claire BLAIS found her voice in *La Belle Bête* (1959; tr *Mad Shadows*, 1971) and *Tête blanche* (1960; tr 1974), 2 stories of adolescent revolt played out in a dream state. Gérard BESSETTE published *La Bagarre* (1958; tr *The Brawl*, 1976), a novel of social events, and *Le Libraire* (1960; tr *Not for Every Eye*, 1963), which appeared at the perfect moment to contribute to the QUIET REVOLUTION, the "ideological exorcism" of Québec. RÉJEAN ROBIDOUX

#### Novel in French, 1960–82

During the 1960s and 1970s new developments in the Québec novel coincided with important social changes. Although it did not provide a direct reflection of reality, the novel nevertheless interacted with other current forms of discourse and in this way responded to its social environment. The arrival of a new generation of writers during the Quiet Revolution helped turn these changes into something of an event — a dramatic period of contestation and rebellion, from which the Québec novel emerged transformed.

Several writers advocated the use of popular levels of language (JOURNAL) in order to portray more accurately the long-ignored realities of the working class. Initially these writers were connected with the magazine PARTI PRIS. Jacques RENAUD (*Le Cassé*, 1964) and André MAJOR (*Le Cabochon*, 1964, and *La Chair de poule*, 1965) contributed to bringing about this transformation, using popular forms of language to reflect and symbolize the degrading effects of self-contempt, colonization and social deprivation. Apart from the political implications of writing in *joual*, this new approach rapidly led to the formulation of a new kind of literary style exemplified by Jacques GODOUBT in *Salut Galarneau!* (1967), and Victor-Lévy BEAULIEU in *Race de monde* (1969) and *La Nuit de Malcolm Hudd* (1969). For all these writers the juxtaposition of different levels of language was a way of establishing a new linguistic identity and of setting out a new conception of Québec reality.

The same period brought the appearance of extremist characters who personified or expressed revolt, radicalism and intransigence, such as the revolutionaries in Hubert AQUIN's *Prochain épisode* (1965) and *Trou de mémoire* (1968), and Claude JASMIN's *Ethel et le terroriste* (1964). Réjean DUCHARME's character Bérénice in *l'Avalée des avalés* (1966) is a clear example of this dynamic negativism whose goal is to sweep away all existing social and cultural values. Bérénice provides the foremost expression of an impulse to deny reality, which to varying degrees motivates the characters in many of the novels of this decade. As in Ducharme's works, this rejection is personified by children and adolescents in the writing of Marie-Claire BLAIS (*Une saison dans la vie d'Emmanuel*, 1965, *l'Insoumise*, 1966, *Les*

*Manuscripts de Pauline Archange*, 1968, and *David Sterne*, 1967). The values of childhood and art are often presented as a refuge from the degraded world of adults.

In many cases subversion or repudiation is expressed in parody. The novels reinterpret history and ridicule older forms of writing and obsolete values in order both to laugh at them and to advocate their opposites. In *La Guerre, yes sirl* (1968) ROCH CARRIER presents a carnival-like version of the CONSCRIPTION crisis by showing farmers in the process of gleefully reversing the "civilized" values of the army and the church. In *Le Ciel de Québec* (1969) JACQUES FERRON presents an absurd mock epic dealing with Québec history and French Canadian messianism, and at the same time settles his accounts with writers of the previous generation (such as Saint-Denis Garneau and Jean Lemoyne). Irony also provides an important dimension to Blais's *Une Saison. . .* and *Les Manuscrits. . .* in which she parodies certain kinds of "uplifting" literature, and the writing of Ducharme, who mocks and inverts many different styles in *La Fille de Christophe Colomb* (1969) and *L'Hiver de force* (1973).

These stories not only undermine history and contest it; they also propose a new version of it. This reinterpretation and reconstruction of history connects with the use of *joual* in that it brings the oral tradition (see ORAL LITERATURE) back into literature. In this way the historical novel and the novel of the land are reinterpreted in the light of a new form of awareness: the awareness of being dominated. This can be seen in the work of Antonine MAILLET and Victor-Lévy Beaulieu, among others. It is the voice of the people that is heard when Maillet recalls the Acadians' historical misfortunes and the delights of their language in a series of novels culminating in *Les Cordes de bois* (1977), *Pêlagie-la-charrette* (Prix Goncourt, 1979) and *Cent ans dans les bois* (1981, republished 1982 in France as *La gribouille*). For his part, Beaulieu tells the "true saga of the Beuchemins," a grandiose and preposterous story of a working-class family transplanted from the Gaspé coast to the sleepy suburb of Montréal-Nord (or, as he writes it, Moréal-Mort). By 1984, 5 titles in the series had been published: *Race de monde* (1969), *Jos Connaissant* (1970), *Les Grands-pères* (1971), *Don Quichotte de la démanche* (1974) and *Satan Belhumeur* (1981).

In a similar vein to these extended series, a number of other novels were involved in transforming or contesting the novel's basic conventions. Previously Gérard Bessette, in *L'Incubation* (1965) and *Le Cycle* (1971), and André Langevin, in *L'Élan d'Amérique* (1972), had introduced new ways of telling a story along the lines of the "nouveau roman" in France. In the writing of Aquin and Beaulieu the ambiguities of the narration create some uncertainty in the story, since the plot does not evolve in the usual chronological order. For these writers, however, the ambiguities stem from the social and political alienation they are intended to reflect. For others such as Jean-Marie Poupard, in *Angoisse play* (1968), *Chère Touffe, c'est plein plein de fautes dans ta lettre d'amour* (1973) and *C'est pas donné à tous le monde d'avoir une belle mort* (1974), and Jacques BENOÎT, in *Patience et Firlipon* (1970), the interrogation and disintegration of the traditional narrative structure are more gratuitous and playful, with the narrator thinking aloud about his telling of the story. More than the theme of the writer as hero, the act of writing itself has now become a determining factor in the process of narration.

Even an early novel such as Bessette's *Le Libraire* (1960) contains statements that undermine the story's realism: it is the narrator himself who invites us to undertake a second reading by describing the room in which he is writing his diary as having dimensions (8½' x

11') that are analagous to those of the sheet of paper on which he is writing (8½" x 11"). To Bessette, in this example, and especially to Aquin and Beaulieu, historical references often become a metaphor for the process of writing. At its most extreme, as critic Jean Ricardou has pointed out, the writing of adventure is paralleled by the adventure of writing. In *Prochain épisode* and *Don Quichotte de la démanche* the reader witnesses a sort of short circuit between the levels of the story, or, an interference between the storyteller and the story told. The autobiographical form, which is most prevalent in the Québec novel, favours this interchange between the story being narrated and the circumstance in which it is narrated. This game of cross-references, even as it destroys the traditional impression of verisimilitude, creates a new effect: that of a writer writing his story within the context of a history that is beyond his control but in which he is necessarily involved.

In an even more radical fashion, a few writers, such as Nicole BROSSARD in *Un livre* (1970), *Sold Out* (1973) and *French Kiss* (1974), have advocated "completely getting rid of the plot" and dispensing with all logic in the narrative. Here the traditional narration is replaced by a series of fragmented, often autobiographical texts arranged in symbolic order; both because of their expressive qualities and their layout, such texts tend to resemble poetic discourse more than traditional prose. This new "textuality," a blend of theory and fiction, was taken up with particular enthusiasm by the feminist writers who used it both as a trademark and as an area in which they could wage war on "patriarchal" language. Since the publication of *L'Eugélonne* (1976) by Louky Bersianik, the new women's writing has made constant gains in strength and importance. By liberating the novel from its conventional structures, this feminist contribution has brought about a new brand of writing and a new way of expressing the feminine, as is apparent, for example, in *La Mère des herbes* (1980) by Jovette Marchessault, *Lueur* (1979) by Madeleine Gagnon and *La Vie en prose* (1980) by Yolande Villemaire. Several women writers express a desire for a new language that can be reconciled with women's "otherness." In *Nous parlerons comme on écrit* (1982), France Théoret clearly shows the determination to "denaturalize" language and culture through the exercise of writing. Such an undertaking is based on a demanding literary ethic that emphasizes the modernist precept of transforming our relationship to language as a means of thoroughly transforming reality itself.

Among the older, more traditional writers, Gabrielle Roy, Anne Hébert and Yves Thériault, all of whom began their writing careers during WWII, continued publishing in the 1960s and 1970s. With *La Route d'Altamont* (1966) and *Ces enfants de ma vie* (1977), Roy presents highly personal stories that are evocative of her life in Manitoba, whereas Hébert continues her exploration of the tormented, extreme world of guilt and passion in 3 novels with historical settings, *Kamouraska* (1970), *Les Enfants du sabbat* (1975) and *Les Fous de bassan* (1982), as well as a supernatural short story entitled *Eloïse* (1980). Thériault, meanwhile, followed his existing series of Inuit and Amerindian stories with *Ashini* (1960), *Tay-aout, fils d'Agaguk* (1969), *Agaguk, l'héritage d'Agaguk* (1975) and *La Quête de l'ourse* (1980).

During the 1970s writers such as Claude Jasmin and André Major moved away from novels of protest to delve more deeply into introspection. Major produced a trilogy, *L'Épouvantail* (1974), *L'Épidémie* (1975) and *Les Rescapés* (1976), in which the characters observe themselves and their lives in the little world of Saint Emmanuel. The main events in the story are almost always told retrospectively, with the

remoteness of hindsight, and the distance between past and present seems to condemn the characters to perpetual remembrance. The displacement between the hero's life and his acute awareness of it not only coincides with the narrative process but also confines the character to solitary dreaming. Excluded from direct action, the character is left with no immediate grasp of reality. Rather than acting, he is acted upon; rather than being shown in acting, he is shown dreaming about the things he has done. Similarly impotent characters, imprisoned in their past, appear in Hébert's *Kamouraska*, Langevin's *L'Élan d'Amérique* and Beaulieu's *Un Rêve québécois* (1972). The narrative juxtaposes a series of retrospections representing the discontinuous flow of memory in an alienated individual who has stopped evolving. Rebellion has given way to dumbfounded amazement in a character dazed by the trauma of unavoidable events. (This kind of stunned reaction is not unrelated to the moral depression affecting many writers after the imposition of the WAR MEASURES ACT in 1970.) For Jasmin too, the "cycle of violence" gave way to what the author himself called the "cycle of memories," in which he recalls the happy childhood and adolescence he spent in his family surroundings: *La Petite Patrie* (1972), *Pointe-Calumet Boogie-Woogie* (1973), *Sainte-Adèle-la-vaisselle* (1974) and *La Sablière* (1979).

Early in the 1980s it was possible to discern various tendencies indicating something of a return to established traditions in the novel. The historical novel reappeared in the series "Les Fils de la liberté" by Louis Carion: *Le Canard de bois* (1981) and *La Corne de brume* (1982). And the social chronicle was making a comeback in the form of the first volumes of the "Chroniques du Plateau Mont-Royal" by Michel TREMBLAY: *La Grosse Femme d'à côté est enceinte* (1978), *Thérèse et Pierrette à l'école des Saintes-Anges* (1980) and *La Duchesse et le roturier* (1982).

JACQUES MICHON  
Reading: A. Belleau, *Le Romancier fictif* (1979); M. Lemire, ed., *Dictionnaire des oeuvres littéraires du Québec* (4 vols to date, 1980-84); G. Marcotte, *Le Roman à l'imparfait* (1976); B.Z. Shek, *Social Realism in the French-Canadian Novel* (1977); G. Tougas, *History of French Canadian Literature* (1966).

**Nowlan, Alden**, poet (b at Windsor, NS 25 Jan 1933; d at Fredericton, NB 27 June 1983). Largely self-educated, Nowlan was a former newspaperman whose many collections of poetry grew steadily in their power and intensity. Primary among them are *Bread, Wine and Salt* (1967, Gov Gen's Award), *Playing the Jesus Game* (1970) and *Between Tears and Laughter* (1971), all of them rich in regional sensibility and in affection for ordinary people but connected by Nowlan's intelligence, temperament and reading to a literary world far beyond folk culture. He was also a playwright, a story writer and, with *Various Persons Named Kevin O'Brien* (1973), a novelist; several other Nowlan books appeared posthumously. He was often at the centre of the literary community in Fredericton and Atlantic Canada generally, through the vivid example of his craftsmanship, his work at UNB, where he became writer-in-residence in 1969, and his individualistic personality. DOUG FETHERLING

**Nowlan, George Clyde**, lawyer, politician (b at Havelock, NS 14 Aug 1898; d at Ottawa 31 May 1965). A gunner in WWI, educated at Acadia and Dalhousie, he was elected an MLA for Kings County, NS, in the MARITIME RIGHTS election of 1925. Defeated in 1933, he continued to be active in the demoralized Conservative Party and captured the federal riding of Digby-Annapolis-Kings in a series of spectacular elections (1948-50). President of the PC Party (1950-54) and vigorous spokesman for Atlantic Canada, Nowlan served as minister of national revenue (1957-62) and finance (1962-63) in the Diefenbaker government. Never comfortable

with Diefenbaker, who suspected him of treachery on the leadership question, Nowlan remained loyal to the Conservative Party until his death.

MARGARET CONRAD

**Nuclear Energy** is ENERGY from the nucleus of an atom. In stars such as the SUN, pairs of light atoms (mostly hydrogen) fuse together and release the radiation received on earth as SOLAR ENERGY. This NUCLEAR FUSION, the joining of the nuclei of atoms, is one form of nuclear energy. Another form is the splitting (fission) of heavy atoms such as URANIUM. Each atom of naturally occurring uranium has a very small probability of undergoing spontaneous fission at any given moment. When this happens, a pair of lighter atoms (known as fission products) are formed and 2 or 3 neutrons (subatomic particles from the original nucleus) are released. Nuclear reactions are fundamentally different from other common energy reactions. When a conventional fuel burns or when water flows through a hydroelectric generator, the atoms themselves are unaffected, although in the case of fuels they recombine chemically. Hence, the amount of matter remains the same. In nuclear reactions, the atoms themselves are altered and a tiny amount of matter is converted into energy.

To understand how the opposite processes, fusion and fission, can both release energy requires some knowledge of the "curve of binding energy" and Einstein's equation  $E=mc^2$ . The nuclei of all atoms consist of nucleons. A nucleon is either a proton, a subatomic particle with positive electric charge, or a neutron with a neutral charge. The mass of any nucleus is slightly less than the sum of the masses of its constituent nucleons. This difference, or "mass defect," represents the binding energy holding the nucleons together. According to Einstein's equation relating energy (E) to mass (m) through the square of the velocity of light (c), even tiny masses represent large energies: a mass of 100 kg completely converted to energy would supply all Canadian needs for one year. If the binding energy per nucleon is plotted against the number of nucleons in the nucleus, the hump-backed "curve of binding energy" is obtained. Starting at hydrogen (1 nucleon), the curve rises rapidly to oxygen (16 nucleons), then more slowly to arsenic (75 nucleons), before dropping slowly to uranium (238 nucleons). Thus, fusing 2 light nuclei into a heavier one releases some nuclear-binding energy; fissioning a very heavy nucleus into 2 intermediate ones releases a smaller amount of energy per nucleon but involves many more nucleons. Either way, large amounts of energy are released.

#### Radioactivity

Nuclear energy is also released as radioactivity, which is associated with naturally occurring radioactive minerals (eg, RADIUM ores) and with man-made radioisotopes used in medicine and industry. Most fission-product nuclei are radioactive. All radioactive nuclei are unstable and, sooner or later, will decay through the emission of subatomic particles accompanied by gamma radiation (similar to X radiation). The particle released may be an alpha particle, a particularly stable combination of 2 neutrons and 2 protons, or a beta particle (also known as an electron), which is a negatively charged subatomic particle formed when a neutron transforms into a proton. After emission the nucleus may remain radioactive, or may be stable. Just when any given radioactive nucleus will decay is unpredictable. However, in a large number of nuclei of the same kind, half will decay in a period characteristic of that kind of nucleus, its "half-life." Half the remainder will decay in a second half-life period, and so on. Consequently, only about 1/1000 of the original amount of any radioactive material will remain after 10 half-lives. GEOTHERMAL ENERGY, the heat flowing

to Earth's surface from its core, results from the radioactive decay of heavy nuclei such as uranium and is therefore another form of nuclear energy.

Radioisotopes are extremely reliable sources of heat for certain applications. An isotope of plutonium (plutonium-238) formed as a by-product in nuclear fission reactors is used to power heart pacemakers and space satellites. Cobalt-60 can be used to power navigation buoys. If the radioisotope emits gamma radiation, equipment using it must incorporate shielding to protect anyone nearby. A fundamental limitation is inherent in radioactive sources: the more intense the radioactivity (hence, the greater the heat produced), the shorter the source's half-life. For instance, cobalt-60 has a half-life of 5.27 years; therefore after 5.27 years it will produce half as much heat and radiation as it did initially.

#### Nuclear Fission

A vital contribution to the understanding of radioactivity was made by Ernest RUTHERFORD and Frederick Soddy working at McGill University in Montréal early in this century. It was they who first suggested the manner in which a nucleus of one element became a nucleus of another element, ie, by radioactive emissions. In 1904 Rutherford conjectured "that an enormous store of latent energy is resident in the atoms of the radio-elements" and that this energy could be tapped if the rate of radioactive disintegration could be controlled. While it has not been possible to control that rate, human control of nuclear fission has proved practicable. This fact, first demonstrated by Enrico Fermi in a squash court at University of Chicago in 1942, has made this particular nuclear reaction so important.

Control of the fission process depends on the existence of a chain reaction. Naturally occurring uranium consists of 99.28% of the uranium-238 isotope, 0.71% of uranium-235 and very small amounts of other isotopes. When hit by a neutron, the nucleus of a uranium-235 atom has a high probability of fissioning; if the atom is uranium-238 the probability is very low. This induced fission process was first discovered in 1938 by the Germans Otto Hahn and Fritz Strassmann. When a uranium-235 atom fissions, it emits 2 or 3 neutrons. If one of these neutrons hits and thus causes fission in another uranium-235 atom, more neutrons are emitted, one of which could possibly cause a further fission, and so on in a chain reaction. Thus, once started, the fission process can be self-sustaining. If, on the average, exactly one neutron from each fission results in one other fission, the process is in equilibrium and a steady level of heat is produced. The other neutrons escape from the mass of uranium or are absorbed by materials other than uranium-235 within the mass. This is the situation in a nuclear reactor operating at steady power. To increase the power, some of the competitive absorbers of neutrons are removed, allowing the chain reaction to diverge until the desired power level is attained. The equilibrium production of neutrons is then restored to stabilize the power. To decrease the power or shut down the reactor, more absorbers are introduced.

However much natural uranium is heaped up, no significant fission will result, because there are not enough fissile uranium-235 atoms present to sustain a chain reaction. The few neutrons produced are absorbed by the much more abundant uranium-238 atoms and so are unavailable to cause further fission. One solution is to increase the proportion of uranium-235 atoms artificially; this is done in uranium enrichment plants which exploit the small differences in physical properties between the 2 uranium isotopes. A more subtle solution is to divide up the uranium into small packets, each

surrounded by a "moderator" which slows down the neutrons emitted from one packet of uranium before they hit the next packet. Slow neutrons cause fission in uranium-235 much more readily than faster ones. Generally, elements with light atoms are good moderators: ordinary water is not good enough to sustain a chain reaction with natural uranium; very pure graphite (carbon) is better; heavy water, a compound of deuterium and oxygen is best. Deuterium, the heavy isotope of hydrogen, is present in all naturally occurring hydrogen (about one part in 7000). Heavy water is produced by enriching the deuterium content of natural water in heavy-water plants.

A neutron absorbed by a uranium-238 atom is not lost, merely stored. The resulting compound nucleus subsequently transforms spontaneously by radioactive decay into an isotope of another element, plutonium-239. Although uranium-238 is not fissile, plutonium-239 is. Thus, uranium-238 is said to be fertile. Plutonium-239 can be used to sustain a nuclear fission reaction in the same way as uranium-235. Thorium, another naturally occurring nuclear fuel that is somewhat like uranium, consists almost entirely of the fertile isotope thorium-232, which can yield the fissile uranium-233 by absorbing a neutron. These alternative nuclear fuels and moderators can be combined to produce heat and electricity in NUCLEAR POWER PLANTS.

#### History

Natural nuclear reactors predated the man-made variety by about 2 billion years. At that time, nuclear chain reactions generating considerable heat occurred in several rich uranium deposits at Oklo, Gabon, W Africa. This prehistoric event, which has been deduced recently from chemical analysis of the remaining uranium, illustrates basic principles of radioactivity and fission. Since uranium-235 is radioactive, with a half-life of 0.7 billion years, natural uranium then would have contained over 5% uranium-235, a sufficiently high fissile concentration to sustain a chain reaction with ordinary water as a moderator. The nuclear reaction presumably started when groundwater seeped into the deposits. When the chain reaction and the associated fission heat built up to a sufficient level to boil the water and expel it, the resulting lack of a moderator would have caused the reaction to shut down automatically. This cycle must have repeated itself many times, like a gigantic coffee pot percolating away over hundreds of thousands of years. Analysis shows that, despite the absence of any deliberate means of retention, the plutonium produced in these natural reactors remained trapped in the uranium deposits until it had decayed away by its own radioactivity.

Since the early work of Rutherford and Soddy, Canada has contributed significantly to the science and application of nuclear energy. In 1933 Gilbert LABINE brought into production Canada's first radium mine at Port Radium, NWT, on Great Bear Lk. Uranium, always found in association with radium, was then considered a waste product. In 1940 George Laurence started experiments in the National Research Council's Ottawa laboratories with uranium and a graphite moderator. Had his materials been purer, he might have achieved a chain reaction before Fermi. The Port Radium mine of Eldorado Gold Mines Ltd was reopened in 1942 to produce uranium.

In 1943, as part of the Allied war effort, a joint Canadian-UK team, with important French participation, was established at Montréal to pursue the concept of nuclear reactors with heavy water. In the same year heavy water was first produced in Canada at the synthetic ammonia fertilizer plant of the Consolidated Mining and Smelting Corp at Trail, BC, using a

Norwegian process. In 1944, C.J. Mackenzie, who was then in charge of the Canadian program, wrote with great foresight to C.D. HOWE, who was the minister responsible for it: "In my opinion Canada has a unique opportunity to become involved in a project which is not only of the greatest immediate military importance but which may revolutionize the future world in the same degree as did the invention of the steam engine and the discovery of electricity." The Chalk River, Ont, laboratories were established in 1944, and in 1945 the Zero Energy Experimental Pile (ZEEP), the first reactor outside the US, started up at Chalk River. In 1946 Bennett LEWIS, who subsequently was primarily responsible for the technical development of the Canadian CANDU reactor system, became technical director at Chalk River, replacing John Cockcroft who went on to lead the United Kingdom's program. The first radioisotopes produced in the NRX reactor at Chalk River were marketed in 1949. In 1951 the world's first cobalt radiotherapy units for the treatment of cancer, using radioactive COBALT produced in the NRX reactor, were developed by Harold Johns and others. These units were installed in the Victoria Hospital in London, Ont, and in the University Hospital in Saskatoon, Sask. Since then Canada has exported more than 1300 units, and the associated cobalt, to more than 80 countries. These units are credited with saving 13 million person-years of life for the patients involved. In 1962 Canada's first nuclear power plant, the Nuclear Power Demonstration plant, was opened at Rolphton, Ont. This plant demonstrated all-important principles for the CANDU design of reactor.

#### Future

Although it has not yet been possible to control fusion, the required conditions are reasonably well established. It is known that fusing atoms of ordinary hydrogen (the reaction that occurs in the sun) would be extremely difficult. Instead the hydrogen isotopes deuterium and tritium are used in fusion experiments. The deuterium-tritium combination is believed to offer fusion more easily than the deuterium-deuterium. First, the atoms of deuterium and tritium must be at a very high temperature, about 100 million °C; then the atoms must be together long enough for fusion to occur. The time needed is least for densely packed atoms and increases as the density decreases. The minimum requirement commonly quoted for the product of density and time for fusion of deuterium and tritium is  $10^{14}$  atom seconds/cm<sup>3</sup>.

Since no structural materials can operate at the high temperatures required for the fusion reaction, other means of confining the reacting atoms had to be found. At these temperatures the atoms are ionized, ie, electrically charged, and subject to forces when they move in a magnetic field. Hence, magnetic fields can be designed to keep the hot atoms "bottled up" through magnetic confinement. In inertial confinement a small pellet of solid deuterium-tritium would be bombarded from all sides by high-energy beams of LASER light or charged particles. The intense beams would heat the pellet and, by causing shock waves, compress it to about 1/1000 of its original volume. The increased density means that a shorter period of confinement is necessary.

Until controlled fusion has been demonstrated and a practical fusion reactor designed, it would be premature to estimate costs. Like solar energy and nuclear fission, the fuel is abundant and cheap, but the cost of the equipment needed to provide the energy in usable form will be appreciable. Long before fusion becomes an alternative to fission as an energy source, the 2 may complement each other in a hybrid system. In addition to releasing energy, the fusion reaction

provides high-energy neutrons which could, through other nuclear reactions, be multiplied into many neutrons of lower energy. These, in turn, could be absorbed by fertile materials, such as uranium-238 or thorium, to produce fissionable materials to fuel conventional fission reactors. For this purpose another nuclear reaction, spallation, must be regarded as an alternative to fusion. In spallation, heavy atoms (eg, lead) bombarded by light particles (eg, hydrogen nuclei) emit high-energy neutrons which can be used in the same way to provide fuel. Unlike fusion, spallation has already been demonstrated in the laboratory.

Nuclear energy offers a new energy source just when the limits of the chemical fuels — oil, natural gas and coal — are being realized. If recycled, the world's nuclear fuels are virtually inexhaustible. However, the radiation from the nuclear energy, like the fire of chemical energy, has its hazards as well as its benefits.

Like fire, radiation should be respected but not feared. All life has evolved in a sea of radiation that existed from the start of time. To ensure the safety of the public and of workers, and to protect the environment, the federal government regulates the ELECTRICAL UTILITIES, hospitals, universities and others using nuclear energy and radioisotopes. The regulations are based on internationally agreed standards; in Canada the regulatory body is the Atomic Energy Control Board. In addition, more than 10 public inquiries have been held in Canada, dealing with various aspects of the nuclear industry, from uranium PROSPECTING and MINING, through reactor safety to the disposal of nuclear HAZARDOUS WASTES. The overwhelming conclusion of these examinations has been that it is in the public interest to continue with the exploitation of nuclear energy, subject to proper regulation. See NUCLEAR SAFETY. J.A.L. ROBERTSON

**Nuclear Fusion** is the combination of the nuclei of 2 light atoms to form a heavier one. The resulting atom has a smaller mass than the original ones; therefore, nuclear fusion is a method of transforming mass into ENERGY. This reaction produces the energy of stars such as the SUN. By weight, the fusion process yields 8 times more energy than the fission of uranium (see NUCLEAR ENERGY), and over a million times more than the burning of fossil fuels. Fusion is a very attractive energy source not only because of its high-energy yield but also because of the almost limitless abundance of its fuels and the fact that its principal by-product, helium, is inert, unlike the radioactive by-products of conventional fission reactors. Supplies of one major fuel, deuterium, a hydrogen isotope found in ordinary seawater, are virtually inexhaustible. The other major fuel, tritium, could be produced from lithium found in land deposits and seawater, which contain supplies for thousands of years. The amount of fuel in the reactor at any time is very small, so there is no hazard of uncontrolled energy release or runaway reactions. Problems of radioactivity, fuel handling, contamination and waste disposal are small compared to those associated with fission reactors in NUCLEAR POWER PLANTS. The first man-made fusion reaction was the US thermonuclear hydrogen bomb tested in 1952. Unfortunately, the reaction has proved very difficult to contain and harness for peaceful purposes. Controlled experiments have barely reached the point where the energy released is greater than the energy put in, but if research and development proceed successfully, fusion could be an important commercial energy source early in the 21st century.

The important fusion reactions are those involving the isotopes of HYDROGEN: hydrogen (H), consisting of 1 proton and 1 electron; deuterium (D), 1 proton, 1 neutron and 1 electron; and tritium (T), 1 proton, 2 neutrons and 1 electron.

The products of such reactions are helium (<sup>4</sup>He), also known as an alpha particle, and energetic neutrons (n) or protons (p). Fusion reactions are difficult to achieve because the interacting nuclei each has a positive electrical charge and, therefore, strongly repel one another. Fusion can occur only if the nuclei approach each other at very high velocities, sufficient to overcome their electrostatic repulsive forces. To release energy at a practical level, using gaseous deuterium-tritium as a fuel, requires the heating of the mixture to a temperature of 100 million °C or more. Even at lower temperatures, the gas becomes ionized as the electrons become detached from the atoms. In this state, called a plasma, the separated negatively charged electrons and positively charged nuclei move freely, giving the mixture properties different from those of a normal gas. To release more energy than was supplied, it is necessary to confine the plasma to permit a sufficient number of fusion reactions to take place. In the sun the gravitational field heats and confines the hydrogen fuel, resulting in the formation of helium and other heavier elements. On Earth there are 2 classes of approach to containing and heating the plasma: magnetic confinement and inertial confinement.

Since a plasma is a very good conductor of electricity, it can be influenced by magnetic fields. In a magnetic field, the plasma particles are forced to follow spiral paths about the field line; hence, magnetic fields can confine the charged particles of the high-temperature plasma and prevent them from striking the walls of the containing vessel. Many magnetic containment schemes have been suggested and experimentally investigated. One very successful approach has been the tokamak, a closed magnetic-field device with a hollow, doughnut-shaped vessel through which magnetic fields twist to confine the plasma. The fields are produced by external magnetic-field coils and by electrical currents made to flow through the plasma. Initial heating is often achieved by passing a current through the plasma or by rapidly changing the confining magnetic field, but the required temperatures cannot be reached by such methods. Hence, auxiliary heating techniques are used, eg, neutral beam injection, whereby high-energy neutral atoms are introduced into the hot plasma where they are immediately ionized and trapped by the magnetic field, and radio-frequency heating, which uses high-frequency electromagnetic waves generated by external oscillators and introduced into the plasma where the energy is transferred to the charged particles.

In the inertial-confinement approach to fusion, a small spherical pellet containing the fuel is compressed to extremely high density. This process heats the pellet to the required temperature and causes the fuel to ignite before the compressed mass can disassemble. The interaction occurs so rapidly that the compressed pellet remains together by its own inertia. High-power, short-pulsed LASERS and ion-particle beams are the principal candidates for delivering the intense pulses of energy required to heat the outer layers of the fuel pellet rapidly. The ensuing blow off of vaporized material creates an implosion of the fuel. For ignition of D-T fuel to occur, compression of the order of 20 times the density of lead is necessary. The hydrogen bomb uses this approach.

Intensive research is being conducted on controlled fusion energy in many countries, particularly the US, the USSR, Japan and the European Economic Community. Annual spending on fusion research worldwide was over \$2 billion in 1980. In Varennes, Qué, Canada has a national research facility based on a tokamak machine. The \$40-million project is being financed by the NRC and HYDRO-QUÉBEC. M.P. BACHYNSKI

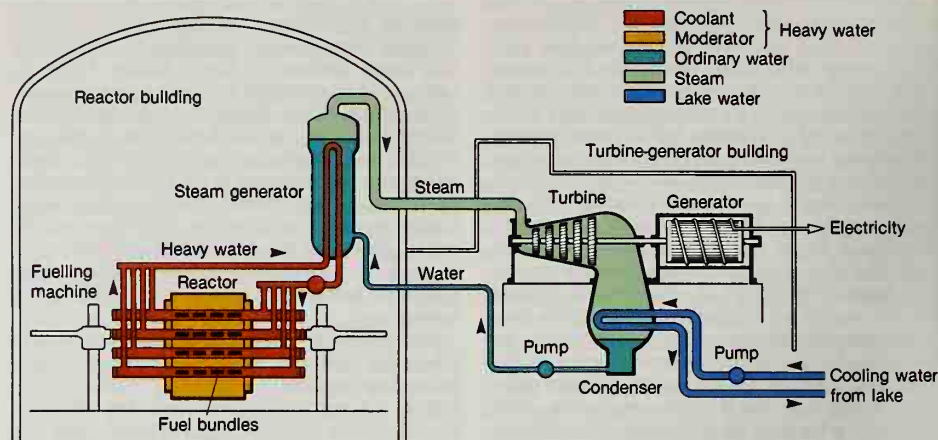

**Nuclear Power Plants** generate electricity from NUCLEAR ENERGY. As in all thermal-electric generating stations (see ELECTRIC-POWER GENERATION), heat is used to boil water into steam, which turns a turbine and drives a generator, producing electricity. A conventional thermal generating station obtains heat by burning coal or other fuels; a nuclear power plant obtains heat from the fission of nuclear fuel in a nuclear reactor. There are many ways of applying the basic principles of fission to the design of actual reactors. In Canada, a unique design known as the Canada Deuterium-Uranium (CANDU) is used. Other countries employ various other designs. A number of auxiliary plants also are needed for nuclear-power generation. All current power reactors use URANIUM as fuel. Uranium is relatively abundant, being present in most rocks and soils and in the oceans. Currently ores that contain about 0.1% uranium by weight, or greater, are economic to mine. After mining and milling, the uranium is a yellow powder (yellowcake); after further chemical treatment, it becomes a black powder (uranium dioxide).

**CANDU Reactors** To make fuel pellets for a CANDU reactor, the uranium dioxide is compressed, then baked at high temperatures to yield hard, insoluble, ceramic cylinders about 14 mm in diameter by 20 mm long. To make one fuel element, a 500 mm long stack of pellets is loaded into a metal tube (made of the zirconium alloy, Zircaloy), which is sealed at each end by welding. For present CANDU reactors 37 elements are assembled by further welding to form a fuel bundle, with individual elements held apart from each other. This fuel bundle is the first basic building block for the reactor. Uranium is a very concentrated energy source. A fuel bundle 500 mm long, 100 mm in diameter and weighing 22 kg could be carried in an overnight bag. When put in a CANDU reactor, it can produce as much ENERGY as burning about 400 t of coal or 2000 barrels of oil.

In the reactor, 12 bundles are placed end-to-end in a tube through which water coolant is pumped. Since the water is at nearly 300°C, it develops a pressure of about 100 atmospheres; the tubes are therefore known as pressure tubes. Each pressure tube, with its contained fuel and coolant and with end fittings to get the coolant in and out, constitutes a fuel channel, the next larger building block for a CANDU reactor. The reactor core consists of several hundred fuel channels positioned in a carefully calculated grid and passing horizontally through a tank, or calandria, containing heavy water as a moderator. Heavy water is a compound of hydrogen and oxygen, having a higher proportion of the heavy hydrogen isotope deuterium than does natural water. The presence of the heavy water and the particular arrangement of channels are essential for fission to occur in the uranium. This arrangement contributes to the safety of the reactor: if the reactor were to be seriously damaged one or both of these conditions would probably be affected and the fission process would stop automatically. This is an example of what is known as a fail-safe feature.

The coolant from the fuel channels is piped to steam generators, where the heat from the fuel is used to boil water in a secondary circuit. The resulting steam drives the turbine and turns the generator to produce electricity. The reactor coolant, now at a lower temperature, circulates back to the reactor in the closed primary circuit.

When a fuel bundle has to be replaced (after about a year and a half in the reactor), remotely controlled fuelling machines are clamped to each end of its fuel channel. Fresh fuel is pushed in from one end and the used fuel is deposited in the machine at the other end. A used fuel bundle, which looks much the same as a fresh one, retains all its wastes sealed within it. Used bun-

Schematic of a CANDU nuclear power system. A fuel bundle 500 mm × 100 mm, weighing 22 kg, can produce as much energy as burning 2000 barrels of oil (courtesy Atomic Energy of Canada).

dles are stored in a water-filled tank, like an extra-deep swimming pool, in a building adjacent to the reactor. The water cools the bundles and absorbs the radiation they emit. The ability to change fuel without having to shut down the reactor makes the CANDU design unique among current commercial reactors, and contributes to their exceptionally high capacity factors, ie, the electricity actually generated during some period, expressed as a percentage of what is theoretically possible.

To control the power level of the reactor, control rods are moved into or out of the reactor core. They are contained in tubes which penetrate the top of the calandria and pass between fuel channels. A reactor control system is used much as is an accelerator in controlling the speed of a car. However, unlike the car's accelerator, the control rods in the reactor can also bring things to a stop, ie, shut down the chain reaction. In addition to control rods there are 2 independent systems, each capable of shutting down the reactor quickly. These can be compared to 2 independent braking systems in a car, although the shutdown systems, unlike brakes, are neither needed nor used in normal operation. They are called upon only if some other system fails. One type consists of rods similar to control rods but capable of being inserted into the reactor core more rapidly; the other consists of perforated horizontal tubes in the calandria through which a liquid can be squirted into the heavy-water moderator. Control rods and shutdown systems both work by introducing into the reactor materials (eg, cadmium or gadolinium) that absorb neutrons strongly. Adding absorbers slows down, then stops the fission chain reaction; withdrawing them allows the reaction to start up again.

The fuel in an operating reactor (and even when discharged) is highly radioactive, ie, it emits gamma radiation similar to medical X rays. To protect the station operators, the reactor core is surrounded by heavy shielding, typically of reinforced concrete about 1 m thick. To protect the public against the possibility of radioactive releases which might occur in the event of an accident, the whole reactor and its primary coolant circuit are located within a sealed containment building, a massive concrete structure. No dwellings are allowed within a radius of about 1 km; thus any escaping radioactive material would be diluted and dispersed before reaching the public (see NUCLEAR SAFETY).

**Other Commercial Reactors** CANDU reactors are moderated and cooled by heavy water; the moderator and coolant are in separate circuits. Another general type of power reactor, known as a light-water reactor, uses ordinary or "light" water for moderator and coolant, without any

separation. All the fuel is immersed in water under pressure, contained in a single large pressure vessel. Since light water is not a good enough moderator to sustain a fission chain reaction in natural uranium, the uranium fuel for light-water reactors has to be artificially enriched in uranium-235. The light-water reactor, first developed in the US, has 2 subtypes: the pressurized-water reactor and the boiling-water reactor. In the first, the cooling water in the pressure vessel is maintained at a high enough pressure to prevent boiling. Thus, just as in the CANDU design, steam for the turbines is produced in a secondary circuit with heat being transferred from the primary to the secondary circuit in steam generators. In the boiling-water reactor the coolant is under less pressure, so that boiling occurs. After separation from entrained water, the steam passes directly to the turbine. This procedure has the benefit of eliminating the cost and temperature drop associated with the steam generator, but the presence of radioactive coolant in the turbine makes maintenance more difficult.

Another type of power reactor, originally developed in the UK and France, uses graphite as moderator and a gas as coolant, hence the term gas-graphite reactor. The earliest of these used uranium metal contained in magnesium-alloy cans as fuel and carbon dioxide as coolant. The UK's design is called the Magnox Reactor after the particular magnesium alloy developed for the fuel cans. Graphite, being intermediate between light and heavy water as a moderator, enables natural, unenriched uranium to be used. This type is no longer competitive. In the UK it has been superseded by the advanced gas-cooled reactor which uses graphite and carbon dioxide but, by changing the fuel to uranium dioxide in stainless-steel cans, is able to take the coolant to higher temperatures. This system gives a higher thermal efficiency, ie, more electricity can be obtained from the same amount of heat. There is insufficient operating experience with advanced gas-cooled reactors to assess how well they will compete with established water-cooled reactors.

Several countries are investigating a high-temperature gas-cooled reactor that promises even higher temperatures. Here the carbon-dioxide coolant is replaced by noncorrosive gaseous helium, and the fuel consists of myriads of tiny particles of uranium carbide individually coated with graphite and embedded in a graphite block or sphere. The concept is technically attractive but, in the absence of any full-size commercial plants, the economics are largely unknown.

The USSR has developed 2 types of reactor for use in central power stations: the VVER (pressure-vessel-type water-water reactor) and the RBMK (channel-type water-graphite boiling reactor). The VVER is very similar to the US design of pressurized-water reactor; the RBMK

is a unique design. It has a graphite moderator through which run hundreds of fuel channels, generally similar to those in the CANDU.

**Fuel Recycling** All currently commercial nuclear-power reactors consume only about 1% of the uranium fed to them. As long as uranium is relatively abundant and cheap, the present procedure, the "once through" fuel cycle, which involves storing the used fuel discharged from the reactor, is the simplest and most economic. Used in this way, the world's known resources of economically recoverable uranium have an energy content comparable to the world's recoverable resources of conventional oil. When the richer uranium ores have been exploited and leaner ores have to be mined, it may make economic sense to recycle the used fuel to obtain more of the energy potentially available. Recycling would involve dissolving the used fuel, removing the true wastes (about 1% of the total fuel weight) and fabricating the residues into fresh fuel for reactors. Fuel recycling is an essential component of any proposal to extract appreciably more energy from our nuclear-fuel resources.

The best-known application for fuel recycling is in the liquid-metal fast breeder reactor, a radically different design that is not yet available commercially. "Liquid-metal" refers to the coolant, usually a molten alloy of sodium and potassium. "Fast" refers to the speed of the neutrons in the reactor core. Since fast reactors do not incorporate a moderator, the neutrons are not slowed down much from their speed at birth in the fission process. "Breeder" refers to the fact that more fissile material is bred from fertile material than is consumed by fission. Often, and misleadingly, this type of reactor is said to produce more fuel than it consumes. However, the essential characteristic of this reactor type is that it consumes much less nuclear fuel (normally uranium) than current reactors. Thus the cost of the electricity produced is largely independent of the cost of the uranium.

Fuel recycling would greatly extend the world's nuclear fuel resources for 2 reasons. Since ELECTRIC UTILITIES could afford to pay a higher price for uranium, mining leaner ores would become feasible and much more uranium could be economically recovered. For any particular amount of uranium mined, a larger fraction would be consumed and converted to energy. Together, these factors mean that

nuclear-fission energy, with fuel recycling, becomes a nearly inexhaustible energy source. In Canada, the same principle of largely decoupling electricity costs from fuel costs is possible in the existing and commercially proven design of CANDU reactors, by exploiting fuel recycling and switching from uranium to thorium (another naturally occurring nuclear fuel) as feed. Thus, Canada could be assured of the same indefinite supply of energy without having to introduce a new reactor type.

J.A.L. ROBERTSON

**Nuclear Research Establishments** The research company of ATOMIC ENERGY OF CANADA LTD (AECL) operates 2 major NUCLEAR ENERGY research centres in Canada: Chalk River Nuclear Laboratories (CRNL), established during World War II on the Ottawa R some 60 km upstream from Pembroke, Ont; and Whiteshell Nuclear Research Establishment (WNRE) opened in 1962 beside WHITESHELL PROVINCIAL PARK, 105 km NE of Winnipeg, Man. Both conduct research and development on a wide variety of energy-related projects on behalf of AECL and under contract to outside companies and government bodies.

Chalk River was the site of Canada's first large research reactor, NRX, a 10 megawatt (MW) facility which used natural uranium fuel and a deuterium moderator. Originally operated as a project of the NATIONAL RESEARCH COUNCIL, CRNL became the main laboratory of AECL, the crown corporation established in 1952 to develop peaceful uses of nuclear energy. The Allies designed NRX to be an efficient producer of plutonium-239 for nuclear weapons; however, after WWII CRNL turned its attention to research in other fields. NRX proved to be a uniquely powerful research tool and attracted worldwide attention to Chalk River in the post-war era. A complete technology evolved around the use of NRX and its later, more powerful companion, NRU. Designers of the Canadian nuclear power system, CANDU, relied heavily upon the experience at Chalk River, not least as a training ground for engineers and technologists from private-sector companies which would become suppliers of CANDU fuel and components (see NUCLEAR POWER PLANTS). W. Bennett LEWIS, CRNL's technical director 1946-76, left a lasting imprint on CRNL and on CANDU. Under his direction, the laboratories expanded from a wartime project of 200-300 professional and support staff to a world-class science centre, making important contributions to PHYSICS, CHEMISTRY, BIOLOGY, nuclear technology and ENGI-

NEERING. Research in GENETICS illuminated the processes of repair in damaged living cells and shed new light on the genetic basis of susceptibility to cancer. Former Chalk River scientists and engineers are found in universities, industry and government services across Canada and the US. Devices and techniques developed at Chalk River, such as those for cancer therapy, neutron-activation analysis and radiation measurement, are in use around the world. CRNL serviced contracts totalling \$27 million during 1981-82, roughly 25% of its annual budget.

The Whiteshell research centre is a sizable establishment, employing just under 1000 scientists, engineers and support staff. The centrepiece of WNRE is WR-1, a 40 MW research reactor, moderated with heavy water but cooled with a special, noncorrosive organic liquid (OS-84) which can achieve temperatures of 400°C without boiling. The WR-1 concept could lead to an advanced generation of Canadian power reactors burning thorium rather than uranium. WR-1 provides some space heating for Whiteshell, but is used primarily for various research and development programs, including the testing of advanced thorium fuel types. In collaboration with universities and federal and provincial authorities, WNRE devotes a very large effort to evaluating the disposal of radioactive HAZARDOUS WASTES, the by-products of nuclear-power generation. Another major concern is tests of reactor safety. Test rigs simulate the effects of system failures, which are studied to determine the correctness of safety codes and the effectiveness of safety-design features. Work is also in progress on the effects of radiation on living cells to ensure that human safety is adequately protected by codes and regulations (see NUCLEAR SAFETY). WNRE's annual budget was \$57 million for 1982-83 and revenue from industrial contracts \$7-8 million. F.H. KRENZ

**Nuclear Safety** Few choices are more plagued by uncertainty than the weighing of risks and benefits in the decision to use NUCLEAR ENERGY. It is a daunting problem, for the cost of being wrong is so high: overestimation of the risks denies access to a clean, high-quality ENERGY source; underestimation endangers the peace, health and freedom of the human race. The threat to peace is the greatest hazard. The first use of nuclear power, at Hiroshima and Nagasaki in 1945, was as a weapon. The danger of nuclear proliferation has been heightened since 1974 when India used Canadian nuclear technology to fashion an atomic bomb; India joined the nuclear "club" that already included the US, the USSR, Britain, France and China. Israel, South Africa and Pakistan are believed to possess nuclear-weapons capability, all developed in the guise of peaceful nuclear power. Intense competition among reactor sellers has led to a softening of international antiproliferation safeguards. During Britain's war with Argentina in 1982, Canada continued shipping fuel to Argentina's Canadian-built nuclear reactors. The relatively safe, reliable Canadian reactor design (CANDU) is well suited to production of plutonium for atomic weapons. A horrifying device could be made by packing radioactive wastes around conventional explosives, or simply by sabotaging a reactor. Only an effective nonproliferation treaty, presumably combined with some sort of policing, could substantially reduce this danger.

The second great issue of nuclear safety concerns the hazards power-plant operation may pose to workers, nearby residents, the general population and the biosphere. This is always a relative risk: any increment of radiation from the sun, medical or dental X rays, even coal ash, increases the likelihood of cancer and genetic defects. However, a great deal of scientific work

Ontario Hydro's nuclear generating plant on Lake Ontario, at Pickering (photo by Jim Merrithew).

has gone into designing reactor facilities to minimize health risks during normal operation, and compared to the black-lung, ACID RAIN foulness of coal power, the deadly vapours of high-sulphur natural gas and the belching stacks and dirty tailings ponds of tar-sands plants, nuclear power does seem alluringly safe and clean. In man-days lost per unit of energy output, US and UK studies indicate that nuclear power is 250 times less hazardous than coal and up to 180 times safer than oil; only natural gas poses fewer hazards to workers. Unfortunately, until the 1970s, much less attention was paid to the health and safety of uranium miners and their communities; the full cost of caring for afflicted miners and of cleaning up low-level radioactive wastes from mines and mills of the 1950s to 1960s has not yet been paid.

Most worries about nuclear safety stem less from normal operation than from the potential for catastrophic accident. There were several serious accidents in the early days of nuclear technology, including radiation releases at Chalk River, Ont, in 1952 and 1958, but the safety record of the nascent nuclear industry up to 1979 was quite astounding; even the reactor accident at Three Mile Island, which shattered that record, caused no direct, immediate deaths. The real importance of Three Mile Island was that it showed that nuclear engineers are fallible. The ultimate disaster would be a "melt-down," in which the reactor loses all its coolant and the core heats up uncontrollably, melting through its steel-and-concrete housing. Although the Three Mile Island reactor did not melt down, it did lose its coolant and release some radiation.

Since the Three Mile Island accident, there have been 2 major changes in nuclear-risk analysis. First, it is no longer assumed that subsystems of a reactor are independent; new studies accept that a failure in any one system can affect the integrity of all the others. Secondly, more and more data have been gathered about the actual operating record of all reactor components, including workers. Prior to the 1979 accident, experts estimated that the odds against a given reactor melting down in a given year were one in 20 000; an analysis of Three Mile Island by the US Nuclear Regulatory Commission dropped the odds to one in 500. However, the more recent analyses claim that the consequences of a major accident would be less catastrophic than had previously been believed. Experts claimed that only one meltdown in 5000 would produce a massive release of radiation that would cause thousands of deaths. The biggest single hazard would be release of the radioactive isotope iodine-131, which is quickly absorbed by living tissues. The new studies suggest much of the iodine might be soaked up by water in the damaged reactor building or condensed on cool surfaces nearby.

ATOMIC ENERGY OF CANADA LTD argues that its unique natural-uranium-fueled, heavy-water-moderated CANDU reactors are safer and more reliable than the reactors that have been analysed so intensely. CANDUs consistently win international honours for technological excellence. AECL officials maintain that a CANDU cannot melt down like an American light-water reactor, but critics are less certain. There have been some disturbing incidents with CANDUs. Ontario Hydro's Douglas Point station operated for 6 months (1980-81) without the proper filters to contain radioactive gases. In Feb 1982 Ontario's Bruce-2 reactor was taken out of service because of a pressure-tube leak. The Point Lepreau nuclear station was allowed to go ahead in New Brunswick although it turned out to be in an area prone to EARTHQUAKES; when Lepreau was first charged with heavy water in Dec 1981, two 15 000-gallon tanks buckled under the weight.

The most serious accident at a CANDU reactor to date occurred at Ontario Hydro's Pickering generating station Unit 2 on 1 Aug 1983, when a pressure tube burst. The "loss of coolant" accident was similar to the accident at Three Mile Island, but no radiation was released to the environment. Later in 1983, less serious leaks were detected at all 3 of Ontario's nuclear megaprojects. The growing list of failures suggests that Canadian risk analysis may be a more optimistic interpretation of a smaller data base.

The odds making is not just an academic exercise: it would take only one serious accident to halt nuclear power, as surely as the crash of the Hindenburg in May, 1937, ended the era of zeppelin travel. Unfortunately, only thousands of reactor-years of operating experience could produce the data for truly accurate accident-risk analysis. To make things worse, as demand for nuclear-generated ELECTRIC POWER sagged in the early 1980s, nuclear-safety research budgets were trimmed at the same time that governments began to expedite the domestic licensing and export sales of reactors. Meanwhile, new problems, such as a brittleness in steel reactor vessels after long bombardment with radiation, were coming to light as more reactors aged.

The final major issue concerns the long-lived radioactive wastes which are piling up in alarming quantities around the world, eventually to be joined by the irradiated rubble of today's nuclear power plants (see HAZARDOUS WASTES). For the first quarter century of the nuclear age, lethal, high-level wastes from reactor cores were simply stored in "swimming pools" of cooling water at reactor sites, while the more short-lived isotopes exhausted their radiation. Low-level wastes such as spent coolant, mine and mill tailings, contaminated equipment, etc, were buried or stockpiled. For example, by 1982 there were 100 million tonnes of uranium mine and mill tailings lying around Canada. The industry simply assumed that safe means of permanent disposal would be found. No such solution has been adopted, although scientists expect that high-level wastes will eventually be sealed in inert containers (eg, of glass or ceramic) and buried in geologically stable deep rock, salt caverns or seabed formations. Some might be recycled to make more fuel for future reactors. Certain wastes remain potentially toxic for tens of thousands of years: 10 times longer than recorded history.

Ian Burton of the Institute for Environmental Studies at the University of Toronto has suggested the following test for weighing risks, based on the "reasonableness" concept in COMMON LAW: "A risk would be unreasonable where those at risk are not fully informed of all the benefits and risks, the distribution of risks and benefits is unfair, a less risky alternative exists that yields equal or greater benefit, full participation in the decision process has been denied to those at risk, or the value judgements involved in the assessment of risk and benefit have been hidden from view or not clearly articulated." On the basis of this test, nuclear power still poses unreasonable risks. Yet, if the choice is between building a coal-fired power station (a well-documented, highly visible hazard to land, air, water and workers) and a nuclear station with vaguely defined risks borne largely by future generations, it is tempting to opt for nuclear power and hope for the best. In that case, priority should be given to quantifying accurately and then minimizing nuclear risks. But that is not the only choice, another option is to build neither coal-fired nor nuclear plants, but to use less power and use it more efficiently and wisely.

ROBERT D. BOTT

**Nueltin Lake**, 2279 km<sup>2</sup>, elev 278 m, max length 144 km, is located on the border of the NWT and northeastern Manitoba, about 660 km

S of the Arctic Circle. An irregularly shaped lake, it has a heavily indented shoreline and contains numerous small islands. It is fed by a number of surrounding lakes and is drained NE into Hudson Bay by the Thlewiaza R. There has long been a trading post on the lake and the area has been explored extensively since WWII — beginning with the Nueltin Lake Expedition (1947). The lake takes its name from the Chipewyan *nu-thel-tin-tu-ch*, meaning "sleeping island lake." Discovered by Samuel HEARNE (1770-72), it appears on his map as Island Lk. Aaron Arrow-smith's map of MACKENZIE'S journeys (1789, 1793) shows it as Northlined Lk. DAVID EVANS

**Nugent, John Cullen**, artist, educator (b at Montréal 1921). Nugent has been making steel sculpture in Lumsden, Sask, for 30 years and has combined this with a teaching career at U of Regina, liturgical commissions and even a candlemaking enterprise. Early in his studies at St John's (Collegeville, Minn), his attitudes were marked by left-leaning ideals stirred by Catholic theology, as reflected in his "Christian craftsman" manufacture of sacred objects for church use and decoration. More significant, however, is his steel collage sculpture. Cutting, welding and adapting prefabricated steel elements, Nugent recombines pieces into sculptures often recalling a prairie landscape metaphor or encoding a primitive agricultural symbolism. His public commissions include works for the National Capital Commission (Ottawa), the Banff Centre and the CBC Broadcast Centre, Regina.

CAROL A. PHILLIPS

**Nunatak** [Inuktitut, "lonely peak"], MOUNTAIN rising above large ice sheets. Nunataks were first described from Greenland but also occur in Antarctica and Canada, particularly ELLESMERE ISLAND. The term is also used for any nonglaciated area, highland or lowland, which was surrounded by GLACIER ice. Such nunataks may have been biological refugia where plants and animals survived Quaternary GLACIATION and from which they dispersed as the glaciers melted. This controversial "nunatak hypothesis" was developed to explain strange biotic distributions in Canada and Scandinavia. Quaternary nunataks have been identified in the highlands and leeward lowlands of Baffin I and Labrador, above or beyond the Laurentide ice limit. Lowlands around Clyde Inlet (Baffin I) and Iron Strand (Labrador) have undisturbed raised beaches with FOSSILS predating the last glaciation. Mountain nunataks have heavily weathered rock surfaces with former ice limits marked by MORAINES or trimlines, below which the rocks appear freshly ice scoured. Several weathering zones, at different altitudes, indicate that the nunataks survived several glaciations. Similar weathering zones and certain plant distributions suggest that Quaternary nunataks exist around the Gulf of St Lawrence. Counter arguments attack the biological evidence and suggest that cold-based glaciers, known to perform little EROSION, may have protected the weathered surfaces during glaciation.

R.J. ROGERSON

**Nursery School**, as part of early childhood education, refers to group experience for 3 and 4 year olds and includes DAY CARE as well as various types of "nursery" programs. Influenced by the work of the McMillan sisters in England and their commitment to nurturing all aspects of the child's development, nursery schools in America took root in the early 20th century. Nursery-school practice today is best described as eclectic in its philosophy and is characterized in Canada, as elsewhere, by much diversity in program function, setting and sponsorship. However, the nursery school's long-standing commitment to parent involvement continues and illustrates a feature of its practice that has

influenced thinking about the parent's role in the educational process. See EDUCATION, EARLY-CHILDHOOD.

ELLEN M. REGAN

**Nursing** Marie Hubou has been credited with being the first person in what is now Canada to provide nursing care to the sick. The wife of Louis HÉBERT, a surgeon-apothecary, she arrived in Québec in 1617 and assisted her husband in caring for the sick. The first "trained nurses" to immigrate to the present site of Québec City in 1639 were members of religious orders. In fact, these nurses were not like modern nurses; they served as administrators much of the time, as doctors most of the time (ie, making medicine, undertaking surgery), and many miracles were attributed to them. Three of the nurses were Augustinian Hospitaliers whose journey was financed by the Duchesse d'Aiguillon in France (the duchess, a niece of Cardinal Richelieu, had been stirred by the reports published in JESUIT RELATIONS in France of the needs of Jesuit missionaries in New France), while the other 3 were Ursuline sisters (Sisters of Charity). In 1642, in Ville-Marie [Montréal] Jeanne MANCE built a 30-bed hospital called the HÔTEL-DIEU; she was later assisted by nursing sisters from the Society of St-Joseph de la Flèche.

The Grey Nuns, a noncloistered order, began their work in Québec in 1738. Although these sisters, who might be considered Canada's first PUBLIC HEALTH nurses, built a hospital and an orphanage, they concentrated their work on home visits to the sick. Their free health care was funded by philanthropic gifts, but mostly through a number of entrepreneurial activities that they undertook, eg, running a brewery, and operating a freight and cartage company for the government.

In the 18th and 19th centuries the most common health problems in Canada were the frequent EPIDEMICS of smallpox, INFLUENZA, measles, scarlet fever, typhoid, typhus and tuberculosis. Because the nursing sisters recognized the need to segregate the sick, and because much of the population was migrant and homeless, the Grey Nuns built a number of hospitals — one of them (1845) in Bytown [Ottawa]. In 1844 these women canoed to uncharted areas. In 1855 they built a hospital in the RED RIVER COLONY, and they established an orphanage and a home for the aged at Lac Ste-Anne near Ft Edmonton in 1859. Later they built substantial hospitals in Ft McMurray, Alta (1938), Ft Resolution, NWT (1939), and Ft Rae, NWT (1940).

In 1819 the 24-bed Montreal General Hospital was opened in a building on Craig Street. By 1822 it had moved to a new building and expanded to 72 beds. It was affiliated with the Montreal Medical Institution which was eventually absorbed by the medical faculty of McGill University. The early allopathic physicians tried to introduce untrained lay nurses into the hospital — an act that was unheard of in the French community, where it was believed that the sick should be nursed by sisters devoted to the service of God. The outcome of the debate was a duel (not fatal) between one of the anglophone doctors, Dr Caldwell, and a member of the legislature, Michael O'Sullivan; the result was that untrained lay nurses were hired.

During the 19th century the hospitals of the nursing sisters were filled to capacity, so tents and other temporary shelters had to be erected to house the sick. To alleviate some of these problems, wealthy women created benevolent societies in their communities. Assisted by municipal and provincial funds, many of these women's groups managed to construct hospitals. These hospitals were reminiscent of the institutions in England before Florence Nightingale's time — sanitary conditions were not considered important, and the care of the sick was undertaken by untrained staff who were

paid in beer and shared the food and lodgings of the patients.

Other hospitals were established as money-making ventures by private individuals. It was in one of these hospitals, started by an entrepreneurial physician, Dr T. Mack, that the first school of nursing in Canada was established, at the General and Marine Hospital in St Catharines, Ont, in 1874.

After several unsuccessful attempts, nursing schools based on a modification of the Nightingale system were also started at the Toronto General Hospital (1881) and Montreal General Hospital (1890). Apart from a director of nursing and perhaps a supervisor-instructor, the student nurses generally comprised the entire nursing staff of the lay hospitals. Often the students were sent out to attend private cases, but their wages were usurped by the hospitals. Graduate nurses, most of whom were not employed in these institutions, marketed their services in the community, undertaking private nursing in the homes of the more wealthy citizens.

To close the gap between the nursing care of the affluent and the poorer working people, the Victorian Order of Nurses (VON) was set up in 1897 by Lady ABERDEEN, the wife of the governor general. The opposition of doctors to an order of health workers who were chosen by their communities and who returned to the communities after a short training in first aid, hygiene, etc, turned this national, nonprofit organization into one that employed many professional nurses under more restricted circumstances than previously designed. In its early years, however, the VON was largely concerned with the treatment and control of communicable diseases and with child health care. To meet an acute need for hospitals, especially in western Canada, the VON built and operated some 40 hospitals, ranging in size from 6 to 40 beds. Its nurses also administered to miners during the KLONDIKE GOLD RUSH and staffed the newly built hospital in Dawson City. After 1924, when control over the last of its hospitals had been transferred to municipal authorities, the VON concentrated on visiting nursing.

Promoted by the International Council of Nurses, an organization arising out of the women's movement in the late 19th century, the Canadian nurses, led by Mary Agnes Snively, the superintendent of nurses at the Toronto General Hospital from 1884 to 1910, established a national organization in Canada and lobbied for legislation granting nurses the status of professionals. Their aims were to ensure the quality of nursing care through improved educational programs for nurses and the licensing of graduates to protect the title of nurse. In 1907 the Canadian National Association of Nurses, the precursor to the present Canadian Nurses' Association (CNA), was formed; in 1908 it joined the international body. In 1916 it founded its national monthly magazine publication, *The Canadian Nurse*.

Securing legislation for nurses was not easy. Legally, women had the same status as imbeciles and children, and many members of Parliament did not feel that women were capable of managing such worldly affairs. The schools of nursing and the hospitals were run by male doctors and administrators who did not wish to relinquish their control over the nursing programs to the professional nurses. Even after nurses' Acts had been passed in all provinces (the first in Nova Scotia in 1910) changes in the nursing curriculum were not easily introduced. The first university degree program for nurses, initiated at UBC in 1919, was for a long time the only one in Canada. In a 1932 report on nursing education across Canada, Dr G. Weir found that between 1913 and 1930 there had been a sevenfold increase in the number of hospital-nursing schools, but that the hospital-training schools

did not provide the quality of education necessary for highly competent nurses. The 220 training schools turned out a disciplined work force largely used to make hospitals attractive for patients. The money charged the patients was not paid to the student nurses for their labour but invested in expanding the physical plant. The working day of a typical nurse was between 12 and 20 hours, with one day (or one half-day) free weekly. The schools themselves were mostly primitive and cramped. In response to this situation the Canadian Nurses' Association and the Canadian RED CROSS SOCIETY (which founded the Metropolitan Demonstration School of Nursing in Windsor, Ont, in 1946) initiated a nursing education program, independent of hospital control, to prove that, if it controlled the curriculum, a school of nursing could train skilled clinical nurses in only 2 years.

Another report, issued under the auspices of the Pilot Project for the Evaluation of Schools in Canada in 1960, recommended that the CNA undertake a study of nursing education in Canada; that a national school improvement program be implemented; and that a national evaluation of nursing service programs be undertaken. Within 10 years, in all but the Atlantic provinces, nursing education was to be carried out within the educational system. In 1984 there were 142 diploma schools of nursing. While some are still located in the hospitals, most are in community colleges. All programs are conducted at the post-secondary level under provincial education requirements. From province to province the programs vary from 2 to 3 years. By 1982, 25 universities offered undergraduate degrees (BScN, BN) in nursing; 8 universities offered graduate degrees at the master's level.

Because the primary aim of the hospital schools of nursing had been to supply the institutions with cheap labour, little importance had been paid to the educational programs and none to the community's demand for private-duty nursing. The continual supply of graduates resulted in a high unemployment rate that was exacerbated by the GREAT DEPRESSION. During the 1930s very few people could afford a private nurse. The governments at the time responded by providing funds so that the sick could be sent to hospitals and graduate nurses could be hired to care for them. But high unemployment and poor wages plagued the profession until WWII, when many nurses joined the armed forces as officers. Nevertheless, many women were still attracted to nursing because it was one of the few "respectable" occupations open to them.

The military recruitment of the nurses resulted in a shortage in Canada that was filled by older women returning to the profession they had been forced to leave when they married. Because of demands of homes and families, hospital authorities could no longer require nurses to live within hospital premises and many single women also took this opportunity to move out of nurses' residences. In the community the nurses found their living costs to be higher than their salaries, and they began to demand higher wages. Married nurses also argued for shorter hours to enable them to manage their home responsibilities. Legislation had granted nurses professional status and had given them rights and some power over educational curriculum, but it had not given them the power to improve their wages or working conditions. Thus, they turned to unionization.

The first group of nurses to negotiate an employment contract in 1939 did so through a professional organization formed by a nursing sister in Québec City. In 1945 the BC nurses' professional association became the first to assist nurses in becoming unionized province wide. It was not until 20 years later that nurses in the rest of the country followed suit. In 1973 the Saskatchewan Supreme Court ruled that the pro-

professional association in that province could no longer involve itself in union activities. As a result the collective bargaining arm of the association split off and became a full-fledged nurses' union. Similar separations occurred in other provinces as well; by 1980 all of the medical nurses had 2 provincial organizations to represent their interests — a professional body and a nurses' union.

In 1981 the 3 nurses' federations (unions) in Québec joined together to form a bargaining cartel called the Regroupement of Nurses in Québec. That same year the nurses' unions in other provinces joined to form the National Federation of Nurses' Unions. At the national level the nurses' interests were then represented by the union and by the professional body, the Canadian Nurses' Association.

In 1984 there were some 185 000 active practicing registered nurses in Canada. Most of them were "employed in hospitals while others worked as nurse educators or nurse practitioners. About 7% were employed in areas such as community health, public health, out-post nursing, home-care nursing and industrial nursing. Only 2% (some 4300) nurses are male.

**Military Nursing** It was through the work of the American nurses in the Civil War and the English nurses in the Crimean War that nursing as a laywoman's occupation gained social status and acceptance in a medical world dominated by male physicians. The first Canadian military nurses were those who volunteered to help the wounded in the NORTH-WEST REBELLION of 1885. Four VON nurses were attached to the YUKON FIELD FORCE in 1898 and Canadian nurses joined the British Medical Staff Corps in 1899, during the SOUTH AFRICAN WAR. In WWI some 2500 nurses served overseas with the Canadian Army Medical Corps and almost twice that number went overseas during WWII. Over 380 decorations were awarded to Canadian nurses who distinguished themselves in the war. During the Korean War 60 Canadian nurses served with the Canadian forces in field dressing stations and field surgical teams. Currently, some 350 nurses

serve in 61 military bases across Canada and Europe.

**Psychiatric Nursing** The history of psychiatric nursing is separate from that of medical nursing but follows a similar pattern. The first psychiatric nurses were the French religious sisters who in 1714 established a 12-bed ward in the hospital in Québec City. The forerunners to the contemporary psychiatric nurses were employed as custodial workers in the new asylum in Brandon, Man. In 1921 regular training programs for nurses were organized by the psychiatric hospital; other training programs were soon established in the psychiatric hospitals in the other 3 western provinces.

In contrast to the medical nurses, psychiatric nurses were unionized with the rest of the public service beginning in the 1940s, but they soon felt the need for control of their own profession. The movement for professionalization of psychiatric nurses began in Saskatchewan in 1948. The BC psychiatric nurses gained recognition as recently as 1968. A few years prior to this, the precursor to the Psychiatric Nurses' Association of Canada had been formed. In 1961 the *Canadian Journal of Psychiatric Nursing* succeeded an earlier publication devoted to issues in the profession.

In 1984 there were 5000 registered active psychiatric nurses in Canada, most of whom were employed in psychiatric hospitals and homes for the mentally handicapped. A new area has opened up for psychiatric nurses in community health and a few are employed in this type of work.

**Public Health** In 1919 a federal department of health was founded in response to the influenza epidemic, and provincial departments of health began to replace provincial health boards. Provincial public-health nursing services were developed, beginning in Manitoba in 1916, to assist with municipal immunization and child health-protection programs. The federal health department, which was replaced in 1944 by the Department of NATIONAL HEALTH AND WELFARE, is now responsible for all federal

matters relating to the promotion and preservation of health, social security, emergency health services, provision of health, medical and hospital services to Indians, Inuit and the general population of the 2 territories, etc (see NATIVE PEOPLE, HEALTH). Since 1945, nursing positions have been established to advise the department, provide consultative services to the provinces and direct services to certain segments of the population. The Medical Services Branch of Health and Welfare also provides direct nursing services to a small segment of the population, ie, Indians, Inuit and other residents of the territories. The branch administers and staffs the outpost nursing stations and health services where registered professional nurses function as general practitioners.

PHYLLIS MARIE JENSEN

**Nuthatch** (Sittidae), family of small, tree-climbing BIRDS with short tail, pointed bill and long, sturdy toes and claws. Of the 18 species of true nuthatches in the genus *Sitta*, 3 occur in Canada. Red-breasted nuthatch (*S. canadensis*) is found coast to coast; white-breasted nuthatch (*S. carolinensis*) has a patchy distribution in southern areas. The pygmy nuthatch (*S. pygmaea*) is restricted primarily to the southern interior of BC. Nuthatches can climb up and down tree trunks with equal facility by using their lower leg as a prop and hanging from the upper one. The tail is not used for support. They eat invertebrates and seeds and often store seeds in crevices in bark. Hard-shelled seeds are hammered open in such crevices, hence the name "nuthatch." Nuthatches excavate nest cavities in trees and may modify natural cavities with mud masonry to reduce the size of the entrance hole. They lay 4-10 eggs. The young have a very long nestling period (22-24 days). Nuthatches do not migrate but sometimes undergo massive eruptive flights. They are easily identified by their loud and characteristic calls and sometimes associate with chickadees, kinglets and other birds in mixed-species feeding flocks.

JAMES N.M. SMITH

**O Canada**, written by Calixa LAVALLÉE (music) and Adolphe-Basile Routhier (words in French), was first performed at a banquet of skaters in Québec City on 24 June 1880. Originally called "Chant nationale," the anthem was sung widely in Québec but was not heard in English Canada until the turn of the century. The English translation most widely used is by Toronto school-teacher Robert Stanley Weir. "O Canada" was approved as the national anthem by the Parliament of Canada in 1967 and designated officially by the National Anthem Act, 27 June 1980. The words in English, which were altered somewhat after parliamentary debate, are as follows:  
 O Canada! Our home and native land!  
 True patriot love in all thy sons command.  
 With glowing hearts we see thee rise,  
 The True North strong and free!  
 From far and wide, O Canada, we stand on guard for thee.  
 God keep our land glorious and free!  
 O Canada, we stand on guard for thee.  
 O Canada, we stand on guard for thee!

**Oak** (*Quercus*), genus of TREES and shrubs of the beech family (Fagaceae). Of the estimated 200 species found worldwide, 75-80 occur in N America and 10 in Canada. Canadian species grow very locally in Ontario and eastward, except Garry oak, found only in BC, and bur oak, which occurs as far W as Manitoba. Oaks are usually divided into 3 groups: red or black oaks (red, black and pin); white oaks (white, Garry and bur); and chestnut oaks (swamp white, chinquapin, dwarf chinquapin and chestnut). These beautiful trees have a fairly short trunk, a broad crown and alternate, simple, usually lobed leaves of variable shape and size. The acorns, produced in large quantities, are important to the diets of various wild animals. Oaks are generally found in areas with moderate precipitation. They flourish on hillsides where the most suitable lighting and well-drained soil are found, except swamp white oak which prefers low, wet terrain. The hard, strong wood, highly valued for cabinetmaking and parquetry, is also used for casks for whisky. Known for its strength and longevity, the oak has been the national symbol of several peoples and is often referred to in literature. The generic name means "most excellent of trees." ESTELLE LACOURSIERE

**Oak Bay**, District Municipality, pop 16 990 (1981c), area 1637 ha, inc 1906, is located on the SE corner of Vancouver I, adjoining the city of VICTORIA. Oak Bay is surrounded by the Pacific Ocean on the S and E and overlooks Haro Strait. Oak Bay has developed into a high-quality residential area and retirement community, and contains no large industries. A strong British influence can be seen in the many tea shops, English-styled buildings, English accents and private schools. Forty-one percent of the population are over 55 years old and 85% are of British descent. Oak Bay is governed by a mayor and 6 aldermen, and shares some responsibility with the Capital Regional Dist. The townscape includes many fine examples of BC's grandest architectural era, including many residences designed by F.M. RATTENBURY. Oak Bay also contains the oldest continuously occupied dwelling in western Canada — Tod House, built in 1851 for John Tod, an HBC fur trader. The most famous annual event is a giant tea party held in early June. ALAN F.J. ARTIBISE

**Oak Island**, one of over 300 islands in MAHONE BAY on Nova Scotia's Atlantic coast, is about 1.6 km long and 0.8 km wide. It is reputed by legend to be the site of buried treasure, the loot being attributed to various pirates, including William Kidd, Henry Morgan and Blackbeard, as well as to Inca refugees fleeing from Spanish conquistadores in S America. In 1795, 3 men discovered a depression in the ground near a

huge oak tree and evidence that a block and tackle had been used there. Their digging revealed a filled-in shaft with platforms of decayed oak logs at 3 m levels. They quit digging after 9 m, but in 1804 another group reached the 30 m level before the shaft filled up with salt water. Subsequent digs uncovered tunnels connecting the "money pit" with the ocean. A dam built to solve the problem was destroyed in a storm. Vast sums of money have since been spent in excavations that have cratered the island, and 3 treasure hunters died in an accident in 1965. Though no treasure has yet been found, a submarine TV camera, lowered into a cavity 60 m below the surface in 1971, produced faint images of 3 chests, a pick and a dismembered human hand. EDWARD BUTTS

Reading: W.S. Crocker, *The Oak Island Quest* (1978).

**Oakes, Sir Harry**, prospector, mine owner (b at Sangerville, Maine 23 Dec 1874; d near Nassau, Bahamas 8 July 1943). A graduate of Bowdoin College, Oakes abandoned medical school in 1898 to prospect in the Klondike. After working in mining camps around the world, he staked the Lakeshore and Tough-Oakes properties near Swastika, Ont, in 1912. He became immensely wealthy from the Lakeshore mine, N America's second-largest gold producer, but ill health, disappointment at not being appointed to the Senate, and rising taxes were apparently the reasons for his move to the Bahamas in 1935. There he became a member of the legislature and council and a major real-estate developer. He received a baronetcy in 1939 for his philanthropy in Eng-

land. Eccentric, unpopular in Canada and exuding the manner and dress of the mining frontier, Oakes died at his home — victim of an unsolved murder. His former estate in NIAGARA FALLS, Ont, forms the basis of that city's scenic parks. J. LINDSEY

**Oakville**, Ont, Town, pop 75 773 (1981c), inc 1857, located on Lk Ontario at the mouth of Sixteen Mile (Oakville) Cr, midway between Toronto and Hamilton. The site, originally inhabited by Mississauga Indians, was purchased 1827 by William Chisholm, a wealthy merchant and politician, and developed as a townsite. The name derives from the local oak-stave industry. Blessed with a good harbour, it became a ship-building centre as well as serving an extensive agricultural hinterland. Several buildings have been preserved from the 19th century, including decorous Georgian manses, Victorian follies, the Old Post Office Museum (1835), Thomas House (1829) and a customhouse (1855). An important component of the local economy is the FORD MOTOR CO plant which was built following WWII. A campus of Sheridan College of Applied Arts and Technology is located here. DANIEL FRANCIS

**Oats** (*Avena sativa*), member of the GRASS family (Gramineae) grown for its CEREAL grains. For commercial purposes, oats are classed as a small or coarse grain. The origin of cultivated oats cannot be traced, but the species came to Canada with settlers from Europe, and was used primarily as livestock feed (principal grain fed to horses) and as a staple breakfast food for humans. Oats are best suited to cool, moist climates. The plant usually reaches 1-1.5 m and requires 90-115 days to mature, depending on variety and growing conditions. Under field conditions, each seed yields 1-3 stems, each of which carries a single panicle (cluster of reproductive organs) bearing hulled seeds. At one time, oats were second only to WHEAT as a grain crop in Canada, occupying up to 6.8 million ha. Oats now occupy about 2 million ha, the reduction resulting partly from the decline in horse population and partly from the introduction of herbicides to control the closely related WEED, wild oats (*A. fatua*). These herbicides affect common oats but do not interfere with CROPS such as wheat and barley. Canadian scientists have developed many oat varieties with improved disease and lodging resistance, earlier maturity and better yield, as well as hull-less varieties. Oats are still used primarily for livestock feed or breakfast food. M.L. KAUFMANN

**Oblates of Mary Immaculate**, see CHRISTIAN RELIGIOUS COMMUNITIES.

**Obomsawin, Alanis**, singer, filmmaker (b near Lebanon, NH, 31 Aug 1932). An Abenaki, raised on the Odanak reserve, Qué, and later at Trois-Rivières, she was committed at an early age to the celebration of native tradition and the preservation of its culture. In the late 1950s she began to sing professionally and to collect and write songs on Indian and folk themes; she has since become a popular performer, native activist and philanthropist. She has made educational and documentary films and audio-visual packages, recording elders' and remote peoples' experiences of Indian life. She directed *Christmas at Moose Factory* (NFB, 1971) and directed and produced *Amisk* (1977), *Mother of Many Children* (NFB, 1977) and *Incident at Restigouche* (1984). BENNETT MCCARDLE

**O'Brien, Lucius Richard**, painter (b at Shanty Bay, UC 15 Aug 1832; d at Toronto 13 Dec 1899). He studied art under John G. HOWARD at Upper Canada College, Toronto. Although he demonstrated youthful artistic ability, he worked as a civil engineer in Toronto until about 1872. Thereafter, as a professional artist, he was considered the country's most proficient landscap-

Bur oak (*Quercus macrocarpa*), with flowers and acorn (artwork by Claire Tremblay).

Lucius O'Brien, *Sunrise on the Saguenay*, oil on canvas, 1880 (courtesy National Gallery of Canada/Royal Canadian Academy, Diploma Work, deposited 1880).

ist, in both oil and watercolour. O'Brien painted widely, in Ontario and Québec, on Grand Manan and along the Atlantic seaboard and, sponsored by the CPR, in the Rockies and along the Pacific. Many of his landscapes are distinguished by a sense of light similar to that in paintings by Albert Bierstadt and the American "luminists," and by the realism in paintings by John A. Fraser and other artists associated with the Notman photographic studios. O'Brien supported the Ontario Society of Artists, helped organize the Royal Canadian Academy, serving as its first president, 1880-90, and edited *Picturesque Canada* (1882). After 1882 he painted and taught in Toronto.

J. RUSSELL HARPER

**Obscenity** became an offence in 1663 when Sir Charles Sidley was convicted for his behaviour after a drinking orgy. He appeared naked on a balcony and threw bottles down among the people in Covent Garden. This case was the basis for convicting Curl in 1727 for publishing a pornographic book, an English case that established the crime of obscene libel. The Obscene Publications Act of 1857 (England), with its definition of obscenity, was most famously applied in the *Hicklin* case (1868). In upholding an order for the destruction of a publication, Chief Justice Cockburn declared, "I think the test of obscenity is this, whether the tendency of the matter charged as obscenity is to deprave and corrupt those whose minds are open to such immoral influences, and into whose hands a publication of this sort may fall."

From its enactment in 1892, the Canadian Criminal Code has included as an offence the publication of indecent matter tending to the corruption of morals. Definition of "obscene matter" was not provided; the test applied was the *Hicklin* case. The 1959 amendment to the code (s159.8) reads: "For the purposes of this Act, any publication a dominant characteristic of which is the undue exploitation of sex, or of sex and any one or more of the following subjects, namely, crime, horror, cruelty and violence, shall be deemed to be obscene." The "undue exploitation of sex" is determined either by "the internal necessities" of the work itself, or by "the standards of acceptance of the community," the best guide for which was provided by Mr. Justice Freedman of the Manitoba Court of Appeal in the *Dominion News & Gifts* case (1963), upheld by the Supreme Court of Canada: "Those standards are not set by those of lowest taste or interest. Nor are they set exclusively by those of rigid, austere, conservative, or puritan taste and habit of mind. Something approaching a general average of community thinking and feeling has to be discovered. Community standards must be contemporary. Times change, and ideas change with them. Community standards must also be local. In other words, they must be Canadian. In applying the definition in the Criminal Code, we must determine what is obscene by Canadian standards, regardless of attitudes which

may prevail elsewhere, be they more liberal or less so." See CENSORSHIP. WALTER S. TARNOPOLSKY

**Observatory** Since the earliest civilizations, princes and priests have maintained observatories where, by observing the SUN, MOON, stars and planets, astronomers could determine the passage of the months, seasons and years, and watch the skies for any changes, which they often interpreted as portents. Remains of these early observatories are found worldwide, Stonehenge being one well-known example. Early observatories were located to take advantage of their surroundings, ie, in open terrain with natural or artificial markers, and modern observatories continue to be located at carefully selected sites.

Of the observatories in use before invention of the telescope, perhaps the most scientifically productive was that of Tycho Brahe, built 400 years ago on the island of Hveen in the Baltic Sea. Johannes Kepler used Tycho's precise sightings of the planets to establish his laws of planetary motion. The first telescopic observatory was that of Galileo (1609). The telescope consisted of tiny lenses mounted in wooden tubes. The era of big-telescope observatories began just over 200 years ago with Sir William Herschel and his metal mirrors in England. The 20th century has seen a constant growth in telescope size, number, complexity and performance.

#### Optical Observatory

Optical observations are made by means of light, ie, those "optical" photons to which our eyes are sensitive. Stars emit them in great abundance. Modern optical telescopes employ concave (parabolic) mirrors of low-expansion glass as the primary means of collecting photons. One or more following mirrors help form the images of celestial bodies in the focal plane of the telescope. There they are recorded photographically or by means of a modern photon detector. The aim is to extract the maximum information carried by the photons about the nature, origin and behaviour of the object from which they came. Knowledge is greatly increased if the spectrum of the object, rather than its direct image alone, can be observed.

Successful observations depend on many factors, one of which is the siting of the observatory. The best locations will have relatively few cloudy periods throughout the year, air as transparent as possible (mountain tops preferred) and freedom from local air turbulence of thermal origin, which could blur the image by causing the photons to arrive "out of step." Stable electric power, staff living quarters and technical support facilities must be provided. The largest observatories are usually so remote and of such complexity that they must be supported at

the national or international level. Astronomers from distant places take turns as users. It is commonplace for one observatory to contain several telescopes, ranging from 3 or 4 m to a few tens of centimetres in mirror diameter. A small telescope can be effective and is often preferred for certain types of observation.

The earliest observatory in N America was likely that at LOUISBOURG (1750-51) and a number of observatories with modest telescopes were created in Canada in the 19th century: Fredericton, 1851; Québec City, 1854; Kingston, Ont, 1856; and Montréal, 1862. An early observatory at Toronto, under government auspices, was devoted to observations of geomagnetism and, later, METEOROLOGY as well as ASTRONOMY. In those days, much effort was expended in the determination of longitude by astronomical observations, and indeed it was the opening up of the Canadian West and the need for accurate surveys and maps that led to the founding of the Dominion Observatory in Ottawa in 1905. Although its primary purpose was geodetic and included the provision and distribution of precise TIME signals, research in "physical astronomy" was not neglected. Physical astronomy, now called astrophysics, was to develop rapidly.

Within 8 years the federal government decided to build an astrophysical observatory to be furnished with a telescope which, in its time, was the largest in the world. After a careful survey, Victoria, BC, was selected as the best site in Canada, with "good seeing" and a large percentage of clear nights. The Dominion Astrophysical Observatory (DAO) began its work in 1918, specializing in observing the spectra of faint stars and measuring their radial velocities by means of the Doppler effect. The DAO now operates 2 large telescopes, the original (1.83 m) and a more modern, smaller one (1.22 m).

A generous gift from the DUNLAP family enabled University of Toronto to establish the David Dunlap Observatory in 1935. Equipped with a 1.88 m telescope, it is located outside the city but near enough to serve as a teaching and research centre. As enrolment in graduate studies increased in the 1960s, it became necessary for U of T to provide additional, dependable observing facilities. In 1971 a 61 cm telescope was erected by the university in Chile at one of the most highly prized observing sites in the Southern Hemisphere, Las Campanas.

Canada's latest development in optical observatories has been the construction of the Canada-France-Hawaii Telescope (CFHT) on Mauna Kea in Hawaii. During the 1960s several groups in Canada pointed out the need for a larger and more up-to-date telescope. The federal government was sympathetic and finally decided on a joint undertaking with France and the state of Hawaii. The site, at an altitude of 4600 m (and above 40% of Earth's atmosphere), is regarded as the best in the Northern Hemisphere. A 3.6 m telescope of the most modern design (the mirror was ground and polished in Victoria) was inaugurated in Sept 1979. This telescope is being equipped with the best of modern instrumentation and will rapidly become one of the world's most productive telescopes.

Canada, like other countries searching for a fuller understanding of the universe, has many smaller observatories from coast to coast. Most major universities now maintain telescopes for instruction and research, including Université de Montréal and Laval (jointly at Mégantic, Qué), University of Western Ontario (at London), York University, University of Alberta, University of Calgary, University of British Columbia and University of Victoria. Several amateur centres across Canada have their own telescopes. Virtually all observatories, including the CFHT, admit the public at scheduled times.

DONALD A. MACRAE

The Canada-France-Hawaii Telescope on Mauna Kea in Hawaii is located at an elevation of 4600 m, above 40% of the Earth's atmosphere. It is regarded as the best site for an observatory in the Northern Hemisphere (courtesy National Research Council).

### Radio Observatory

Soon after the discovery of radio waves by Heinrich Hertz in 1887 came the realization that objects that emit light and heat also emit radio waves. Thomas Edison appears to have been the first to suggest the possibility of detecting radio waves from the sun and several early attempts were made. However, extraterrestrial radio signals were not discovered until 1932. During an investigation of the origin of radio interference (static) Karl Jansky, an American engineer, noticed that his antenna was receiving radio noise from the direction of the centre of our GALAXY. Momentous as this discovery was, it was not actively followed up until after WWII. The first radio astronomical observations in Canada were made in 1946 by A.E. COVINGTON, working at the NATIONAL RESEARCH COUNCIL, OTTAWA. When RADAR research was curtailed at the close of WWII, Covington used surplus equipment to construct a radio telescope which he used to detect radio emissions from the sun. The NRC has continued the program of radio observations of the sun to the present day.

Both optical and radio telescopes collect energy in the form of electromagnetic radiation. They differ, however, in the frequency (wavelength) of the radiation that they can detect. Radio waves that can penetrate Earth's atmosphere have wavelengths ranging from a few millimetres to tens of metres (about 10 000 to 100 million times longer than light waves). Telescopes for observations at shorter radio wavelengths often resemble optical telescopes and normally consist of a parabolic dish, analogous to the mirror of a reflecting telescope. Telescopes for use at long wavelengths are quite different, usually consisting of large arrays of individual radio antennae.

Radio signals reaching Earth from celestial sources are exceedingly weak; therefore, radio telescopes must have large collecting areas. A more important consideration is often the telescope's resolving power, ie, its ability to reveal detail in an object's radio image. The resolving power of a telescope is directly proportional to its linear dimensions (not its collecting area) and inversely proportional to the operating wavelength. Since radio wavelengths are long, radio telescopes must have large dimensions to possess even modest resolving powers. For example, the human eye can just distinguish 2 points with an angular separation of one minute of arc. To do the same thing, a radio telescope operating at a wavelength of one metre must have a diameter of about 3 km. Since it is impractical to build single structures of such dimensions, radio scientists have devised ways of interconnecting several smaller elements (dishes or antennae) to produce a single telescope. Both single- and multi-element telescopes are used at Canadian radio observatories.

The NRC's Herzberg Institute of Astrophysics operates 2 national radio observatories: Algonquin Radio Observatory (ARO) and Dominion Radio Astrophysical Observatory (DRAO). Both sites were chosen for their freedom from man-made radio interference which can readily spoil measurement of the very weak signals from astronomical sources.

ARO, located in the central region of Ontario's ALGONQUIN PROVINCIAL PARK, began operation in 1960 with the transfer from Ottawa of the solar program, which was becoming increasingly affected by radar and radio interference. A parabolic telescope was installed to monitor solar emission continually at a wavelength of 10.7 cm. To extend the time during which the sun is under continuous observation, an identical telescope was later installed at DRAO. The dish is relatively small (1.8 m diameter), since its purpose is to collect radiation from the sun's entire disk. The intensity of the radiation at a wavelength of 10.7 cm is an effective measure of the

general level of solar activity and a sudden enhancement indicates the occurrence of a solar flare. The measurements are important in studies of the relationship between solar activity and geophysical phenomena (eg, NORTHERN LIGHTS). Determination of the position of localized regions of intense solar emissions is made at noon each day, using a multi-element telescope that produces strip scans of the sun with a resolution of 1.5 minutes of arc (ie, one-twentieth of the sun's diameter) in the E-W direction. When compared with optical photographs, these scans enable the regions of enhanced emission to be identified.

The principal telescope of the ARO is a large parabolic dish (46 m diameter) completed in 1966. The dish is supported by a mounting, which permits it to be moved, under computer control, to point to any position in the sky or to scan a selected region. Several receiving systems and an associated spectrometer are available for observing at various wavelengths. The shortest usable wavelength, determined by the accuracy of the parabolic surface, is about 1 cm. There are, however, plans to replace the original surface with a more accurate one enabling observations to be made down to a wavelength of about 3 mm. This versatile telescope has been used by observers on a wide variety of programs, including studies of planets, external galaxies and quasars.

DRAO, situated in a secluded valley S of Penticton, BC, opened in 1960. The first instrument, a 26 m parabolic telescope and associated receiver, was designed primarily for studies of our galaxy, a field in which Canadian optical astronomers have made significant contributions. The dish's surface is aluminum mesh, an almost perfect reflector at a wavelength of 21 cm, which is the wavelength of emission and absorption of hydrogen gas, the major constituent of interstellar space. From observations of the distribution of this gas in the galaxy and its motions, as revealed by shifts in the observed wavelength, much has been learned about our galaxy's structure and dynamics.

The telescope accepts radiation from an area of the sky about  $0.5^\circ$  in diameter, but the much smaller angular structures of many nebulae and other objects in our galaxy cannot be revealed by the telescope. In addition the resolving power is inadequate for studies of even the closest external galaxies. Since construction of a parabolic telescope of sufficient size is impractical, a different instrument has been constructed, the Aperture Synthesis Telescope, which employs a technique first developed at Cambridge University. The telescope consists of four 8.5 m parabolic dishes, the outputs of which are combined. Two of the dishes are movable on an E-W track 300 m long; 2 are fixed, one 300 m E of the track and the other 300 m W. The 4 dishes observe the same region of the sky for 12 hours at each of about 120 positions of the movable dishes. When used with its spectrometer receiver, the system produces computer maps at 128 wavelengths of an area of the sky  $2^\circ$  in diameter, with a resolution of one minute of arc.

For observations at a wavelength of 13.5 m, the observatory employs a telescope consisting of a large number of collecting elements or dipole antennae, laid out in a horizontal plane in the form of a "T." Each dipole is connected by cable to the centre of the array, where the signals are amplified and recorded. The crossbar of the "T" is 1.3 km long and the entire array occupies an area of 65 000 km<sup>2</sup>. Its performance is approximately equivalent to that of a conventional paraboloid 750 m in diameter.

In 1967 radio astronomers and engineers from Canadian universities and the NRC pioneered the development of a powerful new technique which has dramatically increased the resolution attainable at radio wavelengths. Known

as Very Long Baseline Interferometry, the technique allows signals collected with widely separated telescopes to be combined to form a single instrument. Independent, highly stable atomic clocks are used to convert the signals collected at each telescope to lower frequencies which can be recorded on magnetic tape, together with accurate time markers. The tapes are subsequently brought together and played in unison. For the initial experiments, the parabolic telescopes at Penticton and Algonquin Park were used to form a 2-element interferometer. More recently, however, a number of the world's radio telescopes have been used simultaneously to form a powerful, integrated instrument capable of producing images that reveal detail of the order of one-thousandth of one second of arc. This is 100-1000 times better than can normally be obtained with the largest optical telescopes. Thus, it is now possible to study the structure of quasars and the small cores of galaxies, to observe changes in their structure with time and to investigate details of many other radio sources. In addition, very accurate determinations of the positions of radio sources are now possible, permitting the investigation of relativistic and other effects. In geophysics the ability to measure small angular displacements can be inverted to study the motion of Earth's axis of rotation, variations in its rate of rotation, movements of its crust, etc. These and other possibilities have led to an imaginative proposal by Canadian scientists to build a Canadian Long Baseline Array, consisting of 8 radio telescopes, in a line from BC to Newfoundland, operating as a single instrument. If constructed, it would be the world's largest telescope, as large as Canada itself.

J.L. LOCKE

### Space Observatory

Various kinds of electromagnetic radiation (ie, very low-energy infrared radiation and high-energy ultraviolet and X-ray radiation) are incapable of penetrating Earth's atmosphere and must be observed from the upper atmosphere or from space. Upper-atmosphere observations have been an ongoing part of Canada's satellite-research program since its inception, and NRC is involved in various space-oriented programs with the US and European space authorities (NASA and ESA, respectively). The most dramatic of these projects is Starlab, a joint Australia-US program to construct a 1 m telescope equipped with a camera and spectrograph, to be carried to one of NASA's proposed space platforms aboard a Space Shuttle flight in the late 1980s. The Canadian government withdrew from the program in 1984.

**Occupational Disease** today includes not only those diseases associated with industry, but diseases that may be indirectly related to occupation, eg, ALCOHOLISM and stress. Since the time of the Pharaohs, scholars have commented on the diseases caused by various occupations. In 1472 goldsmiths and metalworkers were warned about the poisonous effects of MERCURY and LEAD, but the first systematic account of occupational disease did not appear until 1713, when Ramazzini observed, "Various and manifold is the harvest of disease reaped by certain workers from the crafts and trades that they pursue. All the profit that they get is fatal injury to their health." Since the Industrial Revolution, workers have been exposed to thousands of potentially hazardous substances and to generally dangerous working conditions. In fact 2 out of 3 workplaces expose workers to many cancer-causing substances absorbed through skin contact, the respiratory tract or the mouth and digestive tract. Those who work with rubber, asbestos, steel, uranium, aluminum, vinyl chloride and dyes, as well as nickel workers, machinists, garage employees, painters, petroleum workers, pesticide workers, cleaners working

with solvents and workers in copper, gold and lead smelters have been cited by researchers as particularly vulnerable to a wide variety of CANCERS. Some occupations are particularly dangerous. For example, in 1981, 49.5% of deaths from occupational disease (eg, pneumoconiosis, asbestosis, exposure to radiation) occurred in mining.

Occupational disease hazards can be classified as chemical, biological, physical or those affecting mental health. In Canada safe-exposure levels are based on American standards adopted by the American Conference of Government Industrial Hygienists. Unfortunately the data cover only about 5% of the chemicals now used in various workplaces. As well, workers are often in contact with more than one substance at a time, and the hazards associated with combined chemical reactions have never been researched. Biological hazards include the inhalation of cotton dust, which can lead to the lung disease byssinosis, and dusts from wool, hemp and wheat. Farmers are particularly susceptible to lung problems caused by inhaling plant fungi that gather on damp hay and other dried animal feed. Physical hazards include noise, vibration and extreme temperature, and radiation which may lead to deterioration of hearing, injury to soft tissues, and injury to the circulation system. Mental illness as an occupational hazard is associated with alcoholism, drug abuse and depression.

National and international statistics on industrial disease are unreliable, partly because the period between exposure to a substance and onset of disease can be as long as 10 or 20 years, so the cause and frequency of an illness have often been misdiagnosed; because medical schools have not traditionally provided much training in this area; and because little research on industrial disease has been conducted by independent, qualified scientists as opposed to those who have an interest in minimizing the risks. However, by a rough extrapolation of US government figures, it is possible to estimate that each year 10 000 Canadians will die, and 39 000 more will be disabled, by industrial diseases.

The intense and critical media coverage of industrial diseases since the mid-1970s has produced some medical schools into taking a more active role in the area of occupational disease, but government response, often qualified by the interests of industry, is divided among a host of unintegrated and often contradictory regulatory

agencies such as workers' compensation boards and the provincial and federal departments of health, mines, environment, labour and justice. ELLIOTT LEYTON

**Ocean** The world ocean and its marginal seas cover about 71% of the Earth's surface. Its division into individual oceans and seas is largely arbitrary and has varied through the years. Historically, people referred to 5 oceans: Atlantic, Pacific, Indian, Arctic and Antarctic (or Southern). Modern convention speaks of only the first 3: the Arctic is considered a marginal sea of the Atlantic; the Southern, the southern continuation of the Atlantic, Indian and Pacific oceans. Thus, Canada can be seen to be surrounded by 2 (Atlantic, Pacific) or 3 (Atlantic, Pacific, Arctic) oceans, depending on the scheme of division used. The interplay of these ocean waters with freshwater runoff from land creates the conditions that support large biological production on Canada's continental shelves and embayments (see COASTAL LANDFORM; DRAINAGE BASINS). The COASTAL WATERS also affect SHIPPING, offshore RESOURCE industries and maritime CLIMATE. OCEANOGRAPHY is the science that studies the physical and biological properties of the oceans and analyses the impacts resulting from exploitation of their resources.

The average oceanic depth is nearly 4000 m; that of the marginal seas 1200 m. The continents generally extend under the ocean, forming continental shelves tens to hundreds of kilometres wide and up to 500 m deep. At their outer edge, the WATER depth increases rapidly to the ocean basin depths of 3000-6000 m. This region is called the continental slope. The oceans are divided into several deep basins by mid-ocean ridges where new oceanic crust is formed (see PLATE TECTONICS). Rising to depths of 2000 m or shallower and sometimes forming ISLANDS (eg, Iceland, the Azores), these ridges constrain the distribution of the deep waters and affect the upper-ocean circulation. Transverse ridges (eg, the shallow ridges joining Greenland to Iceland and Scotland) also separate ocean basins.

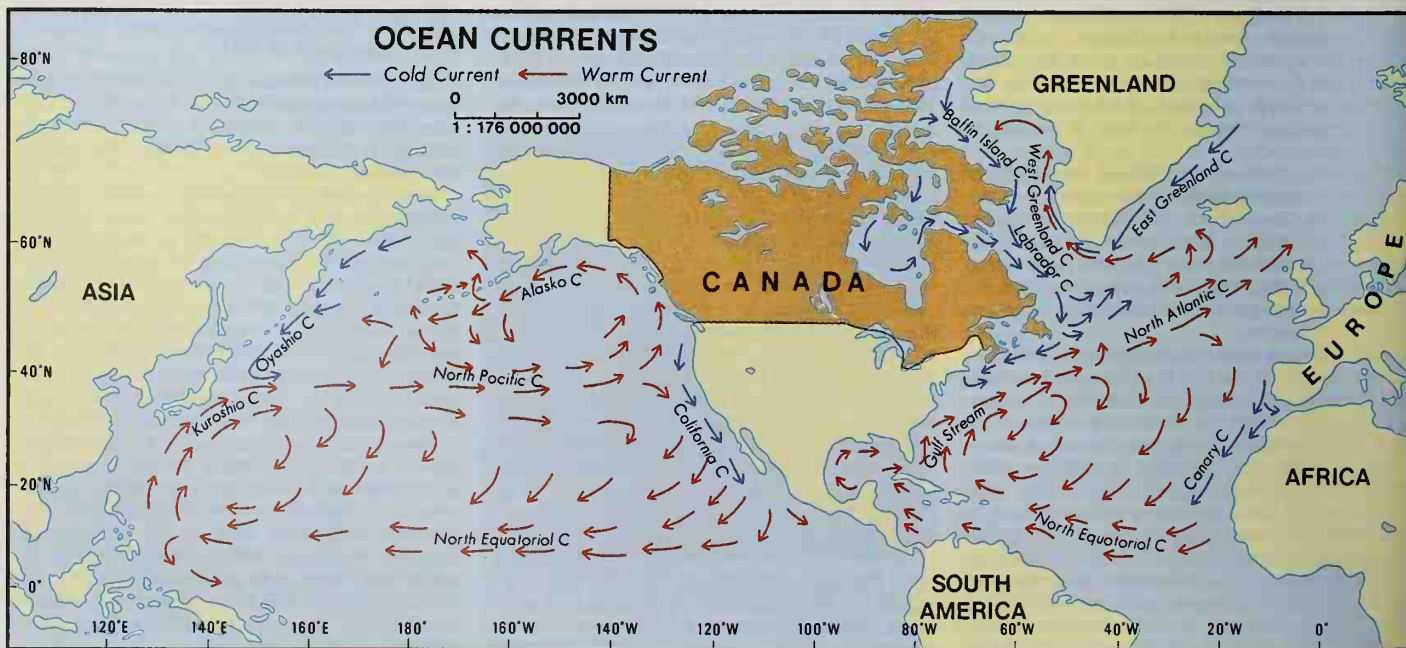

Island arcs and deep-sea trenches are formed where oceanic crust is moving under another tectonic plate. The deepest oceanic depths are found in such trenches, the greatest being over 11 000 m in the Mariana Trench, western N Pacific. Island arcs (eg, Antilles, Aleutians) frequently form the boundaries between marginal seas and the adjacent ocean. The deep basins are

also interrupted by isolated seamounts rising several thousand metres from the seafloor and often forming elongated chains. Some of these volcanic structures rise above the surface and form islands (eg, Hawaiian Is.).

The density of seawater is determined by its salinity and temperature, colder or more saline water being denser. In the ocean, water characteristics change with depth: the least dense water is at the surface; the most dense at the bottom. In tropical and temperate latitudes, density is largely controlled by temperature; temperature generally decreases with depth. In polar and subpolar regions, salinity plays a more important role; here cold, low-salinity surface layers overlie warmer, saltier deep layers.

In the upper few tens of metres of the ocean, the euphotic zone, one-celled planktonic organisms use sunlight to convert various nutrients (eg, inorganic carbon, nitrates, phosphates) into organic molecules through photosynthesis. By this means they multiply to form a food source for larger organisms, thus forming the basis for marine food chains and webs. The upper ocean usually consists of a "mixed layer" some tens of metres thick which is homogenized through wind and wave action. At the bottom of the mixed layer, the density of the water increases markedly; this region is called the seasonal pycnocline. During spring and summer, in temperate latitudes, shallow mixed layers are formed because solar radiation absorbed in the surface layers makes them warmer and less dense. Biological productivity within the mixed layer depletes the nutrients and the seasonal pycnocline inhibits the transfer of nutrients from below; hence, after an initial spring bloom, biological productivity is limited by the rate at which nutrients can be regenerated from the standing crop. In fall and winter, stronger winds and waves as well as convection caused by cooling at the surface causes the mixed layer to become denser and deeper, incorporating deeper nutrient-rich waters into the surface waters in preparation for the following spring. In sub-polar regions, mixed layers deeper than 2000 m can form in late winter.

In general any mechanism which causes mixing of ocean waters contributes to an increase in biological productivity. Frontal mixing between lower salinity inshore waters and warmer offshore waters results in the injection of heat, salt and nutrients into the coastal waters. On Canada's East Coast the boundary or front between

inshore and offshore waters generally lies beyond the edge of the Continental Shelf, making this an especially rich area for fishing. Other factors which can promote horizontal and vertical mixing include wind action and eddies spinning off major currents. Mixing between surface and bottom waters occurs more readily if the water is relatively shallow (up to 200 m). Hence, the continental shelves are more productive than open-ocean areas. Canada has a much greater area of shelf on the East Coast than on the West Coast, a fact reflected in much greater fish catches in the East. In 1982, for example, 1.2 million t were landed on the East Coast, compared with 0.13 million on the West Coast.

The seasonal pycnocline changes in depth and temperature from season to season. Below it is found the main thermocline where, from depths of 200-4000 m, the water temperature falls from as high as 18°C to 2.5°C. The main thermocline arises because water from the progressively colder, denser, winter-mixed layers of higher latitudes flows equatorward below the warmer, less dense layers. The deepest waters of the main thermocline are formed by winter convection in a few high-latitude locations, then spread to fill the deep basins of the world oceans. These deep waters are remarkably uniform in temperature and salinity. For example, fully 10% of the total volume of the ocean has temperatures of 0.6-1.6°C and salinities of 0.03467-0.03472.

Half of the ocean's volume occurs in 2 concentrations. The first, with temperatures of -0.8 to 2.6°C and salinities of 0.03457 to 0.03476, is formed off Antarctica (especially in the Weddell Sea). It sinks, flows eastward around Antarctica and northward to fill the deep basins of the Indian, Pacific and S Atlantic oceans. The second concentration, with temperatures of 1.7-3.0°C and salinities of 0.03487-0.03496, is formed in the Norwegian and Greenland seas and enters the Atlantic between Greenland and Iceland, and Iceland and Scotland, filling the entire N Atlantic Basin below 2000 m and continuing to flow southward in the S Atlantic, above the Antarctic water moving northward.

Only a small percentage of the total volume of these waters is affected even by an exceptionally severe winter. To change the properties of the deep waters requires periods of hundreds of years or longer; this stability is believed to have a direct effect in moderating short-term climate variations. The deep ocean also contains a vast volume of dissolved carbon dioxide (CO<sub>2</sub>) and, by regulating the atmospheric levels of CO<sub>2</sub>, plays an important role in determining the world's temperature (see CLIMATE CHANGE).

Early in the atomic age, nations began using the deep oceans as disposal sites for low-level nuclear wastes. It was theorized that these concentrations would be diluted by the large volumes of water and diminished by radioactive decay to levels inconsequential to health before reaching surface waters. The tracking of radioactive isotopes injected into the oceans by atmospheric nuclear testing in the 1950s and 1960s and the direct measurement of deep current velocities, have forced a change in the idea of a nearly motionless deep ocean. The practice of dumping in the deep oceans is now being re-evaluated by international agencies. See HAZARDOUS WASTES; LAW OF THE SEA; NUCLEAR SAFETY.

R. ALLYN CLARKE

**Ocean Industry** The search for hydrocarbon resources in offshore areas, the driving force behind the development of the ocean industry, began in earnest in the early 1960s in the shallow waters of the Gulf of Mexico. Since then, the hunt has expanded to include the coastal waters of the North Sea, Australia, SE Asia, India and Canada. More than 40 countries have plans for supporting such activities, creating a potential

for the export of services and equipment, which has heavily influenced the development of the Canadian ocean industry.

In 1978 a federally sponsored sector task force identified 180 companies engaged in the ocean industry. Of these, 40 were core organizations depending on the market for most of their revenues. By the end of 1982 the number of companies in the field had grown by about 15% and the industry had gained a public voice, though the Canadian Ocean Industries Association (COIA). According to federal government estimates, sales by ocean industry companies increased to about \$1 billion in 1982 from \$200 million in 1976. Exports, accounting for about 50% of sales, included hardware (drilling rigs, SUBMERSIBLES, offshore-drilling accessories) as well as diving and subsea SURVEYING services.

**Drilling Platforms** The largest items produced in Canada for offshore work are the various platforms which support drilling equipment. Between 1978 and 1982, Davie Shipbuilding Ltd of Lauzon, Qué, one of the 3 largest shipyards in Canada, moved strongly into this field when orders for conventional vessels dropped off in the wake of a worldwide shipping slump (see SHIPBUILDING). By early 1983 Davie had orders for construction of 12 jack-up platforms under licence to the designer, Marathon le Tourneau Inc of Vicksburg, Miss. Most of these systems, designed to operate directly on the seafloor in relatively shallow water, were destined for the Gulf of Mexico. By the early 1980s, none of the Canadian-built jack-ups had been built specifically for use in Canadian waters, although foreign-constructed rigs of the bottom-supported type were in use in the shallow, ice-free zone off SABLE ISLAND, NS. Development of bottom-supported systems capable of withstanding impact by moving SEA ICE is being studied by several Canadian organizations, including Mobil Oil Canada Ltd and Dome Petroleum Ltd.

In areas where floe ice and ICEBERGS do present dangers, such as the BEAUFORT SEA in the western Arctic and the Grand Banks off Newfoundland, the most widely employed strategy is one of avoidance rather than confrontation. Hence, mobile drilling platforms are used, either drilling ships or semisubmersible rigs (ie, platforms mounted on submerged, neutrally buoyant pontoons, which are anchored or positioned by motors over the drill site). The first Canadian-built semisubmersible was under construction in 1982 at Saint John Shipbuilding and Dry Dock Co Ltd of Saint John.

**Undersea Vehicles** It is in the HIGH-TECHNOLOGY field associated with exploration in the deeper waters of the world's continental shelves that Canadians are probably best known — particularly in the design and construction of manned and remote-control undersea vehicles and systems. One of the most famous Canadian submersible builders (until it went into receivership in 1978) was International Hydrodynamics Co Ltd of Vancouver, which manufactured the Hyco family of manned submarines, named after signs of the zodiac. During its best year, 1976, Hyco employed 165 people, but a surplus of submersibles on the world market, coupled with a drastic cutback in North Sea operations by a major British customer, eventually contributed to the breakup of this innovative company.

Submersibles have been around for nearly 20 years, but only since the mid-1970s have remote-control vehicles (which do not require complex and expensive life-support systems) become sophisticated enough to challenge manned craft. Remotely operated submersibles, built by International Submarine Engineering Ltd of Port Moody, BC, are being used in the Far East, the North Sea, the Middle East and other oil-producing areas. Founded by company president James McFarlane in 1974, when the field was still in its infancy, ISE had designed and

built more than 70 systems by the end of 1982, mostly for export. ISE manufactures a family of submersibles, most of which are unmanned and controlled through cables by a surface operator. New technology is conceived and developed with breathtaking speed. Early remote-control submarines were equipped with cameras for PIPELINE inspection; modern computer-controlled machines can perform more complex tasks, including oil-rig inspections and underwater shackle-ups at depths exceeding 1000 m. On-board diagnostic apparatus on the latest models enables technicians at ISE's Port Moody laboratory to monitor the internal workings of a submersible operating from a drillship as far afield as Australia.

A 2-vehicle package, designed to support drilling to even greater depths (about 2700 m), was under construction at ISE in 1983, together with the first in a new generation of untethered submersibles known as ARCS (automatic remotely controlled submersible), ordered by the BEDFORD INSTITUTE OF OCEANOGRAPHY, Dartmouth, NS.

In addition to manned and remote-control self-propelled submersibles, Canadian companies also design and manufacture towed underwater devices, designed to perform tasks ranging from location of enemy submarines to identification of shipwreck sites and of geological structures capable of containing hydrocarbon deposits. A leader in this field is Fathom Oceanology Ltd of Mississauga, Ont, which has grown steadily since it was founded in 1978. Fathom's products include fish-shaped housings for detection packages and associated shipboard towing systems; drilling-rig accessories (eg, fairings for cables, pipes, drill risers) and SONAR domes for naval vessels. Acquisition of British, US and Canadian subsidiaries in 1981 and 1982 allowed the company to expand its expertise from the purely mechanical side of underwater towing systems into microprocessing and electronics. From the start, most of Fathom's revenues came from the navies of N America and western Europe, but by the end of the company's 1982 fiscal year (anticipated revenues, \$8 million), the military share was expected to drop to 65%. A towed system known as BATFISH, designed by the Bedford Institute of Oceanography and equipped to carry oceanographic-research instrument packages, is manufactured by Guildline Instruments Ltd of Smiths Falls, Ont.

**Diving** For the most delicate tasks associated with the ocean industry, divers working with their hands are still needed. Because they are exposed to enormous pressures and other potential dangers, Canadian divers earn good wages. In 1982, those working in domestic offshore oil and gas fields earned up to \$60 000. Specialists willing to work elsewhere in the world earned even higher wages, a situation that raised concern over whether these highly trained people would be available to work in Canadian waters. In 1982, about 50% of divers working in the domestic industry were Canadian. At that time, Newfoundland was the only province that discriminated in favour of residents in its offshore industry.

Divers operating from diving bells now work at depths of more than 330 m and tests have indicated that humans can survive (though not very efficiently) at more than twice that depth. Work at even 200 m by unprotected divers was unheard of until 1968, when Phil Nuytten, president of Can-Dive Services Ltd of Vancouver and a pioneer in the development of underwater systems, established a commercial DIVING record to that depth.

As humans have gone deeper into the oceans, new problems have been encountered and, while technology has provided some solutions, many dangers are still only partially understood. Rapid compression to working depths

was found to cause uncontrollable muscle tremors, dizziness and nausea. Consequently, divers now spend up to 24 hours inside a hyperbaric chamber, slowly adjusting to the immense pressure. This delay in attending to an underwater problem can cost tens of thousands of dollars in oil rig downtime. Under pressure, divers sometimes complain of painful stiffness, where joints creak and pop and any movement causes discomfort. Sometimes bone necrosis (bone death) occurs under pressure, a problem whose cause is not fully understood.

Perhaps the best-known danger associated with deep diving is decompression sickness ("the bends"), which can occur if a diver ascends too quickly. On the way down, under increasing pressure, gases are dissolved in the blood. Reduced pressures during ascent cause the gases to bubble out; if this occurs too quickly, the bubbles can lodge in joints and cause severe pain, even death. Divers must ascend slowly or, as is often done with divers working in waters too cold for dallying, spend hours, days or even weeks in a surface decompression chamber which gradually reduces outside pressure on the body. Divers are paid for time in the chamber, so deep dives, even of short duration, are expensive.

Wherever possible, the dangers and associated costs are reduced by using one-atmosphere armoured diving suits that allow diver-operators to breathe air at sea-level atmospheric pressure. The suits are not cheap (they can cost about \$1 million) but they offer greater safety, quicker response time and savings in breathing gas. A 2-week decompression can consume more than \$100 000 worth of helium and oxygen breathing gas.

Can-Dive (formerly part of the Oceaneering International group of Houston, Texas, now an independent, Canadian-owned company) operates several one-atmosphere systems, eg, Jim and Wasp. Jim is an articulated suit with arms and legs, meant for walking on the ocean floor or on underwater platforms. Wasp is a mid-water suit with jets instead of legs (Nuytten calls it a "submarine that you wear"); the diver "flies" it underwater by using foot pedals. Can-Dive also has ARMS (atmospheric roving manipulator system), a diving bell that permits operations to 1000 m. In 1982 these and other one-atmosphere systems accounted for about half the manned deep-water work in Canada.

In 1983 Can-Dive was developing a new lightweight version of the Jim suit, with improved flexibility in the joints, for operations to 200 m. The company was also working with Deep Ocean Technology of San Francisco on an acrylic "bubble," known as the underwater helicopter, which was expected to operate 2000 m deep. See OCEAN MINING; OCEANOGRAPHY.

CAREY FRENCH

**Ocean Mining** Several types of valuable MINERAL deposits are known to exist under the oceans or under other large bodies of water. Where water is shallow, placer deposits can be recovered by large dredges (eg, tin minerals off the coasts of Java and Borneo). Where deposits lie in shallow water near the shore, dams may be built around sections of the shoreline and the areas pumped out so that shovels or scrapers can be used to excavate the material. Diamond-bearing gravels are mined in this way along the coast of southwestern Africa. Conventional, underground MINING methods may be used to follow mineral deposits extending beyond shorelines, if the rock strata above the ore body or coal seam are thick, strong and not porous or fractured. For example, coal is mined beneath the Atlantic Ocean over 8 km from CAPE BRETON I. The seams were first found on land and mine buildings, shaft and slope entrances were established on land. Mining by the longwall method

has followed the seams as they dipped beneath the ocean. Although the rock strata above the seams subside into the excavated areas after they are mined, no water has entered the mines. Mining of IRON ORE extended 5.5 km beyond the shore at Wabana, Nfld. The empty chambers remained dry and are available for storage purposes.

Deep-ocean exploration has discovered jets and springs of hot water (to 350°C) rising from fissures and vents in ocean floors. These emissions appear to occur mainly along major ocean ridges and along fractures of the Earth's crust, such as in the Red Sea and off the BC coast. They may carry various metals and other elements in solution which, on encountering cold ocean water, precipitate as muds, layers, crusts or chimneys. Sulphides of copper, zinc, iron and other metals have been found in such deposits. These discoveries provide new information to geologists about the origin of hydrothermal mineral deposits. They may also provide future sources of economically recoverable minerals, if deposits of suitable size, grade and location are found.

The recovery of such deposits and of other mineral deposits known to lie at some depth below the ocean floor and at considerable distances from the nearest land will be difficult. Where the distance is too great to warrant driving long tunnels from shore-based shafts, it may be necessary to adapt the techniques which are now being developed for offshore PETROLEUM recovery. The difficulties are further complicated by the need to establish national and international legal controls. The recovery of metal-bearing nodules, for example those occurring on the ocean floor in the mid-Pacific at depths of up to 5 km, is a challenge for the future. These fist-sized nodules contain manganese, copper, nickel and cobalt. Recovery will depend on the development of suitable technology and on the establishment of international agreements to regulate the work. Several multinational groups are investigating methods of recovery, including use of continuous lines of buckets, drag scrapers and suction devices. Research is also needed to develop suitable methods of processing nodules on boats or barges at sea.

T.H. PATCHING

**Oceanography** is the SCIENCE that studies the OCEANS and seas in all their aspects: the movement and composition of their WATERS; their origin; the evolution of their form; the nature, distribution and interactions of their PLANT and ANIMAL denizens; and their interactions with the atmosphere which affect CLIMATE and WEATHER.

**Subfields** From descriptive beginnings as the GEOGRAPHY of the sea, oceanography has matured into a quantitative, multidisciplinary science bringing together experts from many basic fields. The interconnectedness of marine problems demands from scientists of many disciplines a close collaboration which gives oceanographic research a special flavour. Physical oceanography combines the work of instrument makers who design sophisticated apparatus to measure or sample the corrosive and often inaccessible oceanic medium, analysts and computer specialists who interpret the data, and theoreticians who explain the observed physical properties of the ocean using the PHYSICS of rotating fluids. HYDROGRAPHY is an applied branch of physical oceanography concerned with mapping the ocean depths, calculating TIDE tables and producing navigational charts (see CARTOGRAPHY). Chemical oceanography studies the composition of seawater, the elements and compounds it holds in solution, their reactions with inert and living matter, and the effects of natural and man-made POLLUTION. Marine geology and geophysics study the origin of ocean basins, the spreading and shrinking of seas through

geological ages, the erosion of shorelines and the evolution of bottom sediments. BIOLOGICAL OCEANOGRAPHY brings together botanists, zoologists, bacteriologists, FISHERIES experts and other biological specialists in the study of marine life and its availability to mankind. Marine ecology, an important interdisciplinary aspect of oceanography, studies marine ecosystems.

**Relations to Other Fields** Oceanographers share common theoretical and methodological approaches with researchers working in related areas. For example, oceanography is closely related to limnology, the study of LAKES; and physical oceanography has much in common with METEOROLOGY, which studies the motion of another fluid, the atmosphere. Oceanographers can also supply important practical data to workers in other fields. For example, ocean engineering combines oceanographic knowledge with ENGINEERING techniques in the design and protection of coastal installations and offshore structures.

**History in Canada** The growth of oceanography in Canada, a country abutting 3 oceans (Atlantic, Pacific, Arctic) and containing large freshwater inland seas, has been continuous for almost a century. Oceanography was first applied, in Canada as elsewhere, to problems of navigation. The Canadian Tidal Survey (now Canadian Hydrographic Service) was formed in 1893. Under the leadership of its first director, William Bell DAWSON, it started its work of compiling marine charts and measuring currents and sea levels, a task which rapidly transcended its purely practical goals. Hydrography is the progenitor of physical oceanography. In the same period a board of management for fisheries and marine research was established under the Department of Naval Service. The board was superseded by the Biological Board of Canada, later the Fisheries Research Board of Canada.

Although biological oceanography originated, in part, in the practical concerns of fisheries, it received much of its life breath from the scientific interest generated by voyages of discovery in the second half of the 19th century, especially the CHALLENGER EXPEDITION (1872-76). The expedition, based in Halifax for a time, pioneered deep-sea dredging for marine organisms. During the late 19th century, marine research laboratories proliferated in Europe and the US. Two marine stations were established in Canada in 1908, at St Andrews, NB, and Nanaimo, BC, under the impetus and direction of E.E. Prince. These establishments, formally under the direction of the federal Department of Fisheries, were given a broad mandate to study not only FISH, but also the plants, chemistry and motions of the ocean. Under the direction of the Fisheries Research Board of Canada, the Atlantic and Pacific biological stations were for decades focal points of Canadian oceanography, mapping fisheries resources and water properties, mounting deep-sea expeditions and providing expertise for Canadian participation in international bodies. On the Atlantic coast, fisheries oceanographers W. Huntsman, W. Mackey and L. Lauzier participated in the description of local waters and in the work of the International Commission for North Atlantic Fisheries; W. Ford led Canadian participation in the study of the Gulf Stream during Operation Cabot in 1950. In the Pacific J.P. TULLY and his colleagues in Nanaimo pioneered the study of FJORDS and participated (with the US and Japan) in the North Pacific expeditions that mapped the ocean habitat of salmon. The waters of the ARCTIC ARCHIPELAGO were also explored; in the East, the *Calanus* expeditions (1948-1979) led by M. DUNBAR of McGill University investigated Hudson Bay and its approaches; in the West, W.M. CAMERON played a leading role in the joint Canadian-US expeditions to the Beaufort Sea in the early 1950s.

Following WWII, defence research laboratories in Canada and elsewhere rapidly became interested in physical oceanographic problems, such as ocean wave forecasting and ocean acoustics. In the late 1940s and 1950s, the need for professional oceanographers led to the foundation of graduate research and teaching institutes at the universities of British Columbia, Dalhousie and McGill. The spread of oceanographic studies to academic institutions continued in the 1960s with the formation of the Groupe inter-universitaire de recherches océanographiques du Québec (GIRQ), to which Laval, Université de Montréal and McGill contribute, and with the establishment of teaching and research laboratories at Université du Québec à Rimouski. Oceanographic studies are also offered at the universities of Victoria, Guelph and Memorial, and at Royal Roads Military College.

A major recent development in Canadian oceanography has been the concentration and significant expansion, through the 1960s and 1970s, of research and service operations run by the federal government through the Department of Fisheries and Oceans in 3 large institutions: the BEDFORD INSTITUTE OF OCEANOGRAPHY (BIO), Dartmouth, NS; the CANADA CENTRE FOR INLAND WATERS (CCIW), Burlington, Ont; and the Institute of Ocean Sciences (IOS), Sidney, BC. These are on a scale comparable to that of other major oceanographic research centres of the world, housing hundreds of scientists concerned with all aspects of marine science. A smaller laboratory is located in Québec City and a central information storage and dissemination agency (the Marine Environmental Data Service) is based in Ottawa. Fisheries laboratories in Nanaimo and St Andrews (as well as in St John's, Nfld, and Halifax, NS) have become more specialized in fish-stock management. Federal research laboratories also operate Canada's oceanographic fleet, which includes a few medium-sized deep-sea vessels (eg, *Baffin*, *Hudson*, *Parizeau*, *Dawson*, *Endeavour*) and smaller vessels for hydrographic and coastal work. A research SUBMERSIBLE, the *Pisces IV* (and its tender ship the *Pandora*) is used for deep-visual exploration. Although these ships are used mainly for coastal work, occasional long-range cruises take Canadian oceanographers to remote seas. The Hudson-70 expedition accomplished the first complete circumnavigation of the Americas, taking a group of University of British Columbia oceanographers, led by G.L. PICKARD, on the first scientific survey of the fjords of southern Chile, and taking a team from the Bedford Institute, led by C.R. MANN, to make deep-flow measurements through Drake Passage, S of Cape Horn.

Practical problems now facing Canadian oceanography include fisheries management and the complex interactions between its scientific and socioeconomic aspects; problems of nearshore pollution and deep-ocean dumping; improved understanding of SEA-ICE conditions for purposes of navigational safety and offshore operations; exploitation of offshore PETROLEUM and MINERAL resources on the Canadian continental shelves; and development of instruments for in situ and remote sampling of the ocean to gather the information necessary to tackle the above problems. The arctic regions continue to be an area of special concern. In the early 1970s joint government and industry surveys of the Beaufort Sea paved the way for current hydrocarbon exploration. A few years later, the Eastern Arctic Marine Environmental Studies (EAMES) program gathered extensive baseline information about marine ecosystems and circulation patterns in Baffin Bay, Lancaster Sound and adjacent passages. Geophysical and oceanographic expeditions to the deep Arctic Ocean, north of the archipelago, such as the Lomonosov Ridge Experiment (LOREX, 1979) and the

Canadian Expedition to Study the Alpha Ridge (CESAR, 1983), have confirmed Canada's interests in the High North (see ARCTIC OCEANOGRAPHY).

Canadian oceanographers also participate in the elucidation of fundamental problems of a global nature, such as the role played by the oceans in CLIMATE CHANGE and, in particular, their capacity for holding in solution much of the carbon dioxide released by the burning of fossil fuels. A significant increase in the concentration of this gas in the atmosphere could lead to a net warming trend, a significant concern to subpolar countries. A detailed understanding of oceanic dynamics is still lacking, and oceanic weather prediction will not be achieved until a more intimate knowledge of ocean currents is attained and supported by a dense network of observation stations. This task will occupy physical oceanographers for years to come. The history of seafloor spreading and its relation to the formation of deep-sea mineral deposits is also of great interest. In Canada seafloor spreading occurs off the BC coast at the Juan de Fuca and Explorer ridges, submarine mountain chains where new ocean floor is continually being created (see OCEAN MINING; PLATE TECTONICS).

Of the more than 1000 oceanographers in Canada, most work for the federal or provincial governments, a few teach in universities, and an increasing number are employed by the private sector to help in offshore exploitation and nearshore engineering and pollution problems. The Canadian Meteorological and Oceanographic Society, the principal professional society of oceanographers in Canada, gathers together mainly physical and chemical oceanographers. It publishes a quarterly journal of scientific research, *Atmosphere-Ocean*, and a newsletter of general information, and holds an annual scientific congress. Another Canadian research publication devoted mainly to fisheries science is the monthly *Canadian Journal of Fisheries and Aquatic Sciences*, published by the Scientific Information and Publications Branch of the federal Dept of Fisheries and Oceans.

PAUL H. LEBLOND

Reading: K. Johnstone, *The Aquatic Explorers* (1977); D.A. Ross, *Introduction to Oceanography* (1982).

**October Crisis**, the kidnapping on 5 Oct 1970 of James Cross, the British trade commissioner in Montréal, by members of the FRONT DE LIBÉRATION DU QUÉBEC. The kidnappers' demands, communicated in a series of public messages, included the freeing of a number of convicted or detained FLQ members and the broadcasting of the FLQ manifesto. The manifesto, a diatribe against established authority, was read on Radio-Canada, and on Oct 10 the Québec minister of justice offered safe passage abroad to the kidnappers in return for the liberation of their hostage; but on the same day a second FLQ cell kidnapped the Québec minister of labour and immigration, Pierre LAPORTE. On Oct 15 the Québec government requested the assistance of the Canadian Armed Forces to supplement the local police, and on Oct 16 the federal government proclaimed the existence of a state of "apprehended insurrection" under the WAR MEASURES ACT. Under the emergency regulations, the FLQ was banned, normal liberties were suspended, and arrests and detentions were authorized without charge. Over 450 persons were detained in Québec, most of whom were eventually released without the laying or hearing of charges. On Oct 17 the body of Pierre Laporte was found in a car trunk near St Hubert airport.

In early Dec 1970, the cell holding James Cross was discovered by police, and his release was negotiated in return for the provision of safe conduct to Cuba for the kidnappers and some family members. Four weeks later the second group was located and arrested, subsequently to be tried and convicted for kidnapping and murder. Emergency regulations under War

Demonstrators in Montréal protesting the implementation of the War Measures Act during the October Crisis (courtesy Canapress).

Measures were replaced in Dec 1970 by similar regulations under the Public Order (Temporary Measures) Act which lapsed on 30 Apr 1971. The federal response to the kidnapping was intensely controversial. According to opinion polls, an overwhelming majority of Canadians supported the Cabinet's action, but it was criticized as excessive by Québec nationalists and by civil libertarians throughout the country. Supporters of the response claim that the disappearance of terrorism in Québec is evidence of its success, but this disappearance might equally be attributed to public distaste for political terror and to the steady growth of the democratic separatist movement in the 1970s, which led to the election of a PARTI QUÉBÉCOIS government (1976).

After the crisis the federal Cabinet gave ambiguous instructions to the RCMP Security Service, permitting dubious acts which were later condemned as illegal by the federal INQUIRY INTO CERTAIN ACTIVITIES OF THE RCMP and the Keable Commission (D'enquête sur des opérations policières en territoire Québécois) in Québec. The federal minister of justice in 1970, John TURNER, justified the use of War Measures as a means of reversing an "erosion of public will" in Québec, and Prem Robert BOURASSA similarly conceded that it was intended to rally popular support to the authorities rather than to confront an "apprehended insurrection."

DENIS SMITH

**Octopus**, common name for all 8-armed cephalopod MOLLUSCS; it more properly refers to the largest genus in order Octopoda (over 100 species). Octopuses are also called devil fishes for the "horns" (cirri) behind their eyes, but the image of an 8-legged cat is more apt. They have large slit eyes and explore the sea bottom with catlike intelligence, pouncing on prey, eg, crabs. Canada has 2 of the world's largest octopods: the Pacific *Octopus dofleini*, a slow but typical benthic (bottom-dwelling) hunter of up to 80 kg; and the Atlantic *Alloposus mollis*, which floats in the PLANKTON like a 40 kg jellyfish. There are 9 smaller species. The paper-thin "shells" of the octopod *Argonauta* (paper nautilus) occasionally drift to Canadian shores from the tropics. Not true shells, they are boatlike nests secreted by the female and used by her as a brood chamber and retreat.

R K O'DOR

**Odell, Jonathan**, doctor, clergyman, spy, poet, politician (b at Newark, NJ 25 Sept 1737; d at Fredericton 25 Nov 1818). He was trained in medicine but entered the Church of England ministry. He served as parish priest at Burling-

ton, NJ, until his Loyalist political sympathies forced him to flee to New York in 1776 during the AMERICAN REVOLUTION. There he worked for the Loyalist cause as an administrator and satirical poet-propagandist. He was also a secret go-between in the espionage activities of Benedict ARNOLD and John André. In 1784 he immigrated to New Brunswick, having been appointed provincial secretary as a reward for his loyalty. He was influential and respected in NB politics.

THOMAS B. VINCENT

**Odjig, Daphne**, artist (b at Wikwemikong IR, Manitoulin I, Ont 11 Sept 1919). Of a Potawatomi father and English war-bride mother, she was encouraged in her early artistic expression by her grandfather and father, tombstone carvers and artists. Leaving the reserve in 1938, she migrated to BC and was ultimately elected to the BC Federation of Artists. Her work has been influenced by the growing political awareness of her people and her experiences in native communities in Manitoba during the 1960s. In 1970 she opened a gallery devoted to native art in Winnipeg and, with MORRISSEAU, JANVIER, BEARDY and others, formed the short-lived but significant Professional Native Indian Artists' Assn (1973). Odjig has developed a unique synthesis of western styles (cubism, surrealism) and native world view to express the universal themes of identity, family relationships and spirituality. A central motif is the curved arch enclosing her figures in lyric, rhythmic line. Her work has been exhibited in Europe, Israel and Japan. Her great mural *The Indian in Transition* (1978) graces the National Arts Centre in Ottawa, and her influence is evident in the work of many younger native artists.

ROSAMOND M. VANDERBURGH

Native artist Daphne Odjig shown with her massive painting *The Indian in Transition* (courtesy Canapress).

**Odium, Victor Wentworth**, journalist, soldier, diplomat (b at Cobourg, Ont 21 Oct 1880; d at Vancouver 4 Apr 1971). He served in the South African War and WWI, and between the wars pursued a career as a journalist. He was connected with several newspapers, including the *Vancouver Daily Star*, of which he was publisher 1924-32. In the late 1930s he served on the Canadian Radio Broadcasting Commission. With the rank of major-general, he commanded the 2nd Canadian Division (1940-41) and was released to become high commissioner to Australia and Canada's first ambassador to China, 1943-46. An admirer of Chiang K'ai-shek, Odium was out of step with events in China, although many of his proposals regarding Canada-China relations were innovative. He was ambassador to Turkey 1947-52. BRIAN L. EVANS

**O'Donoghue, Daniel John**, printer, trade union leader, politician (b at Lakes of Killarney, Ire 1844; d at Toronto 16 Jan 1907). "The father of the Canadian labour movement" began his apprenticeship as a printer in Ottawa at age 13. He helped organize the Ottawa Typograph-

ical Union, 1867, promoted the Ottawa Trades Council, and was elected vice-president of the Canadian Labour Union in 1873. He was elected to the Ontario Legislature in 1874 as an independent workman, but moved ever closer to MOWAT's Liberal government. As chairman of the legislative committee of the Toronto Trades and Labour Council, he was at the centre of labour politics in the 1880s. Joining the KNIGHTS OF LABOR in October 1882, O'Donoghue quickly emerged as the chief Canadian lieutenant, handling the delicate negotiations with French Canadian Roman Catholic bishops who had condemned the order as a "secret society." Although loyal to what he thought best for his class, he remained a Liberal partisan. Appointed a clerk in the Ontario Bureau of Industry in 1885, he was Canada's first federal fair wages officer, 1900-07. His son John was to become Canada's first prominent labour lawyer.

G.S. KEALEY

**Office Automation** is a general term that includes a wide range of applications of computer, communication and information technologies in office environments. Though the process is still considered to be in its early stages, it is clear that the TECHNOLOGY available in 1985 is much more advanced than what was on the market in the mid-1970s. Automation is in a state of flux, but the size of the market is already huge, with annual investments measured in billions of dollars. Most experts believe that the progress achieved by the early 1980s is just the beginning of what will be a continued period of rapid expansion.

The technology we see today had its start in the 1960s, when 3 clearly identifiable streams of development became evident. The first was computing, where the earliest applications were automated payroll and inventory-control systems. Other applications were also limited to the processing of numerical data. These systems were usually operated only by programmers in the data-processing division of the organization, who jealously guarded their computers and the power their knowledge of the computer gave them. Nevertheless the applications of computers in organizational settings grew to include more and more kinds of data processing.

The second stream of technological development was in the area of text processing. In the mid-1970s IBM introduced a product called the MCST — Magnetic Card Selectric Typewriter. This device had a box crammed with electronic equipment. The operator would insert a specially coated card the size and shape of a standard IBM punch card into a slot on the top of the box and type on the attached typewriter as usual. The card served as a memory device, on which the text would be written in a code based on magnetized spots. Once it was entered, the text could be edited and played back, causing a new copy to be typed out on the attached typewriter. Compared to current word-processing systems, this one was primitive, but it was more advanced than anything else on the market at the time and it worked. A string of improved versions of this typewriter-with-a-memory — also known as the word processor — were subsequently developed and made available.

While the first 2 streams were centered around the processing of information in the office, the third, COMMUNICATIONS TECHNOLOGY, focused on the movement of information from one place to another. A wide range of techniques to achieve this end were introduced, from telex and facsimile services to services using specially conditioned TELEPHONE lines and others using sophisticated satellite links between distant points (see SATELLITE COMMUNICATIONS).

When the 3 technologies are incorporated into an office environment, many improvements

become possible, but they are mostly improvements in the speed with which work is done rather than in the kind of work that is done. Office automation in the 1980s is beginning a new trend — the integration of previously separate capabilities into single powerful "work stations." An automated office using the best technology commercially available in 1984 would probably have at least the following capabilities. *Communicating word-processing* abilities, including spelling correction and access through a local-area network or over telephone lines to information previously stored on files at other locations, together with the ability to communicate with other stations on the net or on other nets. *Electronic messaging systems* including any combination of text, graphics and voice. They help users to compose and send messages to others on the same net or, through gateways, to people on different nets in other places. *Activity-management systems*, including time-management, project planning and scheduling, and electronic calendar capabilities, useful to managers and planners in large organizations. *Electronic filing cabinets*, ranging from straightforward storage and retrieval systems, where the user does much of the work of storing and retrieving, to sophisticated natural-language expert systems. These provide assistance for people who deal with large volumes of diverse types of rapidly changing information. Assistance in managing information is a natural complement to technologies aimed at the creation of more information. *Decision-support systems* — the most complex of the capabilities in office-automation packages. These systems include sophisticated programs that allow the user to perform complex analyses on large data bases in a way that improves the speed and quality of decisions that are made.

Most of the capabilities mentioned above make use of 2 or 3 of the original technologies. It is this integration of the previously separate capabilities that gives the new technology its power, and that provides the base upon which new applications will be developed in the near future.

**The Impact of Office Automation** The implementors of office-automation systems hope that the technology will improve the productivity of their organizations and lead to improvements in the quality of their products. Some also realize that the more information there is on a complex computer system, the more power they can exercise over the operation and co-ordination of that system. This makes it possible to develop larger, more complex organizations that are able to react more quickly and appropriately in the face of a dynamic economic and political environment. Others realize that the new technologies have the potential to strengthen the power of transnational corporations in Canada and contribute to the erosion of Canadian autonomy; to displace many people (especially women) whose jobs will be automated; and to "de-skill" the jobs of others who must learn to work for the new machines that make the decisions, rather than working with older, less sophisticated technologies.

There is a rising level of fear of the new technologies and the impact they will have on job security and on the privacy of the individual (see COMPUTERS AND SOCIETY). There is also concern that the Canadian economy will suffer greatly if Canadian organizations do not develop and adapt to the new technologies. Numerous studies have debated whether or not the new technologies will result in an overall reduction in the number of jobs or a dramatic improvement in the quality of working life. Most of this research is flawed by neglect of the policies and intentions of those making the decisions about what is to be automated and how the automation is to be accomplished. It is safe

to say, however, that the technologies will have a significant impact on the working lives of millions of Canadians in the coming decades. See also INFORMATION SOCIETY. **Official Languages, Commissioner of**, is appointed to a 7-year term by Parliament under the OFFICIAL LANGUAGES ACT (beginning in 1969); a reappointment may not exceed 7 years. The commissioner, responsible for compliance with the spirit and intent of the Act in the Government of Canada and in Parliament and for ensuring equal recognition of the status of English and French as official languages (see LANGUAGE POLICY), has the authority to investigate complaints of violations of the Act as well as to initiate the examination of possible violations. Results of such investigations may be reported directly to the individuals or agencies involved and are outlined in some cases in special reports to Parliament. The commissioner reviews his office's activities and makes recommendations in an annual report.

**Official Languages Act (1969)**, federal statute that declares French and English to be the official languages of Canada, and under which all federal institutions must provide their services in English or French at the customer's choice. The Act (passed following the recommendation of the Royal Commission on BILINGUALISM AND BICULTURALISM) created the office of Commissioner of Official Languages to oversee its implementation. Politically the Act has been supported by all federal parties, but the public's understanding and acceptance of it has been mixed. See LANGUAGE POLICY. MAX YALDEN

**Official Secrets Act**, the most important statute relating to national security, is designed to prohibit and control access to and the disclosure of sensitive government information; offences cover espionage and leakage of government information. The term "official secrets" is not defined comprehensively in the legislation, but broadly, official secrets may be considered any information of an official character. It is clear that prohibited places, code words, passwords, plans, models, articles, notes or other documents can be regarded as official secrets under the Act. There is some controversy over whether information involved must be secret (in Britain there is no such requirement). In the 1978 prosecution of the Toronto *Star*, the judge presiding at the preliminary inquiry assumed that the information did indeed have to be secret. In one 1948 case the Québec Court of Appeal determined that the Act does not apply to information that has been published, publicized or has fallen into the public domain. The first Official Secrets Act was passed in England in 1889 and with minor modifications became law in Canada in 1890. In 1892 its provisions were transferred to the first Criminal Code of Canada until their repeal and replacement by the Official Secrets Act, 1939. This new Act combined into one the English Acts of 1911 and 1920. Minor changes were made in 1950, 1967 and 1970. An important addition was made in 1973 in the form of a broad power to conduct wiretap investigations pursuant to executive, as opposed to judicial, authorizations.

The Mackenzie Commission of 1969 described the legislation as "an unwieldy statute couched in very broad and ambiguous language" and one possessing "unusual" and "extraordinarily onerous" evidentiary and procedural provisions

relating to espionage cases. Successive royal commissions have criticized the broad powers of search and seizure conferred under the legislation of substantive offences, eg, leakage of classified information, created by the statute. Over 50% of the 22 Canadian prosecutions under the Official Secrets Act arose as a result of the defection of Igor GOUZENKO in 1946 and his revelations about a series of Soviet spy rings operating in Canada. Only 4 prosecutions have occurred since 1961. Two of the most recent cases have involved the leakage provisions of the Act, and in both of these 1978 prosecutions charges were dismissed. The Royal Commission of INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE (McDonald Commission) noted in 1979 that "much more is needed by way of legislative reform than the mere dismantling of the Official Secrets Act and the recognition of espionage and leakage as separate kinds of offences. The definition of these offences in the Official Secrets Act leave much to be desired...it is now time for this part of our law to be revised so that it is both clear and in tune with the values and needs of contemporary Canada." STANLEY A. COHEN

**Offshore Mineral Rights Reference** (1967) The Supreme Court of Canada, in a decision about the ownership of seabed mineral rights off BC and on the legislative jurisdiction over these rights, decided that Parliament, not the BC legislature, owned the territorial seabed adjacent to that province and enjoyed exclusive legislative jurisdiction by virtue of the CONSTITUTION ACT, 1867 (s91.1A), ie, Parliament's residuary power. Rights in the territorial sea derive from INTERNATIONAL LAW and Canada is the sovereign state recognized by international law. BC could not claim the rights of the continental shelf either, according to the rights under international law defined in the Geneva Convention (1958). GERALD-A. BEAUDOIN

**Ogilvie, Will**, painter (b at Stutterheim, S Africa 30 Mar 1901). The first official Canadian war artist (appointed Jan 1943), he painted many of his war works under fire, for which he was awarded the OBE. In Johannesburg Ogilvie studied with Erich Mayer. After emigrating in 1925, he studied at New York's Art Students

League (1927-30) with Kimon Nicolaides, whose standard text on drawing, *The Natural Way to Draw* (1941), gave Ogilvie solid preparation for his war work. War artists Alex COLVILLE, Charles COMFORT, Lawren HARRIS and Campbell Tinning considered Ogilvie the best of the group. He himself loved Goya, Piero della Francesca and British war artist Paul Nash. There seem to be few traces of his enthusiasms, however, in his detailed, lovingly drawn work. His drawings in the field were spontaneous; his paintings more formal and symbolic. After the war, he taught at the Ontario College of Art 1947-57, then as lecturer at U of T (1960-69). JOAN MURRAY

**Ogopogo**, fabled aquatic monster said to inhabit Okanagan Lake. The Salish called it "snake in the lake"; the Chinook called it "wicked one" and "great beast in the lake." Representation appeared in precontact petroglyphs. Like "Nessie," the Orm of Loch Ness, Ogopogo is variously described as having the head of a sheep or a horse and a long serpentine neck, and is reported to swim with an undulating motion; it is generally "sighted" as several humps moving rapidly through the water. The name "Ogopogo" is a palindrome from a comic English music-hall song, "Ogopogo Song." Okanagan Lake has temperamental weather conditions, which might explain the apparition, and an ill-defined lake bottom, which gives rise to speculation about long-trapped dinosaur eggs released by movements of the Earth's crust. CAROLE H. CARPENTER

**O'Grady, Standish**, clergyman, farmer, poet (fl 1793-1841). Born in Ireland, he was educated at Trinity Coll, Dublin, and was ordained into the Church of Ireland ministry. Poverty forced him to immigrate to Lower Canada in 1836 where he settled on a farm near Sorel. He is remembered in Canada for his long narrative poem *The Emigrant*, published in Montréal in 1841, in which he describes the hardships of settlement life and expresses his profound dislike for the social, cultural and climatic environment of Canada. In his nostalgic yearnings for the "old country" and his unhappiness over hardships in the "New World," he epitomizes the main characteristics of the emigrant theme in early Canadian literature. THOMAS B. VINCENT

**O'Hagan, Howard**, writer (b at Lethbridge, Alta 17 Feb 1902; d 1982). O'Hagan was one of the first native-born westerners to make a mark on Canadian literature and is best known for his novel of the Rocky Mountains, *Tay John* (1939).

Will Ogilvie's fine drawing *Return of a Foot Patrol* shows Canadian soldiers in the flooded terrain of Holland during WWII (courtesy Canadian War Museum/MMC/NMC/13537).

His life is almost as noteworthy as his writing. As a youth, he worked on survey parties in the Rockies. He later studied law at McGill and, upon graduation in 1925, returned West. In his oft-quoted words, "I practised law for a month in Jasper, put one man into jail and got another out." He returned to guiding and packing through the mountains, with the famous Brewster outfitting. After a stint as chief of publicity for the Central Argentine Ry, he lived in Australia, the US, England and Italy.

More than any other modern writer, O'Hagan has been the quintessential "mountain man" who knew the wilderness intimately and celebrated it through fiction. The protagonist of *Tay John* is a blonde giant, "Tête Jaune," whose legend inspired the naming of Yellowhead Pass through the northern Rockies. It is a fictional account, set in 1880, about a primitive half-breed outcast who becomes a myth, both worshipped and despised, before disappearing into the earth from which he had sprung. O'Hagan's short fiction is also respected. *The Woman Who Got on at Jasper Station & Other Stories* (1963) is a collection of 11 powerful short tales. *Wilderness Men* (1958), 10 biographies of western heroes, includes Grey Owl and the legendary West Coast fugitive, Gun-an-noot. A more recent novel is *The School-Marm Tree* (1977). O'Hagan lived in Victoria, B.C. with his wife Margaret Peterson, a noted artist.

KEN MITCHELL

**Oil, Chemical and Atomic Workers International Union v Imperial Limited et al** In 1961 the BC legislature prohibited trade unions from using membership fees paid under collective agreement checkoff provision for political purposes. The OCAW challenged the statute on the ground that only Parliament has constitutional jurisdiction to restrict a union's federal political activities. The majority of the Supreme Court of Canada rejected the union's argument and held that the legislation was within provincial jurisdiction as it concerned the control of labour relations in the province. This decision upheld a major restriction on trade-union political activity.

TIMOTHY J. CHRISTIAN

**Oil and Natural Gas**, liquid and gaseous forms of PETROLEUM, are the most important ENERGY commodities (along with electricity) of the 20th century because of their relatively low cost, convenience of use and widespread distribution. Oil replaced COAL as the world's (and Canada's) most important fuel after WWII. Natural gas has become increasingly important with the spread of PIPELINES, distribution utilities and liquefied-natural-gas tanker and storage systems. Natural gas has already replaced oil in many applications, not only for industrial, residential and commercial heating, but also as an automotive fuel and petrochemical feedstock. In future it may become the dominant fuel in much of the world.

Good-quality crude oil, free flowing and low in sulphur, is formed only under a narrow range of temperatures and pressures in sedimentary basins. After more than a century of exploration, geologists believe they have delineated most of the major, easily accessible reservoirs of crude oil. Most of the remaining large fields are believed to be located in remote arctic regions and offshore waters. The other large source of oil is synthetic crude oil refined from BITUMEN in areas such as the Alberta oil sands and Venezuela's Orinoco heavy-oil deposits. Although there are vast resources of bitumen (known deposits are as large as the conventional oil resources of the Persian Gulf nations), the costs of upgrading it into synthetic crude are almost as high as those of developing competing fuels from COAL LIQUEFACTION and BIOMASS.

Until the rapid price increases of the 1970s, the PETROLEUM INDUSTRIES did not explore for natural gas. The gas was found as a by-product

Turner Valley discovery well (courtesy Glenbow Archives/photo by W.J. Oliver).

of conventional oil drilling and was considered a waste product. Large quantities were simply burned (flared) on site. The move to petroleum conservation has reduced flaring to a minimum, but there is often no alternative in remote areas far from pipeline hookups. PETROLEUM EXPLORATION now indicates that large reserves of natural gas exist in areas outside the regions already explored. In the US, large reserves of gas have been found in "geopressurized zones" at depths below 4000 m, where oil is seldom found and little drilling had been conducted. In addition to the "glut" of gas discovered in western Canada in the late 1970s and early 1980s, major natural-gas reserves have also been found in the arctic islands and offshore NS.

Although natural gas can substitute for oil in most uses, it is an expensive and lengthy process to switch an economy from the scarcer to the more plentiful fuel. In 1984, converting a single automobile from gasoline to compressed natural gas (CNG) cost about \$1800. However, if world oil shortages recur, Canada is likely to move towards a much greater reliance on natural gas. GOVERNMENT ENERGY POLICY already has encouraged this move, and many technologies are now ready to take advantage of the next major swing in the oil market, but the actual rate of change will depend on patterns of energy pricing, conservation and use.

ROBERT D. BOTT

**Oil City**, Alta, site of western Canada's first producing oil well, known previously as Original Discovery No 1, located in WATERTON LKS NATIONAL PK. Kutenai had used oil from seepage pools along Cameron Cr and early settlers used it to lubricate wagons. In 1878 A.P. Patrick, a Dominion surveyor, drilled a primitive well, but it was not until 1901, when Patrick, John Leeson and John Lineham (a local rancher) formed the Rocky Mountain Development Co, that drilling began in earnest. Oil was struck at 300 m in Aug of that year. Hopes for a local boom were raised, but the well was erratic and was closed in 1906 after producing 32 000 litres. A cairn in the shape of an oil rig marks the historic site of this pioneer development in Alberta's oil industry.

ERIC J. HOLMGREN

**Oilseed Crops** are grown primarily for the oil contained in the seeds. The oil content of small grains (eg, wheat) is only 1-2%; that of oilseeds ranges from about 20% for SOYBEANS to over 40% for SUNFLOWERS and rapeseed (CANOLA). The major world sources of edible seed oils are soybeans, sunflowers, rapeseed, cotton and peanuts. Seed oils from FLAX (linseed) and castor beans are used for industrial purposes. Edible fats and oils

are similar in molecular structure; however, fats are solid at room temperature, while oils are liquid. Fats and oils are essential nutrients, comprising about 40% of the calories in the diet of the average Canadian. Edible vegetable oils are used as salad or cooking oils, or may be solidified (by a process called hydrogenation) to make margarine and shortening. These products supplement or replace animal products (eg, butter, lard), supplies of which are inadequate to meet the needs of an increasing world population.

While there are many uses for industrial vegetable oils, total world production is only about 3% of that of edible oils. Industrial applications are based on the properties of particular fatty-acid components of these oils. For example, flaxseed oil, rich in the unsaturated fatty acid linolenic, is a drying oil and is used in protective coatings (eg, paints, varnishes). Vegetable oils are used in putty, printing inks, erasers, coating or core oils, greases, plastics, etc. The residue remaining after the oil has been extracted from oilseeds is an important source of nutrients for farm animals. Oilseed meals from soybeans, peanuts, rapeseed and flaxseed are rich in protein; mixed with other ingredients (eg, cereal grains), they provide nutritionally balanced feeds.

The major oilseeds grown in Canada are soybeans, sunflowers, canola and flax. In addition, experimental production of peanuts on a commercial scale began in 1981 in SW Ontario. Plant breeding experiments are underway at the Agriculture Canada RESEARCH STATION, Saskatoon, Sask, to develop an edible oil from mustard seed and a usable animal feed from the residue. The program involves reducing the content of 2 harmful substances, erucic acid and glucosinolate, which were formerly a problem in rapeseed oil.

Soybeans require a relatively long growing season (100-140 days) and warm temperatures; hence, Canadian production is concentrated in SW Ontario. Sunflowers will tolerate a somewhat shorter (100-120 days), cooler growing season; most Canadian production occurs in southern Manitoba. Flax and canola are adapted to the relatively short, cool growing season of the Prairie provinces and most production occurs in that area. The size of the area of adaptation and the development of varieties with improved quality have permitted canola to become the major edible oilseed crop in Canada.

Cultural practices have been developed to obtain optimum production from each crop. Soybeans and sunflowers are usually grown as row crops; flax and canola are solid seeded. The usual seeding rate for soybeans is 130 kg per hectare; sunflowers, 6 kg/ha; canola, 7 kg/ha;

flax, 38 kg/ha. Small-seed crops, flax and canola, are seeded at depths of 2.5-4 cm; larger-seeded crops, sunflowers and soybeans, may be seeded up to 10 cm deep, if deep seeding is required to reach moist soil. Weeds are controlled by cultivation in the row crops; by crop rotation in solid-seeded crops; and by extensive use of herbicides. Diseases are controlled by using disease-resistant cultivars (commercial varieties), by seed treatments and fungicides. Insecticides are used to control outbreaks of INSECT PESTS (see PESTICIDES).

From 1976 to 1980, the average seed yields for flaxseed, canola, soybeans and sunflowers in Canada were 940 kg/ha, 1193 kg/ha, 2174 kg/ha and 1238 kg/ha, respectively. High soybean yields can be attributed to the longer growing season and relatively favourable moisture conditions in Ontario. The other major oilseed crops are grown in a shorter, dryer season and yields are often reduced by moisture deficiencies. From 1976 to 1980, average annual production of flaxseed, canola, soybeans and sunflowers in Canada was 0.5, 2.45, 0.53 and 0.12 million t, respectively, valued at \$1 billion annually. Edible oilseed production, which began during WWII, now provides the raw material for a multimillion-dollar crushing, refining and processing industry. During the last 3 decades, Canada has changed from a major importer to a net exporter of edible oil and oilseeds.

B.R. STEFANSSON

**Ojibwa** The term Ojibwa (Ojibway, Chippewa) derives from Outchibou, the 17th-century name of a group living N of Sault Ste Marie, Ont. They were one of a series of closely related but distinctly named groups residing between north-eastern Georgian Bay and eastern Lk Superior to whom the term Ojibwa was later extended. Those peoples who congregated near present-day Sault Ste Marie were also called Saulteurs or Saulteaux. Although groups identified as Ojibwa in 17th-century French records totalled around 4500 persons, historic population movements into new areas, combined with the later application of the label Ojibwa to some neighbouring groups, enlarged the population and the territory occupied. The Ojibwa speak a Central Algonquian language closely related to ALGONQUIN, OTTAWA, CREE and Potawatomi.

At contact, the Ojibwa subsisted by hunting, fishing and gathering, resided in conical or dome-shaped birchbark dwellings, wore animal-skin clothing and travelled by birchbark canoe in warm weather and snowshoes in winter. Politically autonomous summer villages of 150-300 persons appear to have borne totemic names. An appropriate spouse was a person categorized as a cross-cousin — the child of either the mother's brother or father's sister. Ojibwa religion was animistic, the natural world being inhabited by numerous spirits both good and evil, some of which required special treatment. Bear ceremonialism and the vision quest to obtain a guardian helper were practised. A SHAMAN cured the ill and performed SHAKING TENT rites to communicate with spirits. After about 1700, the MIDEWIWIN or Grand Medicine Society was conducted by an organized priesthood among the more westerly Ojibwa.

The European FUR TRADE profoundly affected the Ojibwa. Initially, they received French trade items for furs from Nipissing and Algonquin, but following the mid-17th-century dispersal of the HURON and neighbouring Algonquians, the Ottawa and their Ojibwa allies became middlemen to tribes farther west. The Ojibwa participated in the occasional multi-tribal FEAST OF THE DEAD at which furs and trade goods were distributed. The western expansion of the French fur trade and the establishment of the English HUDSON'S BAY COMPANY trade near James Bay and Hudson Bay drew some Ojibwa into new areas,

first as temporary trader-hunters, but later as permanent residents. Between 1680 and 1800, 4 divisions of Ojibwa emerged, each representing a different adaptation to environmental and contact conditions. Those who moved S of Lk Superior into Wisconsin and Minnesota, displacing, often forcefully, the Dakota, are known as the Southwestern Chippewa. The harsher environment of the coniferous forests of northern Ontario and Manitoba was exploited by the Northern Ojibwa. After 1780 some shifted to Manitoba, Saskatchewan and N Dakota, becoming the Plains Ojibwa or Bungi. Still others, now known as Southeastern Ojibwa, moved into S-central Ontario and the lower Michigan Peninsula. Although most Ojibwa continued to live by hunting, fishing and gathering, some, particularly those in southern Ontario, adopted farming. Today, Ojibwa occupy reserve communities in these 4 areas.

Before 1760 most Ojibwa supported the French but became British allies during the American Revolution and WAR OF 1812. The social and economic life of all Ojibwa groups was affected by the fur trade. Aboriginal items were replaced by western materials and certain natural resources became depleted. Family-possessed fur-hunting territories emerged among northern groups. First in the SE and later in more remote areas, Ojibwa became at least nominal Christians. Most Ojibwa did not sign treaties with the government until after 1850, at which time each BAND-reserve community elected a chief and council.

From perhaps 10 000 persons at contact whose descendants are now called Ojibwa, the population has grown to over 100 000 in 1981, two-thirds of whom live in Canada. There is also a large MÉTIS population. Among and within Ojibwa communities there is considerable socioeconomic variability, depending on the ability to exploit natural resources and gain access to Canadian markets. Arts and crafts have recently been revitalized and several Ojibwa artists have gained international recognition. See also NATIVE PEOPLE: EASTERN WOODLANDS, and general articles under NATIVE PEOPLE.

**Oka**, Qué, UP, pop 1538 (1981c), is located on Lac-des-Deux-Montagnes, 10 km W of Montréal 1. Established in 1875, the village developed at a strategic position on a point of land that extends well into the lake. In 1717 the governor of New France granted the seigneurie of Lac-des-Deux-Montagnes to the clergy of the Séminaire de Montréal so they could build a mission to the Indians. In 1881 Trappist monks from France founded their famous Abbey of Notre-Dame-du-Lac. La Trappe, as it is also called, is one of the largest Trappist monasteries in the world. In 1962 the provincial government developed Parc Paul-Sauvé a few km downstream from the village, its main attraction being its large bay, an ecological sanctuary and the Montagne du Calvaire, on whose peak the seigneurs built a pilgrimage site in 1739 for the Indians who went there every autumn before setting out on their hunt. Some 600 Indians still live at Oka.

GILLES BOILEAU

**Okak**, archaeological sites in northern LABRADOR that represent a microcosm of more than 5000 years of PREHISTORY. Excavations have revealed sites of 4 major cultures that occupied the area. The earliest of these is a southern-derived Indian culture called the Maritime ARCHAIC tradition. About 4000 years ago a new people, known to archaeologists as Early Paleo-eskimos, arrived from the north and expanded southward at the expense of the earlier Indian peoples. These people continued to move southward along the Labrador coast and eventually populated the island of Newfoundland. They became extinct shortly after 2200 years ago but were replaced by a second group of Paleo-eskimos known as Dorset Eskimo. They, in turn, apparently became extinct sometime following 1200 AD, perhaps at about the same time that the ancestors of the present-day LABRADOR INUIT arrived from the N in the Okak region. See also ARCHAEOLOGY.

JAMES A. TUCK

**Okanagan Valley**, BC, roughly 200 km long (in Canada) and 20 km wide, lies between the Columbia and Cascade mountain ranges in S-central BC. Its landscape of low hills and oblong lakes was formed by glacial activity during the Tertiary and Pleistocene eras, the final retreat (between 11 000 and 9000 years ago) leaving large deposits of gravel, silt and sand on the bottom and sides of the valley. These sediments were eroded by water and wind, resulting in large alluvial fans and deltas such as those on which VERNON, KELOWNA and PENTICTON partly stand. It is these sediments which have been colonized and used for agriculture. Spilled along the valley floor are the watery remnants of a large glacial lake, the largest of which is Okanagan Lk. Lying in a string to the E are Swan, Kalamalka and Wood lakes; to the S lie Skaha, Vaseaux and Osoyoos lakes. The whole system drains S through the Okanagan R into the COLUMBIA R.

The valley lies in the shadow of the Cascade Mts, creating a hot, sunny, dry climate. Most of the valley receives about 2000 hours of sunlight per year and 30-40 cm of precipitation. The southern valley, around Vaseaux Lk, which gets less than 30 cm of precipitation, is desertlike, with cactus, rattlesnakes and painted turtles.

The valley contains the largest concentration of population in interior BC (about 8% of the provincial total). The 3 largest centres are Kelowna (59 196), Penticton (23 181) and Vernon (19 987). Enderby (1816) and Armstrong (2683) lie in the dairy and vegetable-growing region of the northern valley, and Okanagan Falls (1030), OLIVER (1893) and OSOYOOS (2738) in the dry fruit-growing area S of Penticton.

The valley was first inhabited by the Okanagan tribe of the Interior SALISH, who likely gave the valley its name, translated roughly as "place of water." There are large Indian reserves

on the NW arm of Okanagan Lk, SW of the lake and N of Osoyoos, and others near Enderby and Kelowna. David Stuart, a Scottish fur trader in the employ of the PACIFIC FUR CO. was likely the first white person to see the valley (1811), and his cousin, John Stuart of the HBC, followed the trail (1814) through the valley that continued to be used until 1847 by fur traders, and later by miners. Missionaries built the first settlements at the head of Okanagan Lk about 1840 and near Kelowna in 1857. Some miners stayed on after a small gold rush at Cherry Creek (50 km E of Vernon), as did a few of the OVERLANDERS OF 1862. Ranching, in the northern valley, was the first viable industry.

Next to the FRASER RIVER LOWLANDS, the Okanagan Valley is the most important agricultural region in BC. The primary crop is fruit, which was first planted by Oblate missionaries near Kelowna (1862) and by Hiram "Okanagan" Smith near Penticton (about 1869). Lord ABERDEEN, who owned a huge range in the northern valley, gave a strong impetus to fruit growing (1890s) by offering land for this purpose. New plantings were made around Osoyoos for soldiers returning after WWI. The pioneer orchards suffered from inadequate irrigation, winter freezes, the codling moth and an inadequate marketing system. It was not until the 1930s that irrigation turned the semidesert of sagebrush into a premier fruit-growing area. Today the valley produces 30% of Canada's apples, 100% of its apricots, 60% of its cherries, 20% of its peaches and 50% of its pears and prunes. The first commercial plantings of grapes were made around Kelowna (1926) and today about 1400 ha support local and coastal wineries.

Growing numbers of tourists are attracted by the valley's scenic splendour, warm summers, freshwater beaches and numerous festivities. There are 2 large (Silver Star and Okanagan Mountain) and several smaller provincial parks in the valley.

JAMES MARSH

**O'Keefe, Eugene**, brewer, banker (b at Brandon, Ire 10 Dec 1827; d at Toronto 1 Oct 1913). He came to Canada in 1832, was educated in Toronto schools and in 1846 became a junior accountant in the Toronto Savings Bank. On borrowed capital he founded Victoria Brewery, Toronto, in 1861, and the next year he bought Hannath and Hart Brewery, also of Toronto. By the 1890s O'Keefe was the largest brewer of lager beer in Canada, using refrigeration technology imported from the US. The company was incorporated as the O'Keefe Brewing Co Ltd in 1891. During the TEMPERANCE agitation he campaigned publicly to defend the sale of beer as an alternative to hard liquor, claiming that whisky was too cheap in Canada. Devastated by the death of his son in 1911, he sold out to a holding company under Sir Henry PELLATT, Sir William MULOCK and Charles Miller. This company was bought by E.P. TAYLOR in 1934 and incorporated into Canadian Breweries Ltd. O'Keefe was recognized for his benefactions to the Roman Catholic Church.

ALBERT TUCKER

**Okra** (*Hibiscus esculentus* or *Abelmoschus esculentus*), annual VEGETABLE of the Malvaceae family, native to the Old World tropics. Many *Hibiscus* species are flowering ORNAMENTALS. Okra thrives

best in hot weather, but dwarf types have been developed for sheltered gardens in short-season areas in Canada. Garden types may be 75-150 cm in height; their edible pods, 10-20 cm long. Usually seeded in warm soils, okra may be transplanted from GREENHOUSES or hotbeds at 4 weeks. INSECT PESTS are aphids, leaf miners and stinkbugs; PLANT DISEASES, mainly *Verticillium* wilt. In continuous warm weather, pods are edible 4-6 days after flowering. Okra can be stored for up to 2 weeks at 10°C and 85-90% humidity. Also called "gumbo," okra pods are used primarily in canned soups and stews because of their flavour and natural thickening properties. Okra contains vitamins A and C, magnesium, phosphorus and potash.

V.W. NUTTALL

**Old-Age Pension** The first old-age pension (1927) was jointly financed by federal and provincial governments but administered by the latter. It paid up to \$20 per month, depending on other income and assets, and was available to Canadian citizens 70 years of age and older, but only after they had passed a strict means test. In 1951 the federal government introduced the Old Age Security Act, which provided a universal pension of \$40 per month paid and administered by the federal government to all Canadians, age 70 and over, without a means test. A second piece of legislation, the Old Age Assistance Act, a cost-shared program with the provinces, made a pension available to Canadians age 65 to 69, but retained the means test. By 1964 the universal pension had been raised to \$75 per month, widely regarded as inadequate. The federal government then introduced the CANADA PENSION PLAN (1965), which requires almost all workers and their employers to contribute to a social-insurance plan that provides a wage-related pension on retirement as well as other benefits. It also introduced the Guaranteed Income Supplement program (1966), which paid a supplement of up to \$30 per month to pensioners with little or no income other than their Old Age Security pension and which lowered the eligibility age for Old Age Security to 65. In 1975 the Old Age Security system was supplemented by Spouses' Allowances, a guarantee of a minimum monthly income to couples where only one person receives pension income while the other is between 60 and 64 years of age. By Dec 1984 the Old Age Security pension was \$272.00 per month and the maximum Guaranteed Income Supplement was \$323.00 and \$211.00 for single and married pensioners, respectively. Over 2.5 million Canadians receive Old Age Security and about 1.3 million qualify for the supplement. A minority of pensioners also have an employer-sponsored pension to supplement their retirement income.

DENNIS GUEST

**Old Crow, YT**, UP, pop 243 (1981c), a settlement of Loucheux Indians on the Porcupine R, is located 770 km N of Whitehorse and 112 km inside the Arctic Circle. The Loucheux settled at New Rampart House near the Alaska boundary in the 1870s when their original village around Ft Yukon was found to be on American soil. A smallpox epidemic decimated their numbers in

The community of Old Crow, located on the Porcupine R, YT (photo by Richard Harrington).

1911 and the survivors moved to the muskrat breeding grounds at the confluence of the Crow and Porcupine rivers. The new settlement was named for Walking Crow, a revered chief who died in the 1870s.

H. GUEST

**Old Crow Basin**, in northern Yukon Territory, is important for the richness of its fossil record and the discovery there of some of the oldest artifacts in Canada. During the last major glacial period (the Wisconsin), the basin was occupied by a single large lake in which a thick layer of clay was deposited. When the glacial lake drained, about 12 000 years ago, Old Crow R cut through the clay and deeper, older layers creating vertical bluffs more than 30 m high. Hundreds of thousands of fossils, representing many varieties of plants, invertebrates and vertebrates, were eroded from the layers beneath the lake clay. Many fossils were redeposited in and on newly formed riverbanks and bars. Among the vertebrate fossils are bones that bear the distinctive marks of breakage and cutting by people who may have killed or scavenged the animals — bones that radiocarbon dating places at about 25 000 years ago. The analysis of these fossils will yield a record of environmental change spanning more than 100 000 years. See also ARCHAEOLOGY; PREHISTORY.

RICHARD E. MORLAN

**Old Crow Plain**, about 5000 km<sup>2</sup>, elev 300 m, referred to locally as Old Crow Flats, is the northernmost part of the Porcupine Plateau in the Yukon, lying N of the Arctic Circle and 150 km S of the BEAUFORT SEA. The name honours the memory of an Indian chieftain of the Loucheux tribe. The plain is a pristine wilderness area underlain by continuous PERMAFROST and covered with a myriad of shallow lakes and ponds, some of which have an oriented rectangular shape related to prevailing wind directions and to patterned ground phenomena, eg, ice polygons and wedges. The vegetation is of the tundra type, with outliers of the boreal spruce forest; willow thickets line the course of the Old Crow R. Geologically the plain represents the floor of the intermontane Old Crow Basin, a structural depression of Tertiary age linking the Eastern and Interior Systems of the Cordillera. The basin is bordered on the E by the Richardson Mts, on the N by the British Mts and on the W and S by the Old Crow Range. The underlying sediments include a veneer of Holocene and Pleistocene clays, silts, sands and organics, overlying a thick sequence of Tertiary, Mesozoic and Paleozoic sediments, some of which are potentially oil bearing. The basin was one of the few areas in Canada untouched by glaciation during the Pleistocene ice ages, and it served as a refuge for many ice-age animals. However, abandoned high-level shorelines indicate that the flats were inundated by proglacial lakes during the ice ages. The modern Old Crow R, which joins the Porcupine R at the Indian village of Old Crow, is a meandering stream with numerous cutoffs and a well-defined terrace system. The river bluffs have yielded an enormous quantity of mammalian bones, together with artifacts of PREHISTORY.

ALAN W. JOPLING

**Oldman River**, 430 km, rises near Mt Lyall in the Rockies of SW Alberta and flows S then E to join the BOW R and form the S SASKATCHEWAN R in Alberta. It receives tributaries from the US (St Mary R) and WATERTON LAKES NATIONAL PARK. One of few major non-glacial-fed rivers in Alberta, it drains 27 500 km<sup>2</sup> of mountains, foothills and prairie. Important as a water supply for FORT MACLEOD and LETHBRIDGE, it has numerous dams and diversions for irrigation in the Lethbridge Irrigation Dist and St Mary and Milk rivers developments. The new Three Rivers Dam is to be built near Brocket. The Oldman River's name may come from the Cree term for "old man's playground."

IAN A. CAMPBELL

**O'Leary, Michael Grattan**, journalist, senator (b at Gaspé, Qué 19 Feb 1889; d at Ottawa 7 Apr 1976). O'Leary joined Ottawa's Press Gallery in 1911, representing the OTTAWA JOURNAL. He was close to most Conservative Party leaders. PM Arthur MEIGHEN took him along to the 1921 Imperial Conference, and O'Leary repaid the favour by standing as Gaspé's candidate in 1925, though unsuccessfully. O'Leary also supported Liberal ministers, such as C.D. HOWE, in columns and editorials. He eventually became editor of the *Journal*, which earned a reputation for high literary standards and good reporting. In 1961 O'Leary headed the Royal Commission on Publications, and in 1962 PM John Diefenbaker appointed him to the Senate. ROBERT BOTHWELL

**Oliphant, Betty**, ballet teacher (b at London, Eng 5 Aug 1918). A grande dame of Canadian dance and internationally famed educator, Oliphant came to Canada in 1947, where she founded the Canadian Dance Teachers Assn, opened a school and became ballet mistress of the NATIONAL BALLET OF CANADA (1951). In 1959 she became founding principal of the NATIONAL BALLET SCHOOL, now acclaimed one of the best anywhere. As principal of the school, and as associate artistic director of the National Ballet (1969-75), Oliphant helped shape the company's style and trained dancers and teachers for Canada and the world. Her accomplishments are widely recognized. At Erik BRUHN's request she reorganized the Royal Swedish Opera Ballet School (1967). Among the honours she has received are the MOLSON PRIZE (1978) and the Diplôme d'honneur of the Canadian Conference on the Arts (1982). PENELOPE DOOB

**Oliver, BC, Village**, pop 1893 (1981c), inc 1945, is located in the Okanagan R valley, 27 km S of Penticton. It was named after Premier John OLIVER, whose Liberal government (1918-27) sponsored the Southern Okanagan Lands Project, irrigating land to be settled by soldiers returning from WWI. Some mining, cattle ranching and fruit growing had existed previously in the area. Agriculture is the most important activity today, followed by mining, logging, tourism and specialized horticultural crops, with some manufacturing. Grape growing has recently expanded. WILLIAM SLOAN

**Oliver, Frank**, newspaper publisher, politician (b Peel County, Canada W 14 Sept 1853; d at Ottawa 31 Mar 1933). He was the son of Allan Bowsfield, but took his mother's maiden name. He brought the first printing press to Edmonton and in 1880 founded the *Edmonton Bulletin* which he published until 1923. He was a member of the North-West Council 1883-85 for Edmonton, and was elected to the Legislative Assembly of the North-West Territories in 1888 and 1894. He sat in the House of Commons as a Liberal under Sir Wilfrid LAURIER 1896-1917 and was minister of the interior and superintendent general of Indian affairs 1905-11. As the former, he continued the immigration policies of Sir Clifford SIFTON. ERIC J. HOLMGREN

**Oliver, John**, politician, premier of BC (b at Hartington, Eng 31 July 1856; d at Victoria 17 Aug 1927). Coming to Ontario with his family in 1870, he moved to BC in 1877 and took up a farm in Delta. After serving in local politics he was elected to the BC legislature in 1900 and became leader of the opposition, but lost his seat in the 1909 election. Re-elected in the sweeping 1916 Liberal victory, he was appointed minister of agriculture and railways. On Harlan BREWSTER's death in 1918, Oliver became premier, remaining in office until his own death. Known as "Honest John," he was a plain man of considerable integrity but not an innovative politician. He governed BC through the difficult readjustments after WWI and the economic stagnation of the early 1920s. He was involved

in efforts to develop fruit growing in the OKANAGAN VALLEY, to solve the problems of the financially troubled Pacific Great Eastern Ry, and to secure freight-rate concessions from the federal government. Late in his premiership, he passed some social legislation. ROBIN FISHER

Reading: James Morton, *Honest John Oliver* (1933).

**Olympic Games** The original Olympic Games developed in ancient Greece, probably from harvest festivals held at the religious centre of Olympia in the eastern Peloponnese. Religious rites in honour of Zeus were an integral feature of the celebration. From 776 bc onward the games were held once every 4-year period, called an "Olympiad." Only foot races appear to have been contested during the early years, and by the mid-5th century bc the events took 3 days of the 5-day festival. The program changed over the years, but during the period of greatest Olympic glory it included chariot and horse races, 3 distances of foot races, boxing, wrestling, *pankration* (a wide-open style of wrestling), pentathlon, a race in armour and boys' events. A sacred truce, *ekhecheria*, was announced for a period before and after the games to assure safe travel for athletes and spectators and to stop warfare in the areas surrounding Olympia. The Olympic Games exemplified the Greek search for excellence, their love of competition and belief in the development of physical health and skill.

The initiative to revive the Olympic values of harmonizing physical, mental and spiritual development came from French aristocrat Baron de Coubertin, who presided at a congress of some 12 or 13 nations at which it was resolved to hold a sports competition every 4 years, inviting all nations. The first modern Olympic Games were held appropriately in Athens in 1896, and have been held every 4 years since, except during WWI and WWII (1916, 1940, 1944). By 1908, when the games were held in London, England, they were gaining worldwide significance, and they continue to be the premier sporting event in the world. The control of the games rests with the International Olympic Committee. New members are selected by present incumbents and represent the IOC to their countries, not the reverse. The IOC has about 85 members; women were first included on it in 1981. The first Winter Olympic Games held under IOC jurisdiction were in 1928, although a 1924 winter sports competition held in Chamonix, France, was later recognized as the first Winter Olympic Games. The sports comprising the Olympics have altered since the early years. The program has expanded considerably even though some sports (golf) have been eliminated. Getting new sports accepted into the program is not easy, as the IOC wishes to retain a 2-week festival. At present the Summer Games offer 23 sports and the Winter only 6.

Canadians participated in the 1900, 1904 and 1906 ("interim") Olympics, but Canada sent its first real national team — of 84 athletes — to London in 1908. Canadians have won 37 gold medals at the Summer Olympic Games: George ORTON, steeplechase (*Paris, 1900*); Etienne DESMARTEAU, weight throwing, George LYON, golf, Winnipeg Shamrocks, lacrosse, and a team from Galt, Ont, soccer (*St Louis, 1904*); William Sherring, marathon (*Athens, Interim Olympics 1906*); Robert Kerr, 200 m race, Walter Ewing, shooting, and National Team, lacrosse (*London, 1908*); George Goulding, 10 000 m walk, and George HODGSON, 400 m and 1500 m swim (*Stockholm, 1912*); Earl Thompson, 110 m hurdles, Bert Schneider, boxing, and Winnipeg Falcons, hockey (*Antwerp, 1920*); Percy WILLIAMS, 100 m and 200 m dashes, Ethel CATHERWOOD, high jump, and women's 4x100 m relay team (*Amsterdam, 1928*); Duncan McNaughton, high jump, and Horace Gwynne, boxing (*Los Angeles,*

Olympic Games, opening ceremonies at the 21st Olympiad, Montréal, 1976 (photo by Frank "Shorty" Wilcox/Masterfile).

1932); Francis AMYOT, canoeing (*Berlin, 1936*); George GENEUREUX, shooting (*Helsinki, 1952*); Gerry OUELLETTE, shooting, and UBC Fours, rowing (*Melbourne, 1956*); Roger Jackson and George Hungerford, rowing (*Tokyo, 1964*); and Jim ELDER, Jim DAY and Tom GAYFORD, equestrian (*Mexico, 1968*). In addition the EDMONTON GRADS won 4 "unofficial" championships in women's basketball (1924, 1928, 1932 and 1936) when it was an auxiliary event.

Canada had by far its most successful Olympic performance at Los Angeles in 1984, with 10 gold medals: Larry CAIN, C-1 500 m; Hugh FISHER and Alwyn MORRIS, K-2 1000 m canoeing; Linda THOM, match pistols; Lori FUNG, rhythmic gymnastics; Sylvie BERNIER, springboard diving; Anne OTTENBRITE, 200 m breaststroke; Victor DAVIS, 200 m breaststroke; Alex BAUMANN, 200 m and 400 m individual medley, swimming; National Team, 8s rowing.

In the Winter Olympics, Canadians have won 13 gold medals: Toronto Granite Club, hockey (*Chamonix, 1924*); U of T Grads, hockey (*St Moritz, 1928*); Winnipeg Hockey Team, hockey (*Lk Placid, 1932*); Barbara Ann SCOTT, figure skating, and RCAF Flyers, hockey (*St Moritz, 1948*); Edmonton Mercurys, hockey (*Oslo, 1952*); Anne HEGGVEIT, slalom, and Barbara WAGNER and Bob PAUL, pairs skating (*Squaw Valley, 1960*); Vic and John EMERY, Douglas Anakin and Peter Kirby, bobsledding (*Innsbruck, 1964*); Nancy GREENE, giant slalom (*Grenoble, 1968*); Kathy KREINER, giant slalom (*Innsbruck, 1976*); and Gaetan BOUCHER, 2 gold medals in speed skating (*Sarajevo, 1984*).

Montréal hosted the Olympic Games in Aug 1976, amid a cloud of controversy over the runaway cost of its new Olympic stadium. Canada boycotted the 1980 Olympic Games, held in Moscow, to protest the Soviet invasion of Afghanistan. Calgary will host the Winter Olympics in Feb 1988. JEAN M. LEIPER

Reading: Lord Killanin and John Rodda, eds, *The Olympic Games 1980* (1979); H. Roxborough, *Canada at the Olympic Games* (1975); J. Segrave and D. Chu, eds, *Olympism* (1981).

**Ombudsman**, an independent officer of the legislature who investigates complaints from the public against administrative action and, if finding the action unfair, recommends a rem-

edy. Unlike a court, an ombudsman does not have power to annul a decision, but in most cases recommendations to the administrative authorities are accepted. If not, the matter can be reported to the legislature. The complaint procedure is much less formal and costly than a court appeal; all it involves is writing a letter to the ombudsman. Originating in Sweden (the word is Swedish for "agent" or "representative"), the office of ombudsman was adopted by Norway and New Zealand in 1962, and then spread rapidly to other countries. By 1981 there were 75 offices in 25 countries. Canada's provinces have been among the world's leaders in adopting the institution. Alberta and NB created the office in 1967, Québec in 1968 (*Protecteur du citoyen*) and Manitoba in 1969. Five other provinces followed in the 1970s, and the institution has been successfully established now in all provinces except PEI.

The first International Ombudsman Conference was held in Edmonton in 1976. The International Ombudsman Institute was established at U of Alberta in 1978, and it serves as the centre for research studies on ombudsmanship. In 1977 a committee of senior officials supported the appointment of a federal ombudsman, but, although the government introduced a bill in 1978 to create the office, ombudsmanlike offices for special purposes were created instead. The first, the commissioner of official languages, was created in 1969 to investigate complaints about the use of English or French by federal agencies. A second, the correctional investigator's office, was set up in 1973 for prisoners' complaints. A third office, created in 1977, is the privacy commissioner, a member of the Canadian Human Rights Commission. This office receives complaints and makes recommendations regarding refusals of access to one's own files held by the federal government. In 1980 the government introduced a bill providing for an information commissioner to receive complaints and make recommendations regarding refusals of public access to federal documents. If the federal government creates a general ombudsman office, these specialized offices will perhaps become subunits of it. DONALD C. ROWAT

**On Canadian Poetry**, a fine overview of 19th- and early to mid-20th-century Canadian poetry by E.K. BROWN (Toronto, 1943; rev 1944). Brown begins with a cogent analysis of the "problem of a Canadian literature," continues by tracing the development of Canadian poetry from the late 18th century to the 1940s and closes with an evaluation of our 3 "masters" — Archibald LAMPMAN, D.C. SCOTT and E.J. PRATT. *On Canadian Poetry* is largely responsible for the current general view that these poets are the major figures of the era, and that Charles G.D. ROBERTS and Bliss CARMAN are of less importance. Brown provides subtle and penetrating interpretations of individual poems and poets, as well as what Northrop FRYE has assessed as the most clearly defined context within which to study Canadian literature. NEIL BESNER

**On to Ottawa Trek** In early Apr 1935, 1500 residents of federal UNEMPLOYMENT RELIEF CAMPS in BC went on strike and moved by train and truck to Vancouver. Organized by the radical Workers' Unity League and led by WUL officer Arthur "Slim" Evans, the subsequent Vancouver sit-in grew out of an angry concern for improved conditions and benefits in the camps and the apparent reluctance of the federal government to provide work and wages programs. In Vancouver the strikers organized themselves into divisions, undertook alliances with civic, labour, ethnic and political elements, held demonstrations, and conducted interviews with government officers, among them Prem T. Duf-

Strikers from the unemployment relief camps en route to eastern Canada during the "On to Ottawa Trek," shown at Kamloops, BC, June 1935 (Public Archives of Canada/C-29399).

ferin PATTULLO and Mayor Gerald McGeer. Highlights of the 2-month sojourn included occupation of the Hudson's Bay store and the city museum and library, and a May Day parade to Stanley Park of some 20 000 strikers and supporters.

When local governments refused responsibility for the strikers' welfare, and when the men themselves began to grow restless at the apparent failure of their movement, Evans and his associates decided to take the strike to Ottawa. On June 3, over 1000 strikers began the "On to Ottawa Trek," determined to inform the nation of their cause and to lay complaints before Parliament and Prime Minister R.B. BENNETT. They commandeered freight trains and made stops in Calgary, Medicine Hat, Swift Current and Moose Jaw before arriving in Regina. There the railways, supported by an edict from the prime minister, refused further access to their trains. Negotiations with the federal government resulted in the dispatch of 8 Trekkers to Ottawa to meet with Bennett, while the remaining marchers, now 2000 in number, waited in the Regina Exhibition Grounds, food and shelter being supplied by townspeople and the Saskatchewan government.

The talks in Ottawa quickly broke down and the delegation returned, having decided to disband the Trek. A rally was called for July 1 to secure last-minute assistance from the townspeople. Although the Trek was dispersing, Bennett had decided to arrest its leaders. That day Regina constables and RCMP squads moved into the crowd of some 300 to arrest Evans and other speakers, thus provoking the Regina Riot. The conflict raged back and forth on Regina streets, as Trekkers assaulted police with rocks and clubs. The fracas ended by midnight, after the rioters had returned to the Exhibition Grounds. One city constable had been killed and several dozen rioters, constables and citizens had been injured. Four days later, the provincial government assisted the marchers on their way, the majority returning on passenger trains to Vancouver. The repression of the Trek and Bennett's antagonism towards Evans contributed to the PM's political decline. VICTOR HOWARD  
*Reading: Ronald Liverversedge, Recollections of the On to Ottawa Trek (1973).*

**Ondaatje, Michael**, poet, filmmaker, editor (b at Colombo, Ceylon [Sri Lanka] 12 Sept 1943). Ondaatje's work often blends or counterposes the factual and the imaginary, poetry and prose. His longer narrative works often include documentary sources, such as photographs, first-person accounts, interviews and newspaper articles. The imagery is characterized by exoticism

and surreal wit, a result of the juxtaposition of real and imaginary voices and events, and of Ondaatje's experience in diverse cultures. His work is also notable for its cinematic quality — its frequent presentation of startling freeze-frame images.

Ondaatje immigrated to Canada via England in 1962, and attended U of T (BA) and Queen's (MA). His first books of poetry include *The Dainty Monsters* (1967), *The Man with Seven Toes* (1969) and *Rat Jelly* (1973). *The Collected Works of Billy the Kid*, an account of the factual and fictional life of the notorious outlaw, won the Gov Gen's Award in 1970 and has been adapted for stage and produced at Stratford, Toronto and New York. *Coming Through Slaughter* (1976) tells of real and imagined events in the life of New Orleans jazz cornetist Buddy Bolden. His collection of poems, 1963-78, *There's a Trick with a Knife I'm Learning to Do*, won a second Gov Gen's Award in 1979. *Running in the Family* (1982) tells of the often bizarre life of his parents and grandparents in colonial Ceylon.

Ondaatje's films include *Sons of Captain Poetry* (about poet bp nichol), *Carry on Crime and Punishment*, *The Clinton Special* (about Theatre Passe Muraille's Farm Show) and *Royal Canadian Hounds*. His critical work on Leonard COHEN was published in 1970, and as editor of *Montreal Broadside* he published poems by James REANEY, Margaret ATWOOD and others. He has also edited a collection about animals, *The Broken Ark: A Book of Beasts* (1971); *Personal Fictions: Stories by Munro, Wiebe, Thomas, and Blaise* (1977) and *The Long Poem Anthology* (1979). In 1971 Ondaatje began teaching at York U. SHARON THESEN

**One Big Union** On 13 Mar 1919 delegates from most union locals in western Canada met at the Western Labour Conference in Calgary and proclaimed support for the Bolshevik and other left-wing revolutions. They decided to conduct a referendum among Canadian union members on whether to secede from the American Federation of Labor and the TRADES AND LABOR CONGRESS OF CANADA, and form a REVOLUTIONARY INDUSTRIAL UNION to be called the One Big Union. The vote, held almost entirely in the West — and during the WINNIPEG GENERAL STRIKE — showed overwhelming support, and the OBU was launched in early June. Thousands of workers joined it, including large parts of the mine, transportation and logging labour force. At its peak in 1920, the OBU had close to 50 000, members from northern Ontario to the Pacific, with other locals in eastern and central Canada and the US. The international CRAFT UNION movement fought back, aided by governments (especially federal) and employers. The counterattack was particularly effective when splits appeared among OBU leaders over policy and tactics. Although by 1923 the union was reduced to approximately 5000 members, it had set an example for later, successful INDUSTRIAL UNIONISM. In 1956 it was absorbed into the CANADIAN LABOUR CONGRESS. D.J. BERCUSON

**Oneida**, the smallest of the 5 nations of the IROQUOIS Confederacy, occupied a single village near Oneida Lk in NY state for most of the historic era. They had only 3 matrilineal clans (Wolf, Bear and Turtle). Nine Oneida chiefs sat on the confederacy council. It is possible that it was an Oneida town that CHAMPLAIN attacked unsuccessfully in 1615; their town was burned by the French in 1696. Unlike most of their brethren in the confederacy, the Oneida espoused the rebel cause in the American Revolution, owing to the influence of the New England missionary Samuel Kirkland. They were still subjected to American pressures to sell their NY lands, however, after the war. A sizable portion of the tribe moved to Wisconsin, and another group of 242 individuals purchased a tract of land and settled near London, Ont, in 1839. AL-

though Methodist and Anglican when they migrated to Ontario, some have since taken up the HANDSOME LAKE RELIGION. Over 2000 names are recorded on the Ontario band list as Oneidas on the Thames. See also NATIVE PEOPLE: EASTERN WOODLANDS and general articles under NATIVE PEOPLE. THOMAS S. ABLER

Reading: B.G. Trigger, ed, *Handbook of North American Indians*, vol 15: *Northeast* (1978).

**O'Neill, James Edward**, "Tip," baseball player (b at Springfield, Canada W 25 May 1858; d at Montréal, 31 Dec 1915). He played amateur baseball in Woodstock, Ont, before beginning a 10-year major-league career in 1883. A popular idol in St Louis, Mo, O'Neill was greeted at bat by blaring trumpets, and in 1888 his picture adorned the team's train. He holds the all-time major league season-high batting average of .492, achieved in 1887 when bases on balls were calculated as hits. His career batting average of .326 is a Canadian major league high.

WILLIAM HUMBER

**Onion** (*Allium cepa*), biennial, herbaceous PLANT of the Amaryllidaceae family. It is Canada's most important CONDIMENT CROP. Onions are native to western Asia; their cultivation predates recorded history. Botanical varieties include *A. cepa solaninum* (Multiplier Onion) and *A. cepa viviparum* (Top or Tree Onion). The bulb is formed of hollow leaves, thickened into 1.5-5 mm fleshy layers which overlap near the root juncture. Bulb skins are usually yellow, white or red. Depending chiefly on variety, mature bulbs range from 6 cm to 14 cm in diameter. The pungent taste derives from sulphurous, volatile oils (eg, pyruvic acid). Onions germinate at temperatures of 9-30°C, tolerate frosts to -2.5°C and mature in 115-135 days. INSECT PESTS include onion maggots and thrips; PLANT DISEASES, smut, downy mildew, pink root, damping-off, leaf spot, purple blotch and neck rot. Young, green bulbs and tops contain useful amounts of vitamins A and C; dehydrated onions contain protein, phosphorus and potassium. Average Canadian production for 1979-81 (on 3734 ha) was 114 933 t, worth \$14.9 million; Ontario produced over one-half. V.W. NUTTALL

**Onley, Norman Antony**, "Toni," painter (b at Douglas, Isle of Man, UK 20 Nov 1928). Onley received his early art training on the Isle of Man. His family immigrated to Canada in 1948, and he worked at various occupations in Ontario, later moving to BC. He studied in Mexico (1957-60), where he came under the influence of American abstract expressionism, and moved to Vancouver in 1960. A Canada Council grant allowed him to travel to England in 1963, where he studied the great artists of the British watercolour tradition. He returned to Vancouver in 1964 and began painting sparse, formal landscapes that were so successful he was soon able to earn his livelihood exclusively from his art; in Aug 1980 he sold 800 works for \$900 000. Onley's watercolours are always done on location and are the spontaneous reaction to the landscape forms he sees. He works in broad washes, usually using a large Chinese brush. The watercolours are the basis for studio oil paintings or silk-screen prints. ROGER H. BOULET

Reading: Roger H. Boulet, *Toni Onley: A Silent Thunder* (1981).

**Onondaga**, geographically at the centre of the 5 IROQUOIS nations, were designated "firekeepers" of the Iroquois league, serving as moderators at councils and retaining the WAMPUM records of the confederacy. Thadodah, the most celebrated title among the 50 confederacy chiefs, was held by an Onondaga. Despite this central position in the confederacy, they often pursued an independent policy, as in 1649 when they remained neutral while the SENECA and MOHAWK fought and defeated the HURON. The main Onon-

daga town served as "capital" of the Iroquois Confederacy, and as a hub of frontier diplomacy for 2 centuries. The Onondaga themselves burned their town when an army under FRONTE-NAC invaded their country in 1696. The village was also burned by Americans during the American Revolution, although the Onondaga had for the most part remained neutral. In population the Onondaga were the third-largest Iroquois group immigrating to lands in Canada on the Grand R in 1785. They did not increase as rapidly as other groups and in the 1970s constituted only 6% of the official band list of over 9000 for the Six Nations Reserve. Another portion of Onondaga retain lands in their ancestral homeland, outside Syracuse, NY. See also NATIVE PEOPLES: EASTERN WOODLANDS and general articles under NATIVE PEOPLE. THOMAS S. ABLER

Reading: B.G. Trigger, ed, *Handbook of North American Indians*, vol 15: *Northeast* (1978).

**Ontario** is Canada's most populous, richest and second-largest province; it stretches from Middle Island in Lake Erie in the S (41°40' N) to the Manitoba-Ontario border on Hudson Bay in the N (56°50' N) and from the banks of the St Lawrence R in the E (74°21' W) to the Manitoba border in the W (95°09' W). For the most part Ontario's frontiers run through the lakes and rivers of the GREAT LAKES system, on the S, and along the Ottawa R to the E; only in the NE and NW do borders follow geographical abstractions. The name Ontario, from an Indian word generally translated as meaning "beautiful lake" or "beautiful water," is apt, since lakes and rivers occupy almost one-fifth of the province's total area of roughly one million km<sup>2</sup>. The word was first applied in 1641 to the easternmost of the Great Lakes, "Old Ontario" was used to refer to the southern portion of land nearest the lake and was applied to the whole province in 1867.

#### Land and Resources

Ontario has the most varied landscape of any Canadian province. Two-thirds of the province lies under the Canadian SHIELD, which covers most of the N, except the Hudson Bay Lowland.

The stark beauty of the landscape of northern Ontario has inspired artists and photographers, notably members of the Group of Seven such as Lawren Harris, whose *North Shore, Lake Superior* is shown (courtesy Lawrence P. Harris/National Gallery of Canada).

From Georgian Bay in the W and near Renfrew in the E the edge of the Shield forms a triangular wedge, with its apex near Brockville on the St Lawrence R. To the E lies the eastern Ontario plain, between the Ottawa and St Lawrence rivers. To the W, from Kingston on, there are belted rolling hills and plains culminating in the flat country in extreme southwestern Ontario. The NIAGARA ESCARPMENT, traversing the area from Niagara to Tobermory and through MANITOULIN I in Georgian Bay, is the most conspicuous feature.

Ontario is often considered to be 2 distinct regions. To the S of the Shield lies southern Ontario where agriculture and most of the population are concentrated; northern Ontario, with nearly 90% of the land, contains only 10% of the population. Nevertheless, geology, climate, soil, vegetation and other factors combine to create distinct areas within this broad classification.

**Geology** The rocks of the Shield are among the oldest on Earth, dating from the Archaean and Proterozoic eons of the Precambrian era; the oldest sections date from 2480 million years ago; the most recent a mere 955 million. These formations contain the large mineral deposits that are so important to the economy of northern Ontario. Sedimentary limestone, shale and sandstone underlying southern Ontario are more recent, dating from the Paleozoic era, and are generally of the Ordovician, Silurian and Devonian periods. Outcrops of these rocks are rare, excepting where differential erosion of beds has exposed the Niagara Escarpment.

All of Ontario was, at one time or another, covered by glaciation. About 10 000 years ago the last ice sheet covering the province receded, resulting in the many lakes in the N and the Great Lakes along its southern and western borders. The proto-Great Lakes were considerably larger than their present descendants. As they evolved, they left behind a sand base along which many of the early roads of the province were located. The rivers that once drained them now flow through broad valleys such as the Grand R.

The effect of the ice age is still apparent. Scattered across southern Ontario are rocks left behind by the glaciers. Systems of moraines, marking the edges of stalled glaciers, traverse the province. The Oak Ridge Moraine, forming the

## Ontario

**Capital:** Toronto

**Motto:** *Ut Incepit Fidelis Sic Permanet* ("Loyal it began, loyal it remains")

**Flower:** White trillium

**Largest Cities:** Toronto, Hamilton, Ottawa, London, Windsor, St Catharines, Kitchener, Oshawa, Sudbury

**Population:** 8 625 000 (1981c); rank first, 35.4% of Canada; 81.7% urban; 15% rural nonfarm; 3.3% farm; 9.7 per km<sup>2</sup> density; 3.3% increase from 1976-81; Jan 1984c pop, 8 887 000

**Languages:** 86% English; 3.9% French; 10.1% Other

**Entered Confederation:** 1 July 1867

**Government:** Provincial — Lieutenant-Governor, Executive Council, Legislative Assembly of 125 members; federal — 24 senators, 95 members of the House of Commons

**Area:** 1 068 582 km<sup>2</sup>, including 177 388 km<sup>2</sup> of inland water; 10.8% of Canada

**Elevation:** Highest point — Timiskaming District (693 m); lowest point Hudson Bay shore

**Gross Domestic Product:** \$137.2 billion (1982e)

**Farm Cash Receipts:** \$4.9 billion (1982)

**Electric Power Generated:** 117 818 001 MWh (1983)

**Sales Tax:** 7% (1984)

height of land between Lake Ontario and Georgian Bay, is the most conspicuous. The Horse-shoe Moraines parallel the eastern shore of Lk Huron to the base of the BRUCE PENINSULA and SE along the escarpment then SW toward Lk Erie. Other deposits, drumlins, are especially frequent in the Peterborough region.

**Surface** The Canadian Shield is mostly, but not entirely, unsuitable for agriculture. The podzolic soils of northern Ontario are extremely thin and low in fertility, although sufficient to support boreal forests. There are only a few areas, such as the clay belts in northeastern Ontario or the Rainy R area in the NW, where enough farming is possible to create the impression of an agricultural landscape. The forest cover of the N is not uniform. In the extreme N, stunted willows and black spruce struggle to grow in bogs; farther S spruce, aspen and jack pine dominate the northern Shield. Farther S again, to the E and W of Lake Superior, the Shield is covered by a mixed forest, known as the Great Lakes-St Lawrence forest region. In the early 19th century, magnificent stands of white pine, the foundation of the central Canadian forest industry, were to be found in this region, as well as hard maples.

The grey-brown luvisolic (grey-brown podzolic) soils of southern Ontario that developed under forest vegetation from till and glacial deposits are reasonably fertile. Deltas, left behind from the Ice Age, form sand plains, especially to the N of Lk Erie.

**Water** Of the total surface area of some 177 000 km<sup>2</sup> of water, almost half is in the Great Lakes. The ST LAWRENCE R and Great Lakes drew explorers, traders, soldiers and settlers into the heart of the continent. More recently, Ontario's abundant rivers and lakes have made possible hydroelectric power and the more obvious forms of INDUSTRIALIZATION. Ontario's water resources are fed by an abundant rainfall, and in most sections of the province by snow. Precipitation is most regular in the southern and central parts of Ontario where variations between winter and summer or spring and fall are not especially great; but winter and spring are somewhat less aqueous in northern and northwestern Ontario. The lower half of the province lies in the Great Lakes-St. Lawrence drainage ba-

sin, and the largest amounts of water flow along Ontario's southern borders: a peak monthly mean of 2390 m<sup>3</sup>/s on the NIAGARA R. Unlike the rivers that connect the Great Lakes, where there are not large variations in volume of flow from month to month, Ontario's inland rivers are subject to large increases in volume during the spring runoff when melting winter snows create an annual threat of flooding. The volume of the OTTAWA R practically triples in May to 2150 m<sup>3</sup>/s from its lowest monthly mean flow of 735 m<sup>3</sup>/s in Aug. An even more extreme example is the Thames R of southwestern Ontario, whose mean flow in March of 143 m<sup>3</sup>/s is over 11 times greater than its Aug mean of only 12.9 m<sup>3</sup>/s.

**Climate** Ontario has a wide range of climates. In the N a bitter subarctic climate prevails, with mean daily temperatures near Hudson Bay of 12° to 15°C in July and -22° to -25°C in Jan. Winter temperatures are highest along the Great Lakes in southwestern Ontario and below the Niagara Escarpment, with mean daily temperatures ranging from -3°C near Windsor to -6°C near Toronto in Jan. In July the area between Chatham and Windsor is warmest (22°C). The winters are severe and stormy through much of the province. The areas receiving westerly winds off the Great Lakes are often called the "Snow Belt"; the areas S of Owen Sound, around Parry Sound and W of Sault Ste Marie, receive snowfall in excess of 250 cm. The areas around Toronto and Hamilton are in the partial rain shadow of the Niagara Escarpment and receive less than 150 cm of snow annually. Although differences in relief are not great, they have a significant impact on climate. The upland areas of Grey County, the Algonquin Park area and the Superior Highlands are notably cooler. Hudson Bay freezes over in winter and makes northern temperatures even colder. The Great Lakes, on the other hand, moderate winter temperatures.

The climate of Ontario greatly affects its agricultural patterns. Most specialized crops such as grain corn, soybeans and sugar beets are concentrated in the SW, with 1760 to 2400 growing degree days. Fruit growing is associated with (but not confined to) the Niagara Peninsula and tobacco growing is done in Norfolk County. The northern Clay Belts, with roughly 1480 to 1500

growing degree days, are suitable for a narrower range of crops, such as silage corn, hay, barley and potatoes. Frost is unusual in the S after the first week of May, but can persist into June in the N. Despite frequent bouts of rain and snow, the province's weather tends to sun. Sault Ste Marie receives roughly as much solar radiation in July as sunny Victoria.

## Resources

Ontario contains the largest amount of Class I agricultural land of any province and is abundantly endowed with rivers that can be harvested for hydroelectric power. The world's largest deposits of NICKEL and COPPER, along with lead, zinc, silver and platinum, were found in the Sudbury Basin in 1883. The largest GOLD deposits in N America were discovered near the towns of Porcupine and Kirkland Lake from 1905 to 1912 (with another more recent find near Henlo), and one of the largest uranium deposits in the world at Elliot Lake in 1954. Major copper, zinc and silver deposits were discovered near Timmins in the 1960s. There is IRON ORE in the Algoma district N of Lk Superior. Southern Ontario has fewer minerals, although there is iron ore near Marmora, uranium near Bancroft and minor oil and gas deposits in southwestern Ontario. Limestone, sand and gravel are available in many parts of southern Ontario as a result of glacial deposits. Some 425 000 km<sup>2</sup> of Ontario's forest is considered to be productive, much of it in the relatively inaccessible NW, and the province ranks third in forestry-related industries.

**Conservation** The history of Ontario's forests has been one of depletion, sometimes from lumbering, sometimes from fires. The principle that forestland belongs to the Crown and that cutting rights are bestowed by licence rather than sale has long been recognized. Ontario has developed an extensive tree-planting program under its forest-resources service, and encourages the planting of "submarginal" land with trees, in the hope that failed farms may at least become productive tree plantations. Consciousness of the value of the wilderness resulted in the establishment of a provincial park system, beginning with ALGONQUIN PROVINCIAL PARK (7511 km<sup>2</sup>), established in 1893. There are now 128 provincial parks, ranging from RONDEAU PROVINCIAL PARK on Lake Erie in the S to Hudson Bay, whose Polar Bear Provincial Park, a true "wilderness" establishment, is practically inaccessible. Among national parks are GEORGIAN BAY ISLANDS NATIONAL PARK; POINT PELEE NATIONAL PARK; PUKASKWA NATIONAL PARK; and ST LAWRENCE ISLANDS NATIONAL PARK.

The government has encouraged the establishment of local conservation authorities and has promoted various schemes for channelling and controlling waterflow. Ontario has the largest and most complex government structure for dealing with land use of any Canadian province, the loss of agricultural land is a major concern, and has been the subject of political controversy and government study and planning. Areas of great natural beauty, such as the Niagara Escarpment, have attracted both environmental and political interest, and in 1984 the 2 constituencies apparently achieved a conspicuous meeting of minds when a far-reaching plan to preserve the escarpment was announced to universal praise.

Considerable energy has been expended on discovering a means of reversing the trend in the Great Lakes fishing industry. As early as the 1920s efforts were being made to restock the lakes with fish; later, attention was directed towards ridding the lakes of the plague of the LAMPREY eel, which preyed on other fish, further reducing stocks. Governments have attempted to improve water quality along the lakes, in some instances successfully, but problems such

as ACID RAIN (with its Canadian-American dimensions) make it difficult to predict ultimate success with any confidence.

### People

Indian settlement began in Ontario far back in prehistoric times. By the time Europeans came in the 17th century, the Indian population of the present province was divided into the nomadic Algonquian hunting tribes of the N and NW, and the Iroquoian tribes of the S, including the NEUTRAL, HURON and Erie. HURONIA was destroyed and the Huron dispersed in the IROQUOIS WARS in the 1640s; the wars also forced the abandonment of the Jesuit mission STE MARIE AMONG THE HURONS (1649) — the first European establishment in present-day Ontario.

Large-scale settlement of the province did not begin until the 1780s. There were scattered French settlements, especially around Detroit, but the first major immigration was that of the United Empire LOYALISTS, refugees from the American Revolution. The Loyalists gave the province its Anglo-Saxon character, which was reinforced by waves of immigration from the US and, during the 19th and early 20th centuries, from the British Isles. From the later 19th century there was localized immigration from Québec into eastern and northeastern Ontario, creating a French-language fringe along the province's frontiers. Although northern Ontario received some overseas immigration early in the century, it was not until after 1945 that immigration from continental Europe, the West Indies and East Asia had a discernible impact on the main populated areas.

Ontario was first settled mostly by farmers, but in the mid-19th century the population was channelling into the cities until by the time of WWI Ontario had become predominantly urban. Despite the attraction of the US, the province has had Canada's largest population from 1867 to 1984, and by a considerable margin: according to the 1981 census, Ontario had gained 360 000 people over the previous 5 years, bringing the total population to 8 534 265, of whom about 7 million were classified as urban and 1.5 million as rural.

**Urban Centres** Ontario is the most highly urbanized province in Canada, with 81.7% of the population found in urban centres at the time of the 1981 census. The outstanding feature of the urban pattern is the south-central conurbation around the western end of Lk Ontario — the so-called "Golden Horseshoe" — which includes the cities of ST CATHARINES (CMA pop 304 353), HAMILTON (CMA pop 542 095), TORONTO and OSHAWA. Nearly one-half of the population of Ontario lives in or around these 4 cities. With a census metropolitan area population of 2 998 947 (1984) Toronto is Canada's largest city and plays a dominant role in Ontario's economy. Hamilton ranks ninth in Canada in population but third in manufacturing.

The urban centres of southwestern Ontario lie around KITCHENER-WATERLOO (pop 287 801) and LONDON (pop 283 668); both are transportation, service and manufacturing centres. WINDSOR (pop 246 110), the longtime home of the AUTOMOTIVE INDUSTRY, is geographically part of the Detroit urban complex. Apart from KINGSTON, the largest city on the eastern end of Lk Ontario, and OTTAWA, which has the largest part of its work force in the federal public service, eastern Ontario has no substantial urban concentration.

The cities of northern Ontario are strung out along the railway lines to which most of them owe their origin. NORTH BAY is still a transportation centre; SUDBURY is at the heart of Canada's largest mining district; SAULT STE MARIE is the country's second-ranked steel producer; and Thunder Bay is a major transshipment port. With the exception of THUNDER BAY on Lake Superior (121 379 inhabitants) and Windsor on the

Typical brick farmhouse near Wyevalle, Ont (photo by Bill Brooks/Masterfile).

Detroit R, the other Great Lakes have no major urban centres along their Canadian shores.

The trend of habitation over time has been, and continues to be, to the suburbs: cities such as Toronto, Ottawa and Hamilton have tended to lose population as their surroundings sprout. In the Toronto area, for example, Scarborough and Mississauga show strong growth rates; however, older postwar suburbs, such as North York, virtually ceased to grow between the 1976 and 1981 censuses. Unlike their American counterparts, the central core of Ontario's large cities have remained in large part residential; there are relatively few blighted areas.

**Labour Force** Ontario was once predominantly agricultural. Out of a labour force totaling 4.4 million in 1981, workers in agriculture and related occupations numbered only 141 805 on 82 448 farms. But for those who believe that Ontario is still largely industrial, there is another surprise in store. Jobs in manufacturing (1 million) certainly overwhelm those in agriculture, but the growth industries of the 1960s, 1970s and 1980s are in the service (1.3 million) and public sectors. The industrial work force suffered serious attrition in the recession of the early 1980s, as reflected in the drastic decline in numbers of the once powerful steelworkers union. The most powerful, and best entrenched, unions in Ontario in the 1980s are those in the civil service or other public enterprises. Ontario now has more than 70 000 provincial civil servants, almost 600 for every member of the Legislative Assembly, as compared with 7 for every MPP in 1904. Traditionally male-dominated industries have also suffered, at least in the number of persons employed. The labour force is divided between 2.6 million males and 1.8 million females. Those areas where men heavily outnumber women, such as agriculture and mining, are employing fewer and fewer people, while clerical and service occupations, where women tend to outnumber men, are on the rise. The number of women is also growing in professional occupations and in management, although in the latter category, the census shows that men still outnumber women by a ratio of roughly 3 to 1. UNEMPLOYMENT is a major problem of the 1980s, the burden falling heavily on the young, but the level of unemployed compared favourably with the national rate, as it has consistently over the decades.

**Language and Ethnicity** Three-quarters of Ontario's 8.6 million people counted English as their mother tongue in 1981. Of the remainder,

467 000 had French as their mother tongue, and 1.5 million were grouped into "other" languages. But these figures do not tell the whole story. Almost 160 000 of the French use English as their home language, while only 22 000 native English speakers return the compliment in French. As for the "others," they seem to have assimilated quite rapidly, with 660 000 claiming to use English as their household tongue. Only 3700 use French.

About 652 000 Ontarians claim French as their sole ancestry. Although the Ontario French community is still numerous and, on the whole, centered in the E and NE of the province, it appears to be slowly declining. In part this can be ascribed to ease of access for Francophones in the Ottawa area to suburbs on the Québec side of the border, so French speakers holding federal jobs can and do locate in a more concentrated French-language environment. In part the trend also reflects the decline of farming and other primary industries and the general drift to the cities (see FRANCO-ONTARIANS).

If Ontario's citizenry of French ancestry have been dwindling as a proportion of the population, so have the British (including, for this purpose, the IRISH). Once overwhelmingly so, Ontario is now barely 50% "British." No other ethnic group, however, constitutes even 10% of the population, although the French come close. There are 487 310 Ontarians of ITALIAN descent, including 256 000 born in Italy, and 373 390 of GERMAN ancestry, 94 000 of whom were European born. The PORTUGUESE are even more recent arrivals. Only 34 000 Ontarians of Portuguese descent were actually born in Canada; the other 95 000 were born in Portugal. Immigration from the West Indies, the Indian subcontinent and East Asia has also greatly increased the population, but the largest single group of residents born outside Ontario still hails from the United Kingdom, to the tune of almost 500 000.

English is Ontario's sole official language, although in practice and to a lesser extent in principle its exclusive use has been modified. The Ontario government has gradually extended French rights in the legal and educational systems and in areas of provincial administration. Other languages have been encouraged by a variety of programs of MULTICULTURALISM up to and including the level of university chairs in Ukrainian, Baltic and Hungarian studies, while school authorities have been experimenting with the teaching of "heritage" languages in Toronto schools. The teaching of French has increased at the elementary-school level, but relaxed educational policies have not encouraged

Ontario students to persevere with a difficult and noncompulsory subject in the high schools. University study of French has also fallen off over time, a fate shared with other modern languages. The results of this confusing pattern of concern and neglect are not yet apparent.

**Religion** Ontario's population continues to be divided among what are traditionally its largest religious denominations. The biggest church is the Catholic Church, strong among the French, Irish and Italian communities, with nearly 3 million members. Next is the UNITED CHURCH, with 1.6 million. ANGLICANS constitute 1.2 million while those Presbyterians who did not join the United Church number 517 000. The remaining larger sects are the BAPTISTS (288 465), LUTHERANS (254 175) and Eastern Rite (167 320). JEWS number 148 255, while ISLAM claims 52 110 adherents. HINDUS and SIKHS count 41 655 and 16 645 among their numbers, respectively. In most cases, women predominate in organized religion. The number of people professing no religious belief (359 085 men and 259 515 women) shows the dramatic change in religious affiliation since the early 20th century.

### Economy

Ontario's economy began with hunting and trapping. It expanded with the arrival of the settlers and until the latter part of the 19th century remained predominantly rural and agriculturally based. By the early 20th century rail lines built across Ontario's northland opened up rich mineral resources in places such as COBALT and TIMMINS. The discovery and growth of hydroelectric power, combined with the export boom of the turn of the 20th century, stimulated great industrial expansion and the growth of cities, large and small. Ontario has been predominantly urban since 1911, and agriculture has adapted to the new realities, shifting from mixed diversified grain and livestock to more specialized regional patterns serving broad urban markets — dairy products, corn to fatten livestock, vegetables, fruit and tobacco.

Ontario is a major exporter of the goods it produces — such as automobiles — but the principal market for Ontario products is and always has been in heavily populated central Canada. Sales to the West and the Maritimes were for the most part marginal, if profitable. As with other parts of the country, the greatest expansion of recent years has been in service industries, while older, heavier industries have tended to decline. After lagging behind the na-

tional rate of growth in overall real domestic product for most of the 1970s, Ontario inched ahead in the early 1980s.

**Agriculture** Ontario has the largest proportion of Canada's "best" agricultural land, just under 20% of the Canadian total; if the category of "good" is included, the proportion comes close to 60%. Ontario ranks second behind only Saskatchewan in cash receipts for farm products. Most farming is done in the S, although clusters of farms on the Shield serve local dairy markets. Forage crops are the largest, but CORN, mixed grains, winter wheat and BARLEY are also grown. Ontario is therefore well able to sustain commercial hog, dairy and beef livestock farms; as of 1981 it has the largest number in Canada. It ranks second in dairy farms to Québec. The latter are most numerous in the London-Woodstock region, in the Bruce Peninsula and in eastern Ontario. Only Québec ranks ahead of Ontario in milk and dairy products; total Ontario receipts in this category were \$871.4 million in 1981. Despite heavy regulation at both the federal and provincial level, 4 big companies process 87% of Ontario's milk (1984). One of the 4 is the brewery John Labatt, which accounts (using the Silverwood and Sealtest brand names in Ontario) for one-seventh of Canada's milk.

Ontario is first in Canada by a very wide margin in prosperous and lucrative farms — those producing \$100 000 or more of products a year. There are equally a large number of farms at the lowest end of the scale as well, and while both the federal and provincial governments have encouraged the depopulation of submarginal farmland, this process is not complete. The lowest incomes in the province, according to the 1981 census, are to be found in counties with large amounts of marginal or submarginal land still under cultivation — along Georgian Bay, Lk Huron or in parts of eastern Ontario.

As in other jurisdictions, Ontario farmers are accustomed to selling their products through marketing boards, established as far back as the 1930s. These boards do not command universal support, even among farmers, but they are intended to introduce a degree of regularity and predictability into the marketing of agricultural products. Economic conditions during the late 1970s and 1980s stimulated protests from "survival" groups that the economic system was operating to the disadvantage of small farmers burdened by debt and high interest rates.

**Industry** Ontario is and always has been the leading manufacturing province in Canada. This situation was well established at the time of Confederation, and the trend since has been to place industry in a province favoured by am-

ple transportation, abundant natural resources and accessibility to export markets in the US. Proximity to the American automotive industry, for example, encouraged the location of manufacturing plants in Ontario. The establishment of Ford, General Motors and Chrysler in Ontario in turn spun off a vast series of related industries dotted all across southern Ontario. Transportation equipment of all kinds, including aircraft and railcars, accounts for \$1 out of every \$5 of value-added production in industrial Ontario.

The latest available estimate (1981) establishes that Ontario produces over half the gross domestic product of manufacturing industries in Canada, or \$31.3 billion. Metropolitan Toronto has the largest number of manufacturing establishments in the province — indeed the largest number in Canada — shipping, in 1976, \$19.9-billion worth of manufactured products. Hamilton, Windsor, St Catharines-Niagara and London each shipped more than \$1-billion worth that same year. During the late 1970s, Ottawa, frequently seen as a staid national capital completely dependent on the largesse of the federal government, confounded its critics by emerging as Canada's equivalent of California's Silicon Valley, a centre for HIGH TECHNOLOGY industries, producing computers and the like. Ontario accounts for almost 60% of Canada's high-tech output, but remains (like the rest of Canada) a net importer of technology.

The appearance of this new and promising venture consoled commentators in the early 1980s, when a slump in the automobile industry seemed to indicate that the industrial system was creaking at its joints, becoming obsolete in precisely those areas where Ontario's greatest strength and heaviest investment was concentrated. The concurrent weakness of an earlier generation of high-tech industries, such as the DE HAVILLAND LTD aircraft company just outside Toronto, gave pause as well. As a result, certain prominent Ontario companies became targets of official concern and well-publicized governmental rescue efforts, with Chrysler, MASSEY-FERGUSON and de Havilland leading the way.

**Mining** The development of Ontario's mining industry is closely associated with the rise of Toronto as Ontario's and Canada's financial centre. The exploitation of minerals in northern Ontario from around 1900 made Toronto first a competitor and then a winner in its long-standing competition with Montréal. Nickel made the prosperity of the Sudbury Basin; silver, lead and zinc caused a rush to Cobalt in the early 1900s; gold helped keep the provincial (and to some extent the national) economy afloat during the 1930s. In the 1950s another great impetus was given the Ontario economy by the discovery of fabulously rich uranium deposits at Elliot Lake.

Mining is still extremely important in the provincial economy, although recent years have been grim ones for the industry. Employment dropped by one-third to 30 000 in the years 1975-83, as downturns occurred in the international market for one major metal after another. Even so, in 1983 the value of nickel production in Ontario was \$595 million; uranium, \$518 million; copper, \$412 million; gold, \$363 million; zinc \$325 million; and iron ore, \$181 million.

**Forestry** In 1976 Ontario had 570 000 km<sup>2</sup> of forestland, all of which was available for forest farming. Most of it was owned by the province, meaning that forestry was carried on under licence by companies obtaining the necessary permission from the government. 1983 sales in the Ontario forest industry were estimated to be \$8.4 billion, with lumber production at 1.7 billion board feet. Most of Ontario's pulp and paper products — about 70% — are directed southward to the US for export.

James Wilson and Son Grist Mill, Fergus, Ont. Much of Ontario's 19th-century industry was concentrated at mills such as this (photo by Bill Brooks/Masterfile).

The INCO smelter in Copper Cliff, northern Ontario (photo by Karl Sommerer).

**Fisheries** Ontario's once prosperous fishing industry has gone into a considerable decline. Whitefish, pickerel and trout were once the principal fish produced in Ontario's Great Lakes fishery, but overfishing and deterioration in water quality, especially in Lk Erie, have taken their toll. During the 1920s, approximately 10 000 people gained their employment from Ontario's inland fishery. By 1981 fishing accounted for only 3.7% of Ontario's economy.

Ontario's modest commercial fishery has been hurt by POLLUTION, which also affects the TOURIST industry of SPORTFISHING, especially in parts of northern Ontario. Nevertheless, sportfishing in the late 1970s was estimated to generate \$500 million in total expenditures.

**Finance** Toronto's Bay Street area is the centre of the Canadian financial system. All the principal Canadian chartered banks have their head offices in Toronto, in fact if not in name, as do many of Canada's major corporations and brokerage firms. The Toronto Stock Exchange, housed in opulent new quarters, is the country's largest. First Canadian Place, chock full of lawyers, accountants and executives, is Canada's tallest building at 290 m. The CN TOWER, another monument to commerce, is the world's tallest, free-standing structure at 533 m. BANKING is a national business in Canada, and there is no study that shows whether Ontario as a whole secures any quantifiable benefit from the location of banks in its provincial capital beyond the *joie de vivre* that bankers and their staffs impart to their community. There is, however, a discernible architectural impact as the banks compete in raising towers to the sky — ziggurats rather than the basilicas that characterized an earlier period in Canadian banking symbolism.

Canadian banks maintained 2875 branches in Ontario in 1979. If numbers of branches are any indication, Ontarians tended to favour the CANADIAN IMPERIAL BANK OF COMMERCE, a bank with a long history in the province. A largish number, second only to Québec, preferred to do business with CREDIT UNIONS rather than chartered banks. Toronto is the principal clearing centre for cheques cashed in Canada, and (as of 1979) accounts for the vast majority cashed in the province, not to mention more than half those cleared in the whole country. Toronto is, as well, the headquarters for some of Canada's largest insurance companies, with all the financial resources they bring in their train. Other cities also sport insurance headquarters: Kitchener-Waterloo has several, and London even more.

**Transportation** Ontario had 15 732 km of railway track in 1977, and rather more than 19 000 km of paved roads operated under the 2 senior levels of government, federal (the TRANSCANADA HWY) and provincial. Roads reach most of the province S of the watershed between Hudson Bay and the Great Lakes; N of that line roads are few; reliable transportation is either by air or by water. Sales of gasoline and diesel fuels in 1977 totaled 12.4 million litres, propelling a very considerable motor transport industry as well as an enormous fleet of private motor vehicles.

Much debate has occurred in recent years concerning the best or most economical means of transportation. The Ontario government has supplied several answers. It has built and is still expanding a superhighway system across the southern tier of the province, stretching from Montréal to Windsor (although it is still impossible to travel all the way from Toronto to Ottawa by 4-lane highway except via Montréal). The province has also created a rail-and-road commuter service, GO (Government of Ontario) Transit to serve the Hamilton-to-Oshawa corridor along Lk Ontario, and has intervened in municipal transport through its Urban Transit Development Corporation.

Ontario has a large navigable water system, the ST LAWRENCE SEAWAY, along its southern fron-

tier. The WELLAND CANAL, an important part of the seaway channel, links Lakes Ontario and Erie. The advent of the seaway, and subsequently the practice of "containerization" of cargo unloaded at East Coast ports, have had a considerable negative impact on the structure of Ontario's water transport. The most notable casualty has been the port of Toronto, where the number of tons shipped and employment have dropped drastically — Montréal, Saint John and Halifax being the beneficiaries.

**Energy** Ontario is and always has been an importer of ENERGY. The primeval forest provided sufficient fuel in pioneer times, but with urban and industrial growth Ontario's energy needs were met by COAL from the nearby pits of Ohio, Pennsylvania and West Virginia. This coal was of a higher quality than that from Nova Scotia, and cheaper to ship. Ontario does have coal deposits of its own, near James Bay, but they have so far been judged uneconomical.

Oil and gas were also possibilities, and here Ontario had a slight initial advantage. The oil fields around Petrolia were first exploited in the late 1850s. Natural gas came somewhat later, and for many years Ontario ranked first as a Canadian producer of these commodities. Production, however, is now insignificant in the overall energy picture.

Oil and gas therefore also have to be imported. For many years this meant imports from the US or through East Coast ports. This could sometimes prove precarious, when American shortages of oil and gas (and coal too) placed Ontario heating at risk. During the 1950s the federal and provincial governments made it a priority to connect Ontario with western Canadian oil and gas fields. Oil came first, followed by gas through the TRANSCANADA PIPELINE, completed in 1958.

Technological advances during the 1880s and 1890s brought Ontario its first large and significant energy source from within the province itself: HYDROELECTRICITY. Ontario is abundantly endowed with streams, rapids and falls. First used for SAWMILLS, these falls could be put to work to generate electricity. NIAGARA FALLS, Ontario, has one of the great waterfalls of the world, as well as one of its major tourist attractions. When Niagara power was developed southern Ontario acquired a significant advantage over rival industrial areas. In 1906 most electricity in Ontario was nationalized under the aegis of ONTARIO HYDRO and its aggressive and

The Adam Beck No 2 powerhouse opened in 1954 at Niagara Falls, Ont (photo by John Reeves/Masterfile).

dynamic founder, Sir Adam BECK. (There is still one private power source, Great Lakes Power). Over the years Ontario Hydro expanded into the Ottawa R system and then the St Lawrence. From an early date, however, Hydro began to import power from Québec, emphasizing that there were very limited untapped sources of power for the province.

As this realization was dawning, in the early 1950s, Ontario faced the possibility of building thermal (coal- or oil-fired) power plants, or of taking a new road. It did both. Thermal plants were built in the 1950s and 1960s, raising the proportion of power generated thermally from practically none in 1960 to over one-third in 1970. At the same time, in conjunction with Atomic Energy of Canada Limited, the federal government's reactor arm, Ontario Hydro began to build nuclear power stations. The first full-scale nuclear power station, at Douglas Point, was opened in 1966, and others have followed at Pickering and Bruce. In 1984 coal, water-power and nuclear power each accounted for about one-third of Ontario's electricity, but nuclear was in the lead (if slightly) for the first time in the province's history. Sales of electricity to the US — some \$447 million in 1983 — are expected to continue at around 10% of production. More nuclear plants as well as a new coal-generating station are planned for 1987, despite the controversies and problems that have surrounded NUCLEAR ENERGY.

#### Government and Politics

Ontario's governmental structure is similar to that of other Canadian provinces. A LIEUTENANT-GOVERNOR, appointed by the federal government, nominally heads the administration, assisted by an executive council or Cabinet, led by a PREMIER. The Cabinet governs as long as it maintains the confidence of the Legislative Assembly or provincial Parliament, a unicameral body of 125 members, elected for a maximum term of 5 years. The term can, however, be extended by legislative action. All Canadian citizens over the age of 18 resident in Ontario can vote in elections. The judiciary, as in other Canadian provinces, is appointed by the province only at the lowest level — "provincial judges," formerly known as magistrates. All other levels of the judiciary are appointed by the federal government. These judges' salaries are paid by Ottawa; the other costs of the courts are borne by the province.

**Local Government** For many years the basic structure of local government in Ontario was that provided by Robert BALDWIN's Municipal Corporations Act of 1849, which divided the

southern part of the province into COUNTIES, cities, towns and villages. The growth of urban population in the 20th century began to strain the traditional jurisdictions. Rather than let the province's cities expand indefinitely into the surrounding suburbs and countryside, the provincial government looked to the creation of supermunicipalities that could operate on a regional basis and encompass a variety of jurisdictions. The first of these to be created (1 Jan 1954) was the Municipality of Metropolitan Toronto, a federation of Toronto and its suburbs carved out of the southern half of York County. In the 1960s and 1970s various "regional municipalities" on the model of Toronto were created, sometimes to the intense resentment of the local citizenry and their politicians (see LOCAL GOVERNMENT.)

There are now 11 regional municipalities, governed by assemblies of locally elected politicians, with jurisdiction over such items as police, water supply and arterial roads. Local cities that come under them have not, however, been abolished, and still enjoy limited powers. There are 48 cities in the province, 145 towns, 1 borough (actually a city), 119 villages and 478 townships, all of which enjoy powers of local taxation based on property. There are also 8 "improvement districts" and 71 police villages, entities that have no independent taxation powers. All Ontario municipalities are subject to the review of their actions by the Ontario Municipal Board, which must approve any bylaws creating debt, and which acts as the court of last resort for appeals against municipal actions.

**Federal Representation** Ontario has 95 members in the House of Commons and 24 senators. Metropolitan Toronto and its environs have more MPs than any province outside Ontario and Québec. When judging its political "clout" it is useful to see Ontario as an assemblage of sub-regions that seldom vote together federally or provincially. It is difficult for any single federal politician to say that he or she "represents" Ontario in Ottawa, as Alexander MACKENZIE was able to claim over 100 years ago. Mackenzie KING, a Torontonian by upbringing, found it possible to constitute most of his governments from 1921 to 1930 and 1935 to 1948 without a single serious representative from that city. Nevertheless, since then federal prime ministers have given adequate representation to Toronto and the regions of Ontario in forming their Cabinets.

Third parties have enjoyed a smattering of support in various federal elections, but they have usually been a distant third in the number of MPs sent to Ottawa.

**Public Finance** Much of Ontario's history has been concerned with wringing what the province considered to be adequate tax resources from the federal government in Ottawa. This traditional rivalry abated considerably after 1948, when premier George DREW left for federal politics in Ottawa. Since then, while there have been tensions, co-operation and soft words have been more usual vehicles of discussion than the traditional bellowing practised by many previous administrations.

Ontario derives large revenues from such items as the taxation of liquor and cigarettes (much higher today than in earlier times), as well as the more commonly thought of forms of revenue, such as income tax. Ontario's income and corporate income taxes are collected by the federal government as part of its national tax system, and the proceeds remitted to the province. In fiscal year 1981-82 provincial gross general revenues totaled \$19.73 billion, and provincial expenditures were \$20.86 billion.

**Health** In 1983 Ontario had 194 "general" and 75 "special" hospitals, and about 50 000 hospital beds, an average of 5.8 beds per 1000 population. According to the 1981 census, On-

tario employed 186 560 people in medicine and health occupations, of whom a large majority, 147 350, were lower-paid women. In governmental (but not personal) health expenditures, this cost \$5.948 billion in 1981.

Ontario's health services, and the means by which they are supported, are similar to those in other provinces. Federal Acts in 1958 and 1966 established first hospital insurance, paid for by the general public from compulsory premiums, and then comprehensive medical care services (usually abbreviated as "medicare"). These acts are federal-provincial in nature, as is the co-operation that is necessary to make them work. This co-operation did not occur without some initial political pain, and there are frequent stresses as the 2 levels of government debate the amount that each should put into the system, as well as the ways in which it should be spent.

Ontario's public-health insurance system is now consolidated in the Ontario Health Insurance Plan, into which solvent citizens pay a premium, and which supports, through subsidy, those unable to pay full or partial premiums. There are, in addition, "extra charges" levied by some doctors, particularly in specialist fields. These charges became the subject of lively political debate in the mid-1980s.

**Politics** There are 3 political parties in Ontario with representation in the provincial legislature. Two, the Progressive CONSERVATIVE PARTY ("Tories") and the LIBERAL PARTY ("Grits"), go back to before Confederation. The third party, the NEW DEMOCRATIC PARTY (NDP), grew out of the Co-operative Commonwealth Federation. The Liberals were in power most of the time to 1905, and the Conservatives most of the time since then.

The PC Party has governed Ontario since 1943. Part of the explanation for its success lies in the noisy and somewhat gamey government which preceded it, that of the Liberal Mitchell HEPBURN (1934-42), and in the fragmentation of the opposition vote between the Liberals and CCF-NDP. But the Conservative Party has consistently found ways to appeal to widely differing groups across the province and to rely on their solid and continuing support, as with the Conservative voting bastion in eastern Ontario. It has a formidable political organization: the "Big Blue Machine," strengthened under the successive premierships of Leslie FROST (1949-61), John ROBERTS (1961-71) and William DAVIS (1971-85). One recent case regarding French-language rights illustrated the government's flexibility and acumen. Davis had cautiously

#### Lieutenant-Governors of Ontario 1867-1984

	Term
Henry William Stisted	1867-68
William Pearce Howland	1868-73
John Willoughby Crawford	1873-75
Donald Alexander Macdonald	1875-80
John Beverley Robinson	1880-87
Alexander Campbell	1887-92
George Airey Kirkpatrick	1892-97
Oliver Mowat	1897-1903
William Mortimer Clark	1903-08
John Morison Gibson	1908-14
John Strathearn Hendrie	1914-19
Lionel Herbert Clarke	1919-21
Henry Cockshutt	1921-27
William Donald Ross	1927-32
Herbert Alexander Bruce	1932-37
Albert Matthews	1937-46
Ray Lawson	1946-52
Louis Orville Breithaupt	1952-57
John Keiller MacKay	1957-63

William Ross Macdonald	1968-74
Pauline Emily McGibbon	1974-80
John Black Aird	1980-

#### Premiers of Ontario 1867-1984

	Party	Term
John Sandfield Macdonald	Liberal-Conservative	1867-71
Edward Blake	Liberal	1871-72
Oliver Mowat	Liberal	1872-96
Arthur Sturgis Hardy	Liberal	1896-99
George William Ross	Liberal	1899-1905
James Pliny Whitney	Conservative	1905-14
William Howard Hearst	Conservative	1914-19
Ernest Charles Drury	United Farmers of Ontario	1919-23
George Howard Ferguson	Conservative	1923-30
George Stewart Henry	Conservative	1930-34
Mitchell Frederick Hepburn	Liberal	1934-42
Gordon Daniel Conant	Liberal	1942-43
Harry Corwin Nixon	Liberal	1943
George Alexander Drew	Conservative	1943-48
Thomas Laird Kennedy	Conservative	1948-49
Leslie Mismacampbell Frost	Conservative	1949-61
John Parmenter Roberts	Conservative	1961-71
William Grenville Davis	Conservative	1971-85
Frank Miller	Conservative	1985-

and gradually conceded the substance of BILINGUALISM — for example, education in the French language, or the right to a French trial anywhere in the province — without giving in on the principle. The Conservatives have consistently refused to give constitutional recognition and protection to the French language or to make it an official language of the province. This has permitted amelioration in practice for Francophones without rousing anti-French voters in various parts of the province — all the while allowing the probilingual Liberals to be tarred with the French-language brush.

**Education** Ontario has the traditional 3-tiered educational system common to most Canadian provinces: primary, secondary and post-secondary. The system comes under strict provincial control, reflecting whatever the province and its educational advisers for the time being think is most appropriate for study by Ontario learners.

The basic system is further divided between 2 kinds of public school: public, in the strict sense, or nonsectarian; and "separate" or Roman Catholic. Each of these systems enjoy powers of taxation, and each is run by boards elected by members of the public who choose to support them through their taxes. This is the result of a compromise at the time of Confederation, when rights for Catholics in Ontario were traded off against those for Protestants in Québec. Unluckily for the Catholics, the Confederation bargain was held not to include complete financial support of separate schools. This was the cause of occasional political protest and action, most notably during the provincial election of 1934. In the 1960s the government decided to extend its full support of elementary separate schools to grades 9 and 10, but for years steadfastly declined to go further, even in the face of pressure from Catholic leaders. In 1984 premier Davis startled Catholics and non-Catholics alike with a sudden announcement that his government would cover all the costs of separate school education in grades 11, 12 and 13 by 1988.

Ontario's primary system runs through grade 8; high schools then take up the burden through to graduation, what was formerly called junior (grade 12) or senior (grade 13) matriculation. Grade 13, however, is gradually being phased out. The curriculum the students study has varied considerably through the years, according to the fashions current in education. The Ontario curriculum reflected the "progressive" ideas current in the 1930s and early 1940s; it showed a greater concern with structure during the 1950s and early 1960s; and it frequently dissolved into a free-form exercise appropriate to the shapeless decade of 1965 to 1975. At the time of writing, it has been lurching back to a greater concern with the basic skills which seemed to be lacking in recent graduates from the school system.

About 5% of Ontario's students are Francophones. Although French-language schools existed in eastern and northern Ontario long before 1968, boards since then were able to set up French schools "when numbers warrant" (see SEPARATE SCHOOL). The interpretation of this phrase has caused much dispute in certain parts of the province, Penetanguishene being a notable example. In 1984 the Ontario Court of Appeal ruled that every francophone (and anglophone) student in the province has a right to education in his or her mother tongue. Linguistic minorities, the court also made clear, must be guaranteed representation on school boards and a say in minority-language instruction. The government immediately moved to give effect to the court's ruling, which was based upon the Charter of Rights and Freedoms.

Beyond high school there is the post-secondary structure: 21 degree-gruating UNIVERSITIES, scattered from Ottawa to Windsor to the Lakehead; 22 colleges of applied arts and technology, or COMMUNITY COLLEGES, and 4 colleges of agricul-

Toronto Parliament Buildings (photo by J.A. Kraulis).

tural technology, a school of horticulture, a chiropractic college and an institute of medical technology. The post-secondary system was expanded greatly during the 1960s, at a time when politicians held education in high regard as a motivator of economic growth. Later, when opinion changed to hold that education and growth were not strictly related, politicians discovered that education cost a great deal and had no obvious constituency. Cut-backs and freezes on spending followed. Education in general nevertheless remained a large item in the provincial budget. In 1981-82, \$4.39 billion (over 20% of gross provincial general expenditure) was spent to keep 1.9 million primary and secondary students and 259 000 post-secondary students in school.

**Cultural Life** Little now survives of indigenous art forms, although early inhabitants of Ontario left behind considerable cultural remnants, from the Serpent Mounds near Peterborough to subsequent more sophisticated examples of carving and pottery. Later settlers brought their own cultural heritage with them, derived from European models. The forms of the mid-19th century, embodied in contemporary handicrafts, still enjoy a considerable popularity and sale with tourists in quest of their heritage. As a general rule, Ontario artists follow international styles, whether literary, artistic or architectural, and their work should be, and sometimes is, judged by the best international standards. Artistic and cultural endeavour is encouraged through a variety of government subsidy programs, some federal and some provincial, such as the Ontario Arts Council (fd 1963), an independent government agency which gives grants to individuals and organizations alike. Ever practical, the government points out that the arts create jobs. Every grant dollar to orchestras, the taxpayer is reminded in Arts Council literature, directly produces almost \$7.00 in wages, fees and operating expenditures. There are symphony orchestras in Toronto, Ottawa, Hamilton and Kitchener-Waterloo, as well as a major Shakespearean festival (STRATFORD FESTIVAL, fd 1953) held each year in Stratford, and the Art Gallery of Ontario and the ROYAL ONTARIO MUSEUM in Toronto.

**Communications** Except for Toronto, Ontario's cities support only one English-language daily paper each, and these NEWSPAPERS are almost invariably owned by newspaper chains. Toronto's newspaper life is the most lively, with 3 widely differing newspapers. Toronto is also

the home for the large majority of Canada's large magazines, including *Maclean's*, *Canadian Business* and *Saturday Night*, and the headquarters of the larger national publishing firms, such as MCCLELLAND & STEWART and UNIVERSITY OF TORONTO Press, are located there. The main English-language facilities of the CANADIAN BROADCASTING CORPORATION and the private CTV network are also in Toronto; besides the English-language media there are 3 French-language TV stations in Ontario, plus dozens of repeater stations and 16 radio stations, not to mention stations broadcasting in a variety of other languages. TVOntario, a public station, broadcasts in both languages.

Most of Ontario is, however, not confined to domestic Canadian television. The 3 major American networks, and the Public Broadcasting System, are within viewing range, either by direct transmission or through cable TV networks. Their availability gives southern Ontario one of the largest choices of TV programming anywhere in the world.

**Historic Sites** Ontario has long enjoyed a vigorous HISTORIC SITE program and rare is the township lacking a plaque or cairn commemorating a notable event. Provincial legislation makes possible the designation of heritage building, and while not an absolute protection this has made possible the preservation of buildings of greater or lesser merit throughout the province.

Among the first historic sites to attract interest were the mid-17th-century Jesuit missions to the Hurons. Having supported research in the area since 1890, the Ontario government undertook the reconstruction of STE MARIE AMONG THE HURONS near Midland in 1964, and opened it to the public 3 years later. Picturesque forts, the legacy of a hundred years of tension along the Canadian-American border from the beginning of the American Revolution, dot the southern reaches of the province. At Kingston, FORT HENRY, whose stone walls were originally completed in the 1830s, is perhaps the best known, but FORT GEORGE and FORT ERIE on the Niagara frontier, FORT WELLINGTON (Prescott), FORT YORK (Toronto) and FORT MALDEN (AMHERSTBURG) have also been restored to their appearance at the time of the international crises and conflicts during the first part of the 19th century. The life of the province's pioneers is depicted in reconstructed townships, including UPPER CANADA VILLAGE near Morrisburg and BLACK CREEK PIONEER VILLAGE north of Toronto; in 1973 the Ontario government began to rebuild FORT WILLIAM (at Thunder Bay), a fur-trading post established

by the North West Company in 1803. Boating enthusiasts enjoy two 19th-century canals — the RIDEAU CANAL, built from 1826 to 1832 by the Royal Engineers for the movement of troops and military supplies, and the Trent, which dates back to 1833 but was fully developed from 1895 to 1918 for commercial traffic.

**History** The first immigrants to Ontario seem to have arrived during the last ice age, approximately 10 000 years ago. As the ice retreated, Ontario's paleo-Indian inhabitants moved into the northern region of the province. For many years Ontario's peoples probably lived by fishing and hunting; deer, elk, bear and beaver were to be found in the S and caribou in the N. By 1000 BC pottery had been introduced, and archaeological sites disclose a far-flung trading system, with importations from as far as the Gulf of Mexico. By 100 AD the inhabitants of the province can be identified with the Algonquian tribes (OJIBWA, CREE and ALGONQUIN found by the explorers), and with the Iroquoian tribes of the S (Iroquois, Huron, Petun, Neutral, Erie and Susquehannock).

**Exploration** The first Europeans known to have approached the present frontiers of Ontario were the luckless Henry HUDSON, cast adrift off the N coast, Etienne BRULÉ and Samuel de CHAMPLAIN, who travelled along the Ottawa R in 1613, reaching the centre of the province in 1615. Brulé was likely the first to see Lakes Huron and Ontario. Champlain allied the French with the Huron. After the dispersal of the Huron in the late 1640s, the OTTAWA took the role of middlemen in the fur trade. The 5 nations (later Six Nations) of the Iroquois Confederacy, located across Lakes Ontario and Erie in what is now New York state, dominated the region without significantly settling it.

Despite the hostility of the Iroquois, the French continued their penetration of the Great Lakes region, utilizing both the Ottawa-French R-Lk Huron route to the W and the St Lawrence-Great Lakes path. The adventurer LA SALLE built and sailed the GRIFFON on the lakes, and the Ontario region became a vital link between the French settlements in Québec and their fur-trading posts in the Mississippi. During the 18th century the main French posts in the Great Lakes region were FORT FRONTENAC [Kingston], Fort Niagara, Fort Detroit and Fort Michilimackinac. France's rivals, the British, did not successfully penetrate the region until 1758-59, when they burned Fort Frontenac and captured Fort Niagara. British occupation was not secure until the Indian allies of the French were defeated after an uprising in 1763-64. The Great Lakes region also served as a base of operations for British (regular and loyalist) forces during the American Revolution. A series of bloody campaigns and raids did not shake the British hold over their Great Lakes forts, but did result in the arrival of Loyalist and Iroquois refugees displaced from the American frontier. The TREATY OF PARIS (1763) divided the Great Lakes down the middle, and created the southern boundary of what is now Ontario.

**Settlement** The modern settlement of Ontario began with the arrival of some 6000 to 10 000 Loyalists during and after the American Revolution. After them came other Americans, attracted by cheap land; crown land was available for sixpence an acre plus survey costs and an oath of allegiance. Under the CONSTITUTIONAL ACT, 1791, the old PROVINCE OF QUEBEC was divided and UPPER CANADA created. A regular colonial government was established, with a lieutenant-governor, an elected legislative assembly, and appointed legislative and executive councils. The first lieutenant-governor was John Graves SIMCOE, an English veteran of the revolutionary war, who aimed to turn Upper Canada into a bastion of the British Crown in the heart of the continent. Simcoe only half succeeded; Upper

Canada continued to mark the northern fringe of the American frontier, but by 1812 approximately 80% of the estimated 100 000 settlers in southern Ontario were of American origin. When the WAR OF 1812 broke out with the US, the attitude of parts of the province's population proved highly ambivalent, and a few Upper Canadians actually sided with and fought alongside the invaders. The British army, with assistance from Indians and local militia, succeeded in defending most of the province, repelling American invasions along the Niagara frontier in 1812 (Queenston Heights) and 1813 (Beaver Dams and Stony Creek). But also in 1813, Americans thrust into southwestern Ontario and raided the provincial capital, York [Toronto], where the government buildings were burned. After several more bloody battles in 1814, the war drew to an end. When news of peace arrived, each side handed back what it had conquered and the boundary remained unchanged.

In the years between 1825 and 1842 the population of Upper Canada tripled to 450 000 and doubled again by 1851. Most of the immigrants came from the British Isles, roughly in the percentages of 20% English, 20% Scottish and 60% Irish. Settlement spread generally from S to N, moving away from the lakes as land along them was occupied. Accessibility to land away from the lakes depended on roads — usually of abominable quality — many of which were built by the settlers themselves. Rampant land speculation added greatly to the irregularity of early settlement patterns. Southern Ontario's fertile land was substantially occupied by the mid-1850s, by which time the form of government had changed again. In the aftermath of the REBELLIONS OF 1837, led in Upper Canada by Toronto "firebrand" William Lyon MACKENZIE, the British government brought Upper and Lower Canada together in the united PROVINCE OF CANADA. A further decade of fractious politics resulted in a measure of RESPONSIBLE GOVERNMENT in 1848-49, by which time immigration, combined with a prolific birthrate, had raised Upper Canada's population (952 004 in 1851) to about 60 000 more than its partner, LOWER CANADA. The agitation, led by George BROWN, FOR REP BY POP ("representation by population"), so that Upper Canada would receive additional representation in the legislature, led to the increasing paralysis of the province's political system. The crisis was finally resolved only in 1864 by the formation of a joint-party regime (see GREAT COALITION) to seek a union of the British North American colonies. This CONFEDERATION was gained in 1867, and Ontario became a province of the new Dominion of Canada.

**Development** Ontario's economy in the 1850s was primarily agricultural, with the emphasis on wheat. Over time the balance shifted to dairy, fruit and vegetable farming, and at the same time there was a drift away from farming areas; emigration took place to the US, to the Canadian West or to the cities. Urban and industrial growth rose apace from the 1850s through the 1860s, with the development of textiles and metalworking, farm implements and machinery. Moreover, Toronto grew especially, both as a railway and manufacturing centre and as provincial capital.

Ontario's governments thereafter took up developing the province's natural resources — lumber, mines and later hydroelectricity. Much political energy was consumed by a lengthy series of quarrels with the federal government over patronage, waterpower and the northern BOUNDARIES of the province — a problem settled in 1889, at the expense of Manitoba, by confirming Ontario's western boundary at the LAKE OF THE WOODS. The final boundary was drawn in 1912. Under Sir Oliver MOWAT's Liberal government (1872-96), Ontario led the way in advo-

cating provincial rights against the overriding powers of the federal government under Sir John A. MACDONALD. It also extended government services for a province now thriving on quite intensive agriculture, widening resource activities and industrial advance in Canada's richest internal market. But the Liberal regime gradually declined from the later 1890s and was at last terminated in a flurry of scandals in 1905.

Its Conservative successor, under Sir James WHITNEY (1905-14), made its mark by establishing the Ontario Hydro-Electric Power Commission. Whitney's successor, Sir William HEARST, was turned out by a political revolution among the province's farmers, who took office with labour support in 1919 as the UNITED FARMERS OF ONTARIO. Although the UFO government curbed some of the peculiarities of its Conservative predecessor, it was politically accident prone and quickly fell victim to a revitalized Conservative Party under Howard FERGUSON (1923-30). Ferguson was a determined man, as well as an able and wily politician. He ended wartime prohibition at last by channelling Ontario's drinking energies into "beverage rooms" which served beer, for years to men only. Ferguson tapped Ontarians' desire to enhance the provincial revenues through the provincially owned Ontario Liquor Control Board, which was designed to promote TEMPERANCE as well as revenue. He also defused a long-standing controversy with the province's French-language population by reintroducing official French classes in schools; and as his predecessors had done, he continued a policy of developing provincial resources, including the colonization of the Ontario north-land, an enterprise with many pitfalls. Ferguson's successor, George HENRY, had to cope with the ravages of the Great Depression, not to mention the attacks of a reinvigorated provincial Liberal Party under Mitchell Hepburn. Hepburn swept Henry out of office with promises of reform and economy in 1934. Neither object was really achieved, although Hepburn did succeed in achieving pasteurization of Ontario's milk against the cries of opposition from dairy farmers.

Hepburn battled the appearance of industrial unionism from the US and in 1937 fought and won a provincial election on the issue. His regime is principally remembered for his violent attacks on his fellow Liberal, Prime Minister W.L.M. King, and for his obstructionist attitude towards attempts to solve Canada's constitutional perplexities. Hepburn resigned in 1942, and his party was promptly turned out of office in an election in 1943 that made the Conservatives under George Drew the government and the Socialist CCF the official opposition. Drew's government vigorously promoted immigration, especially from the British Isles, and a series of overdue reforms. Like Hepburn, Drew combated Ottawa and its "centralizing" schemes. It was only after Drew's departure in 1948 that Premier Leslie Frost adopted a quieter and more co-operative attitude to the central government, a major reversal in Ontario's policy. Frost shared the developmental objectives of Liberal ministers in Ottawa such as C.D. HOWE and the 2 governments co-operated on major projects such as the St Lawrence Seaway, the Trans-Canada Pipeline and the development of nuclear power. Frost's successors, John Robarts and William Davis, were cast in his low-key, down-to-earth mold; both strove to minimize conflict between Conservative Ontario and the usually Liberal federal government. Through his Confederation for Tomorrow conference in 1967, Robarts tried to work out an accommodation that would satisfy Québec and keep it in Confederation. In 1981-82 Davis was Pierre Trudeau's strongest provincial supporter in patriating and reforming the Canadian constitution.

Though Ontario has often been perceived by

other parts of Canada as a massive "central Canada" monolith, it is in reality itself a conglomerate of considerably different subregions — most obviously in its far-flung, primary-resource-based northern area and its industrialized, urbanized south. Despite its overall prosperity, Ontario itself suffers from regional disparities. Peripheral areas believe that they experience discrimination at the hands of the urbanized core, particularly metropolitan Toronto. Attempts to classify these regions (eg, the Ontario government's *Ontario Economic and Social Aspects Survey*, 1961, which outlined 10 "economic regions") have proven inadequate because of the complexity of factors that must be considered. Nevertheless, many of the problems that are sometimes referred to on a national level, such as rural poverty, heavy concentration of industry in a few areas, the precarious life of communities based on a single economic activity, and disparities of income and of economic growth are clearly evident within the province itself.

Still, Ontario does have some aggregate distinctive traits: a political conservatism, seen in the longevity of its provincial regimes; a practical readiness to adapt, evinced in many applications of the power of its governments; and a keen awareness of the all-but-embracing United States around its core, which has meant both strong cross-border ties and determined responses to perceived threats of American power.

**Ontario College of Art** is Canada's best known and largest art school. It was founded in 1876 by the Ontario Society of Artists with the assistance of a \$1000 provincial grant. The college received a provincial charter in 1912 to teach fine art and design and opened its own building in 1921 beside the Art Gallery of Toronto (now ART GALLERY OF ONTARIO), which had donated the site. This was the first building in Canada to be used solely for art education. In 1984 the college accommodated 2890 full- and part-time students and 194 instructors in 3 buildings in Toronto and off-campus study centres in Florence, Italy, and New York City. Many Canadian artists and designers, including Michael SNOW, Allan Fleming, Jack BUSH and members of the GROUP OF SEVEN, have attended OCA as students or staff. In recent years, the traditional skills such as drawing and painting have been augmented by contemporary courses such as holography and photoelectric arts. See also ART EDUCATION. JON MCKEE

**Ontario Economic Council**, est 1968 to advise the Executive Council of Ontario on ways to contribute to public awareness, discussion and understanding of socioeconomic issues of special significance to the people of Ontario. The council is composed primarily of economists and business persons and maintains a small staff in Toronto. Past studies have examined a range of issues, including the elimination of rent controls, the possibility of user charges for social services, the establishment of a N American free trade area and appropriate sale of industrial policy and income distribution. It has advocated a N American free-trade area.

W.F. FORWARD

**Ontario Hydro** is a CROWN CORPORATION owned by the Ontario government. In 1983 it held assets of \$23.2 billion (ranking 2nd among companies in Canada), had sales or operating revenue of \$3.8 billion (ranking 19th) and employed 31 2334 people. It was the first provincially owned electric utility in Canada and is one of the largest public ELECTRIC UTILITIES in N America. Its generation and transmission system includes 68 HYDROELECTRIC, 7 fossil-fueled and 3 NUCLEAR POWER STATIONS (3 more are under construction), along with over 128 000 km of transmission and distribution lines. The system provides power to an estimated 3 million customers in Ontario, in all areas of its 650 000 km<sup>2</sup> jurisdiction. The utility is a special statutory corporation established by the provincial legislature in 1906. Its founding chairman was Sir Adam BECK. In 1908, just 2 years after Ontario's legislature passed the Hydro-Electric Power Commission of Ontario Act, the novice utility entered into agreements with 14 municipalities to provide power at cost. Similar agreements now link Ontario Hydro and 324 co-operating municipalities. Ontario Hydro is responsible for the generation and transmission of ELECTRIC POWER and for its sale to participating utilities. It also acts as a central supervisory body with authority to approve and control certain features of the utilities' operations. Ontario Hydro also plays a prominent role in nuclear technology, operating uranium-fueled generating stations at Bruce "A" (3.2 million kW), Pickering (2.2 million kW) and Rolphoton (20 thousand kW). Nuclear technology has brought new problems and responsibilities, eg, NUCLEAR SAFETY, irradiated fuel management and other environmental concerns, each of which is given high priority by Ontario Hydro.

The mandate of the corporation is to provide power to its customers at the lowest feasible cost. Applications for increases in rates to meet costs are subject to examination at public hearings before the Ontario Energy Board. Ontario Hydro has also been called to account before various committees of the Ontario legislature. The corporation's board of directors consists of a chairman, a vice-chairman, a president and not more than 10 other directors. J.R. WHITEWAY

**Ontario, Lake**, 19 700 km<sup>2</sup> (10 000 km<sup>2</sup> in Canada), drainage area 90 130 km<sup>2</sup>, elev 74 m, mean depth 86 m (max 236 m), length 311 km and width 85 km. It is the smallest in surface area and most easterly of the GREAT LAKES and eighth-largest body of fresh water in N America. The lake receives most of its water supply from the other Great Lks through the NIAGARA R and discharges into the ST LAWRENCE R through the Kingston Basin at its NE end. Other tributaries are the Genesee, Oswego and Black rivers in New York state and the Trent R in Ontario.

Lk Ontario occupies a bedrock depression originally produced by stream erosion and later modified by glaciation. Several glacial lakes of varying elevation occupied the basin before the current level and outlet were established about 11 000 years ago. The present basin has an elliptical plan with an E-W orientation and a complex lake bed reflecting its underlying rock structure and the effects of glaciation. The lake-shore is typically a low bluff of rock or glacial

sediment with a narrow beach. The intersection of older and higher glacial and lake deposits just E of TORONTO has produced the Scarborough Bluffs — spectacular, cathedral-like cliffs rising as high as 100 m above the lake. Other scenic shore features include the rocky coasts and islands of the Kingston Basin and the extensive sandy beaches at HAMILTON and Toronto on the Canadian side and Mexico Bay in the US. Because Lk Ontario is deep and its winter climate is moderated by incursions of warm air from the SW, its open waters rarely freeze in winter. From Nov to May the main body is well mixed at uniform temperature. From June through Oct the lake is stratified, with a warm upper layer 10-20 m thick and a cool lower layer. Temperatures at depths below 100 m are almost always less than 5°C. The average residence time of water in Lk Ontario is 8-10 years, compared with 3 years for Lk ERIE and more than 100 years for Lk SUPERIOR.

The first European known to have visited the lake was Etienne BRULÉ in 1615. The name Ontario is thought to be of Indian origin, meaning "beautiful lake" or "sparkling water." It was first applied to the lake by Europeans in 1641 and appears on maps of N America as early as 1656. Conflict between the English and French and their Indian allies over the local fur trade inhibited European settlement until after the English takeover in 1763. The first major group of settlers were LOYALISTS, many of whom settled on the N shore. The most vigorous campaigns of the WAR OF 1812 between the US and Great Britain were fought on or near Lk Ontario. (The vessels *Hamilton* and *Scourge*, lost in a squall during a naval engagement at that time, have recently been found on the lake bed near Niagara.)

Nearly one-quarter of the present population of Canada lives in southern Ontario near the lake. The "Golden Horseshoe," which encompasses the western end of the lake and includes the major cities of ST CATHARINES, Hamilton and Toronto, is the industrial heartland of the country. Urban centres on the lake E of Toronto include OSHAWA, PORT HOPE, COBBOURG, BELLEVILLE and KINGSTON. The other major factors promoting vigorous settlement and growth have been the productive farmland of southern Ontario and northwestern New York state, and access to ocean shipping via the ST LAWRENCE SEA WAY and to upper Great Lake ports via the WELLAND CANAL. Smaller craft can travel the RIDEAU CANAL from Kingston to Ottawa and the TRENT CANAL between the Bay of Quinte and Georgian Bay. Unfortunately, industrial and agricultural wealth has also led to the degradation of Lk Ontario water quality by pollution. Cautious optimism prevails, however, since the lake seems to be recovering as pollutant levels are reduced.

N. RUKAVINA and F.M. BOYCE

**Ontario Northland Transportation Commission** is a provincial CROWN CORPORATION which operates a transportation and communication network throughout northeastern Ontario. Established by provincial statute in 1902 as the government-owned Temiskaming and Northern Ontario Railway, it was designed to open up resources and encourage settlement northward from the city of NORTH BAY.

Between 1902 and 1908, construction of the railway extended to a junction with the National Transcontinental Railway at the town of Cochrane, a distance of 390 km. Branch lines made possible the exploitation of mineral and timber resources and the founding of new towns such as Cobalt, Timmins and Iroquois Falls. In the 1920s the railway was extended another 300 km northward, from Cochrane to Moosonee at the southern tip of James Bay, and from Swastika eastward to the gold of Kirkland Lake and the copper and zinc of Rouyn-Noranda.

At the same time that lucrative gold mines were being established (Hollinger, Dome, McIntyre, Lake Shore and Teck), and forest products hauled southward, the T&NO Railway was also opening northeast Ontario to farming and settlement. It was a community railway; the first 4 decades of its history were identified with the social and cultural life of the northeast, before the advent of highways, automobiles and buses.

Because of its vital regional function, the commission has been administered like a public corporation by successive Ontario governments, the Cabinet and the premier functioning as major shareholders. The beneficiaries of their partisan politics, however, have generally been small businessmen from the north, so that local political patronage has been combined with a genuine commercial approach to the operation of the commission as a vehicle of development.

To reflect its expanding role for the whole of northeastern Ontario, the provincial government of Premier George DREW changed the name to Ontario Northland Transportation Commission in 1946. Over the following 2 decades, diesel locomotives steadily replaced steam; trucks, buses, boats and Otter aircraft were purchased to extend transportation facilities, while further investments were made to gain control of electronic means for the integration of long-distance TELEPHONES and TELECOMMUNICATIONS into a separate division called Ontario Northland Communications.

In 1982 assets of the ONTC were valued at \$194 million. Its net income was \$13.6 million, more than 60% of which came from telecommunications and 33% from railway freight revenue. Passenger rail service is subsidized annually by the provincial government, which has recently directed the mechanical department of the ONTC at North Bay to become a servicing and manufacturing unit for GO Transit locomotives and for the Urban Transportation Development Corporation, both of which also come under ownership of the Ontario government.

ALBERT TUCKER

**Ontario Research Foundation (ORF)** was established as an independent corporation by a provincial Act in 1928; laboratory facilities were provided at the outset. Although initially academic in outlook, ORF gradually shifted its focus and began to promote industrial development, especially of small companies, through scientific and technological innovations. ORF has developed expertise in textile and knitting technology, asbestos analytical methodology, SOLAR ENERGY and POLLUTION research. Its facilities were expanded substantially in 1969. The president is responsible to a board of governors appointed by the lieutenant-governor-in-council from the industrial, commercial and scientific communities. The foundation has a total staff of over 430. Initial funding was provided by an endowment fund through the CANADIAN MANUFACTURERS' ASSOCIATION and by a matching provincial grant. Since 1967, annual provincial grants have been tied to foundation income. ORF receives about half of all federal funding granted to provincial research organizations. About half of exploratory research is federally funded; industrial contracts finance most applied research. In 1981 ORF served over 2100 industrial clients. Investigations are conducted in 8 departments at ORF laboratories at Sheridan Park Research Community, Mississauga. A subsidiary, ORDCO Technology Ltd, manufactures and markets patented inventions of ORF and its clients, eg, low-polluting waste-disposal technology that produces useful heat. ORF is also responsible for drawing the attention of government and industry to research opportunities that promise social and economic benefits.

MARTIN K. McNICHOLL

**Ontario Schools Question**, regarding the French language in Ontario elementary schools, was the first major schools issue to focus on language, rather than religion. The conflict aligned English-speaking Catholics and Protestants against French-speaking Catholics. English had been made a compulsory subject in 1885. In 1890 regulations further required that English be the language of instruction except where impracticable. In 1910, after their numbers had grown, Franco-Ontarians organized the French-Canadian Education Assn of Ontario to promote French language interests. They were opposed by the ORANGE ORDER, which demanded "English only" education, and by Irish Catholics, led by Bishop FALLON of London. In 1912 Ontario Premier James WHITNEY's Conservative government issued Regulation 17, which limited French as the language of instruction and communication to the first 2 years in elementary schools. Regulation 17 was amended in 1913 to permit French as a subject of study for one hour per day.

Supported by French Canadians in Québec, Franco-Ontarians resisted Regulation 17. The Ontario schools issue escalated to a national conflict, contributing to the tensions of the 1917 CONSCRIPTION crisis and further alienating French Canadians from PM BORDEN's Conservative government. The JUDICIAL COMMITTEE OF THE PRIVY COUNCIL decided that Regulation 17 was constitutional, because denominational school guarantees did not include language, but that the commission appointed by the government to enforce its policy in Ottawa was unconstitutional. A political compromise came after war tensions were removed, and in 1927, unable to enforce Regulation 17, Howard FERGUSON's Conservative provincial government accepted the recommendation that each school be considered on its merits by a departmental committee. See also MANITOBA SCHOOLS QUESTION; NEW BRUNSWICK SCHOOL QUESTION; NORTH-WEST SCHOOLS QUESTION.

MARILYN BARBER

**Ontario Science Centre**, located in the Don Valley, Toronto. It was opened (1969) as one of Ontario's projects for the Canadian CENTENNIAL, funded both provincially and with a federal grant. Construction costs were approximately \$23 million and an additional \$7 million was spent on initial exhibit development. The full-time staff of 200, plus students, have built over 1000 exhibits, of which 400 are participatory experiments in 15 disciplines. Yearly attendance at the centre is about 1.3 million, but another 200 000 people are reached by a travelling "Science Circus." A day school teaches and gives credits to 25 senior high-school students, all talented in science, who attend for one semester. The centre publishes a small monthly paper, *Newscentre*, which is given to visitors and mailed to subscribers. Britain, the US, France, China and Japan have purchased exhibits and rented exhibitions from the centre. To meet this demand the centre has licensed private industry to manufacture and sell copies of its exhibits to museums and SCIENCE CENTRES around the world and in Canada. In 1984 the centre was an agency of the Ontario Ministry of Citizenship and Culture which provided the annual operating budget of about \$9 million.

**Ontario Veterinary College**, Guelph, see VETERINARY MEDICINE, INSTITUTIONS and VETERINARY MEDICINE, HISTORY.

**Ookpik** [Inuktitut, "snowy" or "Arctic owl"] is the name of one of the most popular of Inuit handicrafts, a souvenir sealskin owl with large head and big eyes. The appealing figure was created at the Ft Chimo Eskimo Co-operative in Québec in 1963, and it has become a symbol by which Canadian handicrafts are identified around the world.

JOHN ROBERT COLOMBO

**Oomiak**, see UMIK.

**Oonark, Jessie**, "Una," artist (b in the Back R area, NWT 1906; d at Baker Lake, NWT 7 Mar 1985). She is known for her drawings and wall hangings, and her decorative, hieratic, brilliantly coloured images come from a lifetime of cutting caribou skins and sewing them into clothing. She created a unique personal vision by combining traditional Inuit images of the SHAMAN's flight with symbols from her experience as a devout Christian. A widow with 8 children, she moved from the land to Baker Lk in 1955; 5 of her children have become recognized artists. The printmakers at the Sanavik Co-op have made many stone-cut and stencil prints from her drawings, and one of their largest and most important wall hangings was commissioned by the National Arts Centre in Ottawa. She was elected to the Royal Canadian Academy of Arts in 1975.

K.J. BUTLER

**Opera** was slow to take root in Canada. Once established, it blossomed sporadically before finally flourishing. One musico-dramatic forerunner of opera was MARC LESCARBOT's masque *Le Théâtre de Neptune*, played from small boats in PORT-ROYAL harbour on 14 Nov 1606. An isolated incident, this was concurrent both with the first European settlements in Canada and with the early flourishing of opera in Italy.

Operatic performances by itinerant foreign theatrical companies began in the late 18th century in Montréal, Québec City and Halifax, with light operas of English and French provenance such as Charles Dibdin's *The Padlock* of 1768 (performed in Québec City in 1783 and Montréal in 1786) or Egidio-Romualdo Duni's *Les Deux Chasseurs et la laitière* (performed in Montréal in 1789). Indigenous Canadian opera started with Louis-Joseph QUESNEL's *Colas et Colinette* (composed in 1789 (?) and performed in Montréal in 1790). At this time, operas were performed as "afterpieces" to evenings consisting of a play, in addition to a song, dance or recitation. Typically, the operas had spoken dialogue alternating with musical numbers (ie, ballad opera or opéra-comique).

From the 1790s to about 1830, the repertoire favoured Arne, Duni and Shield. The first operas performed in Toronto were John Braham and C.E. Horn's *The Devil's Bridge*, Coleman's *The*

Mountaineers, and Stephen Storace's *No Song No Supper* in 1825.

Social and political considerations exert an influence on operatic production, and the improvement in means of travel affected the dissemination of opera. In the 1830s, however, political unrest and cholera epidemics seem to have caused a lull in performances. In the 1840s and 1850s opera revived, in abridged form staged by small visiting companies, and the repertoire expanded to include more demanding works by Auber, Bellini, Boïeldieu, Donizetti, Rossini and Verdi. International vocal stars, including John Braham, Jenny Lind, Henriette Sontag and Adelina Patti, visited Montréal, Québec City and Toronto to perform operatic excerpts in recital. During the second half of the 19th century, Montréal and Toronto enjoyed performances of numerous travelling US companies led by American manager-entrepreneurs and prima donnas, even the expatriot Canadian soprano Emma ALBANI. By the end of the century the repertoire included Meyerbeer, Wagner, Gounod and Puccini, though not Mozart.

The formation of resident opera associations in Montréal and Toronto during the 1850s, 1860s and 1870s — the Holman English Opera Troupe and the Cooper English Opera troupe — was an important step followed, in Montréal, by the shorter-lived Société d'opéra français (1893-96) and the Montreal Opera Co (1910-13). The majority of performances, however, were by foreign companies, and cities such as Montréal and Toronto enjoyed more opera than at any other time in their history. After WWI, over 30 opera associations, including amateur, student and light-opera companies, were formed in Montréal and about a dozen in Toronto, though most were short-lived. Of these, the CANADIAN OPERA CO (COC) has been most successful. The Théâtre lyrique de Nouvelle-France began in 1961, changed its name to Théâtre lyrique du Québec in 1966, and dissolved in 1970. L'Opéra du Québec, a co-operative venture for productions in Montréal and Québec City, 1971-75, was revived as the touring company Opéra de chambre du Québec and l'Opéra de Montréal in 1980. The main opera associations currently are based in Vancouver, Calgary, Edmonton, Winnipeg, Hamilton, Toronto, Montréal and Québec City. The Vancouver, Edmonton, Manitoba and Southern Alberta Opera Assns (Calgary) joined forces as Opera West in 1973.

Opera has been promoted in Canada through the CANADIAN BROADCASTING CORPORATION, BANFF CENTRE SCHOOL OF FINE ARTS, JEUNESSES MUSICALES DU CANADA (JMC), and various FESTIVALS and universities. CBC broadcasts in the 1940s and 1950s on radio and from 1953 on television helped disseminate opera. The CBC has commissioned operas from Healey WILLAN, John BECKWITH, Kelsey Jones, Ben McPeck, Murray ADASKIN, Godfrey RIDOUT, Maurice Blackburn, Raymond Pannell and Robert Turner. Festival performances have included the STRATFORD FESTIVAL, Guelph Spring Festival, Vancouver International Festival, and Festival Ottawa (until 1983).

The Metropolitan Opera tours to Montréal and Toronto, which began in 1899, ended in 1961 because of prohibitive costs, except for the one-week tour to the Toronto International Festival, 1984. In 1967 some of the leading opera companies in the world — La Scala, the Royal Swedish Opera, the Vienna State Opera — visited EXPO 67. Although the COC no longer tours, the COC Ensemble has increased its touring in Ontario, including a production with Orchestra London in 1984.

Among the more prestigious of Canada's operatic performers have been conductors Wilfrid PELLETIER and Mario BERNARDI, singers Emma Albani, Pauline DONALDA, Edward JOHNSON, Raoul JOBIN, James Milligan, Victor Braun,

Maureen FORRESTER, Louis QUILICO, George London, Lois MARSHALL, Léopold SIMONEAU, Teresa STRATAS, Jon VICKERS, Claude Corbeil, Ermanno Mauro and Allan Monk.

From the time of Quesnel's *Colas et Colinet*, indigenous Canadian opera has followed a sporadic course. Nineteenth-century works include Calixa LAVALLÉE's 3 light operas of the 1870s and 1880s, Charles A.E. HARRISS's *Torquil*, 1894, and Susie Frances Harrison's *Pipandor* of the late 1880s. In the 20th century, more Canadians have written operas, aided from the 1940s by the CBC. Many of the works composed in the 1950s and 1960s were one-act operas, commissioned by CBC or JMC. The trend begun by Eugène Lapierre in the 1940s or Barbara PENTLAND in the 1950s to focus on Canadian subjects was augmented during Canada's CENTENNIAL YEAR in 1967, the most successful being Harry SOMERS's *Louis Riel*, commissioned by the COC. Through the 1960s and 1970s short operas for small orchestra were most common, by composers such as Gabriel CHARPENTIER, Pannell, Charles Wilson, Tibor Polgar, Violet ARCHER, Somers, Norman SYMONDS, Paul McIntyre, Barrie Cabena and John Rea.

Large operas are relatively rare in recent years owing to production costs. Exceptions are Willson's *Heloise and Abelard* (commissioned by the COC in 1973) and *Psycho Red* (commissioned by the 1978 Guelph Spring Festival), Derek Healey's *Seabird Island* (commissioned by the 1977 Guelph Spring Festival), and Beckwith's *Shivaree* (premiered by Comus Music Theatre, 1979). R. Murray SCHAFER's *Ra* (premiered by Comus Music Theatre, Toronto, 1983) is probably the longest, most experimental musico-theatrical work of the recent past, taking 11 hours to perform. See also MUSIC HISTORY.

GAYNOR G. JONES

Reading: *Encyclopedia of Music in Canada* (1981); *Opera Canada* magazine.

**Ophthalmology** is the medical specialty concerned with the eyes and their relationship to the body. An ophthalmologist (also called eye physician and surgeon, oculist, eye doctor) is a medical doctor who has studied eye conditions and diseases for 3 to 5 years beyond medical internship before taking examinations set by the Royal College of Physicians and Surgeons of Canada or by the College of Physicians and Surgeons of Québec. Once qualified, an ophthalmologist becomes part of the general medical team not only treating diseases and conditions of the eye, but also helping to diagnose many general medical problems, including circulatory disorders (eg, high blood pressure and atherosclerosis), neurological disorders (eg, multiple sclerosis and stroke) and endocrine problems (eg, diabetes and thyroid disease). These conditions can be associated with blurred vision and other symptoms and it is the ophthalmologist who often initiates not only vision-saving but also life-saving treatments.

The modern study of the eye as a medical specialty gradually evolved during the 1800s. Henry Howard of The Montréal Eye and Ear Institution was likely one of the first doctors in Canada to limit his practice to eye problems. His 1850 book, *The Anatomy, Physiology and Pathology of the Eye*, based on his 4 years of practice in Montréal, was published before the invention of the ophthalmoscope in 1851. The ophthalmoscope, a small hand-held telescope for looking through the pupil of the eye, allows doctors to see inside the eye and to examine the retina and optic nerve, which are extensions of the brain. In 1864 Toronto doctors pioneered retinal photography by connecting an ophthalmoscope to a camera to photograph the retina of a cat, a first step in photographing the inside of the living human eye and a technique that today is essential all over the world in evaluating and treating patients with eye diseases. In 1922 Dr

Walter Wright pioneered the use of fascia lata (leg tissue) for repair of ptosis (droopy lids) in a manner that is still in use. The Canadian Ophthalmological Society was formed in Oct 1937, but it was not until the early 1940s that Dr Walter Wright at U of T set up the first in-Canada training program for ophthalmologists. Soon afterwards, Dr Harold Ridley, an Englishman, replaced an opacified lens (cataract) with a new clear plastic one (intraocular lens). Canadian ophthalmologists were among the pioneers to use these lenses.

As part of any complete eye examination, ophthalmologists determine the refractive error for each eye, and inspect the retina, cornea, iris and lens. Ophthalmologists can reconstruct many parts of the diseased eye. The diseased cornea can be replaced by a clear donor cornea in a corneal transplant operation; a clouded lens can be replaced by a clear plastic one in a cataract extraction and lens implantation operation; and glaucoma can be treated with newer medications, laser surgery and glaucoma surgery. Retinal disease can be treated with various lasers and with scleral buckling and vitreous cutting operations. Specialists and subspecialists in all new areas of treatment practise in most major centres across Canada. Training centres at medical schools for ophthalmologists are located in Halifax, Québec City, Sherbrooke, Montréal, Ottawa, Kingston, Toronto, London, Winnipeg, Saskatoon, Edmonton and Vancouver.

Operating microscopes now allow functional magnification; tissue can be repaired with stitches finer than a human hair; and membranes more delicate than tissue paper can be cut, left, or picked clean of scar tissue. LASERS that are capable of evaporating cloudy tissues are manufactured in Canada for international use. Technical advances and clinical data about contact lens technology emanate from Canada to around the world. Techniques for surgically modifying the shape of the eye, to reduce or eliminate the need for glasses in certain patients, are evolving and may find their way to Canada even as technology for these techniques is being developed here. Newer techniques for detection and treatment of glaucoma are also being tested in Canada, and computerized visual field testing machines are already used.

MICHAEL M. HENRY

**Opossum**, common name for about 8 genera and 65 species of omnivorous MAMMALS comprising the family Didelphidae, one of 2 families of MARSUPIALS found outside of Australia. The N American opossum (*Didelphis virginiana*) is the only marsupial native to Canada. An easily recognized, cat-sized animal, it has a long, pointed nose, naked ears, coarse black to white fur; scaly, prehensile (grasping) tail; and a hind-foot with a clawless, opposable first toe. This species probably evolved from the very similar tropical species *D. marsupialis* during the Pleistocene (2.5 million to 10 000 years ago). Young are born in an underdeveloped state after a gestation of less than 13 days; development is completed in a pouch on the mother's belly. Two litters of up to 13 young each may be produced annually. The opossum, poorly adapted to severe cold, reaches the northern limit of its range in Canada and is found in extreme southern Ontario and the lower Fraser Valley, BC.

C.G. VAN ZYL DE JONG

**Opting-Out**, a device by which one or more provinces do not participate in a federal-provincial shared cost program; instead the province receives direct payment (in cash or tax room) of funds which would have been spent there. Under pressure from Québec, the Established Programmes (Interim Arrangements) Act was passed in 1965, permitting opting-out of major programs, including hospital insurance, vocational training, public health and aid to

the old and disabled. Only Québec opted-out. Defended as an example of the ability of the federal system to respond to Québec's needs, the legislation was also attacked for allowing a measure of "special status." The Act set the stage for later developments in fiscal federalism, notably Established Programmes Financing (1977). The CONSTITUTION ACT, 1982, provides for some opting-out in its constitutional amendment provisions, which permit provinces to remove themselves from any amendment that derogates from their existing powers, property or rights.

RICHARD SIMEON

**Optometry** [Gk *optos*, "visible" and *metron*, "measure"], the profession of examining eyes for faults of refraction and motility and of the treatment of abnormal conditions with correctional lenses and orthoptics. The royal charter signed by Charles I of England (1629), which conferred the responsibility for the quality of spectacles and the training of apprentices upon "The Worshipful Company of Spectacle Makers," has been continually renewed by successive monarchs to the present time. The word "optometrist," however, originated in the US in the mid-19th century and has been in general and legal use since about 1880.

Optometrists were first trained through apprenticeships. Later they attended proprietary schools that provided theoretical education, while practising optometrists provided clinical training. Neither the quality nor the quantity of the programs of such schools or of the clinical training were controlled. University programs, which included didactic, laboratory and clinical education, first became available in 1925. Recently, optometric education has been increasingly integrated with other health-science programs, particularly at the clinical training stage. In N America all programs of optometric education are accredited by the Council on Optometric Education of the American Optometric Association.

Two Canadian universities, Montréal and Waterloo, have schools of optometry. Some 40 students graduate from U de M annually, about 60 from Waterloo. Both Canadian schools are accredited by the council. Entry to these programs requires a minimum of 2 years basic science education at a university. The professional programs are 4 years in length. Graduates may enter practice after graduation without serving an internship, but all Canadian provinces require that they pass a provincially administered licensing examination. Graduate education in visual science (Physiological Optics) to the level of the master of science degree is available at both U de M and Waterloo. In addition, Waterloo offers a doctoral program in optometry.

In each province, optometry Acts or health-care legislation confer a self-governing status on the profession. Optometric associations in each province are organized to promote ethical practice and the continuing education of members, to provide for the welfare of the profession's membership and to negotiate fees with governments under the medicare legislation. Continuing education of optometrists is required by law in a majority of Canadian provinces. The Canadian Association of Optometrists, a national body, is a confederation of the 10 provincial associations.

Optometry graduates may establish their own practices, but there is a trend toward group practice. There is also a trend toward specialization in areas such as contact-lens care, low-vision care, pediatrics, geriatrics, electrodiagnosis, ultrasound diagnosis, and orthoptics and visual training.

Optometrists concerned with occupational health are trained to assess work environments to identify hazards to eyes and vision. They may plan, implement and administrate eye-protec-

tion programs, establish vision standards for various types of work, and assist in planning visually efficient work and recreation environments.

M.E. WOODRUFF

**Oral History**, accounts of the past transmitted by word of mouth. Since the beginnings of its modern form, oral history has made important contributions to the ways in which we understand and interpret the past; it has become a "subprofession" and has resulted in some valuable books. Allan Nevins of Columbia University, New York, generally considered to have started the modern oral-history movement, began his interviewing in 1948 accompanied by a graduate student who "took notes in long hand as Nevins evoked a stream of reminiscences from his subject." This method has a long history: Herodotus got information for his account of the Persian Wars in the 5th century BC by writing down what the survivors remembered. Much later, Walter Scott's interviews with the Jacobite remnants of 1745 became the basis for his Waverley novels.

In the early 1950s recording on tape came into general use in N America. The first really portable recording equipment was the Webcor tape machine, which was the size of a suitcase and weighed over 11 kg. By the 1970s the cassette recorder was small enough to be carried over the shoulder or in a pocket. Oral history in the 1980s is a child of the electronic age and, as an organized activity, popular movement or pastime, has expanded as recording equipment has grown smaller.

Although oral history includes FOLKLORE and even folk songs (see FOLK MUSIC), at its centre is the interview. Much of the oral history course offered at Simon Fraser University, Burnaby, BC, is devoted to study of the interview, of which there are various types. Columbia U favours recording the memoirs of important people, or what British oral historian Paul Thompson calls "the great man project." There is also the ordinary-person interview which American historian Louis Starr called "history-from-the-bottom-up"; this has proved to be immensely popular when presented in book form, as in Studs Terkel's *Working* (1974), which became a Broadway show, and Barry Broadfoot's best-selling oral history of the GREAT DEPRESSION in Canada, *Ten Lost Years* (1973), which was also highly successful when it was adapted for stage presentation. Interviews with ordinary people form the basis of the social and community histories favoured by Thompson, numerous local and regional ethnic projects, and such large-scale surveys as the one at Duke University (Durham, NC) on how black disenfranchisement came about in the southern US.

The ordinary-person interview, perhaps requiring more skill and empathy than recording the memoirs of the famous, has given a human dimension previously lacking in historical accounts. It can be said that oral history has made the illiterate literate and given the silent masses a voice. Furthermore the experience of hundreds of interviews has shown that the average person is much more frank and forthcoming when speaking, even in the presence of a microphone and recording machine, than when writing. (This fact may be attributed to use of the telephone, which has largely replaced the pen as the instrument of social contact and communication.) Good oral history requires much more than a microphone and a willing subject: during interviews, questions must be presented deftly and fairly. If the results are to be published, the interviews need to be subjected to careful, often difficult and sophisticated editing which allows the subject's story to be told in his or her own words, with a minimum of distortion.

Canada's academic historians tend to be sus-

picious of oral history; they argue that people's memories are distorted by time, and that oral history is therefore frequently unreliable. They often side with British historian A.J.P. Taylor, who dismissed it contemptuously as "old men drooling about their youth." Some Canadian historians point out that oral history can be no more accurate than AUTOBIOGRAPHY, and urge that a subject's memories must be checked, whenever possible, against documentary sources. In contrast, American historians seem to be much more attuned to the electronic age and, although they may have reservations, many of them make use of interviews in their work. There are oral-history courses in many universities in the US and, in most cases, the history departments run these courses, whereas the history departments of Canadian universities tend to ignore the subject. The movement was first institutionalized in the US: the Oral History Assn (US) was formed in 1967, the British Oral History Assn in 1973 and the Canadian Oral History Assn in 1974.

Universities took the lead in the US, and their projects have been funded by private sources such as the Rockefeller Foundation (see "Soundings of the Sony Age" in *RF Illustrated*, 3 May 1977). In Canada the government archives and agencies are the main proponents of oral history, while the universities, with the exception of Simon Fraser, have taken little interest. The PUBLIC ARCHIVES OF CANADA, under the direction of W.I. Smith, a creative archivist, has actively assisted in oral-history projects. The CANADIAN BROADCASTING CORPORATION was the first institution to collect interviews. The NATIONAL MUSEUMS and provincial archives have continuing projects, the most remarkable of which is the BC government's Sound Heritage Series, published in Victoria since 1973.

But oral history is not the domain of institutions alone. Many individuals and amateur groups have taken up oral history as a hobby. In Canada it received a special impetus with the preparations for the Centennial of 1967: many groups, often assisted by government grants, collected and published local histories, and the trend has continued with such projects being tied to special anniversaries of towns, cities and provinces. See ORAL LITERATURE. PETER STURSBURG *Reading: Allan Anderson, Remembering the Farm* (1977), *Salt Water, Fresh Water* (1979) and *Roughnecks and Wildcatters* (1981); Barry Broadfoot, *Six War Years 1939-1945* (1975), *The Pioneer Years 1895-1914* (1976) and *Years of Sorrow, Years of Shame* (1977); Peter Stursberg, *Diefenbaker, Leadership Gained* (1975), *Diefenbaker, Leadership Lost* (1976), *Lester Pearson and the Dream of Unity* (1978) and *Lester Pearson and the American Dilemma* (1980).

**Oral Literature in English** The term "oral literature" is sometimes used interchangeably with "folklore," but it usually has a broader focus. The expression is self-contradictory: literature, strictly speaking, is that which is written down; but the word is used here to emphasize the imaginative creativity and conventional structures that mark this form of discourse. Oral literature shares with written literature the use of heightened language in various genres (narrative, lyric, epic, etc), but it is set apart by being actualized only in performance and by the fact that the performer can (and sometimes is obliged to) improvise. Oral literature may be composed in performance; transmitted orally over generations, like many Scottish and Irish ballads that have been brought to Canada; or written down specifically for oral performance. The process of transmission itself (often, in recent years, to collecting folklorists and oral historians) shows that oral literature has not been driven out of existence by the ubiquity of books and the electronic media. Indeed, whenever a ghost story is told around a campfire, whenever a protest song or a lullaby is sung, whenever a riddle, tongue twister, counting

rhyme, shaggy dog story or knock-knock joke is shared, or fables and proverbs told, oral literature lives in performance.

The attitudes of scholars and the literate public toward oral literature were largely shaped by the 19th-century romantic movement. William Wordsworth, in his *Preface to Lyrical Ballads* (1798), claimed to have found in the oral discourse of unlettered rustic people the source of literary spontaneity, sincerity and integral unity. At about the same time a rise in nationalism, with its emphasis on local origins, encouraged the study of "popular antiquities" — i.e., the oral tradition of history and narrative. Writers in Canada adopted the trend, transforming tales, legends, proverbs and anecdotes into written form, and sometimes incorporating tale-tellers such as T.C. HALIBURTON's Sam Slick, into their written work. The techniques were borrowed by Susanna MOODIE, who, in *ROUGHING IT IN THE BUSH* (1852), tells a life history that is also a "liar's tale": a hyperbolic account of the hellish life in the new land to counter the land company's lie that Canada was a new Eden. Other examples of borrowing — of techniques or of actual tales (canoe songs, tales of encounters with the devil, etc.) — appear in 19th-century Canadian written literature, and the use of dialect further emphasizes their oral underpinnings. At the end of the century the so-called Confederation poets (Mair, Roberts, Crawford, Johnson, Carman, Lampman) extensively reworked such sources as traditional ghost stories and Indian mythology.

Oral literature has been studied principally by folklorists, who emphasize its ability to act as the voice of a tradition; they collect oral literature in order to preserve something of the culture of ethnic groups facing assimilation into the mainstream. But there are problems associated with gathering and preserving such materials. The communicative act is distorted to a greater or lesser extent by recording methods (eg, gestures are lost when recording is done shorthand or on tape; even on video tapes the ambience of an occasion is lost, although the speaker is recorded both aurally and visually). More significant is the "freezing" of the oral moment into an artefact, when part of the essence of oral literature is its capacity to be changed through generations, and even from occasion to occasion, by storytellers and bards.

Folklorists in Canada, using the classification system devised by Antti Aarne (*The Types of the Folktale*, translated and enlarged by Stith Thompson, 1961), which was designed primarily for narrative, have placed most items they have collected in the broad categories of legend, joke and anecdote. Political oratory and sermons have seldom been studied in Canada as oral literature. Myths and *märchen* are rare, though they are found among the Indians and as archaic elements in areas of Celtic settlement or with close connections to French speakers (eg, New Brunswick). Legends represent the localizing of the marvellous; for example, Captain Kidd's treasure is located in many a Nova Scotia town, the devil is known to have danced at Kensington, PEI, and the burning ship of Chaleur Bay makes periodic appearances elsewhere on the coast.

The heroes of cycles of tall tales, yarns and anecdotes include the Wizard of Miramichi and Paul Bunyan. Sometimes folk heroes tell whoppers about themselves, especially in front of tenderfeet from other regions. Tall tales are often used, as are the Joe MUFFRAW tales of the Ottawa Valley, to promote a locality or "prove" its superiority over others. Sometimes these yarns provide the mainstay of local radio programs, as the electronic media disseminate oral culture.

The performance of oral literature is readily experienced in the form of children's play-

ground rhymes and songs, such as those recorded by Sharon, Lois and Bram, Raffi and others. Although the performance, once recorded, is in a fixed form, the variants in such things as skipping rhymes show that the oral tradition — typically mutable — is alive; and one seldom hears 2 identical recordings of such tall-tale songs as "The Cat Came Back." Less accessible to most Canadians is the living oral tradition of the Newfoundland Mumpers' plays (see MUMMING). The ritual aspect of their performance is common to much of oral literature performed in its proper context.

No other extended poetic forms are found in Canada's oral literature. The lyric predominates in ballads, laments and work songs (eg, sea chanties, lumbering songs and milling songs). Whereas many of these songs are traditional ones from Europe, others embrace new themes reflecting the social and political realities of Canada (eg, Gaelic elegies, songs of emigration, satires and humorous songs). Themes from Canadian history are celebrated in ballads such as "General Wolfe." Newfoundlanders have contributed a rich treasure of sea chanties and ballads of shipwrecks, and have also produced well-known dance songs such as "It's the B'y that Builds the Boat." From Ukrainians in the West have been collected a variety of carols, wedding songs, dance ditties, cumulative songs and drinking songs. Much oral poetry is chanted rather than sung, as are children's counting rhymes and the charms, spells and alliterative rhymes collected from German speakers in Ontario.

Many songs and chants of the native peoples have been recorded, but more attention has been paid to their narratives. Two broad groups of myths involving tales of when the world was young and of the beginning of Indian ways of living may be found across the continent: stories of the great flood are related by the Cowichan in the West and the Iroquois in the East, and the discovery of fire is variously attributed to heroes such as NANABOZO of the Ojibwa and Coyote of the Salish.

This native literature, as well as that of the medieval troubadours and the Yugoslav composers of oral epic, has inspired numerous contemporary writers in N America to adopt an oral poetics. Charles Olson's idea of a "poetry of utterance" and Jack Kerouac's "spontaneous prose" have found extensions in the work of Canadian sound poets such as bp NICHOL, the Four Horsemen, Re:Sounding and Owen Sound, as they attempt to make literature from the ephemeral and improvise before audiences. As he tries to create for himself and his audience a sacred ritual, bill BISSETT's composition in performance draws heavily on Indian chants.

Writers of narrative have been as attracted to the concept of orality as have the poets. Robert KROETSCH, for example, tells liars' tales through his characters. In *The Diviners* Margaret LAURENCE provides a genealogy and history of oral narrative in Canada, from improvised Scottish heroic narratives and legends and Métis songs through novels to the new orality of modern popular ballads. Although Laurence does not use material from traditional folklore, but creates anew from the formula and conventions they employ (a practice folklorists consider "fake lore"), and her material is neither composed in performance nor written specifically for performance, her novel, like those of other contemporary novelists, places the text in a context of performance, and analyses the nature and function of its own telling.

The role of the theatre in keeping alive oral literature in Canada is exemplified by James REANEY's dramatic versions of 2 Ontario legends, the Baldoon mystery of poltergeists and the legend of the folkheroes, the DONNELLYS. In these plays Reaney uses traditional jokes, songs,

stories and proverbs. The range of his creative freedom is greater than that of the traditional performer, but his materials are similar. Contemporary developments suggest that the growth of a written literature does not mean the death of an oral one, but announces change and displacement. While the oral literature of rural Canada may be fading, a new one is being created in the city, where supernatural happenings, numbskull stories and yarns continue. See ETHNIC LITERATURE; FOLKLORE; ORAL HISTORY.

BARBARA GODARD

Reading: R. Finnegan, *Oral Poetry* (1977); Edith Fowke, *Folklore of Canada* (1976); N. Rosenberg, *Folklore and Oral History* (1978).

**Oral Literature in French**, including tales, songs, sayings, legends, superstitions, proverbs and other forms, is part of the heritage left by the first French settlers in N America. Transmitted orally through the centuries, these anonymous traditional forms have enjoyed an excellent environment (an immense, predominantly rural region) for their preservation and transmission. By the 19th century, Ernest GAGNON and others first felt the need to preserve them in written form, but they still circulate orally today, despite the pervasive presence of the mass media. French Canadian oral literature remains faithful to its origins although, after 3 centuries in the new land, it has evolved, adapted and acquired both autonomy and originality. Since it is not formalized in writing, oral FOLKLORE is in a state of perpetual change. Popular tales have been handed down from the earliest days of French civilization. Most of the legends deal with universal themes but some, concerning historical events and characters, began in Québec. Innumerable different versions of songs have resulted from exchanges between immigrants from different French provinces; as with legends, the repertoire of folksongs grew in the new land to include songs about the COUREURS DE BOIS, the VOYAGEURS of the PAYS D'EN HAUT, and life in the forest.

The 19th century was still the golden age of the traditional tale, and storytellers were very popular (see SHORT FICTION IN FRENCH). Crowds spontaneously formed around tramps and peddlers to hear the stories of La Grand'Margaude, La Bête à Sept-Têtes, La Canarde and L'Eau de la Fontaine de Paris, and the incredible adventures of Ti-Jean. In rural areas, people liked to organize entire evenings of storytelling. Forest life was important in preserving and spreading tales, as lumberjacks and raftsmen fought the boredom of long isolation by gathering to tell each other tales in the camps.

Although formal study of folklore in America began relatively recently, each of the major oral genres — tales, legends and songs — is the subject of study and research. Until the early 20th century, popular tales had such vitality that few felt the need to collect them. Their scientific collection and study really began in 1914 with Marius BARBEAU, an anthropologist with the NATIONAL MUSEUM OF CANADA. Although his field was native peoples, his attention was drawn to francophone folklore by Franz BOAS, an American colleague interested in European influences on Canadian Indians. Barbeau's research very quickly extended to all Québec. Barbeau and his collaborators, Adélard Lambert, Gustave Lanctôt, Edouard-Zotique MASSICOTTE and others, presented their rich find to the general public. Since that time, general interest has continued to grow. Among the major publications on the subject, the *Journal of American Folklore* contains more than 200 tales in the francophone repertoire. The most important collections are that of Father Germain Lemieux of Sudbury, *Les vieux m'ont conté* (18 vols, 1973 ff), Carmen Roy's *Contes populaires gaspésiens* (1952) and the other volumes of the *Mémoires d'homme*

collection, *Contes de bûcherons* by Jean-Claude Dupont (1976) and Conrad Laforte's *Menteries drôles et merveilleuses* (1978).

After working with Barbeau, Luc Lacourcière, a teacher of Canadian literature at UNIVERSITÉ LAVAL, made the popular tale his preferred field of research; in 1944 he founded the Folklore Archives at Laval. Thirty years later, his inventory and analysis of several thousand tales from various sources provided him with material for the first *Catalogue raisonné du conte populaire français en Amérique*. This exceptional work will help complete the international catalogue of tales prepared by Stith Thompson on the basis of work by Antti Aarne (*Motif Index of Folk Literature*, 6 vols, 1955-58) and the catalogue developed in France by Paul Delarue and Marie-Louise Ténèze (*Le Conte populaire français*, 1957-64).

Popular tales are composed in a particular style. First, they are marvellous recitations whose sole purpose is to amuse. They often begin and end with well-known sayings. Usually the action is not located in any particular place or time and the characters are not seen as individuals. They are animals, magical beings (kings, princes, princesses or fairies) or fantastic beings (ogres, monsters, giants) who change form, use charms, potions and talismans, and dominate the elements of nature. The tale is therefore not intended to be believed, but to be enjoyed as pure fiction. Unlike tales, legends appear to have historical bases that appeal to the listener's credulity. The site of the action is often indicated with great precision and the characters are carefully developed in space and time. In French Canada, legends have come down in a manner different from that of the tale because the 19th century has left many legends in print. The work of Aurélien Boivin, *Le Conte littéraire québécois au XIXe siècle* (1975), provides an exhaustive treatment of them. Québec writers in the 19th century used "conte" to mean legend rather than the traditional tale, although the forms have been distinct in the eyes of both modern folklorists and the original illiterate audiences. By their nature, legends lend themselves more easily to written presentation, and Canadian authors have drawn abundant material from them. Philippe AUBERT DE GASPÉ (father and son), N.H.E. Faucher de Saint-Maurice, Honoré Beaugrand, Henri-Raymond CASGRAIN and many others have used werewolves, sirens, ghosts, the legend of LA CORRIVEAU or Alexis-le-Trotteur and a host of others. As Lacourcière notes, the many categories of legends include those dealing with the fantastic and the supernatural, those attempting to explain the origins and causes of natural phenomena and those more directly related to history and to real persons; and this is not a complete classification.

The third major genre in oral literature is song (see FOLK MUSIC). It has been said that song gives full expression to the French spirit and, consequently, that it is the richest, most vibrant and most pleasant of French Canadian traditions. The reason is perhaps that song is suited to all life's circumstances and to all ages. Religious at times, ribald at others, its themes encompass the full range of human feelings. Its form, rhythm and assonances have preserved it from the ravages of time. In a rigorous classification, more than 3000 titles of folksongs contained in Laforte's *Le Catalogue de la chanson folklorique française* (1958) reveal all the themes treated in this form of popular poetry, which is often mixed with uniquely Canadian variations.

In the many French Canadian regions, folklorists, ethnomusicologists, researchers in various disciplines and lovers of the oral traditions continue gathering this important part of French Canada's cultural heritage. The documents they produce are the subject of study and research and are preserved and scientifically

treated in archives in Québec, Moncton, Ottawa, Sudbury and elsewhere. MADELINE BÉLAND

**Orange Order**, Protestant fraternal society, fd 1795 in Ireland to commemorate the victory of William of Orange at the Battle of the Boyne in 1690. During the Irish insurrection of 1798 it became the principal link between the British government and the Protestants in Ireland, with Orangemen filling the ranks of the volunteer militia and gaining control of most of the civil service. Although it remains a powerful movement in Ulster, the order lost much of its influence in Ireland after passage of the Catholic Emancipation Act of 1829. The lodges adopted a Masonic-type ritual and organization, providing for mutual aid and organizing social events. Orangemen who migrated to Britain and the colonies found the lodges useful in their adjustment to new environments.

The Grand Lodge of British North America was founded 1 Jan 1830 in Brockville, UC, by Ogle R. Gowan. He sought to use the lodges as a base for a political career, bringing Catholics and Orangemen together in 1836 to support the Conservative cause. By 1844 the power of the Orange vote induced John A. MACDONALD to become an Orangeman. There was a schism in 1853 over the Conservatives' alliance with the French Canadian Parti bleu. This was healed in 1856, but henceforth the Orange vote was divided. The lodges reached the peak of their importance in Canada, both politically and socially, in the last quarter of the 19th century. However, they remained a force until the 1950s, and still retain some influence in rural communities. HERWARD SENIOR

**Orchestral Music** Composers of orchestral music, though they often use a piano as a point of reference in the composing process, conceive their work in terms of the musical colours, timbres and textures available only in an orchestra, which is an ensemble that may vary in size from about 30 musicians to over 100.

Orchestras are divided into 4 families of instruments: strings, woodwinds, brass and percussion. Orchestral music is scored by the composer so that the various instrumental parts are arranged in a particular manner. Each bar of music consists of as many staves as there are instrumental parts. A standard orchestral full score indicates the instrumental parts in the following order, from top to bottom: piccolo,

flutes, oboes, English horn, clarinets; bass clarinet, bassoons, double bassoon, horns, trumpets, trombones, tuba, timpani (and other percussion instruments), harp (if any), violins I, violins II, violas, solo voice(s) and chorus (if any), keyboard (if any), cellos and double bass. In concertos the solo instrument's music is usually placed immediately above the strings' music. Conductors read the full score while individual players are provided with their respective parts.

Orchestral music is composed in a variety of forms, the most common being symphony, concerto, overture, suite and tone poem, and its styles change from age to age and from composer to composer. However, many orchestral works, especially contemporary compositions, defy neat labels.

Although the history of European-style music in Canada dates back to the time of the explorers, orchestral compositions by Canadians have been produced mainly in the 20th century. The 19th-century French Canadian composer Calixa LAVALLÉE wrote a number of orchestral works, including 2 suites, one of which was performed in Paris in 1874. But these manuscripts, as well as those of some of his other works, are lost, and he is remembered primarily as the composer of "O Canada." The only Canadian orchestral work to be published before the turn of the century was Guillaume COUTURE's *Rêverie*, which was published by Girod soon after its performance in Paris in 1875.

A significant problem facing Canadian composers before the turn of the century was the lack of orchestras in this country. There were few permanent orchestras before the early years of the 20th century. In 1898 a Montreal Symphony Orchestra was formed that flourished for 20 consecutive seasons. A Halifax Symphony Orchestra, formed in 1897, lasted for several seasons. Vancouver, Regina, Winnipeg, Edmonton, Saskatoon, Moose Jaw and other cities had amateur orchestras before WWI. An orchestra was formed in Toronto in 1906, becoming in 1908 the first Toronto Symphony Orchestra, which performed regularly until 1918. The oldest orchestra in Canada is the Société symphonique de Québec (1903), which changed its name in 1942 to Orchestre symphonique de Québec.

Ontario-born Clarence Lucas, one of the most prolific Canadian composers of orchestral music during this period, is credited with writing symphonies, symphonic poems, overtures, cantatas and several operas. Other orchestral composers of the early 20th century include Alexis Contant, C.A.E. HARRISS, Donald Heins and Rodolphe MATHIEU.

Parade of Orangemen, led by "King Billy" on horseback, near Metcalfe, Ont, 12 July c1900 (courtesy Public Archives Canada/Francis M. Iveson Coll/PA-122938).

The period between the wars saw a greater number of Canadian orchestral works being composed, but they were usually short because Canadian orchestras, when they could be persuaded to perform Canadian works at all, placed them at the beginning of a program as "warm-up" pieces. Particularly notable are Claude CHAMPAGNE's *Hercule et Omphale* (1918), Ernest MACMILLAN's *Concert Overture* (1924), Healey WILLAN's *Symphony No 1 in D minor* (1936) and works by Colin McPhee and Percival PRICE. A few longer works were also composed, often as doctoral exercises.

The establishment of the CANADIAN BROADCASTING CORPORATION in 1936 and the NATIONAL FILM BOARD in 1939 provided Canadian composers with new opportunities and outlets for orchestral music. Both organizations were keen to use original Canadian music and began to commission composers to write music for radio and film. John WEINZWEIG, Louis APPLEBAUM and Eldon Rathburn were among the first of many composers to have works commissioned by these organizations. Similarly, dance companies were being established during the 1940s, and they too began to commission works by Canadian composers. Walter Kaufmann's *Visages* and Robert FLEMING's *Chapter 13* were both commissioned by the Winnipeg Ballet in 1947. In 1949, 2 important works were commissioned: Jean PAPINEAU-COUTURE's *Papotages/Tittle-Tattle* for the Ballets Ruth Sorel of Montréal, and Weinzwieg's *Red Ear of Corn* for the Boris Volkoff Canadian Ballet.

The CANADIAN LEAGUE OF COMPOSERS was formed in 1951 to promote the music and advance the professional interests of Canadian composers. Its 1957 *Catalogue of Orchestral Music* listed 233 works composed by Canadians between 1918 and 1957. The league was instrumental in setting up the CANADIAN MUSIC CENTRE in 1959. A nonprofit agency for the distribution and promotion of Canadian music in Canada and abroad, the CMC provides, among other services, a lending library of Canadian music. Though most Canadian orchestral works remain unpublished, copies are available through the CMC.

The commissioning of Canadian composers was given a major boost in 1957 with the establishment of the CANADA COUNCIL, a granting agency that provides funds to cover the composing and copying costs of commissions. Of 90 orchestral works sampled for the period 1968 to 1978, two-thirds were composed on commission and most of these were commissioned through the assistance of the Canada Council. Furthermore, all orchestras that receive operating grants from the council are urged to devote at least 10% of their programming to the performance of Canadian music. Provincial arts councils also make funds available for the commissioning of Canadian compositions.

With well-established orchestras throughout the country and organizations and agencies existing to assist the arts in general and composers specifically, the number of works composed for orchestras increased dramatically. The CMC's 1976 *Catalogue of Canadian Music for Orchestra* together with its 1979 Supplement list more than 1000 works by 145 composers.

Postwar composition in Canada has best been described as eclectic. One of the most influential composers is John Weinzwieg. Born in Toronto in 1913, Weinzwieg is credited with bringing the 12-tone technique to Canada. Among his students at U of T were Harry SOMERS, R. Murray SCHAFER, John BECKWITH, Samuel Dolin, Murray ADASKIN, Norma BEECROFT, Harry FREEDMAN and John Fodi, all of whom became well-respected composers. The avant-garde in Canadian orchestral music is associated with the names of composers such as Pierre MERCURE, Serge GARANT, Bruce MATHER, Gilles TREMBLAY, Robert ATKEN, Barbara PENTLAND, István Anhalt, Otto Joachim

and, in particular, R. Murray Schaffer. Alexander BROTT has written more performed orchestral works than any other Canadian composer, and Roger Matton, Clermont PÉPIN and André Prévost are also important.

An examination of the 1981-82 season brochures of 15 major Canadian orchestras revealed that 70 different works by 39 Canadian composers were programmed. The 5 most frequently performed Canadian composers in that season were Oskar MORAWETZ, Jacques HÉTU, Godfrey RIDOUT, François MOREL and Violet ARCHER. See also MUSIC BROADCASTING, MUSIC HISTORY; and individual entries for the Edmonton, Montréal, Toronto, Vancouver and Winnipeg symphony orchestras.

BARBARA NOVAK

Ford, *Canada's Music: An Historical Survey* (1982); H. Kallmann, *A History of Music in Canada, 1534-1914* (1960); R. Markow, "The Puzzle of Orchestral Programs," *Music Magazine* (Jan/Feb 1983).

**Orchestre symphonique de Montréal**, founded in 1934 as the Montreal Symphony Orchestra, was the fourth orchestra established in Montréal. In 1979 it became the Orchestre symphonique de Montréal (OSM). Wilfrid PELLETIER was its first artistic director, 1935-40, followed by Désiré Defauw, 1940-52. Distinguished guest conductors led the orchestra until the appointment of Igor Markevitch, 1957-61. Under Zubin Mehta, 1961-67, the orchestra embarked in 1962 on the first European tour ever undertaken by a Canadian symphony orchestra. In 1963 it moved to new quarters in Place des Arts. The OSM toured Japan in 1970 under the direction of Franz-Paul Decker, 1967-75. In 1976 it made its US debut in Carnegie Hall under Rafael Frühbeck de Burgos, who succeeded Decker. Charles Dutoit (b in Lausanne, Swit) took over as artistic director in 1978.

Markevitch instituted the annual commissioning of a Canadian composition, and since 1965 the orchestra has sponsored an annual competition; winners of the Concours OSM are featured as soloists with the orchestra in concert. The OSM has received 3 Performing Rights Organization of Canada awards for the excep-

tional quality of its contemporary music programming. Its recording of Ravel and Berlioz have led some critics to call the OSM the finest French orchestra today. Under Dutoit, the OSM's recordings, made in the church of St-Eustache, have been greeted with acclaim and have won many prizes.

BARBARA NOVAK

**Orchid**, perennial herbaceous PLANT of family Orchidaceae. The family is one of the largest among flowering plants, represented by 735 genera and 20 000 species worldwide. The genera hybridize readily. Most orchids are tropical and epiphytic (ie, grow in moss and debris on tree branches), but the 17 genera and 63 species native to Canada are terrestrial. Orchids are found throughout Canada. Some are arctic, eg, *Habenaria alba* and *H. hyperborea*; most grow in moist, wooded areas, eg, *Cypripedium*, LADY'S SLIPPER, which has large, striking flowers varying from white through yellow to pink. *Calypso bulbosa* has similar but smaller, delicate pink flowers. Some *Spiranthes* and *Habenaria* species have small, whitish, fragrant flowers in a spike. Two genera, *Euborphyton* (plant is white) and *Corallorhiza* (plant is yellow to purple), live on decaying vegetable matter. Attempts to transplant orchids from the wild usually result in the plant's death. Orchids are recognized internationally as endangered species, and trade in wild orchids is prohibited. PATRICK SEYMOUR

**Order-in-council**, at the federal level, is an order of the GOVERNOR GENERAL by and with the advice and consent of the Queen's PRIVY COUNCIL for Canada. In fact, it is formulated by CABINET or a committee of Cabinet and formally approved by the governor general. Some orders simply make appointments. About a third are legislative, forming part of the law and enforceable by the courts. Most legislative orders are made under authority expressly conferred by ACT of Parliament. With the expansion of state activity in recent decades (public ownership, state regulation of industry, social security), it has become impossible for Parliament to legislate directly and in detail to meet complex and varying problems, and more and more Acts are cast in general terms and empower the governor-in-council to make regulations to carry out the intent of the legislation. Such regulations on, for example, unemployment insurance, fisheries and aeronautics, now form an enormous part of our law (see REGULATORY PROCESS). They are called "subordinate legislation" because they are made by the governor-in-council, subordinate to Parliament, and are subordinate to, and limited by, the Act which authorizes them. A few legislative orders are based on royal prerogative (the relatively small remainder of the SOVEREIGN's ancient law-making power), but these are limited by the content of the particular prerogative which confers the power to make them (see ADMINISTRATIVE LAW). Provincial orders-in-council — orders of the lieutenant-governor-in-councils — are similar to federal ones.

EUGENE A. FORSEY

**Order of Canada**, centrepiece of the Canadian system of HONOURS, was instituted on 1 July 1967, the 100th anniversary of Confederation. Every Canadian is eligible for the order, which is conferred in recognition of exemplary merit and achievement in all major fields of endeavour. Appointments are made by the governor general, based on the recommendations of the Advisory Council of the Order, which meets twice a year under the chairmanship of the chief justice of Canada to consider nominations submitted by members of the public.

There are 3 levels of membership, in which the number of appointments is limited: Companion (not to exceed 150 in all); Officer (46 appointments maximum in any year); Member (92 appointments maximum in any year). In-

The sound quality of the highly regarded recordings of the Orchestre symphonique de Montréal under conductor Charles Dutoit have been greatly enhanced by the marvellous acoustics of the church at St-Eustache, Qué (courtesy Charles Dutoit/Orchestre symphonique de Montréal).

Order of Canada, centrepiece of the Canadian system of honours, est 1 July 1967, on the 100th anniversary of Confederation. It is conferred in recognition of exemplary merit and achievement (courtesy Public Archives of Canada/4386/photo by John Evans).

vestitures take place each spring and autumn at the governor general's official residence, RIDEAU HALL, Ottawa. The order's badge is in the form of a stylized snowflake of 6 points and is worn at the neck by Companions and Officers and on the left breast by Members. Recipients are entitled to have placed after their names the letters representing the category in which each is appointed: CC, OC or CM, and all may wear a small replica of the badge on street clothes. CARL LOCHNAN

**Order of Military Merit** In 1972 the Canadian honours system was extended to include the Order of Military Merit in recognition of exceptional service. All regular and reserve

Order of Military Merit, est 1972 and awarded to regular and reserve personnel of the Armed Forces in recognition of exceptional service (courtesy Public Archives of Canada/4389/photo by John Evans).

personnel of the ARMED FORCES are eligible. There are 3 grades of membership: Commander, Officer and Member. The total number of appointments made yearly may not exceed 0.1% of the strength of the Armed Forces; of that number 6% may be made Commanders, 30% Officers and the remainder Members. Appointments are made by the governor general on recommendation by the minister of national defence. A list of current members is available from the Chancellery of Canadian Orders and Decorations, Government House, Ottawa.

The badge is a blue enameled cross patée (ie, a cross with expanding arms) with a dark blue ribbon edged in gold. The badge of Commander is worn at the neck, those of Officer and Member on the left breast. Recipients are entitled to place after their names the initials corresponding to their grades: CMM, OMM or MMM.

CARL LOCHNAN

**Ordre de Bon Temps** ("Order of Good Cheer") After a disastrous experience at Ste Croix I, Samuel de CHAMPLAIN and his French compatriots resettled in the more salubrious climate at PORT-ROYAL. Several perished from scurvy in the winter of 1605-06, but the following winter was more congenial. Champlain founded the order — modelled loosely on a European order of chivalry — to maintain the spirits of the colonists. Members took turns providing fresh game and, as chief steward of the day, leading a ceremonial procession to the table. The Ordre de Bon Temps de Québec was established in 1946 to honour the original association and to promote adult education and recreation. JAMES MARSH

**Ordre de Jacques-Cartier** (familiarily La Patente), fd 1926, a French Canadian secret, hierarchically structured society. It spread through French Canada during the 1930s, but never had many more than 10 000 members, recruited primarily among the bourgeois elite. The society championed various religious and national causes, infiltrated scores of existing organizations and promoted public-opinion campaigns on themes linked to morality, anticommunism, education and the French language. Its actual influence, however, remains debatable. After it officially disbanded in 1965, it unsuccessfully attempted to reconstitute itself regionally. RICHARD JONES

**Oregon Treaty**, 15 June 1846 between Britain and the US, describing the boundary between BNA and the US W of the Rocky (or Stony) Mts. A compromise between the American desire for a boundary with Russian Alaska at 54°40' N lat to the Columbia R mouth, the treaty set the boundary at 49° to the middle of the channel between the mainland and Vancouver I, thence through the middle of the channel and Juan de Fuca Str to the Pacific. But there were 2 channels through the strait and between them lay San Juan I, which was claimed by both Britain and the US and on which the US landed troops in 1859. The boundary through the strait thus remained in doubt until 1872, when arbitration by the German emperor decided in favour of the US. N.L. NICHOLSON

**O'Reilly, Gerald**, physician (b at Ballinlough, Ire 11 Aug 1806; d at Hamilton, Canada W 26 Feb 1861). After medical studies in Dublin, Ire, and London, Eng, he immigrated in 1833 to Hamilton, where he was a prominent practitioner for the rest of his life. In addition to his wide private practice, he served publicly as surgeon to the Hamilton jail, to the 3rd Gore Militia and to Wentworth and Halton counties. He was a founder, original shareholder and medical officer to the Canada Life Assurance Co, as well as one of the first to hold a policy. Presumably his widow collected on it at his early death, from blood poisoning, after a minor operation. CHARLES G. ROLAND

**Orford String Quartet** was formed in 1965 at the JEUNESSES MUSICALES DU CANADA Orford Art Centre at Mt Orford, Qué, and consisted of Andrew Dawes and Kenneth Perkins, violinists, Terence Helmer, violist, and Marcel St. Cyr, cellist. The quartet remained the same until 1980 when Denis Brott replaced St. Cyr. After its initial concert, the quartet embarked on a series of JMC Canadian tours, which in turn were followed by JMC engagements abroad. The 1967 Carnegie Hall debut brought great praise and signalled a very successful international touring career which was assisted financially by the CANADA COUNCIL and the Dept of External Affairs. Based in Toronto since 1965, and in great demand as concert performers throughout Canada, the group became U of T quartet in residence in 1968. Subsequently, its master classes, individual recitals and performances of complete cycles, such as the 16 Beethoven quartets at Walter Hall in Toronto in 1977, and repeated at Festival Ottawa, have made the Orford Quartet one of the best known and most highly regarded string quartets in the world. It has received many awards, including the valuable MOLSON PRIZE in 1975, and Canadian Music Council medals in 1978 for its performances in concert and its many recordings. Its repertoire includes virtually all of the quartet literature as well as works requiring additional performers. It has also served Canadian composers well and has encouraged many aspiring young string players. Frequently the guest performers at festivals across Canada, the "Orfords," as they are affectionately known, are also featured performers at festivals abroad. Their list of recordings is a clear indication of the breadth of their musicianship. MABEL H. LAINE

**Organized Crime** has been officially defined by the Canadian police as "two or more persons consorting together on a continuing basis to participate in illegal activities, either directly or indirectly, for gain"; it has been defined by a former US organized crime boss as "just a bunch of people getting together to take all the money they can from all the suckers they can. Organized crime is a chain of command all the way from London to Canada, the US, Mexico, Italy, France, everywhere."

There is much more to organized crime in Canada and the US than the Italian criminal association, known as the Mafia, Cosa Nostra or Honoured Society. In N America, just about every major national or ethnic group and every segment of society has been involved in organized crime. American criminologist Dr Francis Ianni has developed a theory explaining how organized criminal activity is developed and passed on in N America from one ethnic group to another based on the length of time the group has been in N America, the language and cultural knots that bind the group and the degree to which the group's members have been assimilated into the prevailing society.

For a long time many scholars and academics did not believe organized crime was highly structured or capable of sophisticated operations. Their skepticism derived partly from a reaction to the Hollywood portrayal of the Mafia from the 1930s to 1950s, typified in its treatment of Al Capone ("Scarface"), and partly from the fact that documented, scholarly studies and books on organized crime did not exist.

All this changed because of the revelations at the US Senate "Valachi" hearings in the early 1960s; because of the documentary evidence from police wiretaps and bugs in the 1970s, which allowed police to listen to Mafia leaders discussing their hierarchy and operations in both the US and Canada; and partly because of the establishment of the American Witness Protection Program, by which Mafia defectors and informers could build a new life.

Through various court cases and royal commissions and television and newspaper exposés, the existence of a highly organized criminal network in Canada became known to the Canadian public in the late 1970s. In 1984 a joint federal-provincial committee of justice officials estimated that organized crime in Canada took in about \$20 billion annually, almost \$10 billion of which was from the sales of narcotics. (There is no way of estimating, however, the amount of dirty funds that are "laundered" in Canada by members of organized crime in the US and other foreign countries. See UNDERGROUND ECONOMY). The committee was formed in response to a 1980 report on organized crime by the BC attorney general's office, which claimed that organized crime figures in Canada have interests in the textile industry, cheese industry, building industry, disposal industry, vending-machine companies, meat companies, home-insulation companies, autobody shops and car dealerships, among others. The joint committee calculated that the sources of organized crime revenues could be broken down as follows: PORNOGRAPHY, PROSTITUTION, bookmaking, gaming houses, illegal LOTTERIES, other GAMBLING offences, loan-sharking and extortion, which together brought in an estimated \$567.3 million. Other activities, such as white-collar crimes (eg, insurance and construction frauds and illegal bankruptcies), arson, bank robberies and motor vehicle thefts, raised the estimate to \$10 billion; drugs accounted for the rest.

**Mafia** Of all the organized-crime groups operating in Canada, the Mafia is perhaps the best known. This is because the Québec crime probe report of 1976 (which was based primarily on the information gathered by the "bug" planted in the milk cooler of the Montréal mobster Paulo Violi's headquarters) revealed the structure of the Montréal Mafia and its inter-relationship with and dependency on the US Mafia family of Joe Bonanno. Public knowledge of the Mafia is also the result of media attention, eg, the "Connections" series broadcast by CBC Television in the late 1970s.

Scholars do not agree on the origin of the term "Mafia," referring to the original organization in Sicily. According to the Québec Organized Crime Commission's report of 1977, it describes "a state of mind, a feeling of pride, a philosophy of life and a style of behaviour. The mark of a known and respected man, it derives from the Sicilian adjective *mafiusu*, used since the 18th century to describe magnificent or perfect people." While originally a Sicilian society, the Mafia was exported and adapted to N America by a small group of Italian immigrants. Joe Bonanno, a self-described Mafia don, describes it thus in his memoirs: "Mafia is a process, not a thing. Mafia is a form of clan co-operation to which its individual members pledge lifelong loyalty. Friendship connections, family ties, trust, loyalty, obedience — this was the 'glue' that held us together." In Sicily, and later in the US and in Canada, Mafia came to refer to an organized international body of criminals of Sicilian origin, but it is now applied to the present dominant force in organized crime — the predominately Sicilian and Calabrian organized-crime groupings or "families." These families are held together by a code emphasizing respect for senior family members; by "Omerta," ie, a vow of silence about the family's activities; by the structure or hierarchy of the family; and by an initiation rite or ceremony.

Many of the Canadian Mafia families immigrated in the 1940s and 1950s, settling in Montréal, Toronto, Hamilton and Vancouver. Though located mainly in the major cities, family members tend to gravitate to where wealth moves; thus in the past few years some moved westward following the movement of business to BC and Alberta.

**Structure of the Mafia in Canada** In Toronto at least 4 major Mafia-style criminal organizations are run by Canadians of Sicilian or Calabrian origin, 2 of whom were named as members of the Mafia during the Valachi hearings. A third group, also active in Hamilton, is connected with the Magaddino organized-crime family in Buffalo. The most recently established of the 4 is a family known as the Siderno group, so called because many of the members are immigrants from the town of Siderno and its environs in Calabria.

In Montréal the major Mafia family is known as the Cotroni family. Led by the late Vincenzo "Vic" Cotroni (the "godfather") and his brother Frank, it constituted the first significant crime family in Canada. The Québec crime probe exposed the membership and activities of this highly structured group in a number of its reports. Established in the 1940s by Vic Cotroni, the family evolved in the 1950s into an important branch of the powerful New York City Mafia family of Joe Bonanno. It has extensive ties with Mafia families in Italy and throughout the US, as well as with the Toronto, Hamilton and Vancouver organizations.

A serious challenge to the supremacy of the Cotroni family in Québec came from the Dubois family, an indigenous French Canadian gang comprising 9 brothers, which dominated crime in the west end of Montréal until the early 1980s.

Serious internal problems between Sicilians and Calabrians in the Montréal organization led to the violent deaths of Paulo Violi (the chief lieutenant of Vic Cotroni) and his brothers in the late 1970s. The Cotroni family has primarily been involved in illegal gambling, loansharking, drug importation (utilizing the famous French Connection), extortion and the murder and corruption of public officials.

**Other Groups** Recently, motorcycle gangs such as the Hell's Angels, the Outlaws, Satan's Choice, and the Grim Reapers have become significantly involved in organized crime. Their initiation rights have made it difficult for law enforcement officers to penetrate the groups, which have become major suppliers of illegal drugs. They have also been involved in prostitution, and contract killing. It is now not unusual to find them working with other organized crime groups.

Various Chinese organized-crime groups have become more prominent over the past 20 years in Vancouver and Toronto, following a wave of immigration from Hong Kong in the 1960s and 1970s. Chinese youth gangs in Toronto and Vancouver are involved in protection rackets and extortion, but the more sophisticated groups are organized by senior "Triad" members from Hong Kong to import heroin from Southeast Asia through Vancouver. The Triads are ancient Chinese organizations that have evolved into organized-crime groupings.

The organized-crime structure changes quickly in Canada, and usually exists for some years before it is detected in cities or locations; therefore, there are undoubtedly other groups that have not yet been identified.

**Activities of Organized Crime** Organized crime in Canada provides some illegal services which certain sectors of the general public want, eg, gambling, prostitution, loansharking and the sale of soft drugs such as hashish, marijuana, speed and cocaine. In every large Canadian city, local bookmakers are involved in organized crime through an elaborate layoff system established to protect the individual bookie from large losses. Other organized-crime activities are not so readily desired by society at large. They involve the importation and distribution of hard drugs such as heroin (many drugs of the famous "French Connection" came into the US through Montréal with local Mafia involve-

ment), the fencing of stolen goods, and murder and extortion. Other activities that aid and abet organized crime include the ongoing corruption of public officials and the "laundering" of the proceeds of criminal activities.

One of the simplest ways to "launder" money is to use activities in which there is a constant flow of cash, eg, slot machines and gambling. If the owner of a gambling casino claims to have taken in \$1 million when he has actually taken in only \$100 000, to which has been added \$900 000 of illegally obtained money, it is almost impossible to demonstrate that the \$1 million was not procured in the normal course of business.

**Corruption** Without corruption, organized crime would find it very difficult to exist, and the efforts of organized crime to corrupt police, judges, politicians, lawyers and government and civilian officials are probably more deleterious to society than any other activity in which it engages.

**Orienteering** is a sport in which individuals or teams navigate on foot through unknown terrain with the aid of a map and special compass (called a silva), to complete a prescribed course in the fastest possible time, reporting to control points along the way. The sport combines athletic ability and mental exercise in a unique way — competitors are repeatedly put in positions of having to choose among possible routes. Orienteering racing was started in 1918 in Sweden as an attempt to attract young men to competitive track racing. It soon became a sport in its own right, and spread throughout the world after WWII. Introduced in Canada in 1948, the sport was actively promoted in school programs in the 1960s. By 1967, there was sufficient support to justify forming the Canadian Orienteering Federation, and the first Canadian championships were held the following year. In 1972, a Canadian team first attended the world championships. There are now orienteering associations in all 10 provinces and both territories.

BARBARA SCHRODT

**Orillia**, Ont. City, pop 23 995 (1981c), inc 1867 (village), 1875 (town), 1969 (city), located at the narrows between lakes SIMCOE and Couchiching in central Ontario. The site was originally used by a band of Ojibwa Indians led by Chief William Yellowhead. White settlement forced the Indians to move in 1838-39 to nearby Rama. The name may derive from an Indian word for red berry or from a Spanish word for riverbank applied by Sir Peregrine Maitland, lieutenant-governor of UC 1818-28, who had served in Spain. Originally logging and farming were the bases of the economy; later in the 19th century Orillia developed into a summer resort area. In 1902 Orillia established the first municipally owned hydroelectric generating station in Canada, on the nearby Severn R. Orillia served as the model for "Mariposa" in humorist Stephen LEACOCK's satire on small-town Ontario life, *Sunshine Sketches of a Little Town* (1912). The manuscript of *Sunshine Sketches* and a collection of Leacock's papers are held in the summer home, at nearby Old Brewery Bay, where he wrote many of his books.

DANIEL FRANCIS

**Oriole**, common name for members of 2 families of birds. The Old World family Oriolidae occurs from Europe through Africa and Asia to Australia. In the Western Hemisphere, the name refers to brightly coloured, black and yellow or orange birds of genus *Icterus*, family Emberizidae. Thirty species of these melodious songbirds are known, with greatest diversity found in Mexico and Central America. In most species males are larger and more brightly coloured than females. Yearling males often resemble females, perhaps reducing predation or aggression from older males. Two species breed in Canada. The orchard oriole (*I. spurius*) breeds locally in southern Ontario and recently in Manitoba. Northern orioles (*I. galbula*), common throughout southern Canada, breed in scattered trees and open woodland, weaving pendulous nests of plant fibres and hair. The female lays 4-5 greyish white eggs marked with brown or black scrawls. Northern orioles consume insects and small fruits. They winter from southern Mexico to Colombia and Venezuela. The term "northern oriole" is a recent taxonomic revision and includes the Baltimore (*I. galbula*) and Bullock's orioles (*I. bullocki*). R.J. ROBERTSON

**Orléans, Ile d'**, 190 km<sup>2</sup>, 33.3 km long by 8 km wide, is situated just downstream from QUÉBEC in the ST LAWRENCE R. The largest island in the river after the island of Montréal, it is a relatively level plateau, 137 m at its highest point and steep sided. It is surrounded by wide sandbanks on the N and a narrow bank on the S. The plateau is the vestige of an old eroded Appalachian surface, progressively isolated from the mainland by 2 river channels until it formed an island. The central part is wooded; the island is very fertile and drained by the Maheu, la Fleur, Dauphine and du Moulin rivers. Jacques CARTIER called it Ile de Bacchus in 1535 because of the vines growing there, and rebaptized it Ile d'Orléans in 1536 to honour the duc d'Orléans.

In 1542 Jean-François de La Roque de ROBERVAL tried to start a settlement here. It was granted to 8 associates in 1636 by the COMPAGNIE DE LA NOUVELLE FRANCE. It became Ile Ste-Marie during the HURON settlement of 1650 to 1657. These first farmers, installed on land belonging to Eléonore de Grandmaison at the far upstream end, were massacred in 1656 by the Iroquois. Land clearing began again in 1660. The parish of Ste-Famille was founded in 1661 and the first church built in 1669 (see RELIGIOUS BUILDING). Jean des LAUSON, seneschal of New France, fell victim to the Iroquois in 1661. The island became the property of Mgr de LAVAL, first bishop of Québec, in 1668 (it had 471 inhabitants, as many as Québec). It was ceded as a fiefdom to François Berthelot in 1675, under the name of Isle de St-Laurent. The parishes of St-Pierre, St-François and St-Jean were founded in 1679. St-Paul parish became St-Laurent parish in 1698. A precise map of the island was made in 1689 by Robert de Villeneuve.

By 1725, again under the name of Ile d'Orléans, it was very prosperous. In 1759 it was used as a base for British operations against Québec and was ransacked by the troops of WOLFE and GUY CARLETON. In 1824 and 1825 a short-lived naval yard at the upstream end of the island built the *Columbus* and the *Baron Renfrew*. A seaport developed at this site and became the Ste-Pétronille parish in 1870. Agriculture still thrives. The island's beauty, historical buildings, handicraft and horticultural products draw many tourists. SERGE OCCHIETTI

**Ornamentals**, in horticulture, are woody and herbaceous PLANTS used primarily as amenities. Woody ornamentals are perennial (ie, persist for more than 2 years) and include TREES, shrubs and vines; herbaceous ornamentals are annual, biennial or perennial (persist for one, 2 or more years) and make up the vast array of things that

provide colour in flower beds and borders. In Canada, winter hardiness is very important to growers of woody ornamentals. The ability of a woody plant to survive a Canadian winter of moderate severity depends largely on the annual stage of maturity reached and the cold resistance achieved by the end of the growing season. Plants that require a long season in which to mature seldom achieve this state when grown in regions with short growing seasons.

Winter hardiness does not present the same problem with herbaceous ornamentals. Annuals do not overwinter. When the normal growing season is not long enough for them to grow and produce FLOWERS, the grower simply starts them indoors (eg, in a GREENHOUSE), and transplants them outside when the risk of frost is over. The common snapdragon, for example, is generally seeded in the greenhouse in Feb and planted outside in late May or early June. If such plants were seeded directly outdoors in May, in regions where the frost-free period was 90 days or less, they could blossom for only a few weeks before being killed by frost. Herbaceous biennials and perennials are allowed to remain in the soil all year; their winter survival is generally assured if they receive adequate snow cover to protect them from severe temperatures and prevent alternate freezing and thawing of the soil around the roots.

Generally, ornamentals are either selected forms of specific plants (ie, cultivars or commercial varieties) or hybrids between species. Because of the winter-hardiness problem, many woody ornamental cultivars and hybrids have been derived from plants indigenous to Canada and the northern US. However, plants from NW China, Manchuria, Siberia and Korea, regions with CLIMATES similar to many of our own, have provided good parent material for new hybrids, as well as making a valuable contribution on their own. Herbaceous ornamentals are also made up of cultivars and hybrids. Improvement programs involving hybridization, both within and between species, are commonplace. Hardy perennials and biennials are chiefly temperate-region plants; annuals derive mainly from South African and Californian natives.

The Canadian Ornamental Plant Foundation was chartered by the federal government in 1964 to promote selection, testing and distribution of better ornamental plant varieties. The procedures have provided breeders of new cultivars with the means of getting worthwhile new introductions into the trade and, thence, to the general public. Much research into the development of cold-hardy plants takes place at Agriculture Canada RESEARCH STATIONS across the country. Recent successes include a cultivar of *Alstroemeria*, a member of the amaryllis family, developed at the Saanichton Research and Plant Quarantine Station, BC; Northline (a silver maple), Autumn Blaze (a white ash), Wascana (a hybrid linden) and Baron (a box elder), all developed at the Morden Research Station, Man, for prairie use; and 2 new winter-hardy rose cultivars (Charles Albanel and Champlain), developed at the Ottawa Research Station.

R.H. KNOWLES

**Oromocto**, NB, Town, pop 9064 (1981c), inc 1955, is located at the junction of the Oromocto and Saint John rivers, 22 km SE of FREDERICTON. The Malecite called the Oromocto *Wel-a-mook'-took* ("deep water") because of its good canoeing. The French had a small settlement there in the late 1600s and after 1763 New England traders used the location during their speculations on the SAINT JOHN R. About 1776 the British army built Fort Hughes to protect the new settlements, the overland route to Québec City and the rich harvest of pine masts for the Royal Navy. Prosperity continued after the arrival of the LOYALISTS after 1783. Timber remained the

economic mainstay well into the 20th century with shipyards, sawmills and the business of the local merchants supplying the hinterland settlers. The most far-reaching changes occurred in the 1950s when CFB GAGETOWN — the largest land-manoeuvres training area in the Commonwealth — was established on Oromocto's borders. When the town expanded to provide for the military influx, a comprehensive plan was adopted and Oromocto became "Canada's Model Town." Its economy has fared well, servicing and supplying the base, and the town has also attracted several nonpolluting manufacturers to its 34 ha industrial park. DALE R. COGSWELL

**Oronhyatekha** ("burning cloud"), or **Peter Martin**, medical doctor (b on the Six Nations Reserve near Brantford, Canada W 10 Aug 1841; d at Savannah, Ga 3 Mar 1907). Oronhyatekha paid for his own education at the Wesleyan Academy at Wilbraham, Mass, and later at Kenyon Coll in Ohio. The Prince of Wales on his 1860 visit to Canada became sufficiently interested in him to invite him to study in England. Oronhyatekha spent 3 years at Oxford, and later completed his medical degree at U of T, the first Canadian Indian to receive a degree from a Canadian university. In Ontario he practised at Frankford (near Belleville), Stratford, Neepaw and London. He joined, and rose rapidly to become supreme chief ranger (1881) of, the Independent Order of Foresters. For 26 years he guided the IOF's growth from a struggling bankrupt fraternal organization of 400 members, to a membership of more than 250 000, and a fund of over \$11 million. Oronhyatekha wrote *History of the Independent Order of Foresters* (1894).

DONALD B. SMITH

**Orr, Robert Gordon**, "Bobby," hockey player (b at Parry Sound, Ont 20 Mar 1948). He was an outstanding junior player with Oshawa Generals and joined Boston Bruins in 1967 at the age of 18, winning the CALDER TROPHY. He revolutionized the role of the defenceman with his end-to-end rushes, playmaking and incredible scoring feats — he is the only defenceman ever to win the ART ROSS TROPHY as leading scorer, and accomplished it twice. He dominated the flow of play, surging forward and skating with an intensity exemplified in the photograph of him soaring through the air after scoring the Stanley Cup winning goal. He was voted the greatest athlete in the history of Boston, ahead of the great baseball and basketball stars. His list of awards is to date unmatched by any player in NHL history: HART TROPHY 1970, 1971 and 1972; CONN SMYTHE TROPHY 1970 and 1972; and JAMES NORRIS TROPHY 8 years 1968-75 — the greatest domination of an award by any player. He suffered his first knee injury in his rookie season, and by the time he left Boston to sign a \$3-million contract with Chicago Black Hawks (1976-77), he had had 6 knee operations. His legs destroyed, he played only 26 more games before retiring. JAMES MARSH

**Orthodox Church**, also commonly known as the Eastern, Greek or Byzantine Church, a family of Christian churches historically found in eastern Europe, the Near East, Africa and Asia. The 1981 census indicates that it now serves some 362 000 Canadians, although the total constituency claimed by the churches is higher. The ancient patriarchal provinces of Rome, Constantinople, Alexandria, Antioch and Jerusalem were all established by the 5th century AD, but thereafter theological, liturgical and canonical divergence, as well as political differences, came between Rome and the other provinces. The great schism of 1054 formally separated Rome (the Roman Catholic Church) from Constantinople and most of the population of the remaining 3 jurisdictions (the Orthodox Church). The issues leading to the

schism, which still separate the Roman and Orthodox churches, include differences in trinitarian theology and church organization: the Orthodox churches dispute the Roman church's teachings on the Holy Spirit and the nature of authority in the church, specifically the primacy of the pope. The juridical ethos of Roman Catholicism and Protestantism is perceived by the Orthodox as the central problem in Western Christian thought and institutions.

The present-day Orthodox Church includes the ancient patriarchates of Constantinople, Alexandria, Antioch and Jerusalem; the "national" Orthodox churches of Russia, Serbia, Romania, Bulgaria, Cyprus, Greece, Albania, Poland and Czechoslovakia; daughter churches of these, formed recently in Europe and N America; and the autonomous churches of Sinai, Finland and Japan. The unity of these "Byzantine" churches is theoretically found in their mutual recognition of a common faith and worship, rather than in any external authority or administrative structure. In practice, however, patriarchs of the various branches, though independent, tend to recognize the primacy of the Ecumenical Patriarch of Constantinople. A second group, the Oriental Orthodox (non-Chalcedonian) churches, includes the Armenian, Coptic, Syrian, Ethiopian and South Indian Orthodox churches. Members of this family, regarded by the Byzantine churches as uncanonical, since they do not formally subscribe to the doctrine defining the dual nature of Christ as adopted by the Council of Chalcedon (451 AD), are nevertheless within the larger Orthodox family.

Orthodox Church buildings are laid out to reveal the experience of God dwelling among men, and are patterned after the image of heaven in the Book of Revelation. The focal point is the Holy Table. An icon screen unites the sanctuary and the place of assembly. Everything which is in and of the church is considered "sacramental," ie, manifesting the mystery of salvation and integrating the faithful into the life of the Kingdom of God. Among numerous rites and acts the Holy Mysteries are central: initiation through baptism (by triple immersion) and chrismation (anointing), the Eucharistic liturgy, marriage, monastic tonsure, reconciliation, anointing of the sick or dying, holy orders and burial. Icons (religious images) are held to be necessary spiritual witnesses to the unity of the church through time and space, making present the Kingdom of God in the persons and presence of the saints. There are daily, weekly and yearly cycles of prayer and worship. The primary focus of the church year, which begins Sept 1, is Pascha (Easter); each Lord's Day (Sunday) is seen as the extension of Pascha.

Most Orthodox Christians in Canada are affiliated with churches of the Byzantine tradition: Russian, Greek, Antiochian, Ukrainian, Byelorussian, Estonian, Bulgarian, Serbian, Macedonian and Romanian. Although an earlier attempt was made to settle Orthodox Christians in Florida, the coming of Russian missionary monks among the Aleut peoples of Alaska in 1794 marked the real advent of Orthodoxy in N America. (The first Orthodox church in Canada may have been that at Wostok, Alta, est 1898.) A diocese centered on Sitka, established 1799, expanded into other parts of N America. In 1905 it became an archdiocese with headquarters in New York, amid successive waves of immigration from Russia, Byelorussia, Carpatho-Russia and Ukraine. After the 1917 Russian Revolution, the Russian church came into conflict with the new communist government. In 1924 most Russian and associated parishes in N America declared their administrative independence, and a new metropolia, the Russian Church in America, was established. Its irregular and tense relationship with the mother

church was resolved in 1970 when the Patriarch of Moscow and All Russia granted it autocephalous (self-governing) status. Now called the Orthodox Church in America, it affirmed the patriarch as its spiritual father, though remaining administratively independent. OCA's Canadian diocese serves some 20 000 adherents with 52 parishes and about 30 clergy. The Liturgy of St John Chrysostom is celebrated in Church Slavonic, Romanian, English or French. Some communities use the Julian (old style) calendar, others the Gregorian (new style). The church operates vigorous catechetical and mission programs.

Some Russian parishes chose to remain under the authority Parishes of the Russian Orthodox Church in Canada. Seventeen parishes in Alberta and Saskatchewan are served by 7 clergy, whose bishop is based in Edmonton. English has been introduced, but Church Slavonic remains the liturgical language. The remaining Russian Orthodox believers are part of the Russian Orthodox Church Outside Russia, formed 1920 in Yugoslavia by refugees of the Russian Revolution. Its headquarters is now in New York. Conservative and monarchist, it has broken communion with canonical churches and supported other ethnic traditionalist groups. Its Canadian Diocese is administered from Montréal, with 25 parishes and several monastic *sketes*. Church Slavonic is the customary language of worship and the Julian calendar is observed.

The Greek Orthodox Archdiocese of N and S America, the major daughter church of the church of Constantinople, has 62 Canadian parishes with a Toronto-based diocese which is a member of the CANADIAN COUNCIL OF CHURCHES (CCC). Substantial Greek immigration in the 1960s and 1970s has caused the membership to rise to over 200 000, served by 48 clergy. The principal language is Greek, and the church maintains strong links with Greek culture. The Gregorian calendar has been used since 1923, although 5 "Old Calendarist" parishes in Montréal and Toronto broke with the Greek church over its adoption of the revised calendar.

The majority of Canadian Christians with Syrian, Lebanese and Palestinian ancestry are part of the Antiochian Orthodox Christian Archdiocese of N America, daughter of the patriarchate of Antioch (Damascus, Syria). A mission established 1892 by the Russian Orthodox Church, and another established 1914 by the Antiochian patriarchate for the Syrian immigration, were its seeds. They merged in 1936, and the present name was adopted in 1969. The Antiochian church, which maintains close links with OCA, has made a concerted effort to use English, which is now the principal liturgical language. Eleven parishes are scattered from PEI to Alberta.

The Ukrainian Orthodox Church in Canada, formerly the Ukrainian Greek Orthodox Church, comprises 278 communities with about 140 000 parishioners. These are largely descendants of immigrants from Galicia, Ukraine, who settled on the Prairies from the turn of the century to 1929, and other Ukrainians who settled in Ontario cities after WWII. In 1932 the church established St Andrew's College, which affiliated with University of Manitoba in 1962. St Michael's parish at Gardenton, Man, the first Ukrainian church in Canada, is the site of an annual PILGRIMAGE.

Historically, Galicia was under the Ruthenian Rite of the Roman Catholic Church. Tension developed between the Canadian community and the Catholic hierarchy over the Galicians' historic right to have married clergy and to use the vernacular language in the liturgy. Oblate priests, sent into various parishes, raised fears among Galicians that they were being "westernized." In response the Ukrainian Greek Ortho-

dox Brotherhood was formed in 1918, and led many Ukrainian Catholics into the Orthodox Church. A Syrian Antiochian Orthodox bishop assumed spiritual responsibility and ordained 3 priests. In 1951 the election of Ilarion Ohienko as metropolitan confirmed the church's autonomy. Metropolitan Ilarion, a noted Slavic linguist, translated the Bible into Ukrainian under the sponsorship of the British and Foreign Bible Society. The church's government is by consistory, a council of laymen and clergy, which is its highest authority. The liturgy is conducted mostly in vernacular Ukrainian. Consistent with its vision of itself as the bearer of Ukrainian culture, the church supports schools and folk groups, which form an integral part of community life.

The Ukrainian Orthodox Church of America (Ecumenical Patriarchate), organized 1928, has 4 parishes in Canada. It became a metropolia in 1983. The (Holy) Ukrainian Autocephalic Orthodox Church in Exile, with 2 Canadian parishes, is a body formed 1954 by clergy and laymen who fled Ukraine following its return to the Soviet sphere in 1944. The church traces its ecclesial origins to the Orthodox Church of Poland, which in 1924 received autocephalous status.

The Bulgarian Eastern Orthodox Church (Diocese of N and S America and Australia), begun as a mission of the Holy Synod of Sofia to Bulgarian and Macedonian immigrants in N America, became a metropolia following WWII. Ties with the Holy Synod were broken 1947-62 as the community debated its relationship to the mother church, which was under the communist umbrella. In 1962 some Bulgarians rejoined the mother church, but others condemned that action. At first organized under the Russian Church in Exile as the Bulgarian Orthodox Church, Diocese of the USA and Canada, the dissidents merged with the OCA, with a diocese centered in Toledo, Ohio. The Patriarchal Church and the Russian Church in Exile each have one Bulgarian community in Canada. Complicating this situation is the Macedonian Orthodox Church, Diocese of America, Canada and Australia, administered from Toronto. Comprising Macedonians and Bulgarians, it is the result of the re-establishment of the ancient Macedonian see of Ohrid as an independent church along national lines.

Created in the 14th century, the Orthodox Church in Byelorussia has almost constantly struggled for autonomy from the patriarch at Moscow. Following the local government's 1946 alignment with Moscow, Byelorussians established churches in exile. In 1968 the diocese of the Byelorussian Autocephalic Orthodox Church based in Toronto received its first archbishop. There one church serves several missions in mid-Canada's industrial belt. A translation of the Divine Liturgy into Byelorussian has been prepared in Canada. In 1951 a Byelorussian church in Toronto became part of the canonical Byelorussian Orthodox Parishes under the jurisdiction of the Ecumenical Patriarch, who exercises his authority through the Greek archbishop of Toronto.

A similar struggle for autonomy has marked the history of the Estonian Orthodox Church, a national church since 1920. At various times it was under the Ecumenical Patriarch or the Patriarch of Moscow. When the USSR occupied Estonia in 1944, Archbishop Aleksander of Tallinn fled to Sweden and established the church in exile under the Patriarch of Constantinople. It was brought to Canada by Estonian immigrants after WWII. Parishes in Toronto, Montréal and Vancouver serve 1500 Estonians.

Serbian immigration began in the 1850s with settlements in BC. Communities on the Prairies developed following the turn of the century and in the 1920s others were established around

Hamilton, Ont. Initially these were served by a Serbian Mission of the Russian Orthodox Church. With the re-establishment of the Holy Synod in Belgrade in 1921, N American churches were transferred to its jurisdiction and became the Serbian Orthodox Church in the USA and Canada. Attempts to establish N America as a metropolia failed, and in 1963 the Holy Synod in Belgrade created 3 dioceses for the continent. The 17 Canadian churches are served by 12 clergymen. Church Slavonic is used and the Julian calendar observed. The Serbian Orthodox Free Diocese in the USA and Canada resulted from a schism in 1963, when the Church-National Assembly voted to retain a bishop suspended by the Holy Synod. The assembly declared its autonomy from the Yugoslavian church, arguing that it was dominated by the communist government. The Serbian communities maintain ties with several autocephalous churches, although some canonical bodies do not recognize them. There are 7 Canadian communities, and a monastery at Chilliwack, BC.

The Romanians adopted Christianity in the 4th century, but a national church was not established until 1859; it became a Holy Synod in 1885. The first Romanian parishes in Canada were established about 1909 on the Prairies, among immigrants from the provinces of Bukovina and Transylvania. In 1930 the patriarchate established the Romanian Orthodox Missionary Episcopate in America, which became an archdiocese in 1950. Though autonomous, it maintains ties with the mother church in Bucharest. Canada's 20 parishes, located largely in the Prairie provinces, follow the Gregorian calendar and use Romanian in the liturgy. In 1951 many Romanians in N America rejected the bishop appointed by the church in Romania. The resulting schism led to the Romanian Orthodox Episcopate of America. Through the Ukrainian Orthodox Church of the USA a bishop was consecrated, and in 1960 he placed the jurisdiction under the Russian Metropolia (later OCA). The episcopate's 13 Canadian churches in Ontario and the Prairie provinces use Romanian and English in their liturgy and follow the Gregorian calendar.

**Oriental Orthodox Christians** in Canada (non-Chalcedonians) are of Armenian, Coptic, Ethiopian, S Indian and Syrian origin. The Ca-

Bishop Ioasaph blessing the waters on White Fish Lake, Alberta, c1949 (courtesy Folk Life Program/Provincial Museum of Alberta).

nadian diocese of the Armenian Church of N America (est 1898) is governed by an assembly of laymen and clergy who elect a primate for a 4-year term, and is a member of CCC. The church is under the patriarch of Etchmiadzin (USSR), head of the Armenian Church, and historically linked to the patriarchates at Jerusalem and Constantinople. The Armenian community in Canada was established following WWI, and in the 1950s and 1960s a second immigration largely from Turkey, Egypt, Syria, Lebanon and Iran occurred. Eight Canadian parishes now serve 50 000 Armenians. The first parishes were established in St Catharines and Hamilton, Ont, followed by those in Toronto, Montréal, Ottawa, Edmonton and Vancouver. The Liturgy of St Basil is customarily celebrated in classical Armenian. The use of unleavened bread at communion reflects the influence of a brief union with the Roman church in the 13th and 14th centuries. Though the Armenians follow the Julian calendar, they continue the ancient form of celebrating the Christ's nativity as part of the feast of Epiphany.

The Coptic Orthodox Church, Diocese of N America, was established 1961 to serve recent Egyptian immigrants, who settled principally in Montréal, Toronto, Kitchener and Ottawa. Followers of the Coptic Church of Ethiopia and the St Thomas Church of S India have joined in their liturgy. The Coptic Church traces its origin to the apostle Mark who, tradition claims, evangelized Egypt. The patriarchate of Alexandria

was of great significance in the early church, ranking in importance with Rome and Jerusalem. The N American diocese functions directly under the Coptic patriarch. The Liturgy of St Mark is regularly celebrated using the ancient Coptic chant and modern Arabic with occasional English and French. The Canadian church has recently translated this liturgy. It also sponsors a quarterly publication, *Coptologia Studia Coptica Orthodoxa*, and holds membership in the CCC.

The Syrian Orthodox Church of Antioch in the US and Canada (frequently termed "Jacobite" after 6th-century organizer Jacob Baradaeus) is part of the ancient Antiochian patriarchate in Damascus. Along with the Syrian Liturgy of St James, a distinctive aspect of piety is a rigorous private prayer life. The 2 churches in Canada, in Montréal and Toronto, serve Syrians who immigrated in the 1950s.

Two additional bodies which regard themselves as Orthodox exist in Canada. The Evangelical Orthodox Church, Saskatoon Diocese, separated from an Evangelical Mennonite Brethren church and identified with similar movements in the US, initially as the New Covenant Apostolic Order. Members developed a PRESBYTERIAN form of government, adopted apostolic forms of ministry and developed liturgical worship. This movement formed the Evangelical Orthodox Church of America in 1976 and is now seeking canonical status. The African Orthodox Church, of which the single Canadian parish was established in Sydney, NS, in 1921, developed as part of the movement of black self-consciousness early in the century. It accepts the teaching of the 7 ecumenical councils and conforms to standard Orthodox practice.

Orthodox churches in Canada, while reflecting world Orthodoxy, have been affected by political activities and ethnic divisions in their regions of national origin. Some jurisdictions argue that such divisions contravene the canonical principle that the church be united, with all the faithful gathered around a common episcopate. Efforts are being made in N America to realize this principle. Although the churches in Canada continue to serve their historic constituency, the initial immigrants, they now face new generations whose linguistic and cultural formation has taken place entirely in Canada. Questions about liturgical language and practice and about the mission of the church in Canadian society form the agenda of today's church. See also CHRISTIANITY.

**Orton, George W.**, runner (b at Strathroy, Ont 10 Jan 1873; d at Meredith, NH 26 June 1958). Canada's first Olympic champion, Orton was one of N America's premier track competitors in the 1890s. Regarded as the most scientific student of middle-distance running, he won the Canadian and American mile championships in 1892 and 1893. By 1900 he had accumulated 121 victories, including 15 American championships. Since Canada sent no team to the 1900 Paris Olympics, he competed for the US, winning the 2500 m steeplechase and finishing 3rd in the 400 m hurdles. He was a prolific writer on sport and running. J. THOMAS WEST

**Osgoode, William**, judge (b at London, Eng 1754; d there 17 Jan 1824). Educated at Christ Church, Oxford, he was admitted to Lincoln's Inn in 1779. After some years of chancery practice, he took office in 1792 as the first chief justice of UPPER CANADA and 2 years later took up a similar post in LOWER CANADA. In 1801 he returned to England and lived the rest of his life as a country gentleman. He was a man of tranquil temperament who played an important mediating role during his time in Canada. He did not

leave a strong judicial legacy but drafted much of the pioneering legislation. The law courts in Toronto and Canada's best-known law school are named after him.

GRAHAM E. PARKER

**Osgoode Hall**, named after William OSGOODE, was built 1829-32 as the headquarters of the Law Society of Upper Canada. It was later expanded to house law courts and the Osgoode Hall Law School. As originally designed by John Ewart and W.W. Baldwin, Osgoode Hall was a modest 2-and-one-half-storey brick building. In 1844 and again in 1855-57 it was extensively refurbished and enlarged, first by the Toronto architect, Henry Bower Lane, and then by the local firm of Cumberland and Storm. The 1829 building became the east wing of a larger composition defined by a long central pavilion surmounted by a dome and flanked by 2 projecting wings fronted by a classical portico. Despite this gradual evolution, the building presents a unified appearance, and the design, with its classical porticos set on rusticated arcades, provides one of Canada's most important examples of public architecture in a late Palladian style.

JANET WRIGHT

**Oshawa, Ont., City**, pop 117 519 (1981c), inc 1924, is located 52 km E of Toronto on Lk Ontario. Originally called Skae's Corners, its present name is an Indian term whose exact meaning is disputed, though "portage" is a common choice. In 1970 Oshawa became administrative centre of the newly formed Durham region. Its initial function as a transportation centre was because of an excellent harbour, good road connections and the GRAND TRUNK RY (1856). Manufacturing soon took precedence. Especially notable was Joseph Hall Iron Works, manufacturer of the Champion plough and other farm implements, and A.S. Whiting Co, manufacturer of smaller farm tools. The dominant manufacturer became McLaughlin Carriage Works, developer of the Buick automobile. In 1918 the newly formed GENERAL MOTORS CORP bought the business from local entrepreneur Robert S. "Colonel Sam" MCLAUGHLIN. In the years that followed, GM became not only the dominant employer, but after several years of poor labour relations, the target of a strike. GM workers certified the United Automobile Workers, an industrial union affiliated with the Congress of Industrial Organization. Much to the chagrin of Ontario Premier Mitchell HEPBURN, who hoped the UAW would lose the strike, the union, despite the use of special police, established itself as a force in Canadian labour (see OSHAWA STRIKE).

Prominent Oshawans have included Michael Starr, cabinet minister in the Diefenbaker government; Edward BROADBENT, federal leader of the New Democratic Party; and Donald JACKSON, world figure-skating champion.

**Oshawa Strike**, 8-23 Apr 1937, when more than 4000 workers of the huge General Motors plant in Oshawa, Ont, struck. Their requests were simple: an 8-hour day, better wages and working conditions, a seniority system and recognition of their union, the new United Automobile Workers. This last demand had caused the strike: the UAW was an affiliate of the recently created Committee for Industrial Organizations (CIO), which was organizing industrial workers throughout the US. Vigorously supported by Ontario Premier Mitchell HEPBURN, GM management strove to keep the CIO out of Ontario. Both the company and the premier wanted a pliant labour force — unorganized, impotent and cheap. To break the strike, Hepburn even created his own police force, known irreverently as Hepburn's Hussars and Sons-of-Mitches. Two of Hepburn's cabinet colleagues who opposed his actions, Labour Minister David Croll and Attorney General Arthur Roebuck, were persuaded to resign. Supported by fellow unionists, neighbours, and CCF and communist activists, but significantly not by the CIO which had little money to spare for Canada, the workers held out for 2 weeks.

Eventually GM, afraid of losing markets to its competitors, capitulated. In the Apr 23 agreement GM accepted many of the union's demands, without recognizing the union. To gain recognition, the union leadership publicly repudiated the CIO connection. Nevertheless everyone knew it was a great CIO victory — the first major one in Canada. According to some, the strike marked the birth of INDUSTRIAL UNIONISM in Canada.

IRVING ABELLA

Outstanding physician and educator Sir William Osler (courtesy Public Archives of Canada/C-7105).

**Osler, Sir William**, physician, writer, educator (b at Bond Head, Canada W 12 July 1849; d at Oxford, Eng 29 Dec 1919). His importance stems from his contributions to knowledge in a wide spectrum of clinical fields, his educational activities both in person and through his writings, his stimulation of students who later became leaders of the medical profession, his enthusiastic support of scientific libraries, and his example as a person of integrity, equanimity and sincere humanity.

Osler was raised in Dundas, Canada W, and educated at U of T and McGill, where he graduated MD in 1872. After postgraduate training in England and Europe, he began his teaching career at McGill, lecturing in medicine and pathology, publishing extensively and building an international reputation as an astute and humane clinician. In 1884 he accepted an invitation to join the faculty of U of Pennsylvania, and 5 years later he became the first professor of medicine at Johns Hopkins U in Baltimore.

By the turn of the century, Osler was probably the best-known physician in the English-speaking world. He achieved this position with a combination of superb practice, excellent and innovative teaching, wide-ranging publication, and association with outstanding colleagues in the most advanced school of its time. His professional interests were unusually wide, but he was particularly expert in diagnosis of diseases of the heart, lungs and blood. His textbook, *The Principles and Practice of Medicine*, first published in 1892 and frequently revised, was considered authoritative for more than 30 years. His description of the inadequacy of treatment methods for most disorders was a major factor leading to the creation of the Rockefeller Institute for Medical Research in New York City.

Osler was an outgoing, vivacious man, given to practical jokes and pranks. He knew how to dispel gloom in the sickroom and how to inspire his patients with hope. He advocated changes in the medical curriculum to decrease the amount of lecturing and increase the time students spent with patients. He was one of those who formalized the methods of postgraduate training for physicians, helping to create the system followed today.

Osler married at age 42, his wife being a direct descendant of Paul Revere. One of their 2 chil-

Distribution of Industrial Activity\* by Industry Grouping within Census Metropolitan Areas, 1980

#### Industry groupings

1. Food and beverage and tobacco products industries
2. Leather, textile, knitting mills and clothing industries
3. Wood, furniture and fixtures, paper and allied and printing, publishing and allied industries
4. Machinery, transportation equipment and electrical products industries
5. Primary metal and metal fabricating industries
6. Rubber and plastic products, petroleum and coal products and chemical products industries
7. Non-metallic mineral products and miscellaneous manufacturing industries.

\* Industry activity based on the average of percentage shares of the value shipments of goods of own manufacture, total value added and total number of employees for each of the selected metropolitan areas.

Source: Figure 11, Catalogue 31-209, Statistics Canada.

dren died at birth, the other in WWI. In 1905 the family left N America for Great Britain, where Osler became Regius professor of medicine at Oxford. The recipient of many honorary degrees, he was created a baronet in 1911. His last years were spent carrying on a busy consultant's practice, writing, teaching and building up his extensive library in the history of medicine, which eventually was bequeathed to McGill. In 1919 Osler died of pneumonia developed after a lengthy trip of consultation. His ashes rest in the Osler Library, Montréal. His name is still much quoted and his life remains an exemplar for students and physicians. CHARLES G. ROLAND

**Osoyoos**, BC, Village, pop 2738 (1981c), inc 1946, is located on Osoyoos Lk, 60 km S of Penticton. *Soyoos* ("where two lakes meet") was a local Indian name. HBC brigades passed here 1812-48. The BC gold rushes helped open the area. A customs house was placed at the narrows in 1865. Customs collector John Carmichael Haynes, justice of the peace for Osoyoos and Kootenay districts, was a pioneer settler at Osoyoos and accumulated 8900 ha of land for a cattle and horse ranch. The first commercial orchard was established nearby in 1890. The South Okanagan Irrigation Project brought an irrigation canal to the area by 1919. Agriculture is now the largest sector and gives rise to some manufacturing. Less important are cattle raising and forestry. Warm lakes attract many tourists. Osoyoos has been picked as the site for the 1985 BC Winter Games, which will further development of Mt Baldy, a ski area E of the village.

WILLIAM A. SLOAN

**Osprey** (*Pandion haliaetus*), large, cosmopolitan BIRD OF PREY characterized by a crested head and contrasting black, white and grey plumage. It feeds exclusively on fish and is commonly called fish hawk. Adaptations for fishing include nostrils that close, feet designed for catching and holding quarry with sharp spicules (small spines) on the underside, and a reversible outer toe. Although frequently accused of feeding on sport fish, ospreys feed mainly on non-game fish found near the surface or in shallow water. Ospreys breed across Canada, building large, stick nests near or over water. Early each fall they migrate to S America. R.W. FYFE

**Ostell, John**, architect, surveyor (b at London, Eng 7 Aug 1813; d at Montréal 6 Apr 1892). The most important architect in Montréal between 1836 and 1859, Ostell designed the Custom House, Place Royale, the McGill arts building, the Episcopal Palace, the Grand Seminary of St Sulpice, the Court House and the Church of St Jacques. Appointed city surveyor in 1842, he was also the provincial surveyor in the late 1840s and early 1850s. In 1859 he gave up his practice to concentrate on lumber manufacturing. Ostell became a director of the New City Gas Company in 1850, president of the Montréal and Champlain Railroad in 1860, and helped to found the Montreal City Passenger Railway in 1861. ELLEN S. JAMES

**Ostry, Bernard** (b at Wadena, Sask 10 Jun 1927), public servant. After studying history at U of Man, Ostry launched an academic career at the universities of London and Birmingham in England. There, in collaboration with H.S. Ferns, he published *The Age of Mackenzie King: The Rise of the Leader* (1955; 2nd ed 1976), a critical and controversial study of the former prime minister. Ostry returned to Canada in the late 1950s, working for the CBC 1960-68 as a broadcaster and subsequently as an administrator in the public affairs department. He was then a commissioner on a prime-ministerial task force regarding government information, and one of the authors of its report, *To Know and Be Known* (1969); this provided a transition for the ambitious and now well-connected Ostry to the top

level of the federal government cultural bureaucracy. He was assistant undersecretary of state 1970-73; secretary general, National Museums of Canada, 1974-78; and finally deputy minister of communications 1978-80. His strong views on the importance of the arts and the government's role in cultural life are contained in his *The Cultural Connection* (1978). In 1981, after a brief sojourn in France, he moved to the Ontario government, where he served in a series of deputy minister appointments. NORMAN HILLMER

**Ostry, Sylvia**, née Knelman, economist, public servant (b at Winnipeg 3 June 1927). Ostry was educated in Winnipeg and at McGill and Cambridge. She began her career in university teaching at McGill and Oxford. In 1964 she joined the federal public service as assistant director and then director, special Manpower Studies, Dominion Bureau of Statistics (1964-69). She was director, Economic Council of Canada (1969-72); chief statistician of Canada (1972-75); deputy minister, Consumer and Corporate Affairs (1975-78); chairman, Economic Council of Canada (1978-79). In 1980 she was appointed head, Dept of Economics and Statistics, Organization for Economic Cooperation and Development, Paris. In 1983 she returned to Ottawa as special adviser to the Privy Council Office on loan to the Inst of Research on Public Policy. In Jan 1984 she became a deputy minister, internal trade, Dept of External Affairs. Called the "ultimate public servant," she has contributed especially in the areas of labour economics, manpower studies and productivity. She is co-author of *Labour Economics in Canada* (3rd ed, 1979) and has also published on demography, productivity and competition policy.

**Ottawa** (or Odawa) were an Algonquian-speaking group living north of the HURON at the time of French penetration to the Upper Great Lakes. A tradition of the Ottawa, shared by the Ojibwa and Potawatomi, states that these 3 groups were once one people. The division of the Upper Great Lake Algonquians apparently took place at Michilimackinac, the meeting point of Lakes Huron and Michigan. The Ottawa, or "traders," remained near Michilimackinac, while the Potawatomi, "Those-who-make-or-keep-a-fire," moved S, up Lk Michigan. The Ojibwa, or "To-roast-till-puckered-up," went NW to Sault Ste Marie.

The farming, fishing, hunting and trading economy of the Ottawa resembled that of other Great Lakes people. The Ottawa were closely tied to their Huron neighbours and, in fact, were a vital part of the so-called "Huron Trading Empire." When HURONIA was destroyed by the IROQUOIS in the mid-17th century, the Ottawa fled west. After 2 decades they were back on MANITOULIN I, but they continued to occupy settlements elsewhere on the shores of the Great Lakes. They located their principal settlements near the French fort at Michilimackinac, though many migrated to the Detroit area when the French built a fort there in 1701. During the final struggle for northeastern N America, the Ottawa supported the French.

After the French defeat, the Ottawa, under PONTIAC of the Detroit region, organized a pan-Indian uprising against the English who threatened to encroach on Indian lands. Though unsuccessful, the uprising led the British to issue the royal PROCLAMATION OF 1763, which recognized the legal right of Indian tribes to claim title to the lands they occupied. The proclamation is the Magna Carta of Indian land rights in Canada, and still applies today (see LAND CLAIMS).

During the American Revolution and the War of 1812, the Ottawa (or Odawa as they prefer to be called) sided with the British, Chief Jean-Baptiste Assikinack being one of their leaders in the War of 1812. After signing treaties in the 1820s and 1830s with the Americans,

many Ottawa in Michigan moved to Manitoulin I. Assikinack, who had become a Roman Catholic catechist, convinced many of his people on the island to become Christians. Although Assikinack supported the surrender of Manitoulin I to the government of the Province of Canada in 1862, many Ottawa refused and the eastern section of the island, at Wikwemikong, remains uncaded land.

Because the Ottawa tended to settle in mixed communities, it is difficult to state population figures. Many Ottawa descendants are identified as Ojibwa or Potawatomi. It has been estimated that in the 1970s there were 3000 Ottawa in Ontario and some 5000 in the US, on reservations in Michigan, Wisconsin and Oklahoma.

In the 19th century many Ottawa operated their own farms, or worked as farm labourers and lumbermen. Since 1945 a number of Ottawa have moved from Wikwemikong to Sudbury and Toronto to find employment. Daphne ODJIG, a well-known Indian artist, is the great-great-granddaughter of Assikinack. See also NATIVE PEOPLE: EASTERN WOODLANDS and general articles under NATIVE PEOPLE. DONALD B. SMITH  
Reading: H.H. Peckham, *Pontiac and the Indian Uprising* (1961); B.G. Trigger, ed, *Handbook of North American Indians*, vol 15: *Northeast* (1978).

**Ottawa**, Ont, capital of Canada and seat of Carleton County, is located on the OTTAWA R on Ontario's eastern boundary with Québec, about 160 km W of Montréal.

**Settlement** Evidence of Algonquian settlements has been found throughout the Ottawa Valley. "Ottawa" is thought to derive from a tribe of the same name, probably from a word meaning "to trade." As the Ottawa and its tributaries form the most direct water route between the St Lawrence and the continental interior, it was part of aboriginal trading systems and, from the 17th to 19th centuries, the chief artery of the Montréal FUR TRADE. Minor fur outposts were established in the valley before 1800, when the first permanent settlement, an agricultural community at the site of HULL, was established by New Englander Philemon WRIGHT. Itinerant lumberers were drawn by the trade in square timber begun in 1806 by Wright. An unnamed campsite, established 1826 by Royal Engineers under Lt-Col John BY as construction base for the RIDEAU CANAL, was situated on a 30 m bluff flanking the headlocks, near Chaudière Falls and the mouths of the Rideau and Gatineau rivers. It immediately attracted contractors, labourers, and a small community of merchants, tradesmen and professionals. By 1827 a considerable town named Bytown had sprung up. In the 1830s the TIMBER TRADE to Britain became the focus of economic activity. Bytown eclipsed "Wrightstown" (later Hull) as the principal valley town. A new industry emerged in the 1850s when the power of Chaudière and Rideau falls was employed to saw logs into lumber for the American market.

**Development** By the 1860s, in addition to a large trade in square timber, Ottawa contained one of the largest milling operations in the world, accompanied by huge cutting, (driving)

and barging operations, and was connected to the GRAND TRUNK RY and American rail networks. The railway made Ottawa a serious candidate as permanent capital of the Province of Canada, but urban rivalries made any choice politically dangerous and the matter was thrust upon Queen Victoria. Colonial officials ensured her only possible choice would be Ottawa, as announced the last day of 1857. Construction of PARLIAMENT BUILDINGS began 1859, and they were in use by 1866. In 1867 the city was made capital of the new Dominion of Canada. About 1890, the hydroelectric potential of Ottawa's rivers was exploited, the chief industrial application being in pulp and paper production, using the inferior logs of depleted valley forests. The sawn lumber industry declined significantly in the 20th century.

By 1940, the federal government had emerged as the dominant employer. For 30 years it has generated almost unparalleled growth. Government jobs until recently were mainly in Ottawa proper, which also developed as a centre for tourism, the city's second-largest industry. It now caters to an estimated 2.5 million visitors annually.

**Cityscape** Ottawa has an outstanding physical endowment. Rapids and falls punctuate river courses, which are protected by parks and driveways. Lower Town, E of the canal, was the first growth pole, and much of the mid-19th-century city is found here, including the restored "Mile of History" along Sussex Dr and the Byward Market. It was outstripped in the 1860s by Upper Town, which was entrenched by a government economy as the chief retail and office locus of the city. The large Central Experimental Farm located in the SW part of the city, and a federal "greenbelt" girdling the built-up region are treasured amenities though they have completely girdled recent suburban expansion.

Since the 1920s, much of the core area has been appropriated and redeveloped with parks (Confederation Square) or major national buildings (National Arts Centre, National Defence Building, Bank of Canada Building) by the federal authority. It also collaborated on construction of the Rideau Centre, a downtown convention, hotel and shopping complex opened in 1983. Office towers, which from the 1960s began to overwhelm the Parliament Buildings, are the dominant feature of the downtown landscape. The NATIONAL CAPITAL COMMISSION and its predecessors have carried out much of the beautification of the city, removing rail lines and yards from the city core and preserving the scenic canal. Today the NCC maintains the extensive system of driveways in the city, lined with millions of tulip bulbs and other flowering plants, operates a number of parks and in winter maintains the world's longest skating rink on the frozen Rideau Canal. City planning is conducted by the Ottawa Planning Board.

**Population** With 295 163 inhabitants Ottawa is Canada's twelfth-largest city. (The CMA ranks fourth.) The contours of this population have persisted for 150 years: about one-quarter French Roman Catholics, one-quarter Irish Roman Catholics, and most of the remainder Protestants of British origin. Small communities — chiefly Jewish, German and Italian — arrived at the turn of the century and now comprise about 10% of the population. Recently, an Arabic-speaking (mainly Lebanese) community has struck roots in Ottawa. In general, the Protestant and English community has favoured Upper Town, the Roman Catholic and French community, Lower Town. Religious institutions (churches, schools, hospitals), ethnic associations, and even political organizations have solidified this pattern. Nineteenth-century Ottawa became a focal point of Catholic and Protestant-Orange militance, and also emerged as the capital of Franco-Ontario, and centre of

**Distribution of Industrial Activity\* by Industry Grouping within Census Metropolitan Areas, 1980**

**Industry groupings**

1. Food and beverage and tobacco products industries
2. Leather, textile, knitting mills and clothing industries
3. Wood, furniture and fixtures, paper and allied and printing, publishing and allied industries
4. Machinery, transportation equipment and electrical products industries
5. Primary metal and metal fabricating industries
6. Rubber and plastic products, petroleum and coal products and chemical products industries
7. Non-metallic mineral products and miscellaneous manufacturing industries.

\* Industry activity based on the average of percentage shares of the value shipments of goods of own manufacture, total value added and total number of employees for each of the selected metropolitan areas.

Source: Figure 11, Catalogue 31-209, Statistics Canada.

conflicts over language. In the 1850s, sawmilling firms at Chaudière generated a working-class community, broadly French and Irish Catholic. The growing public service tended to diffuse into the pre-existing communities. Recent renewal and renovation in older areas has altered the pattern, attracting professionals to all core areas.

**Economy and Labour Force** Though patterns in the Ottawa work force have undergone dramatic change, "service" to a dominant industry has been a continuing motif. Original settlers serviced the needs of canal construction, the squared timber trade and agriculture. In 1861 "industrial" jobs, most associated with saw milling, comprised about 48% of the labour force. Government employment, only 10% in 1871, grew by 1971 to about one-third, including large numbers of women, while manufacturing fell to about 6%. Few corporate head offices have been established in Ottawa, with the exception of Metropolitan Life Insurance and a number of burgeoning computer firms. Aerial surveying has also developed, contracting about 40% of the world's business outside the Soviet Bloc, and a major chip technology industry has developed since 1970.

**Transportation** Rivers formed the city's original transportation corridors and were the basis of its claim to be the economic capital of central Canada: the Rideau to Kingston; the Gatineau into the Québec Laurentians; and the Ottawa E to Montréal and W to Lk Huron. However, transportation is now largely by road and rail; the city is on both transcontinental rail lines and the Trans-Canada Highway. It has one of Canada's busiest air terminals, largely owing to its location on the Montréal-Toronto-Ottawa air triangle, and is the centre for the federal government's air fleet and a large Armed Forces base.

Uplands and Rockcliffe are the airports in the Ottawa-Carleton region. Public transportation is provided by quasi-autonomous OC Transpo, based on the Ottawa-Carleton region.

**Government and Politics** Ottawa's jurisdictional divisions, its location in a population-poor region (shared with its sister city, Hull) and its distance from provincial capitals, coupled with the predominating economic influence of nearby Montréal, make for a complex, but weak metropolitan system. In addition, the municipal regions of Ottawa (Ottawa-Carleton) and Hull (the Outaouais Regional Community), covering together about 5200 km<sup>2</sup>, overlap the 4700 km<sup>2</sup> federal district run by the National Capital Commission, which wields considerable influence as autonomous landowner and developer of public works.

From the outset, Ottawa had a ward system sensitive to the Upper Town/Lower Town division. Administration was a council-committee system until 1908, when a council-board of control system (the mayor and 4 controllers elected at large), was adopted. In 1980, the city returned to the original pattern. Reform politics emerged in the 1970s and has changed the traditional small-business configuration at City Hall. The federal authority, though the city's largest landowner, is constitutionally exempt from city by-laws and taxes, and the extent of its responsibility to respect laws and provide grants in lieu of taxes has for more than 100 years been a chronic, controversial and unresolved issue between the Crown and the Town. Since 1841 Ottawa's Irish-French Catholic communities have mainly voted reform or Liberal; the Anglo-Protestant communities, Conservative. An NDP presence, and shifting social patterns, has recently altered this tendency. A complex school system, overseen by the nondenominational Ottawa Board of Education and Ottawa Roman Catholic Separate School Board, parallels the political one. The separate board has traditionally educated in English and French about equally. The federal bilingual thrust has generated a large immersion program in the nondenominational system and the program now runs one school entirely in French.

**Cultural Life** CARLETON UNIVERSITY is located in the SW. The UNIVERSITY OF OTTAWA offers programs in both English and French and, though formally secular, embodies much of the tradition of the Oblate Order that ran it for many years. St Paul's is denominational. Through Algonquin College, Ottawa is also the centre of the region's community college system.

Much of the city's cultural life and most of its facilities are dominated by the federal government. Almost all federal cultural agencies have showcases in Ottawa, including the NATIONAL MUSEUMS, NATIONAL GALLERY, PUBLIC ARCHIVES and National Library. The NATIONAL ARTS CENTRE, with its National Symphony Orchestra and theatres in French and English, also attracts international and N American performers. The city also has a small symphony orchestra and supports several theatre companies, including Ottawa Little Theatre and Great Canada Theatre Co. The Bytown Museum operates in one of Col By's original buildings and the city operates a municipal archives. Landsdowne Park is the site of the annual Central Canada Exhibition, home of the OTTAWA ROUGH RIDERS professional football team and the amateur Junior A hockey team, the '67s. Rowing, canoeing, track and gymnastics clubs also operate in the city. Ottawa is served by 2 private TV networks, the CBC's French and English services and the public networks of Ontario and Québec. Its daily newspapers are *Le Droit* (French) and *The Citizen* (English). The weekly *Herald* was begun in 1983.

**Ottawa Agreements**, 12 bilateral trade agreements providing for mutual tariff concessions and certain other commitments, negotiated 20 July-20 Aug 1932 at Ottawa by Britain, Canada and other COMMONWEALTH Dominions and territories. They may be seen as the culmination of a trend towards IMPERIAL PREFERENCE, which began with Canada's unilateral grant of such preferences in 1897. Among the Canadian industries that may have benefited from the agreements were wheat growing, lumbering and milling, apple growing, automobile manufacturing and the nonferrous metals industry. Canada's negotiators, anxious to gain a lot and to give a little, nevertheless promised to admit British manufactures on terms that would give them a fair chance in the Canadian market. Canada also lowered some tariffs on British goods while raising them on some non-British goods, widening the margin between ordinary and preferential rates and thereby annoying the US. Similar arrangements were made by Britain with South Africa, Australia and New Zealand. Britain promised to impose no duties on empire foodstuffs, to raise duties and to impose quotas on many non-empire foodstuffs, and to continue duty-free or low-tariff arrangements for empire manufactures, such as Canadian automobiles. Thus there were new duties on "foreign" dairy products, quotas for certain meats, and many other realignments of British and Dominion duties. The agreements succeeded in giving the Dominions a larger share of the British market, but they did not arrest the decline in Britain's share of the imperial market. The Anglo-Canadian Agreement was modified in 1937, again in 1938 and many times since 1945. In 1982 mutual concessions still existed, most of which can be traced to the Ottawa Agreements.

**Ottawa Journal** was founded in 1885 by A.S. Woodburn, who briefly employed J.W. DAFOE as the paper's editor. In 1886 the paper was bought by P.D. Ross, who ran it for many years as Ottawa's Conservative evening newspaper. The *Journal* merged in 1917 with E. Norman Smith's *Ottawa Free Press*, and thereafter ran a morning edition, until 1949. Ross controlled the paper until his death, also in 1949. Smith then became the paper's president, until his death in 1957. Under Ross and Smith, M. Grattan O'LEARY dominated the *Journal*'s editorial page, and he was Smith's natural successor as *Journal* president, a post he held until 1966. The *Journal* succeeded, within the limits of its finances, in maintaining a highly literate editorial page while specializing in parliamentary reporting. Although Conservative, the paper kept its partisanship within bounds, between elections.

The *Journal*'s finances were never strong. O'Leary brought about the sale of the paper to the Free Press newspaper chain in 1959, while retaining editorial control. During the 1970s the *Journal* began to experience financial difficulties and considerable labour trouble. In 1980 it was sold to the THOMSON GROUP, and some months later closed down. See also JOURNALISM; NEWS-PAPERS.

ROBERT BOTHWELL

Reading: I.N. Smith, *The Journal Men* (1974).

**Ottawa River**, 1271 km long, chief tributary of the ST LAWRENCE R, rises in a chain of lakes in the LAURENTIAN HIGHLANDS, at the height of land which marks the commencement of the slope northward to Hudson Bay. It continues with Dazois Reservoir, Grand-Lac-Victoria, Lac Granet, Decelles Reservoir, Lac Simard and Lk Timiskaming, entering each slowly and discharging with a heavy rush. South from Lk Timiskaming, it grows broad and forceful, widening into marshy lakes, then constricting into turbulent rapids. At St-André-Est, the Ot-

tawa expands to form Lac des Deux Montagnes, from which it enters the St Lawrence through Rivière des Prairies and Rivière des Mille-Îles to the E, and by a channel to Lac St-Louis to the S. Tributaries from the N-side highlands are often wild and swift: DUMOINE R (129 km), Coulouge R (217 km), Gatineau R (386 km), du Lièvre R (330 km), Petite Nation R (97 km) and Rouge R (185 km). From the S, the Petawawa R (187 km) and Madawaska R (230 km) also flow through rugged terrain, but the Mississippi R (169 km), Rideau R (146 km) and South Nation R (161 km) drain gentler land. After the last glacier melted, it was the Ottawa that drained the Great Lakes until the land rose and a new channel was found via the St Lawrence. The fine clay soil of the southern valley was deposited by the Ottawa in its journey to the sea, forming a long fertile intrusion into the otherwise implacable Canadian Shield. From Lk Timiskaming to Montréal, the river forms the border between Ontario and Québec, but the division is more than political — to the S are rich farms and gentle hills, to the N the forests of the Laurentians.

For several hundred years, the Ottawa was the primary transportation route to the western interior. The Algonquin controlled it in early times and one group exacted tolls from a strategic base on Allumette I, where they also grew corn and tobacco. Jacques CARTIER probably saw the river from atop Mont Royal, but Etienne BRÛLÉ was likely the first European to travel it (1610). In 1613 via the Mattawa and FRENCH rivers to Georgian Bay, CHAMPLAIN travelled the route, which was used to carry furs for the next 200 years. The river was a tough challenge for the voyageurs, requiring 18 portages, some of the most difficult being at Long Sault Deschênes, Lac des Chats, Chenaux, Portage-du-Fort, Chaudière Falls, Roche Fendue, Des Joachims, La Cave and Des Érables.

The French made small impact on the river valley, though they built a few posts and even drove some timber in the 1740s. L'ORIGNAL, granted in 1674, was the first seigneurie in present-day Ontario, but was not developed for 100 years. HAWKESBURY was founded in 1798, and there Thomas Mears built the first gristmill, sawmill and later the first steamer, the *Union*, on the Ottawa. The first paper mill in Canada was built 1803-05 at St-André-Est, and the American Philemon WRIGHT founded Wrightsville (later HULL) in 1800 with American settlers. Loyalists, led by Sir John JOHNSON, moved into the valley in 1814, and French settlers onto Petite Nation seigneurie. In 1817 land along the Rideau R was granted to 1000 British veterans, and in 1825 Archibald MCNAB led a group of Scots to the mouth of the Madawaska R.

Log rafts descended the Ottawa even before it ceased to be the prime route of the fur trade after 1821. Wright showed that the route was feasible in 1807, and the British demand for pine grew until, by 1830, the valley timber trade dominated the Canadian economy. After 1850 the British demand for square timber fell, but in 1854 RECIPROCITY gained free access for Canadian lumber into the US market. The timber trade pervaded the social life of the valley. Armies of

men lived in crude shanties during winter and descended on civilization with their rafts come spring. Competition among shanties and between French and Irish led to feuds and violent clashes. After the completion of the RIDEAU CANAL (1832), Bytown (later OTTAWA) grew to be the largest lumber centre on the river. Though a few timber barons, such as E.B. EDDY and J.R. BOOTH, made fortunes, many lumbermen and Irish labourers lived in poverty and disease. The ravages of the axe swept up the river and its tributaries. By 1828 there was a sawmill at the future site of PEMBROKE; after 1850 cutting reached the Madawaska R, and by the 1870s Lk Timiskaming. Railways challenged the river by the 1850s, carrying lumber S to BROCKVILLE and Ogdensburg, NY. By the 1870s rail lines reached CARLETON PLACE, RENFREW, ALMONTE and PEMBROKE. Steamers plied the river with goods and passengers, aided by a canal at Carillon, which permitted uninterrupted travel from Montréal to Ottawa. This river transport ceased by 1900.

Most of the valley's stands of pine had been decimated by 1910. Where land was fertile, farmers settled; elsewhere there remained a wasteland of stumps and debris vulnerable to fire. Part of the wilderness was saved from the axe when ALGONQUIN PROVINCIAL PARK was created (1893), and in 1918 Canada's first forestry research station was established at Petawawa to study the effects of logging, disease and fire. With the loss of the larger trees, most mills converted to pulp and paper, still an important industry along the river. But except for the farming area of the lower valley, the heritage of the timber trade is a depressed economy, with little industry and high unemployment. Much of the hydroelectric power gained by harnessing the Ottawa is transmitted to Toronto and elsewhere. Ottawa, which was chosen as Canada's capital in 1857, is clearly the dominant urban centre, but its prosperity is based on the federal government, not valley resources or its riverine connections. First called the Grand Rivière des Algonquins, the river took its name from a later group of middlemen in the fur trade, the Ottawa.

JAMES MARSH

**Ottawa Rough Riders**, football team. Ottawa has had FOOTBALL teams since the 1870s, including the Canadian Rugby Union Champions in 1898, 1900 and 1902 and the Ottawa Senators (a combination of the Rough Riders and Ottawa St Brigid's), which won the GREY CUP in 1925 and 1926. The Rough Riders returned to the Dominion final in 1939, 1940, 1948 and 1951, defeating Toronto Balmy Beach and Saskatchewan respectively in 1940 and 1951. Coach Frank Clair and quarterback Russ JACKSON, probably the greatest Canadian ever to play that position, took Ottawa to Grey Cups in 1960, 1966, 1968 and 1969, losing only to Saskatchewan in 1966. In 1973 Jack Gotta coached the Riders to another Cup victory and his successor George Brancato won the championship in 1976 and lost to Edmonton in 1981. Their present stadium at Lansdowne Park was opened in 1967 (and now seats 34 838) although the site has been their home since the early 1900s.

DEREK DRAGER

**Ottenbrite, Anne**, swimmer (b at Whitby, Ont 12 May 1966). She won gold medals in the 200 m breaststroke and 4 x 100 m medley relay and silver in the 100 m breaststroke at the 1982 COMMONWEALTH GAMES in Brisbane, Australia, and a gold medal in the 100 m breaststroke and silver in the 4 x 100 m relay at the 1983 Pan-American Games, where she was disqualified in the 200 m breaststroke for using a dolphin kick. At the 1984 Los Angeles Olympics she won a gold medal in the 200 m breaststroke, silver in the 100 m breaststroke and bronze in the 4 x 100 m relay. She was still a high-school student at the time of the Olympic Games. JAMES MARSH

**Otter** The river otter (*Lutra canadensis*) occurs throughout N America except in desert and arid tundra regions. In Canada, it is scarce, except along the BC coast, where it is abundant and often wrongly identified as a SEA OTTER. The otter is a large WEASEL, males reaching 1.3 m in length and weighing 8 kg; females, slightly smaller. Its colour is dark brown, paler below. It is amphibious, its streamlined body and tail, short legs, webbed feet and dense waterproof fur equipping it to hunt in water. The otter's food is 90% fish but crustaceans, amphibians, mammals and birds are also important. It has a lengthy mating period in late winter and spring; gestation lasts 9½-12½ months. Young (1-4) are born in a nest under a rock pile or in a burrow or similar shelter. The pelage is dense with an underfur of several fine hairs per follicle, protected by long guard hairs. It is valued as a beautiful and durable fur and several thousand otters are trapped each year. Where not harassed, otters tame easily. They are abundant even in such busy harbours as Vancouver. See FUR TRAPPING.

IAN McTAGGART-COWAN

**Otter, Sir William Dillon**, soldier (b at Clinton, Ont 3 Dec 1843; d at Toronto 6 May 1929). A veteran of the battle at Ridgeway in 1866 and a part-time soldier, Otter joined the permanent force in 1883. He commanded the Battleford column in the North-West Campaign of 1885 and was the first commanding officer of the Royal Canadian Regiment of Infantry in 1893. In 1899 Otter was the obvious choice to lead the first Canadian contingent in the SOUTH AFRICAN WAR. His austere professionalism was unpopular with subordinates but contributed to Canadian prestige. In 1908 he was the first Canadian-born chief of the general staff and was inspector general of the Canadian Militia 1910-12, when he retired. He commanded INTERMENT operations during WWI. Otter was knighted in 1913 and in 1922 became the second Canadian soldier to reach the rank of general. DESMOND MORTON

Reading: Desmond Morton, *Ministers and Generals*. (1970) and *The Canadian General, Sir William Otter* (1974).

**Ouellette, Fernand**, writer (b at Montréal 1930). He is one of the most active intellectuals of his generation. Cofounder of the journal *LIBERTÉ* in 1959 and a member of its editorial board, he established with Jean-Guy Pilon the *Rencontre québécoise internationale des écrivains*. He was a member of the commission of inquiry into the teaching of the arts in Québec 1966-68, and has been writer-in-residence or visiting professor at various universities. In addition, he has produced radio programs on cultural topics for Radio-Canada. He published poetry with Editions de l'hexagone, notably *Ces anges de sang* (1955), *Le Soleil sous la mort* (1965), *Dans le sombre* (1967), *Ici, ailleurs, la lumière* (1977), which were collected with others in *Poésie* (1972) and *En la nuit la mer* (1981). Though metaphysical or mystical, his poetry is profoundly physical, taut, erotic, filled with flashes of insight. His quest for the absolute resembles that of the German Romantics — see *Depuis Novalis: errance et gloses* (1973) — while his rigorous demands are like those of Pierre-Jean Jouve. Also a critic and theorizer of his preferred genres, he is an excellent essayist. Shortly after the declaration of the War Measures Act (see OCTOBER CRISIS), Ouellette refused the Gov Gen's Award for *Les Actes retrouvés* (1970) on poetry and poetics, power, violence and tolerance. *Ecrire en notre temps* (1979) continues the same aesthetic and ethical themes. A friend of a number of painters, including Chagall, and of composer Edgard Varèse, whose biography he wrote (1966; Eng tr 1968), Ouellette is interested in the art that underlies all art. His *Journal dénoué* (prize of journal *Études françaises*, 1974) is an important intellectual biography. Two novels, *Tu regardais intensément*

*Geneviève* (1978) and *La Mort vive* (1980) were controversial.

LAURENT MAILHOT

**Ouellette, Gerald**, marksman (b at Windsor, Ont 14 Aug 1934; d near Leamington, Ont 25 June 1975). Ouellette was introduced to shooting during his high school cadet training. By 1952 he was a veteran of several teams that competed at Bisley, Eng. He became proficient in the small-bore rifle competition and captured the 1956 Olympic gold medal with a perfect score of 600. In 1959 he was Canadian sporting rifle champion and won a Pan-American Games gold medal. He was on Canada's Olympic team in 1968. He died flying his own aircraft.

J. THOMAS WEST

**Ouimet, Gédéon**, premier of Québec (b at Ste-Rose, 2 June 1823; d at St-Hilaire-le-Dorset, Qué 23 Apr 1905). Conservative premier for 19 months (Feb 1873 to Sept 1874), he was forced to resign by financial scandals. Also minister of public instruction during his premiership, he was superintendent of education for Québec 1876-95.

DANIEL LATOUCHE

**Ouimet, Joseph-Alphonse**, engineer, CBC president (b at Montréal 12 June 1908). After studying electrical engineering at McGill, Ouimet worked for a firm developing television and built a prototype TV receiver in 1932. He joined the Canadian Radio Broadcasting Commission, later the CBC, in 1934; as chief engineer in 1953 he organized the first Canadian TV broadcasts and film coverage of that year's coronation of Queen Elizabeth. He was appointed CBC general manager that same year and president from 1958. New broadcasting legislation was a contentious political issue from 1963 onward, and Ouimet resigned in 1967, after Secretary of State Judy LAMARSH criticized the CBC's "rotten management." He was chairman of the board of Telesat Canada 1969-80 and was awarded the McNaughton Medal for public service in 1972.

DONALD J.C. PHILLIPSON

**Ouimet, Léo-Ernest**, director, producer, distributor, exhibitor (b at St-Martin, Qué 16 Mar 1877; d at Montréal 2 Mar 1972). On 1 Jan 1906, he opened the first permanent cinema in Montréal, the Ouimetoscope, and a year later opened the first large cinema theatre in N America. Ouimet became one of Canada's first film distributors and to add local flavour to his programs also made shorts, some based on his family (*Mes espérances en 1908*, 1908) and some on current affairs (*L'Affaire de la gare Windsor*, 1909 and *L'Incendie du Herald*, 1910). Clashes with the clergy over Sunday opening of cinemas forced him out of the exhibition business. He produced a feature-length drama, *Le Feu qui brûle* (1918), and organized the British Canadian Pathé News. In Hollywood he produced *Why Get Married* (1924), which virtually marked the end of his career in cinema.

PIERRE VÉRONNEAU

**Ouimet Canyon**, situated in southern Ontario (67 km E of THUNDER BAY) at the end of Black Bay (an arm of Lk SUPERIOR), is the main tourist attraction of the 8 km<sup>2</sup> Ouimet Canyon Provincial Park. The canyon is 150 m wide, 5 km long and has sheer cliffs varying from 90 to 120 m. The rims are tree lined (cedar, birch, jack pine and spruce), and several unusual plant species are found on the canyon floor (arctic wintergreen, northern liverwort, moss and pussy willows) owing to the persistence of winter ice long into summer.

DAVID EVANS

**Overlanders of 1862**, a group of some 150 settlers who travelled from Ontario to the BC interior, led by brothers Thomas and Robert McMicking of Stamford Township, Welland County, Ont. They went in groups by ship and American railway to Ft Garry [Winnipeg]. Leaving there in early June 1862, equipped with red river carts and a few horses, they reached Ft Ed-

monton on July 21 and traded their carts for pack horses. With the help of Indian guides they crossed the Rockies. All but 6 survived the perilous descent of the Fraser R by raft to Ft George [Prince George]. Most went on to the Cariboo gold fields, and many, including the McMickings, had successful careers in BC. The only woman Overlander, Catherine O'Hare Shubert, took her 3 children with her and gave birth to her fourth only hours after arriving at Kamloops in Oct.

BARRY M. GOUGH

**Owen, Donald**, filmmaker (b at Toronto 19 Sept 1934). Owen studied anthropology at U of T and joined the NFB in 1960. He made a few short films there before directing *Nobody Waved Good-bye* (1964), a feature film dealing with teenage alienation that delineated many of the themes of Canadian cinema. *The Ernie Game* (1967) took up where *Nobody Waved Good-bye* left off, but its detached hero failed to win audience sympathies. In 1969 Owen left the NFB. His third feature, *Partners* (1976), was not successful, and Owen has since concentrated on commercial TV work.

PIERS HANDLING

**Owen, Lemuel Cambridge**, merchant, politician, premier of PEI (b at Charlottetown 1 Nov 1822; d there 26 Nov 1912). Successful in shipbuilding and trade, Owen, a leading colonial merchant, was postmaster general of the colony from 1860 until elected to the Assembly in 1866. As premier 1873-76, Owen supervised the end of the proprietorial landholding system — the cost of which was borne by the federal government as a result of the 1873 Confederation agreement.

H.T. HOLMAN

**Owen Sound**, Ont, City, pop 19 883 (1981c), inc 1920, is located on an inlet at the S end of GEORGIAN BAY, at the outlet of the Sydenham and Potawatomi rivers, 190 km NW of Toronto. A preliminary survey was made of the site in 1837 and the first building was erected in 1840. Originally named Sydenham after Lord SYDENHAM, it was renamed 1857 in honour of Sir Edward Campbell Rich Owen, RN, who had charted the bay in 1815. Its fine harbour became a port of call for the steamers plying Georgian Bay and later a transshipment point and a shipbuilding centre. Now the seat of Grey County, it services a mixed-farming hinterland. Major employers are manufacturers of auto accessories, industrial equipment and the printer Richardson, Bond and Wright. In the winter it is a popular skiing area. The painter Tom THOMSON grew up nearby and is honoured by the Tom Thomson Memorial Gallery.

DANIEL FRANCIS

**Owl** (order Strigiformes) efficient, carnivorous, nocturnal BIRD of PREY. Owls' eerie hoots and calls at night often make them seem mysterious — even birds of ill-omen. Fifteen of the world's 133 species reside in Canada. In most species, the substantially smaller adult male feeds the female incubating on the nest. Incubation begins as each egg is laid and there is often an interval of 2 or more days between eggs. As it can take food away from younger nestlings, the oldest owlet is well fed even when prey populations are low. With severe famine, the parent owl may feed the smaller owlets to the larger nestmates. Owls are downy at hatching and most species remain in or near the nest until able to fly. No owl builds its own nest. Canada's best-known owl, the great horned (*Bubo virginianus*), usually appropriates the discarded nest of a red-tailed hawk. Great horned owls will also use an artificial platform or even a ledge in a barn. The latter is the usual nesting place of the common barn owl (*Tyto alba*), a species restricted to southern parts of Ontario and BC. The large, reclusive great gray owl (*Strix nebulosa*) of the boreal forest prefers a northern goshawk nest in a tamarack swamp. The crow-sized, long-eared owl (*Asio otus*) takes over nests of the common crow or

black-billed magpie. The short-eared owl (*A. flammeus*), present transcontinentally, and the snowy owl (*Nyctea scandiaca*), restricted in summer to the arctic TUNDRA, both nest on the ground. The burrowing owl (*Athene cunicularia*) of the western provinces occupies badger holes underground. The barred owl (*Strix varia*) of the southern boreal forest fringe prefers a broken-off, balsam poplar trunk and the rare spotted owl (*S. occidentalis*) of southern BC uses a large tree cavity or cliff crevice. Smaller owls, such as the northern saw-whet owl (*Aegolius acadicus*) and eastern and western screech owls (*Otus asio* and *O. kennicottii*) of the deciduous woods of southern Canada, the northern pygmy (*Glauclidium gnoma*) and flammulated owls (*O. flammeolus*) of BC, and the boreal (*Aegolius funereus*) and northern hawk owls (*Surnia ulula*) of the boreal forest, all nest in woodpecker's holes in hollow trees.

Owls are generally beneficial. Great gray, long-eared, short-eared, boreal and saw-whet owls eat substantial numbers of mice. Great

Fifteen species of owl reside in Canada, including the barn owl shown here (*Tyto alba*), whose usual nesting place is a ledge in a barn (photo by Stephen J. Krasemann/DRK Photo).

Snowy owl (artwork by John Crosby).

horned owl numbers rise and fall with the 10-year cycle of its favourite prey, the snowshoe hare. Great horned owls also take Norway rats, American coots and pocket gophers. Occasionally, a young great horned owl learns about poultry and visits a farmyard nightly. Regurgitated, well-formed pellets or casts, containing undigested bones and fur, show what owls have been eating. Two of Canada's largest owls, the great gray and great horned owls, are year-round residents, as are the barred, hawk, both screech, boreal and northern saw-whet owls, although large numbers of the last migrate through S Ontario. When hares are scarce in Saskatchewan and Alberta, great horned owls often move up to 1500 km SE. The snowy owl, Canada's third-largest owl, visits southern Canada in winter, and some of the northern owls occasionally undergo large, eruptive flights to the S.

C. STUART HOUSTON

**Oyster**, common name for bivalve (hinged shell) MOLLUSCS, including true oysters (order Ostreoida) and tropical pearl oysters (order Pterioidea), found chiefly in temperate and warm shallow waters. True oysters have been cultivated for centuries and are much used for food;

they are the *huîtres* of French cuisine. Their shells are irregular in outline and fixed to a surface by the left (lower) valve or half-shell. They are divided according to whether young are brooded within the shell, or whether development occurs free in the PLANKTON. Incubatory oysters have no commercial significance in Canada, although a substantial fishery for the Olympic oyster (*Ostrea lurida*) existed on the West Coast until its depletion in 1930. An attempt is being made to introduce the European flat oyster (*O. edulis*) to NS. Nonincubatory oysters (eg, eastern oyster, *Crassostrea virginica*, and Pacific oyster, *C. gigas*) support significant AQUACULTURE operations on both coasts. FRANK R. BERNARD

**Oystercatcher**, name given to 10 species of large SHOREBIRDS of the family Haematopodidae. Oystercatchers are either black and white or entirely black. Their orange-red bills are elongated and compressed from side to side, allowing the birds to chisel open clams and other molluscs. Two species occur in N America: American oystercatchers (*Haematopus palliatus*) breed from Long I south to Mexico (occasional visitors to Canada); American black oystercatchers (*H. bachmani*) breed from the Aleutians S to Baja, California, where they hybridize with the American oystercatcher. A.J. BAKER

**Pacey, William Cyril Desmond**, professor, literary critic (b at Dunedin, NZ 1 May 1917; d at Fredericton 4 July 1975). Educated at U of T and Cambridge he taught English at U Man (1940-44) before moving to UNB, where he remained. Though an accomplished short-story writer, Pacey was best known as a critic and scholar. He produced an anthology of Canadian stories (1947) and editions of Frederick Philip GROVE's stories (1971) and letters (1976). His criticism ranges from Frances BROOKE to Leonard COHEN, and includes books on Grove (1945) and Ethel Wilson (1968). Pacey's balanced judgments have generally endured and his close studies of individual works have been influential. His finest work is found in *Creative Writing in Canada* (1952) and *Ten Canadian Poets* (1958).

TRACY WARE

Reading: D. Pacey, *Essays in Canadian Criticism* (1969).

**Pacific Ballet Theatre**, BC's only professional ballet company, employs 10 dancers for a 30-week season, with regular performances in Vancouver and throughout BC. Founded by Morley Wiseman, incorporated (1970) as "Ballet Horizons," it changed to its present name (1972) when Maria Lewis became director. Renald Rabu became resident choreographer (1978), artistic director (1980), and received the Clifford E. Lee Award in Choreography (1980). Repertoire includes 10 ballets by Rabu and works by Fernand NAULT and Margo Sappington.

GRANT STRATE

**Pacific Fur Company**, est 23 June 1810 and headed by New York fur dealer John Jacob Astor. Principal partners included ex-Nor'Westers Alexander McKay, Donald McKenzie and Duncan McDougall. Astor envisaged a string of fur posts and settlements across the US and planned a fort, Ft Astoria, at the mouth of the Columbia R. On 6 Sept 1810 he sent the *TONQUIN* from New York to the Columbia (arrived 22 Mar 1811) to inaugurate trade with Indians of the NORTHWEST COAST; in June 1811 she was taken by Indians, probably in Clayoquot Sd (Vancouver I). An overland party did not reach Astoria until Feb 1812. Competing with the NORTH WEST COMPANY and unsure of American support in the WAR OF 1812, the partners decided on 25 June 1813 to sell their supplies to the NWC. In July they dissolved the company and on 16 Oct 1813 sold everything to the Nor'Westers; Astoria was later renamed Ft George. The arrival of HMS *RACCOON* in Nov 1813 and the NWC's ship *ISAAC TODD* in Apr 1814 speeded the decline of the PFC. Astor subsequently put his energies into the American Fur Co.

BARRY M. GOUGH

**Pacific Rim National Park** (est 1970) stretches for 105 km along the rugged W coast of VANCOUVER I. It comprises 3 sections: Long Beach, a 10.3 km sweep of surf-pounded sand and rock; the Broken Is Group, including more than 100 islands accessible only by boat; and the West Coast Trail, a 72 km hiking trail between Bamfield and Port Renfrew. Each unit is separate, with its own special character. The PARK is unique in that its boundaries extend offshore to the 10-fathom line to protect the marine environment. Heavy rains and mild temperatures year-round have produced a dense coastal rain forest of Sitka spruce, western hemlock, amabilis fir and western red cedar. The forest, framed to the W by the ocean and to the E by rugged mountains, is home for black bear, black-tailed deer, cougar, marten, otter and squirrel. Offshore the dense forest of giant kelp is home to an amazing variety of fish and invertebrates, eg, giant octopus. Marine mammals include grey and killer whales, harbour porpoises, sea lions and sea otters. The mild climate means year-round camping and hiking. Scuba diving is excellent and the West Coast Trail is a wilderness challenge.

LILLIAN STEWART

**Pacific Salmon**, 7 species of FISH belonging to genus *Oncorhynchus*, family Salmonidae. Two are native to Japan (*O. masou* and *O. rhodurus*); 5 to Canada, pink (*O. gorbuscha*), chum (*O. keta*), sockeye (*O. nerka*), coho (*O. kisutch*) and chinook (*O. tshawytscha*). The genus name refers to the hooked snout characteristic of most spawning males. The native range of Pacific SALMON includes the north Pacific Ocean, Bering Strait, SW Beaufort Sea and surrounding fresh waters. They occur in an estimated 1300-1500 rivers and streams in BC, notably the SKEENA R and NASS R in the N; the FRASER R in the S accounts for about 75% of the total. They have been introduced successfully to New Zealand, parts of Eurasia, the Great Lakes and S America. Pacific salmon are distinguished from other salmonids by their large number of anal fin rays (13-19). In fall, all Canadian species migrate into rivers and streams to spawn; eggs are buried in gravel. The young emerge in spring and stay in fresh water from 1 week to 3 years. Most then go to sea for 1-5 years, although some species have developed landlocked forms (eg, kokanee, a freshwater sockeye). At sea the species attains the following average adult weights: 1-3 kg, pink; 5-7 kg, chum; 3.5-7 kg, coho; 2-4 kg, sockeye; 6-18 kg, chinook (the largest recorded chinook was 56.8 kg). They return to their native stream to spawn and die. Marine adults have dark blue-black or blue-green backs, some species with black spots, and silver sides and belly. Spawning adults be-

come colourful: golden brown (chinook), spotted brown and green (pink), purple (coho and chum) or bright red with green head (sockeye).

All Canadian species are found up the West Coast into Alaska, with pink and chum found as far N as the Mackenzie R. Pink salmon have been introduced to Lk Superior and are spreading through the Great Lakes. In Canada, chum have not been successfully introduced outside their native range. Coho were planted successfully into Lk Michigan in 1966 and have spread throughout the Great Lakes where they support an important sport fishery. Kokanee has been transplanted widely throughout Canada; populations can be found from BC (native and introduced) to Ontario. Attempts to establish chinook outside their range have been made more frequently than for any other species, but success is still questionable. Coho and chinook dominate the BC coastal sport fishery and are fished commercially by hook and line, and, to a lesser extent, by gill and seine nets. Sockeye, pink and chum are harvested primarily by commercial net fishermen. An average of approximately 23.5 million salmon, weighing 70.3 million kg are harvested annually in BC.

ED LANE

**Pacific Scandal**, the result of solicitation by PM John A. MACDONALD, George-Etienne CARTIER and Hector LANGEVIN of some \$360 000 in campaign funds for the Aug 1872 general election, from promoters including Sir Hugh ALLAN. Macdonald and his Conservative colleagues needed money to fight the elections in Ontario and Québec, where a number of seats were in jeopardy. Notwithstanding his bribery of electors, Macdonald did badly, his 1867 majority being substantially reduced. After the election Allan was rewarded with the contract to build the Pacific railway, on the assumption that he would divest himself of American control on his board of directors. Since Allan, unknown to Macdonald, had used American money to bribe the government, this proved difficult, and finally produced blackmail. The Liberals broke the scandal on 2 Apr 1873; a spate of damaging letters and telegrams appeared in Liberal newspapers in July. The government was stunned. It managed to weather a royal commission struck on Aug 14, but it could not survive Parliament. The Commons met on Oct 23; with the threat of new PEI votes against it, and its supporters in disarray, the Macdonald government was obliged to resign. Allan's company never did get started, and a new agreement had to wait until 1880.

P.B. WAITE

**Pacific Western Airlines Ltd**, with headquarters in Calgary, is Canada's largest regional air carrier. The company began in 1946 as Central British Columbia Airways Limited and grew by purchasing other airlines, including Kamloops Air Services (1950) and Skeena Air Transport (1951). In 1953 it became Pacific Western Airlines Ltd. It now provides passenger, mail and cargo services in western Canada, the NWT and the Yukon and to Toronto and Seattle, Wash. Charter flights to the US, the Caribbean and Mexico are offered. Current subsidiaries include Pacific Western (Alberta) Ltd, Midwest Airlines Ltd, Pacific Western Airlines Leasing Ltd and Pacific Western Holidays Ltd. In 1983 PWA had sales or operating revenue of \$328 million, assets of \$546 million and 3000 employees. The Alberta government owned 99.5% of the company from 1974 until Dec 1983, when all but 14.9% of the shares were sold to the public.

DEBORAH C. SAWYER

J.W. Bengough cartoon deploring the political morality during the Pacific Scandal (courtesy Public Archives of Canada/C-78604).

**Pacifism**, an outlook based upon religious or humanitarian belief that condemns war and social violence as inhuman and irrational, if not absolutely and always morally wrong, and therefore demands personal nonparticipation in war or violent revolution as well as a commit-

ment to nonviolent methods of resolving conflicts.

In Canada pacifism is rooted in 2 traditions. One is sectarian pacifism, the historic non-resistance of pacifist religious sects that have tried to remain separate from the mainstream of Canadian society. By the beginning of the 20th century the QUAKERS, MENNONITES, HUTTERITES and DOUKHOBORS had been guaranteed the right to live according to their pacifist beliefs. They received specific exemptions from military obligations, and thus their immunity became entrenched in Canadian law and custom. Sectarian pacifists have provided the largest and most consistent pacifist witness, particularly as conscientious objectors during both world wars.

The second tradition, which attracted popular support, is the liberal Protestant and humanitarian reform tradition, based upon the pacifist teachings of Jesus and belief in the irrationality of war and the brotherhood of man. The various expressions of liberal pacifism in Canada began with the progressive peace movement at the turn of the century, which emphasized international arbitration and conciliation as the best way to achieve world order. Nearly all political, church, farm, labour and women's groups had endorsed that principle before the outbreak of WWI. During the war, however, the liberal peace movement disintegrated, leaving only a few committed pacifists such as J.S. WOODSWORTH and William Ivens, renegade Methodist ministers who openly broke with their church in opposition to CONSCRIPTION. (Most anticonscription sentiment, particularly in Québec, was not based upon pacifist belief.)

The postwar resurgence of liberal pacifism was fueled by both disillusionment with war and support for the LEAGUE OF NATIONS and DISARMAMENT. While Woodsworth and Agnes MACPHAIL pressed the peace issue in Parliament, and the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE and FREEDOM led a campaign to abolish cadet training and militarism in schools, an interwar PEACE MOVEMENT gained momentum. By the early 1930s it had expanded into a broad front representing various religious and political persuasions, but united by the Depression in the quest for socioeconomic justice as well as peace. Under Woodsworth's leadership, the CO-OPERATIVE COMMONWEALTH FEDERATION became the major political expression of this pacifist-socialist alignment. At mid-decade, however, social radicals began to abandon pacifism for the fight against fascism in Spain, and by WWII even the CCF altered its traditional neutralist foreign policy, leaving only Woodsworth in Parliament to voice the pacifist position. The movement narrowed to a few Christian pacifists, primarily United Church ministers in the Fellowship of Reconciliation, who publicly reaffirmed their pacifism in the controversial "Witness Against War" manifesto and were repudiated by their own church leaders. Although sectarian pacifists had remained aloof from the interwar peace movement, they co-operated with liberal pacifists during the war in an effort to ensure the exemption of conscientious objectors from military service.

The dawn of the atomic age increased the urgency and popular appeal of pacifism, and the ranks of the postwar peace movement swelled. Since the new "nuclear pacifists" believed it was nuclear weapons that made war unthinkable, they emphasized nuclear disarmament and the easing of tensions between the USSR and the West. The new movement was initially dominated by the leftist Canadian Peace Congress under the leadership of James ENDICOTT, but in the early 1960s the Canadian Campaign for Nuclear Disarmament and the VOICE OF WOMEN generated wider public support. In the 1980s such organizations as the Physicians for Social Responsibility, Project Ploughshares and Operation Dis-

Demonstrators protesting Duplessis's Padlock Act, Montréal, Jan 1939 (courtesy Public Archives of Canada/PA-129184/Montreal Gazette).

mantle further broadened the base of the peace movement in Canada. Both sectarian and liberal pacifists were swept up in the antinuclear campaign, which remains the focus of pacifists and other peace activists in Canada.

THOMAS P. SOCKNAT

**Padlock Act** (Act Respecting Communistic Propaganda), a 1937 Quebec statute empowering the attorney general to close, for one year, any building used for propagating "communism or bolshevism." Anyone convicted of printing or publishing matter propagating communism or bolshevism could be imprisoned for up to a year, without appeal. Under the Act, police raided numerous offices and meetings and harassed suspected communists. Although many English Canadians and the CO-OPERATIVE COMMONWEALTH FEDERATION argued that the Act threatened civil liberties, it was supported by the Quebec electorate. In 1957 the Supreme Court of Canada declared the Act unconstitutional, an invasion of the federal field of criminal law.

EUGENE A. FORSEY

**Page, John Percy**, educator, basketball coach, politician, lieutenant-governor (b to Canadian parents at Rochester, NY 14 May 1887; d at Edmonton, Alta 2 Mar 1973). He coached the EDMONTON GRADS, the best and most respected women's basketball team in the world, throughout their 25-year history (1915-40). Page was the most important factor in their success, using simple well-executed plays and demanding disciplined behaviour. His feeder-team system maintained the supply of talented players. When the Grads and Page retired from basketball in 1940, he entered provincial politics. He was lieutenant-governor of Alberta 1959-65.

CATHY MACDONALD

**Page, Patricia Kathleen**, writer, painter (b at Swanage, Dorset, Eng 23 Nov 1916). P.K. Page was raised and educated in Calgary. She studied art in Brazil and NY. When she moved to Montréal in the early 1940s she began to write poetry, being first published in *Unit of Five* (1942), ed by Ronald Hambleton. She was part of the group that founded *Preview* (1942-45). From 1953 to 1964 Page lived with her ambassador husband, W.A. Irwin, in Australia, Brazil and Mexico. She has written 7 books, including *The Sun and the Moon* (novel, 1944); *As Ten as Twenty* (poems, 1946); *The Metal and the Flower* (poems, 1954, Gov Gen's Award); *The Sun and the Moon and Other Fictions* (1973); and *Evening Dance of the Grey Flies* (poems and short story, 1981). As a painter Page has had many one-woman shows in Canada and Mexico.

JEAN WILSON

**Paige, Brydon**, professional name of Brydone James Duncan, dancer, teacher, choreographer, ballet director (b at Vancouver 13 Jan 1933). As artistic director since 1976 of the Alberta Ballet, Paige has significantly raised the profile and quality of BALLET in western Canada. He was a founding member of Les Ballets Chiriaeff and

remained with the company as it evolved into LES GRANDS BALLETES CANADIENS, becoming resident choreographer and ballet master. The creator of many ballets, Paige has also been artistic director of the National Ballet of Guatemala and briefly, of the National Ballet of Portugal, as well as assistant head of the Banff Centre's summer dance program.

MICHAEL CRABB

**Paintbrush**, herbaceous PLANT of genus *Castilleja*, figwort family, Scrophulariaceae. Most are perennial. Common name, Indian paintbrush, is applied to several species. About 200 species occur worldwide, mostly in western N America; 23 in Canada (one an annual). In Canada paintbrushes are most common in southern BC and Alberta, decreasing eastward to Ontario. One species is found from the YT and Mackenzie Dist to the Atlantic provinces (excluding NS and PEI). Paintbrushes grow on dry or wet soils, from low grassland to alpine meadows, usually in open areas, but also in thickets and forest openings. Stems are clustered and erect, arising from a curved base. Tiny, tubular, usually greenish flowers occur in a terminal spike, and each is concealed by an enfolding, modified, floral leaf (bract). Bracts (red through orange, yellow and purple to greenish white) form the showy, terminal "brush." Flowers and bracts appear June-Aug. The fruits are cylindrical capsules containing many seeds. Few species are botanically well defined, and most are not readily distinguishable because of hybridization. Paintbrushes are somewhat parasitic on roots of other plants and cannot be transplanted from the wild.

**Painters Eleven** dates from 1953 when a group of artists — Jack BUSH, Oscar CAHEN, Hortense Gordon, Thomas Hodgson, Alexandra Luke, J.W.G. MACDONALD, Ray Mead, Kazuo NAKAMURA, William RONALD, Harold TOWN and Walter Yarwood — banded together with the purpose of exhibiting abstract art in Toronto. Although by the late 1940s the automatistes in Montréal and the abstract expressionists in New York had developed a new artistic vocabulary, Toronto in 1950 was still dominated by the GROUP OF SEVEN. The first public exhibition of abstract artists in Ontario was organized by Luke in 1952 and included 9 of the future members of Painters Eleven.

The group came together in the fall of 1953 as a result of the "Abstracts at Home" exhibition organized by Ronald at the Robert SIMPSON department store. Assembling for publicity photographs, the 7 artists represented decided to meet again at Luke's studio to discuss their common interests in abstraction. With the addition of 4 more artists to the group, Town proposed the name Painters Eleven. Bush undertook to approach his dealer about an exhibition, and the members agreed to finance group exhibitions. In Feb 1954 the first exhibition of Painters Eleven opened at the Roberts Gallery, drawing large crowds but no sales. Annual exhibitions were held at the Roberts Gallery in 1955 and 1956 and the Park Gallery in 1957 and 1958. A high point came in 1956, when Painters Eleven gained international recognition as guest exhibitors with the American Abstract Artists in New York. Exhibitions organized by regional galleries and the National Gallery of Canada circulated through Canada, 1957-61.

Painters Eleven held no single vision of the nature of abstraction. Although Macdonald had explored abstraction as early as 1934, the majority of the group (many a generation younger) became aware of it more than 10 years later, some of them through his teaching. Their sources were varied: Mead trained in England, Cahen in Europe, and Luke, Gordon, Macdonald and Ronald travelled to the US to study with Hans Hofmann. Though the New York school provided an important example for the

group, they developed their own personal painterly vocabulary and expressive forms. Initially critical response in Toronto ranged from bewilderment to hostility, but gradually, reviews became more favourable. Robert FULFORD gave important press support and international critics such as Sir Herbert Read (Britain) and Clement Greenberg (US) praised their work. The 1958 Park Gallery exhibition was the last annual group show: Cahén died tragically in 1956; in 1957 Mead moved to Montréal and Ronald resigned from the group. In 1960 Painters Eleven voted to disband. Their goals had been achieved, commercial and public galleries exhibited their work, and they had become recognized leaders in the local art scene. The National Gallery, the AGO and the Robert McLaughlin Gallery, Oshawa, hold important collections of their work. See also PAINTING.

JOYCE ZEMANS

Reading: D. Burnett and M. Schiff, *Contemporary Canadian Art* (1983); J. Russell Harper, *Painting in Canada* (1977); J. Murray, *Painters Eleven Retrospect* (1979); D. Reid, *A Concise History of Canadian Painting* (1973).

**Painting** The first references to Canadian subjects appeared in the decorated margins and vignettes of maps ("Mappemonde" by Pierre Desceliers) and atlases (Vallard's "Atlas," Guillaume Le Testu's "Atlas") in the mid-16th century. Made in Europe by artists who had never seen Canada but who based their pictorial work on travellers' accounts, these illustrations of the fauna, flora and human population of the newly discovered lands reflected their creators' prejudices as much as they did facts; in 1550 Desceliers placed pygmies near Hochelaga! Indian canoes, however, were frequently portrayed accurately. Later travel chronicles continued the same ambivalence. The map of Hochelaga in *Delle navigationi et viaggi* (1550-59) of Giovanni Battista Ramusio looked more like a utopian Renaissance city than an Iroquois village, whereas the illustrations in Champlain's accounts were reasonably accurate, such as a Huron woman grinding corn in a mortar, or a Huron hunting scene. The most remarkable document of this type is the *Histoire naturelle des Indes occidentales* (c1685) by the Jesuit Louis Nicolas. His manuscript was illustrated by pen-and-ink drawings (the *Codex canadensis*) of the vegetation, animals and people of the New World. Certainly his versions of the fauna were inspired by the engravings in the *Historia animalium* of the great Swiss biologist Konrad Gesner and his portraits of Indians by some poor illustrations in *Historiae canadensis, seu Novae Franciae*. . . by François du Creux. But the abundance of detail, the representation of the flora, and the naïve nature of the drawings combined to make this an important work. The engravings in *Moeurs des sauvages américains comparées aux moeurs des premiers temps* (1724) by Joseph-François LAFITAU, although they drew heavily on the works of Théodore de Bry, also showed the extensive ethnographic knowledge of this Jesuit. The *Histoire . . . de la Nouvelle France* . . . (1744) by Pierre-François-Xavier de CHARLEVOIX included several plates devoted to flora.

While these first images of Canada were appearing in Europe, the 17th-century French colonists in New France were importing paintings and engravings from France. Catholic missionaries used engravings and paintings to convert Indians and remind the settlers of their faith, as is suggested in the large painting *La France apportant la foi aux Indiens de la Nouvelle-France* (post-1666, Ursuline Convent, Québec), in which France is personified by Anne of Austria, teaching an Indian kneeling before her. We know that some priests (Jean Pierron and Claude CHAUCHETIÈRE) were painters themselves, but their work has been lost, except possibly for the portrait of Kateri TEKAKWITHA (c1681) attributed to the latter.

Frère Luc, *Assumption of the Virgin* (1671) located in the Hôtel-Dieu (city hospital) Chapel, Québec City (photo by John deVisser).

For the late 17th-century Jesuits, the engraving by Grégoire Huret of 1664, the *Martyre des pères jésuites*. . . was important enough to have a copy painted in France. Painted or engraved portraits of the Sun King (Louis XIV) made in the mother country were seen in New France; one such portrait certainly existed in the Châteaueau St Louis, the governor's residence in Québec. Even Frère LUC, who spent 16 months in New France, must be considered an uncommitted transient even though he left behind a fair-sized body of church paintings (*L'Assomption*, 1671, for the Hôpital-Général, Québec) and a *Portrait de Monseigneur*. . . Laval (1671-72). It is less certain whether paintings hung in the more modest homes; however, inventories recorded by notaries of the French regime for estate purposes included paintings and engravings which had probably been imported.

Few paintings were commissioned in the colony itself. Under the mercantile system it was more profitable to sell paintings to the colony than to support local talent (see MERCANTILISM). Consequently, the painter as a full-time professional was as yet rare; there were some clerics such as Hugues POMMIER and Jean GUYON; amateurs like Michel DESSAILLIANT, dit Richeterre, and Jean Berger; it is debatable whether they produced all the works attributed to them. It is just as unclear who created the ex-votos (see VOTIVE PAINTING) during the French regime now

preserved in Ste-Anne-de-Beaupré, Qué. As was customary at the time, sombre, bold and highly simplified posthumous portraits, such as that of *Marguerite Bourgeoys* (1700) by Pierre LE BER, were occasionally painted, but few lifetime representations of the great men of New France were made in Canada. Portrait illustrations in books of Canadian history were, for the most part, mid-19th-century imagination.

The British Conquest (1760) introduced new approaches to subject matter and style. Whereas during the French regime views of Canada continued to be fantasy rather than reality, the early TOPOGRAPHIC PAINTINGS were precise, small in format and often colourful. This new group of artists were members of the British army; they were taught at the Royal Military Academy of Woolwich to make not only strategic maps but also agreeable scenes of the environment with which they came into contact. As products of the Age of Enlightenment they looked for the "picturesque and sublime" in nature, the exotic and awe inspiring; majestic mountains and dramatic waterfalls were among their favourite subjects. The scenes were painted on the spot in watercolour and then often engraved in London — as in works by Richard Short, George HERIOT and Capt Hervey Smyth. One of the earliest and most interesting of these topographic artists was Thomas Davies, who was posted to the garrisons in Halifax, Montréal and Québec between 1757 and 1790, leaving a fine series of views, some of which were later reproduced in a travel book.

The period of stability, prosperity and expansion that followed the Conquest and the American Revolution was marked by a general desire to recreate European culture in Canada and emulate European taste. In the towns a variety of societies and clubs were founded (see ARTISTS' ORGANIZATIONS) where art and painting became the occasional focus of attention. French and English theatre flourished and some painters provided stage decorations. A moneyed middle class took over from the church as patron of the arts. A demand for portraits increased; the sitters were no longer only the clergy or government officials, but wealthy merchants and their families as well. Some painters were now able to make a reasonable living as portraitists and decorators. The retired French soldier, Louis Dulongpré, is supposed to have painted more than 3000 portraits between 1785 and 1815. Canadian-born artists such as François Beaucourt and François BAILLAIRGÉ studied in France and returned to Canada with a new stylistic assurance, while a few European artists came to Can-

Thomas Davies, *Otter Creek Falls, Lake Champlain* (c1759), watercolour (courtesy Royal Ontario Museum).

ada who had learned their trade well. William BERCZY had worked in Europe as a painter and architect and had exhibited with the Royal Academy in London. Soon after his arrival in York in 1794 he painted Joseph BRANT, Loyalist chief of the Mohawks, and in 1808 was commissioned to paint *The Woolsey Family* in Québec City, one of the masterpieces of Canadian art. That same year Robert Field arrived in Halifax where, for the next 8 years, he painted fine portraits of NS society. In contrast to the towns, rural Québec continued to be dominated by tradition, the church remained at the centre of life, and FOLK ART flourished. *Saint Louis tenant la couronne d'épines* (1777), which Jean-Antoine AIDECRÉQUY painted for the church of St-Louis on the île aux Coudres (in which the patron saint of the parish bears the features of Louis XVI), symbolized the attachment these French Canadians, turned British subjects, still felt for the French Crown.

As a result of the turmoil following the French Revolution, the Abbé Louis-Joseph Desjardins was able to bring to Québec some 200 European paintings from 1816 onwards. Some of these paintings were used to embellish churches in Lower Canada, the remainder were bought by Joseph LÉGARÉ, who then established the first museum open to the public in Canada. Although minor works for the most part, the Desjardins shipments introduced into Lower Canada a new range of subject matter: still lifes, historical subjects, and different approaches to landscape that had not been considered before by Québec painters.

Légaré's own paintings suggest that he was sensitive to stylistic peculiarities in his collection, which led to his greater technical freedom. As well, Légaré collected engravings which must have influenced him and his friends. He was also an art teacher, though his pupils are best remembered as portraitists, such as Antoine PLAMONDON, who studied in Paris after his apprenticeship with Légaré and was famous as a church painter (he decorated his parish church in Neuville). In 1841 Plamondon painted a series of young nuns of the Hôpital-Général, all daughters of prominent Québec merchants. Whereas Légaré's style did occasionally show boldness, Plamondon's was controlled, almost formal. Théophile HAMEL apprenticed to Plamondon, studied in Europe, and on his return to Québec became a most successful portrait painter for the next 20 years. It was often necessary for him to travel in order to receive commissions; these trips took him to Montréal, Kingston and Toronto. Meanwhile, Toronto had welcomed its own able portraitist in 1844; George Theodore BERTON, a French-trained artist, settled in the city after a sojourn in England.

#### 1840 to 1940

Before the 1840s painting in Canada was dominated by European taste and conventions. There was no dramatic change after that date, but increasingly Canadian content came to have a major influence on the form art took in the country. The most popular and prolific of the romantic painters of the Canadian scene was Cornelius KRIEGHOFF who, after 1841, recorded a variety of local scenes along the St Lawrence — some humorous, some anecdotal. Krieghoff had seen genre painting at Düsseldorf Academy and his naturally ebullient temperament transformed his snapshots of everyday life into subjects of immense popular appeal. He had a lifelong interest in Indians and, as his wife was of French birth, he knew the habitant life-style intimately. It is interesting that Krieghoff's support came from English-speaking patrons in the Canadas, for the French bourgeoisie found his work a vulgar caricature of habitant life and an insult to their cultured life-style.

Parallel to Krieghoff's fascination with the everyday life he observed in Québec was a growing preoccupation with the western frontier. Swiss-born Peter RINDISBACHER immigrated to the RED RIVER COLONY in 1821 as a boy of 15. He was so excited by the way of life in Ft Garry that he painted a remarkable series of watercolours of the local scene, of Indians in strange dress and buffalo on the prairies in winter. Two decades later Paul KANE made himself famous by painting this same western scenery and its native people. He had been a minor Ontario portrait painter who aspired to artistic greatness and studied in Europe. Inspired by George Catlin's American Indian portraits then displayed in London, Kane conceived a similar project of picturing Canadian natives. During a celebrated wilderness trip with fur traders from Ontario to Ft Vancouver, 1846-48, he sketched the landscape and tribes he encountered. Subsequently, he painted 100 canvases based on these sketches and published an account of his travels. Kane inspired other artists. In 1872 Frederick VERNER made a similar sketching trip to picture Indians and buffalo. William G.R. HIND spent a season as an expedition artist with his scientist brother, Henry, in exploring Labrador, then joined the

1862 OVERLANDERS, gold-seeking adventurers who travelled by land to the newly discovered BC goldfields.

Prior to Confederation, the documentary tradition had dominated Canadian painting, whether recording the frontier, high society in the garrison towns, or the scenic wonders of a new land. The remaining years of the 19th century were filled with growth and optimism, and saw industrialization, the Riel rebellions and western expansion. Yet little of this development was recorded by contemporary artists. As PHOTOGRAPHY took over the role of documenting society, Victorian artists escaped to an ideal world of the rural landscape. They established professional art societies, where they could exhibit, promote and sell their works, mostly in Montréal and Toronto (see ARTISTS' ORGANIZATIONS).

Several talented artists worked in the studios of William NOTMAN, a Montréal photographer who had achieved an international reputation for his portrait photographs by the 1860s, then went on to greater heights with landscape and genre subjects. The company had its own exhibiting space and art collection, and it rapidly became the leading, if unofficial, art school in the country. There was a camaraderie among the staff as they painted in their spare time and made sketching trips to the lakes and hills of the Eastern Townships and beyond. John FRASER, an acknowledged leader, opened a branch in Toronto and was instrumental in organizing the Ontario Society of Artists, providing space in the Notman studio for the society's first annual exhibition in 1873. Associated with him were his brother-in-law, Henry Sandham, who later opened a Notman studio in Saint John, Paris-trained Allan EDSON, and Otto Jacobi, who had enjoyed an earlier career in Germany.

The search for the Canadian landscape by Notman photographers and artists was intimately connected with the railway expansion which was opening up the new Dominion. Painters had travelled from Montréal by train in the earlier years to sketch through Québec and the Matapédia Valley. Now they broadened their vision as the transcontinental line of the Canadian Pacific edged its way across the Prairies and through the Rockies. Sir William VAN HORNE, president of the railway and himself an art collector, gave artists free passes to produce

John A. Fraser, *Laurentian Splendour* (1880), oil on canvas (courtesy National Gallery of Canada).

promotional pictures for the CPR. Notman sent a camera crew with the work trains to detail progress through the mountains. Fraser and other artists associated with Notman went to the West to make an oil and watercolour record of the magnificent scenery. Their paintings of the West, technically brilliant and marked by photographic realism, dominated many art exhibitions until the end of the century.

Canadian art achieved new prestige with the founding of the Royal Canadian Academy in 1880, primarily through the efforts of Governor General the marquis of LORNE and his wife Princess Louise. Lucius O'BRIEN, first president of the RCA, was swept up in this new search for the face of Canada. He visited NS and NB, then, as the railway reached the Pacific, he travelled west to paint the mountains and the Vancouver area. Some of his finest paintings, such as his majestic views of Québec or *Sunrise on the Saguenay*, introduced a glowing quality which incorporated the luminism found in contemporary American painting of the Hudson River School.

During the 1880s and 1890s Europe once again became the model for artists in Canada, and painters aspired to study in Paris academies and exhibit at the Salon. It was the conservative French and English masters, not the avant-garde, who attracted the young Canadians, men who painted heroic images in a highly finished naturalistic style. William BRYMNER and Robert HARRIS followed this path and on their return taught "in the French manner" in Montréal and Toronto. In 1883 Harris was commissioned by the federal government to paint *The Fathers of Confederation*. Paul PEEL was acclaimed in Paris and at home for his studies of bathers and children, but demonstrated little Canadianism. George REID used the same monumental figure tradition in his scenes of rural Ontario, such as *Mortgaging the Homestead*.

Two young painters who derived their inspiration from their rural Canadian surroundings and who visited Europe only after they were established were Homer WATSON and Ozias LEDUC. Watson early became a celebrity when *The Pioneer Mill* was purchased for Queen Victoria's royal collection. Leduc lived in virtual seclusion in St Hilaire, Qué, supporting himself from church decoration while painting still lifes and people and landscape close to him for his own satisfaction. Meanwhile in Paris the slick, narrative style of the Salon was increasingly attacked by innovative painters of the impressionist, Barbizon and Hague schools. Horatio WALKER was influenced by this naturalistic depiction of nature and, on his return to Canada, his paintings of rural scenes on Ile d'ORLÉANS rapidly brought him acclaim in N America. In

1910 the National Gallery paid \$10 000 for *Oxen Drinking*.

Maurice CULLEN and James Wilson MORRICE were among the first artists to apply the principles of French impressionism to the Canadian landscape. Cullen attracted attention in Paris before returning to spend his mature years in Québec. Criticism was harsh and sales were poor, but he exerted a tremendous influence through his teaching at the Art Assn of Montréal. Morrice, independently wealthy, lived much of his life in Paris, travelled widely, befriended Henri Matisse and was influenced by James Whistler. Through annual exhibitions with the Canadian Art Club in Toronto, 1907-15, Cullen, Morrice and Marc-Aurèle de Foy SUZOR-CÔTÉ served as models for young artists.

The face of Canadian painting changed completely when a new landscape movement emerged in Toronto in the years immediately preceding WWI. Tom THOMSON died in 1917, but

Tom Thomson's *The Drive* (1916-17), oil on canvas, is typical of the bold, imaginative landscape painting that dominated Canadian art after his death in 1917 (courtesy Macdonald Stewart Art Centre/University of Guelph)

the remaining painters — Frank CARMICHAEL, Lawten HARRIS, A.Y. JACKSON, Frank JOHNSTON, Arthur LISMER, J.E.H. MACDONALD and F.H. VARLEY — organized the first exhibition of the GROUP OF SEVEN in 1920. "Group" subject matter and style dominated Canadian art for the next 30 years. It was bold, imaginative painting employing strident colouring and tending to post-impressionist mannerisms. It was also an art movement which aroused bitter controversy and patriotic fervour, which caught the public interest and allowed little room for serious development of divergent art styles. The group disbanded in 1933 to make way for the broader-based Canadian Group of Painters, which included artists from across the country and encouraged figure painting and modernism as well as the landscape.

Two artists working at the same time as the Group of Seven but disregarded until the late 1930s were Emily CARR and David MILNE. They worked in semi-isolation, devoted to the area in which they had grown up and pursuing their own personal vision while struggling with financial privation and lack of recognition. Carr had visited England and France and was moved by the Fauves' vigorous strokes and strident colour. On her return she painted the dense Pacific forests, Indian villages and totems with an exultant celebration of nature and its mysteries. In contrast to Carr, who began painting with renewed vigour after her meeting with the Seven, Milne had none of the national consciousness of the group but was concerned with individual aesthetic expression and painterly problems. He studied in New York and was represented at the famous Armory Show of 1913 which introduced modernism to America. Thereafter, in the Catskills and at various secluded rural locations in southern Ontario, he experimented with evocative shapes, tonal contrasts and unique picture planes, simplifying his technique to the bare minimum.

The Great Depression, combined with the continued hold of the Group on Canadian art, meant that many excellent painters were virtu-

ally ignored. Opportunities for exhibition were dominated by the academies and societies; collecting of new art was negligible; and institutional and public awareness was resistant or indifferent to change. Lionel LeMoine FITZGERALD painted canvases of intimacy and gentleness centered on his surroundings in Winnipeg, but Charles COMFORT's *Young Canadian*, a haunting portrait of his friend Carl SCHAEFER, best symbolized the era. In Feb 1927 an exhibition of paintings by Bertram BROOKER was held at the Arts and Letters Club in Toronto, the first exhibition of abstract art in Canada. Later that year Lawren Harris helped organize a show of abstract European art at the Art Gallery of Toronto, but it was ridiculed by critics and contemporary artists alike. Developments in Canadian painting would have to await prosperity, another world war, and a new generation of artists working in Québec.

J. RUSSELL HARPER

#### 1940 to the Present

The years since WWII have witnessed an unprecedented expansion in the visual arts throughout Canada, evidenced in the number of professional artists, the proliferation of galleries and exhibitions, and the development of art magazines. The CANADA COUNCIL and the provincial art councils have played crucial roles in this development, as have the expansion of museums, art galleries, alternate and artist-run spaces, and the growth of art departments in colleges and universities. In describing the character of recent painting in Canada it is essential to bear in mind 3 factors: the strength of regional identities, the increased knowledge of

developments across the country and internationally, and the differing sizes of the artistic communities. These factors have combined and recombined in complex ways, producing a dynamic which has discouraged the uniformity of "a Canadian painting" and encouraged the strength of painting in Canada.

The breakthrough to modern movements came in Montréal in the 1940s through efforts initiated by artists themselves. The 3 leading figures, John LYMAN, Alfred PELLAN and especially Paul-Émile BORDUAS, had different, often conflicting views from which came an energy in ideas and a dynamic of change. Lyman returned to Montréal in 1931 after almost 24 years abroad, mostly in France. Besides the example of his own work and his advocacy of modern European art, he wrote criticism for the *Montrealer* (1936-40) and initiated the founding of the CONTEMPORARY ARTS SOCIETY in 1939. The society, open to artists who were not members of the Royal Canadian Academy, organized annual exhibitions during its 9-year existence and introduced European modernism to Canada. The founding membership comprised 26 artists, including Prudence HEWARD, Fritz BRANDTNER, Goodridge ROBERTS, Louis MUHLSTOCK, Marian SCOTT and Philip SURREY. Borduas was among only 5 French Canadian members.

A more radical source of inspiration came from Pellan, who returned to Canada in 1940 after 14 years in Paris. An artist of sparkling eclectic talent, his interpretations of cubism and surrealism were a revelation to artists in Montréal. Borduas, initially struck by Pellan's work, determined a still more radical approach related to the ideas of André Breton, the founder of surrealism. Borduas was set not simply on an imitation of French art but an original expression of spiritual revolution. He became the centre of a group of young men and women, including Fernand LEDUC, Pierre GAUVREAU, Jean-Paul RIOPELLE, Marcel BARBEAU, Françoise Sullivan and Jean-Paul MOUSSEAU. A clearly defined group by the mid-1940s, they gained the name AUTOMATISTES from an exhibition in 1947. Direct connections with French surrealism were maintained through Riopelle, the most prodigious of the young painters, who moved to Paris in 1946, and Leduc, who lived there from 1947 to 1953. The climax of the Automatiste action came with the collective signing of Borduas's 1948 manifesto, REFUS GLOBAL. Advocating personal freedom in cultural and spiritual expression, the pamphlet attacked the repressions of the government and the dominant place of the church in Québec culture and education. The document caused an uproar and led to Borduas losing his teaching post at the École du Meuble. After 5 years of personal and professional hardship, Borduas left Canada. He went to New York (1953-55), coming into contact with the work of the abstract expressionists, and then to Paris

(1955-60). Both in his painting and his advocacy of cultural change, Borduas represents one of the major achievements in Canadian art.

The Automatistes split the Contemporary Arts Society. The older members could not follow their direction and Pellan led a short-lived "anti-automatiste" group, *Prisme d'yeux* (1948-50), with Léon Bellefleur, Jacques de TONNANCOUR and Albert DUMOUCHEL. The Automatiste movement gave way in the mid-1950s to a rigorous form of hard-edge abstraction first marked in the work of Leduc and the PLASTICIENS, a group that was formed in 1954 by the critic Rodolphe de Repentigny (who painted under the pseudonym Jauran) and 3 other painters. This group, influenced by the ideas and work of Malevich and Mondrian, was soon absorbed into the Non-Figurative Artists' Assn of Montréal, which was formed in 1956 with Leduc as president, Repentigny as secretary and Guido MOLINARI as treasurer, and which included artists such as Rita LETENDRE and Jean MCEWEN. The direction somewhat hesitantly begun by the Plasticiens was rapidly developed by Leduc, Molinari and Claude TOUSIGNANT. Leduc returned to France in 1959, and it was the work of Molinari and Tousignant, in particular, rigorously hard-edged and abstract and developed on the dynamics of colour, that led Montréal painting in the 1960s. But their concerns were not exclusive, as is evidenced by the work of Yves GAUCHER, first as a printmaker and from the mid-1960s as a painter, and Charles GAGNON, whose work has been in painting, assemblages and photography.

Toronto, in the 1940s, lacked the atmosphere of radical debate found in Montréal. There were only a few artists, such as Paraskeva CLARK, Robert "Scottie" Wilson, Albert FRANCK and Jock MacDonald (a major figure as both painter and teacher), who worked against the dominance of the Group of Seven, their followers in the Canadian Group of Painters and continued academicism. Others, such as Jack BUSH, and younger artists such as Oscar CAHEN, Walter Yarwood, Harold TOWN and William RONALD, were by the end of the 1940s actively developing more radical solutions, looking to European and, in particular, New York painting. Alexandra Luke organized the touring Canadian Abstract Exhibition in 1952 and in 1953 Ronald initiated an exhibition at Simpsons department store called

Abstracts at Home, including his work and that of 6 other artists, Kazuo NAKAMURA, Luke, Bush, Cahén, Ray Mead and Tom Hodgson. Deciding to continue to exhibit together, the group expanded to include Hortense Gordon, Yarwood, Town and Macdonald, and took the name PAINTERS ELEVEN. They first exhibited together in 1954 and formally dissolved in 1960. Differing widely in approach and style, the best of the group's work was characterized by strong painterly surfaces found in Town, Ronald, Hodgson and Cahén. In 1956 the group exhibited with the American Abstract Artists in New York. Ronald, then working in New York, arranged in 1957 for the critic Clement Greenberg to visit the Toronto artists in their studios, though Town and Yarwood refused to participate. Greenberg's visit had most impact on Bush, whose work from the 1960s brought him into the ambience of American post-painterly abstraction, and who became a major influence on many younger Toronto artists.

Even as Painters Eleven was breaking up, their example was important to a strong and energetic group of young artists centered on Av Isaacs' gallery. The work of this group, reflecting a wide range of interests from dada to abstract expressionism, was characterized by powerfully expressive figurative styles and included Graham COUGHRAY, Joyce WIELAND, John Meredith, Gordon RAYNER, Dennis BURTON, Robert Markle, Nobuo Kubota, Richard Gorman and Robert Hedrick. The most original was Michael SNOW, who began his career as a painter but soon moved into a wide range of media — sculpture, photography and film.

A vital centre of activity also developed through the 1960s in London, in particular with Jack CHAMBERS, Tony URQUHART and Greg CURNOE. Chambers and Curnoe, in different ways, have given forceful definition to regionalism as a vital expression of the reality of living and working in a particular community. It was Chambers who initiated the development of the Canadian Artists Representation in 1967 to set standards in exhibition and copyright fees and to assert the professional status of artists. The community in London, if small, remains a vital and active one in sculpture, installation work and painting; among the painters special mention must be made of Paterson EWEN, who moved there from Montréal in 1968, and Ron MARTIN (since 1983 working in Toronto).

The visual arts in the Atlantic provinces developed radical directions much more slowly than in Québec and Ontario. The first artists in the region seriously to address contemporary issues were Miller BRITTAIN and Jack HUMPHREY in Saint John and, after the war, Bruno BOBAK and Molly Lamb BOBAK in Fredericton. Lawren P. Harris at Mt Allison U in Sackville was essentially alone as an abstract painter. The dominant figure in the Atlantic region since the war has been Alex COLVILLE. His painting has set a new standard for realist art, and through his teaching at Mt Allison (1946-63) he has had an important impact on the development of artists such as Christopher PRATT, Mary PRATT, Tom FORRESTALL, D.P. Brown and Hugh MacKenzie. Since the mid-1960s the Nova Scotia College of Art and Design, with artists such as Garry Neill KENNEDY, Gerald Ferguson and Eric Cameron, has been a gathering point for radical Canadian, American and European artists.

In the West each of the major urban centres has established a distinctive character and sense of community. Vancouver has the largest concentration of artists and the longest history of interest in modern art; Jock Macdonald was working there in the 1930s and Lawren S. Harris settled there in 1940. The 2 principal artists from the 1940s, both as artists and teachers, have been B.C. BINNING and Jack SHADBOLT. Binning is best known as a draftsman and a painter of abstrac-

tions of ships and landscape. Shadbolt, deeply affected by the richness of the landscape and NORTHWEST COAST INDIAN ART, has interpreted these themes in a highly personal surrealist manner. The combination of the landscape and lyrical abstraction characterizes the work of Gordon SMITH, Takao TANABE and Don Jarvis, a direction reinforced by Toni ONLEY who went to Vancouver in 1959. A more rigorous form of abstraction, important for a younger group of painters, came from Roy Kiyooka, who moved from Regina to Vancouver in 1959. In the 1960s and 1970s Vancouver experienced the diversification of interests that occurred in Toronto and Montréal, with particular strengths in conceptual and communication art, video and performance, through the work of Iain and Ingrid BAXTER in their N.E. Thing Co (formed in 1966), Michael Morris and Gathie FALK, whose work has encompassed performance, painting and mixed media. Mention must also be made of painters such as Alan Wood, Robert Young and Glen Howarth.

In Regina the focus of activity in the 1950s

Michael Snow, *Venus Simultaneous* (1962), oil on canvas and wood (courtesy Art Gallery of Ontario).

was on a small group of artists determined to overcome their sense of isolation from the principal centres, particularly New York. The summer school at Emma Lake, founded by Augustus KENDERDINE in 1936, was extended in 1955 by Kenneth LOCHHEAD and Arthur MCKAY to include a workshop for professional artists, the first of which was led by Jack Shadbolt. Subsequently many of the leaders were Americans, the most significant being Barnett Newman (1959), Clement Greenberg (1962), Kenneth Noland (1963) and Jules Olitski (1964). In 1961 Ronald BLOORE, director of the Norman Mackenzie Art Gallery, organized the "Five Painters from Regina" exhibition with work by himself, Lochhead, McKay, Ted Godwin and Douglas Morton. Later that year this show toured Canada under the auspices of the National Gallery, giving rise to the name the REGINA FIVE.

The Emma Lake workshops also had a major effect on artists in Saskatoon, currently a tight-knit community, uniting artists of different generations and styles of work. The doyen of painting in the city is Ernest LINDNER, who has gained national attention over the past 20 years with his precisely rendered close-ups of trees and plants and figure studies. Landscape painting, for instance that of Reta Cowley, Wynona Mulcaster and Dorothy KNOWLES, has become a major force and has encouraged the work of younger artists such as David Alexander. A sensibility to the landscape has also been a major factor in the development of abstract painting, for instance in the dissimilar work of William PEREHUDOFF and Otto ROGERS. Among younger painters, for instance Robert Christie, there is a substantial interest in colour-field abstraction. Separate from these concerns is the constructivism of Eli BORNSTEIN, founder and editor of the journal *Structurist*.

For artists in Alberta, as in Saskatchewan, the Emma Lake workshops and the BANFF CENTRE SCHOOL OF FINE ARTS have been the most significant centres for development of the visual arts. In Calgary an informal group developed around Maxwell BATES, including Ron Spickett, Marion Nicoll and Roy Kiyooka. Bates, a practising architect, painted in Calgary until 1961 (when he moved to Victoria) in an expressionist style. Subsequently, the modernist direction has been developed by artists such as Bruce O'Neil and Gerald Hushlak. A modernist landscape style is found in artists such as Ken Christopher and in various forms of image painting with John Hall, Derek Michael Besant, Ron Moppett and Gary Olson. In Edmonton the interest in formalism, developed out of the Emma Lake workshops, has made the strongest mark, not only in painting but in sculpture. The substantial group of formalist painters working there, led by

Douglas HAYNES, includes Ann Clark, Robert Scott, Phil Darrah and Terrence Keller.

In Winnipeg in the 1930s the most significant artists were Fritz BRANDTNER and LeMoine Fitzgerald. Subsequent developments centered on University of Manitoba with artists and teachers such as George Swinton and Joe Plaskett and, from 1964, Ken Lochhead. In recent years Winnipeg, though somewhat isolated from other centres, has continued to be an active and varied community with such painters as Don Reichert, Ivan EYRE, Esther Warkov, Jack Butler and Sheila Butler, and Suzanne Funnell.

Through the 1970s the place of painting at the leading edge of the visual arts was challenged critically by developments in conceptual art, installation art, sculpture, video and performance (see ART: CONTEMPORARY TRENDS; VIDEO ART). For many people, painting, if it survived at all, would do so as an essentially reactionary form. But painting did not come to a standstill, and in recent years activity in the field, internationally as well as in Canada, has developed rapidly, especially among younger artists. What is notable, in Toronto and Montréal in particular, is a concern with what may be called expressive abstraction and with figurative and image painting, although not to the exclusion of geometric abstraction. At a time when the outcome of these developments is impossible to predict, it is important to recognize that such terms are inexact and arbitrary: for we can describe the work of artists such as Christian Knudson, Richard Mill, Leopold Plotek, Christian Kiopini and Jocelyn Jean in Montréal as abstract and geometric, but must distinguish their concerns not only from each other but also from the approaches of, say, Toronto artists such as Ric Evans and Jaan Poldas, Milton Jewell and Paul Sloggett. The significant factor is to recognize how the matter of painting, in each case, is addressed to the spectator — a point underlined in the work of Ron Martin, whose recent shift from an open and painterly form to a geometric colour structure is a syntactical, not a stylistic change. For many painters, such as Jacques Hurtubise in Montréal, Josef DRAPELL, Milly Ristvedt-Handerek and Harold Feist in Ontario, the character of painting remains abstract, formal and personal. Nor is the distinction between the abstract and figurative exclusive in terms of a concern with painting itself. In the work of David Bolduc, Harold Klunder, Paul Fournier, Alex Cameron, Paul Hutner, Howard Simkins, Eric Gamble and Christopher Broadhurst, among others in Toronto and elsewhere, figurative images are woven into the abstract concerns of the activity of painting.

There can be no question of the importance for many younger painters of an explicit concern with the image as such. It has been a sweeping development spawning terms — new image, neoexpressionism, postmodernism, post-cubist representation — in an attempt to identify the manifestations of this energy. We must cope with the precise images of painters such as Tim Zuck, Doug Kirton and Lynn Donoghue in Ontario; David Thauberger in Regina; and the expressive images of painters such as Luc Beland, Michel Jolliffe, Landon Mackenzie, Lynn Hughes and David Elliot in Montréal; and Shirley Wiitasalo, Brian Burnett, John Scott and Oliver Gillingham among others in Toronto.

What appears now to be a situation of stylistic anarchy arises, in substantial part, from the tendency of criticism since the war to stress a historicist view of current painting. From a wider viewpoint of art in our century it is apparent that it will take many decades to comprehend all that has happened, to realize the potential of the recent past. The revival of interest, for instance, in German expressionism, and in Matisse and de Kooning, is not an aberration from a determinist thrust of progress but the outcome

of successive generations of painters responding to their own time and seeking a voice within the complex of possibilities to which they are heir. Such a situation, in its very complexity, speaks not of decline, but of health.

**Paleoindian**, a loose designation for a cluster of early cultures: the CLOVIS (Llano), Folsom and Plano, and various others of coeval and earlier age which have been proposed by archaeologists but are not fully verified. These 3 cultures are characterized by a subsistence pattern focused on big game — mammoth, big-horned bison, deer and presumably mastodon — and there is evidence of this after 10 000 BC in western N America. Llano, 9500–9000 BC, is characterized by Clovis fluted projectile points. The Folsom culture, 9000–8000 BC, is typified by the Folsom point (finer and smaller than Clovis fluted). Plano, 8000–6000 BC, extends to the early ARCHAIC cultures. All 3 overlap to some extent, depending on geographical area. Paleoindian archaeological sites are generally widespread in Canada, usually in the south with the exception of early material from the Yukon and a late northern variant of Plano. The best-known site is DEBERT (NS). Most of these sites are mass-kill sites where the remains of butchered animals are found in direct association with Paleoindian projectile points. The Paleoindian cultures disappeared with the extinction of the large mammals on which they depended. See also PREHISTORY.

RENÉ R. GADACZ

**Paleontology**, the study of FOSSILS, gives us knowledge of past life, helps us understand the nature of ancient organisms and provides information about the composition of the biomass of past times. The organisms now living represent a stage in the succession of life forms and, according to the concept of EVOLUTION, have descended from past life forms. It is difficult to estimate how many species now exist; the number may be in excess of 45 million. Some authorities estimate that 1.5 million living species (monerans, protists, FUNGI, PLANTS and ANIMALS) have actually been found and described. The fossil record, largely representing the past 600 million years, has been estimated to contain about 250 000 species, a low figure since new species are constantly being described. Nevertheless, the actual number of species represented in the fossil record is low (possibly as low as 5%) compared to the number of species living today because not all organisms have an equal chance of being preserved as fossils, eg, the delicate bodies of INSECTS. In exceptional circumstances, soft-bodied animals may be preserved, eg, the bodies of organisms very quickly buried in sediment. Canada is fortunate in having one of the most famous faunas of this type, British Columbia's Cambrian BURGESS SHALE, first discovered by C.D. Walcott (1909). The Burgess Shale fauna is of great interest to paleontologists because of the unique state of preservation and variety of organisms represented (more than 120 species of soft-bodied marine animals).

By far the greatest proportion of fossils are of animals that had hard skeletal parts. The groups most commonly represented in the fossil record are the protozoans, Archaeocyathids (now extinct), Porifera (SPONGES), Coelenterates (CORALS), Bryozoa, BRACHIOPODS, MOLLUSCS (clams, nautilus), arthropods (TRILOBITES) and ECHINODERMS (crinoids, echinoids). Various minerals have been and are being used by animals for skeletal construction (eg, chitin, calcium carbonate, silica and calcium phosphate). Once an organism dies, its body is incorporated in the sediment and subjected to GROUNDWATERS percolating through the area. Such solutions can have

dramatic effects on the buried organism. In some cases, the skeletal material is removed completely, leaving no trace of the organism. In other instances, new minerals such as silica are precipitated into pore spaces within the skeleton, thereby increasing its weight. TREE material and bones (eg, DINOSAUR bones found around Drumheller, Alta) are commonly preserved in this manner. In another common process, the entire original skeletal material is replaced by a new mineral. Other fossils occur simply as a carbon residue on the surface of rock, the carbon remaining after the more volatile materials have been removed. Fossil plants and graptolites (Paleozoic colonial animals) are commonly preserved in this manner.

The fossil record encompasses a tremendous variety of organisms, ranging from microscopic conodonts to the giants of the fossil world, the dinosaurs. Obviously, there is a need to order the organisms, placing related organisms in groups. This process of classification was initiated by Aristotle, who recognized the differences between major groups, eg, birds and insects. The classification scheme now used by all paleontologists is that proposed by the 18th-century Swedish naturalist Linnaeus. This hierarchical system divides organisms into kingdoms, phyla, classes, orders, families, genera and species. The names attached to each division are associated with a particular group of organisms; therefore, they show relationships among organisms. The most commonly used part of the system is the "binomial designation," eg, the 2-part name *Tyrannosaurus rex* implies that the species name is *rex* and that it belongs to the genus *Tyrannosaurus*. The name *Tyrannosaurus rex* should immediately convey the nature of the beast being described, in this case a large dinosaur — the "king of the terrible lizards."

The study of fossils has many important applications in a wide variety of fields. For example, the study of the fossil record can give insight about when and in what form life first appeared on Earth. The oldest known fossils are thought to be remains of ALGAE, bacteria and possibly fungi, which have been fortuitously preserved in cherts of Precambrian age. For example, the "Fig Tree" chert from South Africa contains algae which are considered to be more than 3.2 billion years old. A famous locality in Canada, the "Gunflint" chert exposed in southern Ontario, has yielded bacteria and algae that are about 1.9 billion years old. Stromatolites, structures formed by algae, are also common in Precambrian rocks dating back to about 2.8 billion years ago. Such stromatolites are quite common in Canadian Precambrian rocks.

The fossil record can also help the paleontologist to pinpoint various important stages in the evolution of life. For example, it shows that life during Precambrian times (before 600 million years ago) was entirely soft bodied. At the beginning of Cambrian times (between 570 and 500 million years ago) organisms developed the ability to secrete hard skeletons. It is through the fossil record that it is known that the Paleozoic era was the time when INVERTEBRATE animals dominated the biomass. Similarly, the fossil record reveals the dominance of the dinosaurs during the Mesozoic era (between 225 and 65 million years ago) and the MAMMALS during the Cenozoic (65 million years ago to the present). From the fossil record, it can also be shown that groups of animals have become extinct. Charles Darwin made extensive studies of fossils in the strata of S America, and used this information along with data from modern species to formulate his theory of evolution. The fossil record also permits the study of the ecology of past times by describing the environment in which an organism lived and the interrelationship of the different groups of organisms present (see BIOGEOGRAPHY).

Perhaps the most important use of fossils is for the relative dating of the rocks in which they occur. It was demonstrated in the 19th century that a distinct succession of fossils will be found in any given sequence of sedimentary rock layers (horizons) and that rocks of a particular age will contain particular types of fossil. This discovery led to the development of biostratigraphy, literally, the tying together of rock units on the basis of their biological content. The principle follows from Darwin's concept of evolution: life changes gradually with time, and once a species has become extinct it will not reappear. As a basic tool in deciphering the geological evolution of an area, biostratigraphy has widespread economic application, playing an integral role in the exploration for oil, gas and minerals. In Canada, many of the most important PETROLEUM discoveries have been based on detailed biostratigraphical studies. See GEO-CHEMISTRY; GEOLOGY; PALYNOLOGY. BRIAN JONES

**Paleontology, History in Canada** The study of FOSSILS was a relatively new science when the geological exploration of Canada began. The first Canadian geologist, and the first to apply the principles of geochronology (GEOLOGICAL DATING) in Canada, was William LOGAN, a native of Montréal, trained in the geology of England and Wales. In 1842, he was appointed to make a geological survey of the United PROVINCE OF CANADA. He began in 1843 by measuring, mapping and systematically subdividing the Devonian rocks (395-345 million years old) of the Gaspé Peninsula. Within the next few years he extended his surveys to the earlier Paleozoic formations of the Eastern Townships of Québec, as well as to the non-fossil-bearing rocks of the Lk Superior region. Thanks to the progress that had been made in identifying and mapping the Paleozoic rocks (570-225 million years old) of western New York and northern New England, Logan was able to establish the broad correlations of the formations in the St Lawrence region. However, he did not have the time, and probably not the knowledge, to work out the details of the fossil succession. In 1856 he appointed Elkanah BILLINGS of Ottawa to be the full-time paleontologist of the GEOLOGICAL SURVEY OF CANADA (GSC).

Billings, a successful lawyer and journalist, was an enthusiastic collector and student of fossils. In the next 20 years he amassed large collections of Paleozoic fossils, which he described and assigned to their stratigraphic positions. Although concentrating on the Ottawa and St Lawrence river valleys, he extended his collecting and identifying to southwestern Ontario and NS. He was especially interested in fossil ECHINODERMS and BRACHIOPODS.

While Logan and his colleagues were working out the GEOLOGY and fossil sequence for central Canada, J.W. DAWSON was doing the same for the Maritime colonies. In the process, he began the study of FOSSIL PLANTS in Canada, describing the flora of the "Coal Measures" (Pennsylvanian or Upper Carboniferous period, 310-280 million years ago) of NS and the Devonian of Gaspé. He became the first principal of McGill and founded there the Redpath Museum, a centre for paleontological research. Fossil plants from western Canada came to his notice, and he described AMPHIBIANS and MOLLUSCS from the hollow tree stumps associated with the coal seams of NS.

Billings was succeeded (1876) as paleontologist of the GSC by J.F. Whiteaves of Montréal, an all-round naturalist. By this time, the geological exploration of the then North-West Territories and of Manitoba was beginning with the work of G.M. DAWSON and his GSC colleagues. Their fieldwork brought to light a series of new faunas, Ordovician (500-425 million years old), Silurian (425-395 million years old)

and Devonian in Manitoba; Cretaceous (140-65 million years old) and Tertiary (65-2.5 million years old) from the future Saskatchewan and Alberta. These were described by Whiteaves, who made correlations with faunas discovered in the western US. Whiteaves also began the study of fossil FISHES in Canada. His detailed accounts of the Devonian fish faunas of the Baie des Chaleurs area (Qué and NB) revealed persistent archaic groups (ostracoderms, antiarchs) contemporary with early lungfish and teleosts and, most exciting, a fringe-finned fish that was on the verge of becoming a limbed VERTEBRATE. Meanwhile, paleontological work was proceeding in the classic fossil fields of central and eastern Canada. The basic work on the Paleozoic faunas of Ontario, begun by Billings, was refined and expanded by W.A. PARKS of University of Toronto, and by E.M. KINDLE, M.Y. Williams and Alice E. WILSON of the GSC. The older (Mississippian or Lower Carboniferous, 345-310 million years old) floras of NB and NS were studied by G.F. Matthew of Saint John and W.A. Bell of the GSC. Their work, added to that of J.W. Dawson, established the sequence of plant life for the late Paleozoic.

The Cretaceous DINOSAUR faunas of Alberta and Saskatchewan are famous. They were first revealed by G.M. Dawson in 1874, and by his successors in the 1880s. L.M. Lambe, assistant to Whiteaves, provided the early descriptions of these fossils, but it was not until Barnum Brown of the American Museum of Natural History came to Alberta with a staff of well-trained collectors (1910) that the wealth and excellence of preservation of Canadian dinosaurs came to be realized. To share in these discoveries the GSC engaged the services of C.H. Sternberg of Kansas and his 3 sons. Their work, and especially that of the second son, C.M. STERNBERG, resulted in the assemblage, at the National Museums of Canada, of a very important dinosaur collection described by Lambe and later by Sternberg. W.A. Parks, assisted by Levi Sternberg, the youngest of the brothers, built up a fine collection of Alberta dinosaurs at the Royal Ontario Museum, and made them known to science. Fossil MAMMALS of Oligocene age (38-26 million years old) were found (1883) in the Cypress Hills, Sask, by R.G. McConnell of the GSC and described by E.D. Cope of Philadelphia. Subsequently, Lambe collected and described additional specimens, correlating them with the White River Group of S Dakota. A late Miocene mammalian fauna (26-12 million years old) was found (1929) in southern Saskatchewan by C.M. Sternberg. L.S. Russell described Paleocene mammals from Alberta and Saskatchewan, a late Eocene mammalian fauna from Saskatchewan and an early Oligocene fauna from southeastern BC. Another famous fossil occurrence in Canada is in the Middle Cambrian BURGESS SHALE in the Rocky Mts near Field, BC. This was discovered (1909) by C.D. Walcott of the Smithsonian Institution, who was a specialist in Cambrian faunas. The remarkable aspect of the Burgess Shale fauna, revealed by Walcott's 5 seasons of excavation and by numerous monographs, was the presence of a rich assemblage of soft-bodied animals, remains of which would ordinarily not be preserved.

Early in the 20th century, commercial companies began drilling for PETROLEUM in the plains and foothills of Alberta. To carry out this activity intelligently, the companies required detailed stratigraphic data, which depended on knowledge of the succession and correlation of fossil faunas. A major step in this direction was provided by the work of F.H. McLearn of the GSC. He revised the Triassic (225-190 million years old), Jurassic (190-140 million years old) and Lower Cretaceous fossil molluscs of the foothills and northern plains of Alberta and those of the Queen Charlotte Is, and established cor-

relations with similar faunas in the US, Europe and Asia. P.S. Warren of University of Alberta also made important contributions in this field, as well as with the late Paleozoic faunas of the Rocky Mts and the Subarctic. Interest in exploration for oil and gas also stimulated the study of "microfossils," mostly Foraminifera, the hard parts of which could be recovered from well cuttings. Although some pioneer observations on such fossils had been made by G.M. Dawson, modern investigations of them in western Canada was begun (1927) by J.A. Cushman of Harvard and continued by one of his students, R.T.D. Wickenden of the Geological Survey. Among more recent workers in this field have been J.H. Wall and C.R. Stelck in Alberta and W.G.E. Caldwell in Saskatchewan and Manitoba.

A similar use has been made in Paleozoic biostratigraphy of the jawlike and toothlike microfossils known as "conodonts." In 1897 G.J. Hinde, then at University of Toronto, described conodonts from local Ordovician rocks. In recent years there has been a revival of interest in them because of their stratigraphic importance; faunas have been described from Alberta, Ontario and farther east. Other Canadian paleontologists have become recognized specialists on particular groups of fossils. W.A. Parks was noted for his numerous papers on stromatoporeoids (Paleozoic colonial organisms superficially resembling corals). Madeleine Fritz, of U of T, has contributed much to the knowledge of Paleozoic Bryozoa. G.W. Sinclair, of the GSC, specialized in the Conularida, early Paleozoic organisms possibly related to JELLYFISH. INSECTS are rare as fossils, but numerous specimens do occur in the Eocene tuffaceous shales of interior BC. These were described by S.H. Scudder of Boston and Anton Handlirsch of Vienna, Austria. Scudder also described late Paleozoic insects from NS.

Almost every university in Canada has a collection of fossils, mainly used in teaching; but for size and number of type specimens, the most important collections are those of the GSC and the National Museum of Natural Sciences in Ottawa, the Redpath Museum of McGill University in Montréal, the Royal Ontario Museum in Toronto, University of Alberta in Edmonton and the Saskatchewan Museum of Natural History in Regina. L.S. RUSSELL

**Palladium**, see PLATINUM.

**Palliser, Hugh**, naval officer, governor of Newfoundland (b at Kirk Deighton, Eng 26 Feb 1722/23; d at Chalfont St Giles, Eng 19 Mar 1796). He was a naval officer at the siege of Québec in 1759, and was appointed governor of Newfoundland 1764. He travelled widely within his jurisdiction policing the French fishery to confine it to the limits set by the TREATY OF PARIS 1763. Palliser's concern was for the English migratory fishery only, but his attempts to discourage settlement failed. Assisted by Moravian missionaries, he was the first official to establish relations with the LABRADOR INUIT and Indians, and he also encouraged Captain James Cook in his hydrographic survey 1763-67. JOHN PARSONS

**Palliser, John**, sportsman, explorer (b at Dublin, Ire 29 Jan 1817; d at Comeragh House, County Waterford, Ire 18 Aug 1887). He spent nearly 3 years (1857-59) exploring what is now western Canada as instigator and leader of the PALLISER EXPEDITION. His interest in the southern prairies and mountains of western British N America had been aroused on an 1847-48 tour of the US, when he had spent almost 11 months hunting buffalo, elk and grizzly bear in the Missouri country. On his return he wrote a popular book about his adventures, *Solitary Rambles and Adventures of a Hunter in the Prairies* (1853).

Heir to an Irish landowner and descendant of a Protestant archbishop of Cashel, he attended Trinity College, Dublin, and saw intermittent militia service 1839-63. Besides his exploration of what is now western Canada, he made 2 important journeys. One was a confidential, semi-official mission in 1862-63 to the Caribbean and Confederate States, and the other was a voyage in 1869 with his brother Frederick in his own specially reinforced vessel, *Sampson*, to Novaya Zemlya (USSR) and the Kara Sea, exploring and hunting walrus and polar bear. Apart from visits to London (where he discussed possible railway routes with Sandford FLEMING), Rome, Switzerland and France, he spent the rest of his life caring for nieces and nephews, in public duties such as justice of the peace, in administering his heavily mortgaged estates, playing Bach's music and walking in the lovely Comeragh Mountains. IRENE M. SPRY

Reading: Irene M. Spry, ed, "Introduction," *The Papers of the Palliser Expedition* (1968).

**Palliser Expedition** (British North American Exploring Expedition), 1857-60, initiated by John PALLISER, who submitted to the Royal Geographical Society a plan to travel from RED RIVER COLONY to and through the Rocky Mts along the unsurveyed American boundary. The society expanded the project into a scientific expedition and applied for a grant of £5000 from the imperial government, which was then facing the problem of the future of the HUDSON'S BAY COMPANY's territories and badly needed information about them. To exploration of the plains south of the N Saskatchewan R and southern passes through the Rockies, the COLONIAL OFFICE added an examination of the old NORTH WEST COMPANY canoe route W from Lk Superior. Under Palliser's command, Dr James HECTOR was appointed geologist and naturalist, Eugène BOURGEOIS botanical collector and John W. Sullivan secretary and astronomical observer. Magnetical observer Lt Thomas W. Blakiston brought his delicate instruments via Hudson Bay to join them on the prairies.

The explorers amassed astronomical, meteorological, geological and magnetic data, and described the country, its fauna and flora, its inhabitants and its "capabilities" for settlement and transportation. They concluded that to establish a "communication" entirely within British territory from Canada to Red River would be difficult and costly; access through American territory was much easier. Although some semi-arid country (now known as "Palliser's Triangle") stretched across the American border into the prairies of modern Canada, it was surrounded by a "fertile belt" well suited for stock raising and agriculture. There were deposits of coal and other minerals. The party traversed 6 passes in the southern Rockies, some of them feasible for a railway (the CPR was later built through one of them), but found the mountains farther W a formidable obstacle. The expedition's reports (published in 1859, 1860 and 1863) and its comprehensive map (1865) were for some time the major source of information about the sweep of country from Lk Superior to BC's Okanagan Valley, and are still of value today. IRENE M. SPRY

**Palmer, Edward**, lawyer, landed proprietor, land agent, politician, judge, premier of PEI (b in Charlottetown, PEI 1 Sept 1809; d there 3 Nov 1889). The son of an Irish-born attorney, he took his schooling in Charlottetown and studied law in his father's office. A Tory, he represented the capital in the legislature 1835-70. Though lacking brilliant abilities, he was a capable political strategist with great force of character, and became premier in 1859, after 10 years as party leader in the assembly. Conflicts within his

party led to Palmer's replacement as premier in 1863; he resigned from the Cabinet 2 years later in opposition to union of the colonies. In 1872 he was elected as a Liberal as part of an attempt to prevent the Island from joining CONFEDERATION. When the Island joined the following year, however, Palmer began a new career, as judge of the Queens County Court. He was named provincial chief justice 1874 and held this position until his death. IAN ROSS ROBERTSON

**Palmer, Herbert James**, lawyer, politician, premier of PEI (b at Charlottetown 26 Aug 1851; d there 22 Dec 1939); son of Edward PALMER. Called to the bar in 1876, appointed Queen's Counsel in 1878, Palmer was elected to the Legislative Assembly in 1900. A Liberal, he became premier in 1911 but was defeated in a by-election 7 months later. He resigned that Dec and returned to his practice. NICOLAS J. DE JONG

**Palynology**, the study of spores and pollen, has many applications in BOTANY, GEOLOGY and MEDICINE. Spores are primitive reproductive bodies of FUNGI and some plants. Pollen grains are small male reproductive bodies produced and dispersed by seed plants. Spores and pollen are small (5-100 µm), spherical or oblong structures, identifiable under a compound light microscope. Fine details of wall structure and sculpturing can be seen under the scanning electron microscope (20 000 to 40 000 magnification). The detailed structure of the wall (exine layer), and the number and arrangements of pores and furrows in the wall, are the diagnostic characters used in identification. Pollen is a key tool in reconstructing past vegetation and environments (paleoecology), because the outer wall is both extremely resistant to decay and elaborately and beautifully constructed so that identification to species or family level is possible. Pollen of many plants is discharged into the air annually (see POLLINATION) and falls into lakes and bogs as a "rain" which represents the surrounding vegetation. Many forest regions in Canada produce a total pollen fallout of 30 000-60 000 grains per cm<sup>2</sup> annually, while tundras produce fewer than 1000. Pollen is preserved in lake or bog sediments that accumulate each year. This preservation results in a sequence of pollen assemblages representing the succession of past vegetation. For example, Tertiary (see GEOLOGICAL HISTORY) sediments 10-20 million years old, under the Mackenzie Delta, NWT, contain deposits of spores which indicate that a rich coniferous forest grew there, similar to modern forests in coastal BC and Washington. Analysis of the spore content of such rocks is used in the search for fossil fuels and the petroleum industry employs palynologists as part of this exploratory activity. Pollen analysis of sediments that have accumulated since the end of the latest GLACIATION reveal the vegetation changes and tree migrations that have produced the present vegetation of Canada.

In addition to showing the responses of vegetation to climatic change, pollen data indicate effects of human cultures such as clearing, burning and agriculture. A pollen record from a small lake near Toronto shows evidence of maize cultivation (1380 AD) in an Iroquoian village near the site, and evidence of forest clearance. The same site shows the beginning of European agriculture by the abrupt rise in frequency of ragweed pollen. Palynology is used in quality control tests of honey to identify the source plants used by bees, and it has been used in forensic science to solve crimes (eg, when pollen adhering to clothing can indicate the scene of a crime). J.C. RITCHIE

Reading: P.D. Moore and J.A. Webb, *An Illustrated Guide to Pollen Analysis* (1978).

**Pan-American Games** are a multi-sport, quadrennial festival for the nations of the Western

Hemisphere, conducted in a similar manner to the OLYMPIC GAMES and held one year prior to them. A comparatively recent event, the first Pan-Am Games were held at Buenos Aires (Argentina) in 1951, when 19 nations were officially represented in 18 sports. Since then they have been celebrated at Mexico City (Mexico) 1955 and 1975; Chicago (USA) 1959; São Paulo (Brazil) 1963; Winnipeg (Canada) 1967; Cali (Colombia) 1971; San Juan (Puerto Rico) 1981; and Caracas (Venezuela) 1983. Canada did not officially compete in the 1951 Games (although a small group of Canadian swimmers did give a demonstration in synchronized swimming) but has been a consistent and successful competitor ever since, with Canadian athletes providing many world-class performances in various sports. In fact, an analysis of medal winners in the 4 Pan-Am Games between 1963 and 1975 shows Canada with a total of 329, 2nd only to the US. The 5th Pan-Am Games at Winnipeg proved a fitting celebration for Centennial Year, 1967, when 2451 athletes from 29 countries participated in 29 sports. Canada won 12 gold, 37 silver and 43 bronze medals for its finest Pan-Am performance. GERALD REDMOND

**Pan-Indianism**, an intertribal movement of native resistance to white domination and assimilation, is characterized primarily by political and religious expression and solidarity. Key historical figures include PONTIAC and HANDSOME LAKE. Leaders since colonial times have advocated that Indians free themselves, even if this meant violence. The Peyote Cult, a reaction to Christian teachings and beliefs, originated in the southern plains area during the later 19th century and gradually symbolized the unity of Indians all over N America. Red Power is pan-Indian sentiment committed to radical political action, as in the National Congress of American Indians (NCAI, 1944) and the American Indian Movement (AIM, 1968). These rights-oriented groups believe that natives must choose between assimilation and being Indian, and that Canadian and American government obligations to Indians are binding. See also NATIVE PEOPLE, POLITICAL ORGANIZATION. RENÉ R. GADACZ

**Pangman, Bastonnais**, Métis buffalo hunter and leader (b at N Saskatchewan R 1778), son of fur trader Peter Pangman and a Cree mother. A skilled hunter, he helped provide the colony founded by Lord SELKIRK with buffalo meat in 1812-13. Angered by the "Pemmican Proclamation" of 1814, Pangman was active in MÉTIS raids upon the new settlement and helped negotiate for the withdrawal of the settlers from Red River in 1815. There is no evidence that he was present at the battle of SEVEN OAKS (1816) and in 1818 he was acquitted of charges of arson. HARRIET GORHAM

**Pangnark, John**, sculptor (b at Windy Lk, NWT 1920; d at Rankin Inlet, NWT 1980). An Inland CARIBOU INUIT, Pangnark was relocated in the late 1950s to Eskimo Point, where he spent his later years carving. Represented in the *Sculpture/Inuit* exhibition of 1971 to 1973, Pangnark was one of 4 Inuit artists chosen to go to Expo 70 in Osaka, Japan. Because of his preoccupation with resolving formal concerns, often at the expense of easily recognizable subject matter, his sculpture is unlike the narrative and naturalistic work of much contemporary Inuit sculpture. His highly individualized abstractions are most appreciated by the critic who sees, outwardly at least, similarities to 20th-century abstract sculpture. NORMAN ZEPF

**Pangnirtung**, NWT, Hamlet, pop 839 (1981c), is located on the SE shore of Pangnirtung Fjord on the S shore of BAFFIN I'S CUMBERLAND SOUND. 2330 air km NE of YELLOWKNIFE. The name derives from an Inuit word said to mean "place of the bull caribou." The area was first visited

by Europeans in 1585, and by 1840 it had become one of the arctic points where WHALING ships gathered most often. Some local Angmarlik Inuit became well known as whaleboat skippers. In 1968 the local Inuit formed a co-operative to promote soapstone and whalebone carvings. Today the community is known for its artworks, particularly the world-famous woven tapestries made by local Inuit artists. See INUIT ART.

ANNELIES POOL

**Panneton, Philippe**, pen name Ringuet, physician, professor, diplomat, novelist (b at Trois-Rivières, Qué 30 Apr 1895; d at Lisbon, Portugal 28 Dec 1960). Panneton was a leading figure in French Canadian literature, thanks primarily to his novel, *Trente Arpents* (1938), which is considered a classic of Canadian literature. Panneton was a true man of letters, and combined work as a professor at Université de Montréal with a full literary life. He wrote for many periodicals, was a founding member and chairman of the Académie canadienne-française and published 7 books, including a pastiche, a collection of short stories, and 5 novels dealing with both rural and urban history (eg, *Un Monde était leur empire*, 1943; *Le Poids du jour*, 1949).

He was acclaimed in both French and English Canada for his works, but it was primarily because of *Trente Arpents* that he received awards, including that of the Province of Québec, the Académie française's Prix des Vikings, and a Gov Gen's Award. The novel, first published in Paris, concerns the transition from agrarian to urban life in Québec. It covers the 45 years from the late 19th century to the Depression, and deals with 3 generations of peasants who exhaust themselves cultivating their 30 acres (12 ha) of land. The main character, Euchariste Moisan, prospers on the land and with maturity achieves ease and fame, but in old age he meets a series of difficulties. As a result he turns over his land to his eldest son and goes into exile in New England with a son who, like several of his brothers and sisters, has left the land for the city. The land, mother and wife, is also a hard mistress. Unyielding and unchanging, she rejects the person who cannot meet her challenge. This was a new vision of rural life. Panneton's predecessors, except for Albert LABERGE and Claude-Henri GRIGNON, all presented idyllic and moralizing accounts of no artistic or literary dimension. This novel, the best to appear until the 1940s, was quickly translated into English and German, and after 1940 was published in both languages. Panneton became ambassador to Portugal in 1957.

ANTOINET SIROIS

**Papineau, Louis-Joseph**, lawyer, seigneur, politician (b at Montréal 7 Oct 1786; d at Montebello, Qué 25 Sept 1871), the son of Joseph Papineau, a seigneur and moderate liberal member of the Assembly. He was educated at the Petit Séminaire de Québec and prepared himself for a career in law, which he carried on intermittently after 1810. Representative of the growing influence of the liberal professions in French Canada he was first elected to the Assembly of LOWER CANADA in 1809, during Craig's "Reign of Terror." With his self assurance, skill as an orator and popular following, he emerged from a group of young nationalists to leadership of the PARTI CANADIEN (later PARTI PATRIOTE) and was made Speaker of the Assembly in 1815. He came to see himself as the defender of the national heritage of French Canada and led the fight for control of the political institutions of Lower Canada. Early in his career he was a moderate who admired British parliamentary institutions, but during the 1820s his views became more radical and his parliamentary strategy was obstructionist, using the Assembly's control of revenues and the civil list to combat the policies of the English commercial

class, which he considered anathema to the interests of French Canada.

Papineau travelled to England in 1823 in his campaign to defeat the Union Bill of 1822, which had been introduced to circumvent his control of the Assembly. The union was rejected and this victory reinforced his desire to reform Lower Canada's political institutions, particularly the council, which was dominated by the CHÂTEAU CLIQUE. Towards 1830 Papineau stepped up his virulent attacks on the nonelective legislative council and declared himself a republican. He became an advocate of independence for Lower Canada and became increasingly critical of imperial authority. After a sweeping electoral victory in 1834, he increased his efforts to paralyse the political system; goaded by revolutionary elements of his party he intensified his policy of boycott and political obstruction in order to force the British government to grant reforms intended to transfer power to representatives of the French Canadian nation.

Papineau and a small committee put forward their demands for control of revenues by the legislature, responsibility of the executive and election of the council in the "Ninety-Two Resolutions." When the demands were categorically rejected by the British in 1837 the political crisis deepened, popular feeling, inflamed by social and economic crises, was roused and Papineau began to lose control of the events he had been so instrumental in setting in motion. He addressed a rally of 4000 at St-Charles, 23 Oct 1837, at which the patriotes more or less declared the independence of the Six Counties and their willingness to resort to arms if necessary. When after the defeat at St-Charles it became clear that the patriotes would be crushed, he fled to the US and, following the failure of the second insurrection, he sailed for France in 1839.

Papineau's career, particularly his behaviour during the REBELLIONS of 1837, has been a continuing source of controversy and conjecture. He claimed that he had taken no part in the insurrections, yet evidence shows he acted as supreme commander until the Battle of Saint-Denis, from where he disappeared just before the fight was engaged. Later, many of his fellow patriotes accused him of cowardice, though they continued to support him as the only viable leader of FRENCH CANADIAN NATIONALISM. He professed to be a liberal and republican, yet was a staunch defender of the SEIGNEURIAL SYSTEM, which had a feudal character, as the basis of French Canada's agricultural economy. He himself owned the seigneurie of Petit Nation, purchased in 1817 from his father, and by all accounts demanded full measure from his habi-

tants. He was an economic conservative, hostile to the commercial and transportation innovations that the merchants considered essential to progress in Lower Canada. Though a deist and a violent anticleric, he nevertheless feared that a weakening of the Catholic Church would play into the hands of the English-speaking Protestant enemies of French Canada.

Papineau was granted amnesty in 1844 and returned from exile to his seigneurie in 1845. He profited amply from timber concessions and built himself a grand manor house at Montebello through the help of his indebted censitaires. He re-entered politics in 1848, but was at odds with the new leadership of Louis LA-FONTAINE. He vehemently opposed the ACT OF UNION and advocated ANNEXATION to the US. Around him coalesced a new group of young liberal nationalists who later became the PARTI ROUGE; Papineau himself left politics in 1854. Complex and contradictory, Papineau was nevertheless the first effective political leader of his people; if he was not the "national hero" they desired, he was a fitting symbol of their discontent.

JAMES MARSH

Reading: F. Ouellet, *Louis-Joseph Papineau, a divided soul* (1961) and *Lower Canada, 1791-1840* (1980).

**Papineau-Couture, Jean**, composer, teacher, administrator (b at Montréal 12 Nov 1916), grandson of Guillaume COUTURE. After studying in Montréal and Boston, he worked at Cambridge, Mass, under Nadia Boulanger, concentrating on Stravinsky and the French Impressionist composers. He has taught at Collège Jean-de-Brébeuf, the Conservatoire de musique de Montréal and in the music faculty of U de M, where he was dean 1968-73. He has emphasized acoustics in his teaching and his students include a number of composers, eg, Jacques Hétu, François MOREL, André Prévost and Gilles TREMBLAY. Papineau-Couture has been president of several organizations, including the Académie de musique de Québec, the JEUNESSES MUSICALES DU CANADA (Montréal branch), the Canadian Music Council, the Canadian Music Centre (of which he was a founding member), the Canadian League of Composers, the Société de musique contemporaine du Québec and the Humanities Research Council of Canada. His awards include the 1962 Prix de musique Calixa-Lavallée and the Canadian Music Council Medal (1973). *Psaume CL, Etude in B-flat Minor*, and *Pièce concertante* (Nos 1 to 5) are considered among his major works.

HÉLÈNE PLOUFFE

**Paquet, Louis-Adolphe**, priest, theologian (b at St Nicolas, Canada E 4 Aug 1859; d at Québec C 24 Feb 1942). Professor at Laval for nearly 60 years, he was French Canada's "national theologian" who guided — some say, created — Québec's archbishops, defining the church's position on public policy and shaping the somewhat defensive "messianic nationalism" of his day. Trained in Rome during the Thomistic revival, Mgr Paquet wrote the 4-volume *Droit public de l'église* (Public Law of the Church) (1908-15), a standard text in ultramontanist terms on the relations between church and state. Having grown up during the disappointing period of the NORTH-WEST REBELLION, Paquet moderated the aggressive nationalism of his predecessors BOURGET and LAFLECHE in a 1902 public address on the vocation of the French race in America, calling on French Canadian Catholics to guard their faith, language and soil from contamination by materialistic foreigners. He formulated the church's official position on such issues as the MANITOBA SCHOOLS QUESTION 1896, Ontario's Regulation 17 (1915) and overseas conscription 1917. A powerful orator, systematizer and teacher, he shaped the church leaders of his day, but his influence waned in the face of the social problems that arose during urbanization in the 1920s.

TOM SINCLAIR-FAULKNER

Louis-Joseph Papineau, from a photo in *Portraits of British Americans* by F. Taylor and William Notman (1868) (courtesy Public Archives of Canada/C-21005).

**Parachuting, Sport**, also known as skydiving. The earliest jumps were made from balloons, and the first successful parachute descent was performed in 1797 over Paris. Free-falling jumps were not possible until 1908, when the ripcord was devised, though the ripcord was not used from an airplane until 1912. Contests began in the US in 1926, and the first world championship was held in Yugoslavia in 1951. Competitors normally use light aircraft to carry them to about 3600 m, and parachutes are usually opened at about 760 m. Sport parachutists compete in 2 areas: aerial maneuvers, or "style" events, and accuracy of landing.

The first parachute jump in Canada was made in 1919, when Frank Ellis descended from a Jenny aircraft over Lake Erie; the Frank Ellis Trophy commemorates this event. After WWII, clubs and competitions were organized in Canada. The oldest surviving club is the St Catharines Parachuting Club, formed in 1947. The Canadian Sport Parachuting Assn was founded in 1967. The Canadian National Parachuting Team has ranked among the top 10 countries in international competition since 1960. S.F. Wykeham-Martin became the first Canadian to win a medal in world competition, placing 2nd in individual accuracy in 1966. In 1976 Pierre Forand won the silver medal in the men's absolute overall category, missing the world championship by one-five-hundredth of a second. In 1980, Kathy Cox won the women's world accuracy championship. Canadian teams dominated parachuting in the late 1970s, winning the world overall relative-work (2 parachutists maneuvering together during free-fall) championships in 1977 and 1979 and placing 2nd in 1981. Five licences of proficiency are awarded, and competition jumping is also organized by the CSPA. The G.R. Masterson Trophy is the premier parachuting award in Canada.

BARBARA SCHRODT

**Parasitology**, branch of BIOLOGY dealing with organisms (ANIMALS or, rarely, PLANTS) which live in or on other species (hosts) from which they derive nourishment. These organisms are called parasites. Some cause disease in humans and domestic and wild animals. Several have complex and fascinating cycles of development in 2 or more hosts. This rather simplistic definition includes some viruses, bacteria and protozoa, various kinds of worms and certain INSECTS, TICKS, MITES and copepod CRUSTACEANS.

Several types of parasites occur in humans, domestic animals and wild animals in Canada, but fortunately they cause less disease than some species in warmer countries. A higher prevalence noted recently results from increased travel to, and immigration from, tropical lands. Canadian researchers have contributed to the knowledge of parasites that occur in Canada and elsewhere. For example, almost 100 years ago the Canadian W.G. MacCallum studied a malarialike parasite in the blood of birds and found a stage of development that provided a clue to a facet of development of the malaria parasite of humans. J.L. Todd, the first professor of parasitology in Canada (at McGill), studied the trypanosomes (parasitic protozoans) that cause sleeping sickness in humans in Africa and discovered the spread of relapsing fever by ticks.

Early explorers related gruesome stories of attacks by MOSQUITOES and BLACK FLIES. Bedbugs in logging camps and boarding houses caused misery. In the middle of the last century, thousands of immigrants died from typhus fever en route to or after landing in Canada. It was not then known that this dreaded disease is transmitted by lice. The significance of ENTOMOLOGY to agriculture and to human and animal health was recognized in 1884 with the appointment of James FLETCHER as the first Dominion Entomologist. In the medical school he established in

1832-34 in Upper Canada, Dr John Rolph gave instruction on malaria. As early as the 1850s Canadians were writing papers on parasites. The private Veterinary College begun by Andrew SMITH in 1862 (later the Ontario Veterinary College) had lectures on parasitology from the beginning. Robert Ramsay WRIGHT at Toronto and William OSLER at McGill were studying parasites in the 1880s. Investigations increased in the early part of the 20th century. Veterinarians such as E.A. WATSON and Seymour Hadwen, associated with the Dominion Health of Animals Branch, were prominent investigators. The former studied the trypanosome that causes dourine in horses. Thanks to his work and that of colleagues, the disease was eradicated from Canada. Hadwen also established the life cycle of the warble fly of cattle.

Parasitology expanded in 1932 with the formation of the Institute of Parasitology at MacDonald College with T.W.M. CAMERON as the first director, and the creation of a Department of Veterinary Science at the Ontario Research Foundation with Hadwen as director. At the same time, E.M. Walker in Zoology and D.T. Fraser in Preventive Medicine at University of Toronto were encouraging research and teaching. With the appointment of Ronald Law as director of the Ontario Experimental Fur Farm, more attention was directed to parasites in wild animals. The Ontario Veterinary College, with its longtime interest in the subject, created a Department of Parasitology with Anthony Kingscote as head. Interest surged during the next 50 years and parasitologists were appointed to each of the larger universities. Several universities offer graduate courses leading to master's and doctoral degrees.

For those engaged in it, research is a challenging, occasionally frustrating, and at times exciting occupation, although it may require years of patient endeavour to make a single significant discovery. The satisfaction of discovery is itself rewarding, especially when the knowledge, along with that produced by others, can be applied to benefit humans. Hadwen's contribution to an understanding of the life cycle of the warble fly of cattle was fundamental to the work in recent years to control and, in places, eradicate the pest. Watson's achievement in eradicating dourine in horses was likewise of immense practical value. Several investigators have worked on ticks and flies affecting livestock and have introduced measures to control these pests more effectively. Tick paralysis in sheep and humans in western Canada is now understood, thanks to intensive research for several years.

Commercial FISHERIES in western Canada were, at one time, adversely affected by a tapeworm, *Trianaeophorus crassus*. It was shown that an intermediate stage of the worm in the whitefish developed into a mature worm when an infected fish was eaten by pike. Practical research followed to eliminate the pike and thus prevent transmission. Research by L. Margolis at the Fisheries Research Laboratory, Nanaimo, illustrates a different practical application of the study of parasites. A survey showed that parasites present in fish from different localities vary. The parasites are therefore useful biological tags indicating the origin of the fish.

For decades scientists and laymen were baffled by paralysis observed in moose in certain areas of the country. The cause was elusive until R.C. Anderson observed a species of lungworm on the membranes of the brain. Elucidation of the life cycle, essential to an understanding of the situation, revealed that the worms also occur in white-tailed deer, but are relatively harmless. The worms' eggs are passed in the feces of deer; their larvae penetrate into various snails and undergo development in them. Moose or deer become infected when they eat vegetation to

which infected snails are attached. The deer are an important part of the story, for moose paralysis occurs only in places where the ranges of moose and deer overlap. The results are especially important for the management of moose populations (see WILDLIFE CONSERVATION AND MANAGEMENT).

**Societies and Journals** A section of the Canadian Society of Zoologists deals with parasitology and arranges symposia and an annual meeting. The Canadian Society of Tropical Medicine and International Health meets annually to present papers and discuss progress, especially in relation to human parasitology. Research is conducted and diagnostic services are provided by provincial and federal ministries of health and natural resources. Veterinary colleges provide similar services for owners of livestock and pets. The *Canadian Journal of Zoology* allocates space for papers on parasitology. Other papers may appear in the *Canadian Journal of Biochemistry and Microbiology*. Parasitologists also publish in Canadian medical and veterinary journals as well as in specialized journals published in other countries. Articles also appear in lay magazines and in the popular press because the lives and behaviour of many parasites provide material for fascinating stories.

**Parc de Val-Jalbert**, Qué, 5 km E of ROBERVAL on the shores of Lac SAINT-JEAN. A ghost town and a very beautiful park, Val-Jalbert since 1960 has become a major attraction in the Saguenay-Lac Saint-Jean region. The village of Val-Jalbert was born at the turn of the century, when a pulp and paper mill was built at the foot of the falls on the Rivière Ouatichouane (1901). The company village, very modern for its day, grew rapidly and had 1000 inhabitants by the mid-1920s. In 1927, however, Quebec Pulp and Paper Mills, the plant's final owner, closed it down and soon Val-Jalbert was deserted (1930). The Québec government bought the site in 1949 and in 1960 decided to make it a park. The abandoned village and mill, important parts of Canada's industrial and urban heritage, now draw hundreds of thousands of visitors each year.

MARC-ST-HILAIRE

**Parent, Étienne**, journalist, lawyer, public servant, essayist (b at Beauport, LC 2 May 1802; d at Ottawa 22 Dec 1874). He was editor of *Le Canadien* 1822-25 and then became editor of the French section of *La Gazette de Québec* in 1825. While working 1825-38 as translator, legal officer and then librarian of the Assembly of Lower Canada, he revived *Le Canadien* in 1831, giving it its famous motto: "Our institutions, our language and our laws." He argued for a national existence for French Canadians, demanding "all the civil and political rights that are the prerogative of an English country." As the REBELLION OF 1837 approached, Louis-Joseph PAPINEAU was becoming more radical; Parent, a clear-headed pragmatist, abandoned him in 1835 and preached moderation for both parties. Denounced as a traitor by many *Patriotes*, he was none the less imprisoned by the English governor in 1838-39 for "seditious schemings." With the establishment of the PROVINCE OF CANADA in 1840, the polemicist resigned himself to fight only for the equality of "the two populations and the two countries." He was elected to the Assembly in 1841 but soon had to withdraw because of his deafness, developed in prison. Appointed clerk of the Executive Council 14 Oct 1842, he resigned from the management of *Le Canadien*, although he continued to contribute to it occasionally (1847, 1851-54). He became assistant secretary for Lower Canada in 1847 and federal undersecretary of state from 1868 to his retirement in 1872. After 1840 he was often consulted by political figures, and between 1846 and 1852

he gave 8 important lectures at the INSTITUT CANADIEN de Montréal. In these he invited his compatriots to become involved in industry and business and to study political economy; he proposed ways to improve education and ameliorate the lot of the working class; and he stressed the importance of the intellectual, spiritual and of the priest in society. Nourished by the best American and European sources, his strong-minded originality was rooted in Canadian soil. He was called the Nestor of the Canadian press and the Victor Cousin of America.

RENÉ DIONNE

**Parent, Madeleine**, labour organizer (b at Montréal June 1918). Despite her conventional upbringing in a middle-class Canadian family, Parent dedicated herself to organizing the unionized. In 1943, she joined Kent Rowley as an organizer for the United Textile Workers of America. In 1946, 6000 workers they had organized in Montréal and Valleyfield won a strike against the combined forces of the employer, Dominion Textile, the church and the state. A year later, after a 3-month trial, Parent was convicted of seditious conspiracy. In DUPLESSIS's Québec, she had to wait until 1954 for her acquittal in a new trial. Fired by the international headquarters of the UTWA in 1952 on the false charge that she was a communist, she, with Rowley, established the Canadian Textile and Chemical Union (1952) and the Confederation of Canadian Unions (1969). She led some bitter strikes in the 1970s, including the 1979 Purtext strike over surveillance of workers via closed-circuit TV.

MARGARET E. MCCALLUM

**Parent, Mimi**, painter, engraver (b at Montréal 1924), daughter of architect Lucien Parent. While enrolled at the École des beaux-arts in Montréal, she met Alfred PELLAN, who introduced her to surrealism, a genre in which she and fellow student Jean BENOÎT are 2 of the world-leading contemporary practitioners. Expelled from the École des beaux-arts because she contested the kind of painting the students were taught, she proceeded to hold a solo exhibition at the Tranquille Library and the Dominion Gallery in 1947. In 1948 she signed the *Prisme d'yeux* manifesto on artistic freedom, and left for Paris with Benoît. She joined the surrealist movement in 1959 at an international exhibition devoted to Eros, where she was in charge of the fetishism room and did the catalogue layout. André Breton cited her 1949 work, *J'habite au choc*, in the final edition of his book, *Le Surréalisme et la peinture*. She participated in all the major surrealist demonstrations and, during the 1960s in particular, published plates for some of the surrealist works of Fernando Arrabal, Joyce Mansour and José Pierre.

ANDRÉ G. BOURASSA

**Parent, Simon-Napoléon**, lawyer, businessman, Liberal politician, premier of Québec (b at Beauport, Canada E 12 Sept 1855; d at Montréal 7 Sept 1920). Québec City's first "modern" mayor (1894-1906), promoting city planning and economic development, Parent became provincial minister of lands and forests in 1897, and immediately began to encourage the large-scale exploitation of Québec's forest and hydraulic resources. He became premier after Félix-Gabriel MARCHAND died in 1900, but was driven from office in 1905 by a combination of personal rivals and young nationalists critical of his concessions to foreign capitalists. He retired as mayor shortly afterwards but became chairman of the federal Transcontinental Railway Commission and later the Québec Streams Commission.

BERNARD L. VIGOD

**Parfleche** is a variety of Plains Indians container made of rawhide. The name comes from that given by the VOYAGEURS to untanned skin. It is a single piece of prepared hide that folds much like an envelope for storage of dried meat

(PEMMICAN) and other food. Saddlebags, tubular headdress containers, and small pouches for personal belongings were also all made of light, durable rawhide and were often painted or decorated with QUILLWORK.

RENÉ R. GADACZ

**Paris**, Ont. Town, pop 7485 (1981c), inc 1855, located 50 km W of Hamilton at the confluence of the Nith and Grand rivers. It was founded 1822 by Hiram "King" Capron, whose house, later named Penmarvian, remains a local landmark. He developed the gypsum deposits, used to make plaster of Paris, from which the name derives. (It was called Forks of the Grand R until 1836.) It has always been a rural community, the centre of a farming and dairy district, but has a small manufacturing sector, principally textiles, furnishings and pharmaceuticals. The Plains Church, a unique cobblestone structure built 1845, stands as a memorial to pioneer settlement. A downtown building marks the site where in 1876 Alexander Graham BELL received from BRANTFORD the first long-distance telephone call.

DANIEL FRANCIS

**Parizeau, Gérard**, underwriter (b at Montréal 16 Dec 1899). After graduating from the École des hautes études commerciales at U de M, Parizeau worked in the civil service from 1920 until 1925, when he became head of the francophone section of Irish & Maulson, an insurance brokerage firm. In 1925 he also founded *L'Actualité économique*, the official magazine of the École des hautes études commerciales, at which Parizeau has taught since 1928. In 1938 he founded his own brokerage house and made it one of the most important in Canada. In 1961 he helped create the reinsurance brokerage house Le Blanc, Eldridge, Parizeau and was its chairman for many years. He bought in 1965 La Nationale, a Canadian reinsurance company until then a subsidiary of La Nationale of Paris. In 1972 he founded the management firm of Sodarcan, grouping under it a dozen insurance and reinsurance companies. Parizeau and his son Robert hold majority control. Another son, Jacques, was minister of finance in the Parti Québécois government.

JORGE NIOSI

**Parka** is a tailored garment worn by the INUIT to protect head, arms and upper body from the rigours of the arctic climate. Style varied from region to region, and parkas for women had a distinctive cut, distinguishing them from male garments. Young children ride inside the parkas, on their mothers' backs or in the hood. Fur lined the hood or it could be tightly closed with drawstrings; both served to trap air warmed by the body inside the garment. In the past, caribou hide, often sewn in a decorative mosaic pattern, was used to make the parka. Today, materials imported from the south are most frequently used to construct the garment.

THOMAS S. ABLER

**Parker, Sir Horatio Gilbert George**, journalist, author, politician (b at Camden E, Canada West 23 Nov 1862; d in London, Eng 6 Sept 1932). Best known for his historical novels, which introduced French Canadians and the North-West to English literature, Gilbert Parker left Canada in the mid-1880s after teaching for several years in Ontario. He settled in England from 1890, became MP for Gravesend (1900-18), and organized British propaganda directed at the US during WWI. Widely travelled, he expressed strong support for British IMPERIALISM. His fiction set in Canada contributed to the validation of Québécois culture within English Canada. His many novels consist mainly of melodramatic plots with idealistic characters in exciting or exotic settings.

TERRENCE CRAIG

**Parker, John Dickerson**, "Jackie," football player (b John D. Flanagan at Knoxville, Tenn 1 Jan 1932). As a youngster, Parker excelled in baseball, and reached Mississippi State on a baseball scholarship. He turned to FOOTBALL and

became an outstanding quarterback. He joined the EDMONTON ESKIMOS in 1954 and helped lead the Eskimos into the GREY CUP against highly favoured Montréal. The image of Parker scooping up a fumble in the final minutes and running 90 yards to tie the score and set up the winning convert is one of the most vivid in Canadian sports history. He returned to quarterback Edmonton to another Grey Cup win in 1955 and was a receiver and halfback in the 1956 victory. During 9 years with the Eskimos (1954-62), he won the Jeff Nicklin most valuable player trophy 7 times, and was Schenley outstanding player 3 times. Parker was traded to the TORONTO ARGONAUTS after the 1962 season. He was general manager of BC LIONS 1970-75. On retirement Parker was the Canadian Football League all-time scoring leader with 750 points. As a quarterback, he successfully completed 1089 passes for 16 476 yards. He rushed for 5210 yards and gained 2308 yards on passes. In 1983 he became head coach of the Edmonton Eskimos.

FRANK COSENTINO

**Parkin, Sir George Robert**, educator (b at Salisbury, NB 8 Feb 1846; d at London, Eng 25 June 1922). In his own words, the "wandering evangelist of Empire," Parkin was a successful teacher at NB high schools who became in the 1880s a leader of the Imperial Federation Movement, about which he wrote 3 books. He was principal of Upper Canada Coll from 1895 to 1902 when he became secretary of the Rhodes Scholarship Trust in England, where he lived until his death. He wrote in 1908 the first biography of Sir John A. MACDONALD, whom he had known, arguing that autonomous dominions could still co-operate in a reorganized British Empire. He was knighted in 1920 for his services to the Empire.

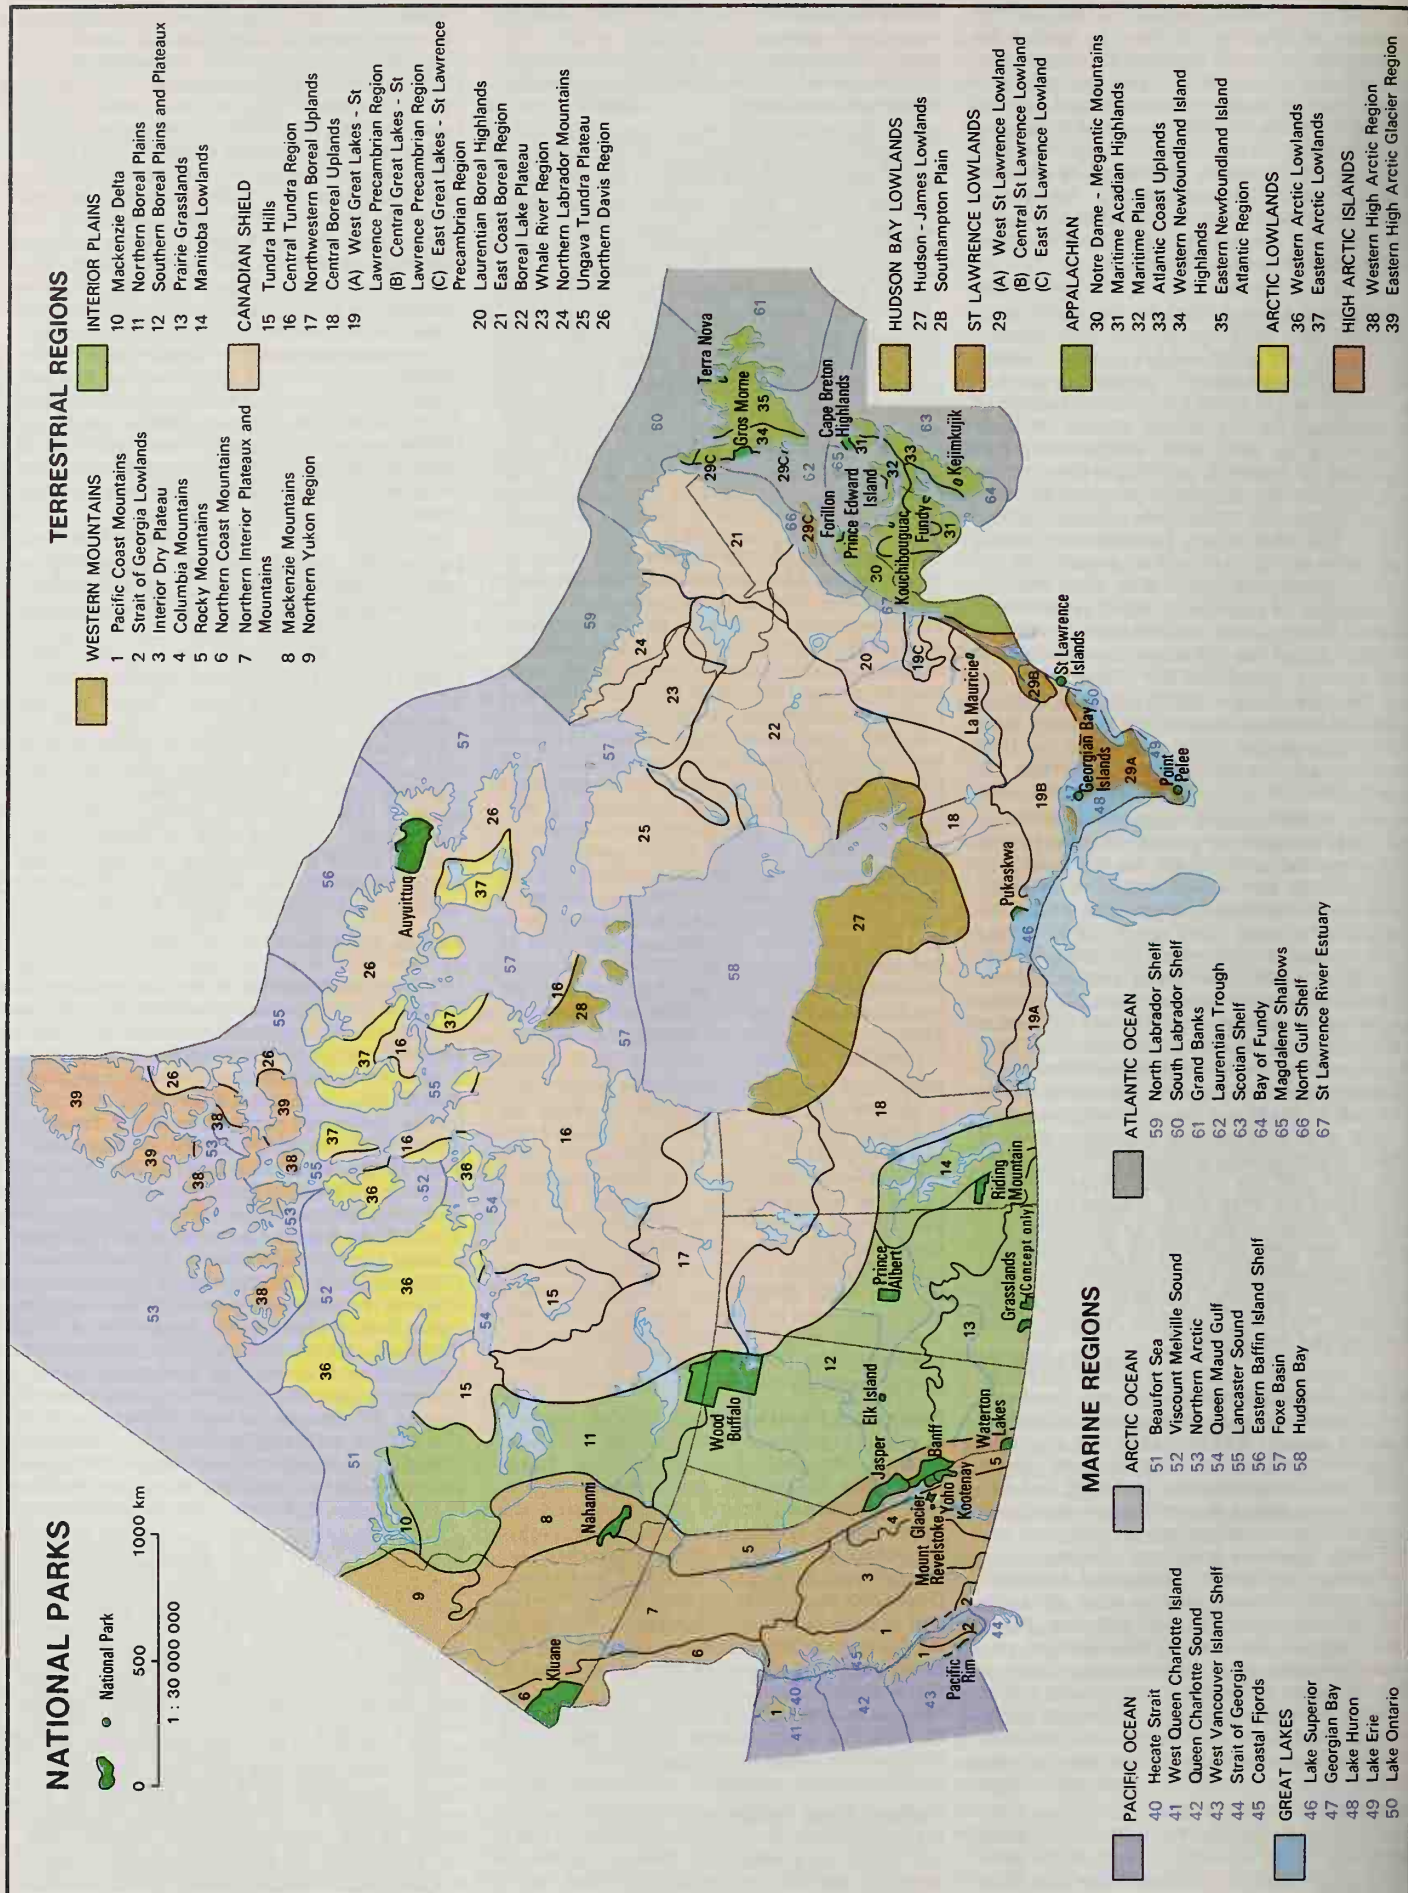

DONALD J.C. PHILLIPS

**Parkin, John Burnett**, architect (b at Toronto 26 June 1911; d at Los Angeles, Calif 17 Aug 1975). Parkin graduated in architecture from U of T in 1935 and worked in London, Eng, before returning to Toronto in 1937 to establish a small architectural practice. Joined in 1944 by John C. PARKIN (no relation), he created an integrated practice that included all the skills necessary for the design and supervision of the construction of major buildings. The firm offered landscape design under his partner and brother, Edmond T. Parkin, graphic and interior design, structural, electrical and mechanical engineering, and specialized experience with hospitals, schools, airports and factories. During the later 1950s and 1960s the firm was the largest in Canada and was responsible for such buildings as Union Station (Ottawa), the head office of IBM (Toronto) and, in collaboration with others, Toronto City Hall and the Toronto-Dominion Centre. Though still within the mainstream of modern architecture its work shows considerable variety, reflecting both the firm's size and changing international fashions. In 1970 Parkin established an associated American practice in Los Angeles, Calif.

MICHAEL McMORDIE

**Parkin, John Cresswell**, architect (b at Sheffield, Eng 24 Mar 1922). After graduating in architecture from U of Man and studies at Harvard under Walter Gropius, Parkin joined John B. PARKIN (no relation) in 1947. As partner in charge of design, Parkin oversaw the creation of a large number of outstanding works whose style was generally rectilinear, undecorated and classical modern. After John B. Parkin moved to Los Angeles in 1970, the firm continued as Neish, Owen Rowland and Roy, and John C. Parkin established the Parkin Partnership. His new firm won the competition for the original design of the National Gallery, Ottawa, 1976, and also that for the additions to the Art Gallery of Ontario. Through his career, Parkin has been an energetic and influential advocate for mod-

ern design, not just in architecture but in industrial and urban design as well, and a mentor for the architects under his supervision.

MICHAEL McMORDIE

**Parkin, John Hamilton**, aeronautical engineer (b at Toronto 27 Sept 1891; d at Ottawa 14 Nov 1981). After graduating in engineering from U of T, Parkin joined the faculty and worked during WWI on explosives production and aviation under T.R. Loudon. In 1917 he built a wind tunnel at U of T where models were tested for the Vickers flying boats, the first Canadian-designed aircraft, built at Montréal in the 1920s. Parkin joined the NATIONAL RESEARCH COUNCIL staff in 1929 and was director of mechanical engineering 1936-57. The Depression largely stifled the Canadian aviation industry, but Parkin wrote in that period a seminal paper on transatlantic airliners. During WWII Parkin's NRC staff provided technical support to new crown corporations building British aircraft and engines, began jet engine design in 1944, and perfected the system of keeping ice off aircraft propellers adopted throughout the world in 1945. Their work was completely reorganized in the postwar years to support the Avro and de Havilland companies' design and production of aircraft. Parkin also laid the foundations of the National Aeronautical Museum and wrote extensively on the early history of Canadian aviation, notably *Bell and Baldwin* (1964).

DONALD J.C. PHILLIPSON

**Parks, National** Canadians live in a land rich in natural beauty. The diversity of landscapes and seascapes and of the flora and fauna inhabiting them is part of a natural heritage preserved in national parks. In addition, this heritage encompasses the relationships of humans to the land (hunting and gathering activities, logging, agricultural development, etc). National parks serve 2 main functions: they protect in an unchanged state areas representative of major natural ENVIRONMENTS; they encourage public appreciation of the national heritage. For millennia Canada's landscape was affected only by natural forces. Now, however, agricultural and industrial activities are altering the environment at an accelerating pace. National parks protect ecosystems from the negative impact of human activities and allow ecological processes to function, ensuring the perpetuation of naturally evolving environments. National park staff inform the public about the parks, either through first-hand experience or through educational programs designed to bring knowledge of the parks to people in their homes. Opportunities are provided for recreational activities compatible with long-term preservation of park resources. Simultaneous preservation of park environments in a natural state and encouragement of public use of the parks requires the maintenance of a delicate balance. Preserving this balance is a major task for staff, who must study and document park resources and then apply this knowledge so that human impact on park ecosystems is minimized.

#### Beginnings

The Canadian national parks system began in Nov 1885, when an area of approximately 26 km<sup>2</sup> on the N slope of Sulphur Mt was set aside for public use. This area, the Cave and Basin Hot Springs, was the beginning of what is now BANFF NATIONAL PARK. The hot springs were discovered in 1883 by 2 railway employees working on the construction of the first transcontinental railway through the ROCKY MOUNTAINS. Knowledge of the discovery (and its potential as a tourist attraction) spread rapidly among the railway workers, and several conflicting claims were addressed to the minister of the interior. The government chose not to grant private title to the lands; instead, it was

decided that they should be preserved for the benefit of all Canadians. In 1886 a Dominion land surveyor was hired to undertake a legal survey of the Hot Springs Reserve. This work resulted in a report by the commissioner of Dominion Lands that "a large tract of country lying outside of the original reservation presented features of the greatest beauty, and was admirably adapted for a national park." A bill to establish the first national park in Canada was introduced in the House of Commons in Apr 1887. The Rocky Mountains Park Act, establishing what is now Banff National Park, was passed on 23 June 1887.

#### Growth and Organization

Banff became a symbol of a new respect for the land. Interest in the development of other reserves ran high among members of Parliament and CPR officials and, in the years 1887-95, 5 new mountain reserves were set aside, unavailable for "sale, settlement or squatting." These later became YOHO, KOOTENAY, GLACIER, MOUNT REVELSTOKE and WATERTON LAKES national parks. The availability of large tracts of undeveloped public lands in western Canada had facilitated establishment of the mountain national parks. Early in the 20th century action was taken to develop national parks in eastern Canada, starting with the establishment of ST LAWRENCE ISLANDS NATIONAL PARK in 1904. The world's first distinct bureau of national parks, the Dominion Parks Branch, was formed in Canada in 1911 under the authority of the Department of the Interior. J.B. HARKIN, the first commissioner, served 1911-36. During his tenure, 9 national parks were established: ELK ISLAND (1913), Mount Revelstoke (1914), POINT PELÉE (1918), Kootenay (1920), WOOD BUFFALO (1922), RIDING MOUNTAIN, PRINCE ALBERT and GEORGIAN BAY ISLANDS (1929) and CAPE BRETON HIGHLANDS (1936). Harkin, who emphasized protection of the natural resources of the new parks, directed the passage of the National Parks Act in 1930. This Act still provides the legislative protection for national park lands.

Further establishment of national parks was sporadic until, in 1961, John I. Nicol became director of the National and Historic Parks Branch. Under his administration, 10 new national parks were created. Nicol also oversaw the preparation of the first Parks Canada Policy in 1964. The present Parks Canada Policy, written in 1979, also shows his influence as it em-

phasizes the preservation of natural ecological processes above all else. Since June 1979, Parks Canada (including National Historic Parks and Sites, Heritage Canals, Agreements for Recreation and Conservation, and National Parks) has been part of the Department of the Environment. Five regional offices administer park operations. The headquarters in Ottawa is responsible for policy development and long-range planning and research. Since 1884, 29 national parks have been established in Canada, ranging from AUYUITTUQ NATIONAL PARK Reserve on Baffin I to Point Pelée National Park on the most southerly tip of Canada's mainland; from TERRA NOVA NATIONAL PARK on the E shore of Newfoundland, to PACIFIC RIM NATIONAL PARK on the W coast of Vancouver I. The total area of Canada's national parks was, at last tally, 129 655 km<sup>2</sup>, an area as large as England and equal to 1.3% of Canada's landmass.

#### To Protect for All Time . . .

The Parks Canada Policy (1979) states that the national parks are designed "to protect for all time representative natural areas of Canadian significance in a system of national parks, and to encourage public understanding, appreciation and enjoyment of this natural heritage so as to leave it unimpaired for future generations." To this end, national parks are protected by federal legislation from all forms of extractive resource use such as MINING, FORESTRY, AGRICULTURE and sport HUNTING. Only activities consistent with the protection of park resources are allowed. Efforts are directed at maintaining the physical environment in as natural a state as possible. If this can be done by allowing natural ecological processes to function with minimal interference, the perpetuation of naturally evolving land and water environments and their associated species is assured. Under certain conditions, however, active manipulation of natural ecological processes does take place. Active manipulation is necessary if the balance of park ecosystems has been so altered by human activities that a natural environment cannot be restored through natural ecological processes, or if park visitors, facilities or neighbouring lands are threatened. If active interference becomes necessary, techniques duplicate natural processes as closely as possible.

The effective protection and management of national parks requires an intimate understanding of park resources and the ecological processes controlling and influencing them. Parks Canada has developed several tools to help

Above Lake O'Hara in Yoho National Park, BC (courtesy Parks Canada/P. McCloskey).

achieve this understanding, eg. the natural resource management process, the basic component of which is a comprehensive natural resources data base, regularly updated for all parks. This information allows a park's capabilities and limitations for visitor use to be evaluated, problems identified, and specific plans for the protection of fragile resources or features made. Zoning, another technique for managing the tension resulting from the dual goals of preservation and use, ensures that most national park lands are protected in a wild state. The system defines 5 zones into which a park's land and water areas may be classified according to their fragility and capacity to accommodate visitors. In zone I, access is strictly limited or prohibited; zones II, III and IV provide increasing visitor facilities and allow more activities. Motorized access is prohibited in zones I and II. Zone V comprises townsites, visitor centres and park administration offices. National parks are also protected through the environmental assessment and review process, which ensures that all the possible adverse effects of any project or activity proposed for lands or waters in national parks are identified and evaluated, and that measures are taken to reduce impacts or cancel the project if its impacts are deemed unacceptable.

#### Representative Natural Areas of Canadian Significance . . .

In the early days of park establishment, no method or set of criteria was used to designate potential park sites so as to ensure that the system of national parks would be truly representative of Canada's landscapes. Scenic vistas with potential for tourism were often chosen as locations for national parks; others were set aside to conserve unique or fragile habitats or to protect endangered species. To protect representative areas, Parks Canada developed the natural region concept. A natural region is an area containing a unique set of biological and ecological characteristics. In Canada, 48 natural regions have been identified: 39 terrestrial, 9 marine. Parks Canada plans to establish a park in each region; to date, 45% of natural regions contain national parks. The park system is far from complete. Proposals for new national parks are being considered for northern Ellesmere I; the West Isles area, S of the Bay of Fundy; northern Yukon; Bruce Peninsula; and the East Arm of Great Slave Lk. See map p1360.

The early emphasis was on providing recreational facilities with leisure orientation, eg. golf courses, tennis courts, ski resorts. Today the aim is to provide outdoor recreational opportunities consistent with the long-term protection of natural resources and requiring a minimum of man-made facilities. Hiking, canoeing, cross-country skiing and snowshoeing are examples of activities considered compatible with a park setting. In all national parks, naturalists are on hand to interpret the park environment to visitors. Interpretation programs are designed not simply to lecture visitors about the park, but to facilitate learning through first-hand experience. Self-guiding HERITAGE TRAILS, pamphlets and exhibits are also provided to assist enjoyment.

Beyond the park gates, naturalists work with schools, clubs and other associations, bringing park experiences to those who may never have visited a national park. Through television and motion pictures, all Canadians have an opportunity to participate. The range of visitor activities compatible with national park objectives is great, but not all acceptable activities can be carried out in all parks. To determine the appropriate activities and tolerable intensity of use for a particular park or site, the visitor activity management process (VAMP) is used. VAMP provides a framework for identifying those

activities which will not adversely affect the environment of a particular park. Used with the natural resource management process, it ensures long-term protection, while providing better services to visitors.

#### International Role

Canada's national park system is part of a global network of more than 2000 protected areas in 120 countries. As a member of the International Union for the Conservation of Nature and Natural Resources (IUCN), Parks Canada contributes to the development of internationally accepted standards and criteria for parks the world over. Parks Canada is also the primary agency responsible for fulfilling Canada's obligations under the World Heritage Convention of the United Nations Education, Scientific and Cultural Organization (UNESCO). The convention recognizes the responsibility of all nations to protect places of such unique natural and cultural value that they are considered part of the heritage of all mankind. KLUANE and NAHANNI national parks, L'ANSE-AUX-MEADOWS National Historic Park and the BURGESS SHALE of Yoho National Park have been designated World Heritage Sites. Waterton Lakes National Park has been chosen as a Biosphere Reserve for UNESCO's Man and Biosphere Program, which recognizes outstanding examples of natural ecosystems throughout the world. See ARCHAEOLOGICAL SURVEY OF CANADA; FORILLON NATIONAL PARK; FUNDY NATIONAL PARK; GRASSLANDS NATIONAL PARK; GROS MORNE NATIONAL PARK; HISTORIC SITE; JASPER NATIONAL PARK; KEJIMIKUJIK NATIONAL PARK; KOUCHIBOUGUAC NATIONAL PARK; LA MAURICIE NATIONAL PARK; PARKS, PROVINCIAL; PUKASKWA NATIONAL PARK; CONSERVATION.

LILLIAN STEWART AND MAX FINKLESTEIN

**Parks, Provincial,** areas of land and water, large or small, natural or man-modified, designated by any of the provincial governments, for the purposes of nature protection, recreation, tourism, historic preservation and education. They range in character from Polar Bear Provincial Park on Hudson Bay, a 29 093 km<sup>2</sup> wilderness park visited by less than 1000 people each year, to Bronte Creek Provincial Park, a 0.01 km<sup>2</sup> recreation park near Toronto that received 220 150 visitors in 1982.

#### History

As in the case of national parks, provincial parks originated at the end of the 19th century as a result of growing concern among civil servants, politicians and the general public about the depletion of natural resources, the degradation of scenic places and the need for an ever-expanding and increasingly urbanized population to have opportunities for recreation in a natural setting. The first provincial park established was ALGONQUIN, now a 7653 km<sup>2</sup> provincial natural environment park about 250 km N of Toronto. The idea for such a park was conceived in 1885 by an Irish immigrant, Alexander Kirkwood. As a clerk of the Crown Lands Department he had become concerned about the destruction of the northern forests and wildlife and was impressed by the new national parks at Yellowstone in the US and BANFF in the Canadian Rockies. Kirkwood advocated the creation of a National Forest and Park called Algonquin, to "perpetuate the name of one of the greatest Indian nations that has inhabited the North American continent." His enthusiasm and the practical support of a provincial land surveyor, James Dickson, led to the appointment of a royal commission and to the investigation of 18 townships in the District of Nipissing, S of the Mattawa R and lying between the Ottawa R and Georgian Bay. In 1893 this area, Algonquin, was declared "a public park and forest reservation, fish and game preserve, health resort and pleasure ground for the bene-

fit, advantage and enjoyment of the people of the Province." Initially the park was a remote wilderness, still subject to lumbering but afforded improved fire and wildlife protection. However, as communications improved and accommodation was provided, its recreational function gained in importance and, in the early 1900s, it became a fashionable destination for tourists wishing to canoe, fish and camp in a wilderness setting.

The next provincial park, RONDEAU, comprising a peninsula on the N coast of Lk Erie, was declared in 1894. Featuring a Carolinian forest of species normally found farther S, and frequented by numerous migratory birds, it was already popular with duck hunters and picnickers. Over the next 50 years, as demands for conservation and recreation areas increased, 5 other provincial parks were established in Ontario. In the granite SHIELD and Boreal Forest Zone, Quetico was created in 1913 and LAKE SUPERIOR in 1944. Along the GREAT LAKES shoreline, Long Point was designated in 1921, Presqu'île in 1922 and Ipperwash in 1938.

Québec's first provincial parks were created contemporaneously to those in Ontario and for similar reasons. In 1895 Laurentides Provincial Park, N of Québec City, and MONT-TREMBLANT, N of Montréal, were created to protect the forests, fish and wildlife for public benefit; however, resource exploitation continued in these areas. Other provincial parks were designated in the 1930s: Gaspésie in 1937, Mont Orford in 1938 and La Vérendrye in 1939. In the last 30 years many smaller parks have been established near cities to meet the demand for recreation in a natural setting.

British Columbia was the first western province to create provincial parks. STRATHCONA, a mountain and lake area on Vancouver I, gained park status in 1911 as a result of public support from such groups as the Alpine Club of Canada, the BC Natural History Society and the Vancouver I Board of Trade. Attention then focused on the mountains and glaciers of eastern BC, Mt ROBSON being declared a provincial park in 1913, followed by MOUNT ASSINIBOINE and Kokanee Glacier in 1922. The province's largest park, 9698 km<sup>2</sup> Tweedsmuir, located in the Coast Range, gained park status in 1938; Wells Gray, in 1939. In more recent years many more provincial parks, including large wilderness areas and small recreational sites, have been designated near cities in the S, as well as in the N.

Provincial status and ownership of resources came later to the Prairie provinces, and so did provincial parks. While the federal government designated national parks and forest reserves in the prairies, it was only with the transfer of resources legislation in 1930 that provincial parks, often originally forest reserves, were created. Alberta passed a Provincial Parks and Protected Areas Act in 1930; 2 years later, Aspen Beach, Park Lk, Gooseberry Lk, Saskatoon I, Lundbreck Falls, Ghost R, Hommy and Sylvan Lk were declared provincial parks. The last 3 were later deleted from the park system but, after jurisdictional changes in 1951 and 1967, more and larger parks were created. By 1972 Alberta had 51 parks, totaling 567 km<sup>2</sup>. Saskatchewan's first 3 provincial parks were created in 1931 from the former forest reserves of Duck Mt, Cypress Hills and Moose Mt. Manitoba likewise took over the management of forest reserves such as Turtle Mt and Spruce Woods but the province's first provincial park, WHITESHELL, was only established in 1962.

The Atlantic provinces began establishing provincial parks in the 1950s, when recreation opportunities in natural areas relatively close to cities were increasingly in demand. Parks with both a recreational and nature conservation orientation have now been established but the number and area remains relatively small. Ter-

ritorial parks in YT and NWT are an even more recent innovation, primarily because most land in the territories is federally owned, recreation demand has been very limited (because of the small population and low levels of seasonal tourism), and unspoiled wilderness is generally abundant.

### Provincial Parks Systems Today

Today, nearly 100 years after the first provincial park was established, all provinces have provincial park systems which usually consist of provincial parks and various other land units designated for recreational and nature conservation purposes. Each provincial system is different, and new parks are being designated each year.

**British Columbia**, in 1978, had 320 provincial parks, 25 recreation areas, and one wilderness conservancy, totaling 44 817 km<sup>2</sup>. Parks range from large, remote wilderness areas such as Tweedsmuir, to marine parks and small, recreational parks near cities. They are divided into 3 classes: class "A" comprises 252 fully protected natural or historic parks in which no commercially extractive industrial uses are permitted; discrete and regulated resource extraction is allowed in the 6 class "B" parks (no new ones will be created); the 62 class "C" parks are small, local, primarily recreational in character and, in time, will be transferred to local government jurisdiction. In 1978 the BC provincial park system received 11 million visitors.

**Alberta**, in 1980, had 59 provincial parks, 3 wilderness areas and 1 wilderness park together encompassing 7785 km<sup>2</sup>. They range in character from large, lightly used, unspoiled wilderness areas in the Rockies (eg, Willmore), to lake-based recreational parks in the drier, more populated areas of eastern Alberta (eg, Sylvan Lk). They are categorized in 4 classes, there being one wildland park of 503 km<sup>2</sup>, 19 natural environment parks covering 522 km<sup>2</sup>, 3 preservation parks covering 698 km<sup>2</sup>, and 36 recreation parks covering 109 km<sup>2</sup>. In 1978 Alberta's provincial park system received 5 million visitors.

**Saskatchewan**, in 1978, had 125 provincial parks covering 5070 km<sup>2</sup>. The system includes large wilderness areas in the northern forest, smaller parks on wooded prairie hills (eg, Cypress Hills), and lake-based recreational parks (eg, Lac Peltier, near Swift Current). The parks are categorized as wilderness, natural environment, recreation, historic and regional, the last category containing the most parks. In 1978 Saskatchewan's provincial park system received 4.5 million visitors.

**Manitoba**, in 1978, had 163 provincial parks covering 10 231 km<sup>2</sup>. They may be categorized as natural or recreational or given a designation such as wilderness, wayside, heritage, marine or historic. Whiteshell, E of Winnipeg, is a natural park as is Nopiming, a Saulteaux word meaning "into the wilderness." St Malo and Birds Hill, the latter 22 km N of Winnipeg, are primarily recreational. In 1978 Manitoba's provincial park system received 5 million visitors.

**Ontario**, in 1982, had 132 provincial parks encompassing 42 535 km<sup>2</sup>. Additional lands designated by provincial conservation authorities and the St Lawrence and Niagara Park Commissions also serve nature conservation and recreational purposes. The park system includes wilderness areas (eg, 4758 km<sup>2</sup> Quetico), historic sites (eg, 1555 ha Petroglyphs) and intensively used recreational areas (eg, Wasaga Beach on Lk Huron). The provincial parks are categorized as follows: wilderness, nature reserves, historical, natural environment, waterway and recreation; most are natural environment and recreation parks, which tend to be located near urban centres. In 1983, with the completion of provincial strategic land-use planning, 5 new wilderness parks were created in

Milk River RCMP post at Writing-on-Stone Provincial Park (photo by Harry Savage).

northern Ontario and over 100 other provincial parks identified for establishment in future. In 1982 Ontario's provincial park system received over 6 million visitors.

**Québec**, in 1978, had 88 provincial parks encompassing 111 370 km<sup>2</sup>. The system includes large wilderness areas (eg, La Vérendrye in the N) and small recreational parks nearer cities such as Montréal and Québec. Since 1977 they have been classified as conservation parks, recreation parks, hunting and fishing reserves and salmon-fishing reserves. In 1978 Québec's provincial park system received 7.1 million visitors.

**New Brunswick**, in 1978, had 62 provincial parks covering 224 km<sup>2</sup>. Varying in size and orientation (recreation or conservation), they can be classified as recreation, rest areas, campgrounds, beach, marine, resource and wildlife areas. In 1978 they received 3.1 million visitors.

**Nova Scotia**, in 1978, had 100 provincial parks covering 130 km<sup>2</sup>. Primarily oriented to roadside, coastal and urban recreation, they were classified as campgrounds, picnic, beach or roadside rest sites. An estimated 154 424 campers used these parks in 1978.

**Prince Edward Island**, in 1978, had 40 provincial parks, encompassing 31 km<sup>2</sup>. While small in number and area they include nature preserves, natural environment, recreation, beach and historic parks. In 1978 the provincial parks of PEI received 1 million visitors.

**Newfoundland**, in 1978, had 81 provincial parks covering 1109 km<sup>2</sup>. Most are small and recreation oriented, including public beaches, camping areas, day use parks and natural scenic attractions. However, there are several seabird sanctuaries and the AVALON PENINSULA has a wilderness area. In 1978 an estimated 3 million people visited these parks.

**Yukon Territory** has a number of territorial campgrounds, primarily along the highways, used by tourists. Larger territorial parks are still in the planning stage.

**Northwest Territories** have established some campgrounds near tourist destinations but no territorial parks have been set up as yet.

### Administration

Provincial parks are administered by provincial government agencies, commonly part of departments dealing with natural resources, tourism or culture. For example, in Ontario the provincial parks branch is part of the Ministry of Natural Resources; in BC it belongs to the Ministry of Lands, Parks and Housing. Staff are located in offices in the provincial capitals, in regional offices and in the parks, where a superintendent is normally in charge, assisted by wardens and interpreters.

Most provincial agencies have developed park-system plans that guide decisions on how many parks are needed, and what characteristics, size and location are appropriate. A management plan is normally prepared for each

park to facilitate decisions on the protection of the park environment, the development of facilities and the provision of services. Given the wide variation in the character and purpose of parks, many agencies classify parks (eg, as wilderness, recreation or historic) and manage them accordingly. Because individual parks, especially large ones, are diverse in character and purpose, they are often zoned, some areas being designated for strict nature protection and others for tourism development. Deciding on the classification and zoning of a park is difficult and may require public involvement.

In trying to protect park environments, yet allow them to serve the needs of visitors, park agencies face many management problems. Few parks are now ecologically self-sufficient; hence, management is needed to deal with fires, wildlife imbalances, diseases of animals and vegetation, and human impacts. The use of parks by visitors necessitates the provision and management of accommodation, transport and recreation facilities, information and education services, and safety features. Some of the problems facing park managers in recent years include maintaining fish stocks; preventing FOREST FIRES, littering and vandalism; protecting visitors from bears; eliminating poaching; reducing crowding in popular areas; dealing with new technologies (eg, snowmobiles, hang gliders, wind surfers); and reducing accidents from risk activities (eg, mountaineering, canoeing, winter camping). In recent years, to improve planning and management, environmental protection and visitor satisfaction, park agencies have undertaken more research and have regularly consulted the public through surveys and public hearings. Increasingly, opportunities are being provided for private enterprise, public interest groups and volunteers to become involved in running parks.

JOHN S. MARSH

**Parks, William Arthur**, geologist, paleontologist, teacher (b at Hamilton, Ont 11 Dec 1868; d at Toronto 3 Oct 1936). A graduate of U of T (BA, 1892; PhD, 1900), he joined its staff in 1893 and became professor and head of the geology department in 1922. One of the founders and original directors of the ROYAL ONTARIO MUSEUM, he trained many students who became professional geologists and paleontologists. Parks was noted for his pioneer explorations in northern Ontario, his reports on Canadian building and ornamental stones, his studies on Paleozoic invertebrate fossils, and his discoveries and descriptions of Alberta dinosaurs. A fellow of the RSC and the Royal Soc of London, he was the author of some 80 scientific papers and (with A.P. Coleman) of *Elementary Geology, with special reference to Canada* (1922).

LORIS S. RUSSELL

**Parksville**, BC, Town, pop 5216 (1981c), inc 1945, is located on the E coast of Vancouver I, 35 km NW of Nanaimo. First known as Englishman's River, Parksville was renamed after a pioneer resident, Francis Parks. It became an important stagecoach stop when the road between Nanaimo and Alberni was completed 1886. Early settlers, chiefly English, had arrived by 1890. Parksville depends primarily on tourism; it is a popular summer resort, having fine sandy beaches and good saltwater and freshwater fishing, and numerous motels. The town is also the commercial centre for a large logging and agricultural area. The townscape of Parksville is beach oriented and includes many attractive subdivisions and tree-lined streets. Nearby geographic features include Cathedral Grove, Little Qualicum Falls Provincial Park and the Mt Arrowsmith Ski Area.

ALAN F.J. ARTIBISE

**Parlby, Mary Irene**, née Marryat, farm woman's leader, politician (b at London, Eng 9 Jan 1868; d at Red Deer, Alta 12 July 1965). An early supporter of the UNITED FARMERS OF ALBERTA, in

1913 she helped form the first women's local. In 1916 she was elected president of the UFA's Women's Auxiliary; she transformed it into the united farm women of Alberta, which played a major role in fostering legislation relating to the welfare of women. In the 1921 provincial election she won the Lacombe riding for the UFA, holding it for 14 years and serving as minister without portfolio. She supported Acts concerning women's rights and participated in the PER-SONS CASE in 1929. She was Canadian delegate to the League of Nations in 1930 and she retired from politics in 1935.

ERIC J. HOLMGREN

**Parliament**, strictly, the HOUSE OF COMMONS, the SENATE, and the Crown represented by the GOVERNOR GENERAL. When it is said that Parliament is supreme (meaning Parliament is beyond the interference of any body), all 3 institutions are included. In common usage, however, the House of Commons alone is often equated with Parliament, which derives from a time when absolute monarchs summoned their legislature to legitimate their taxing and other measures to a time when constitutional monarchs, with royal prerogatives "tamed" by a legislature, primarily acted only on the advice of ministers who were entitled to proffer advice only so long as they could maintain the support of the "commoners."

The bicameral nature of the Canadian Parliament was deemed a necessary inducement to bring provinces of varying size and power and with widely different regional concerns into the broader union that comprised Confederation. However necessary to the original union, the Senate, as a nonelective body, has been constantly subjected to cries for its abolition or reform, although as a committee of "sober second thought" or as a true institutional reflection of a federal Canada, it has many attractions. The House of Commons has become the more important chamber, not least because the government of the day stands or falls on its support. The practical consequence of invoking the supremacy of Parliament is the legislature's capacity to act as the great debating, if not educational, forum for the nation. This capacity, joined with the historic right to have grievances settled by the Crown before approving money in support of the Crown's activities ("control of the purse"), vests in the legislature not only the formal responsibility for approving statutes but also a continuing critical overseeing of executive actions. To this end, according to constitutional requirement, Parliament (as well as each provincial legislature) shall meet at least once a year and no more than 5 years should elapse between elections for a new legislature — only a war, invasion or insurrection can interfere with this guarantee. A normal parliamentary session (following rule changes in 1983) is now divided into semesters with provision for vacation adjournments. The proroguing of Parliament brings an end to a particular session and when reconvened the new session begins with a speech from the throne announcing the government's legislative program for the session. Dissolution, which marks the end of a Parliament, can occur any time within the 5-year period and is invoked by the governor general on the advice of the PRIME MINISTER. Dissolution involves an election and the formation of a new Parliament.

Protections also exist to ensure that Parliament shall not only be unconstrained in what it can debate but that the individual legislators shall enjoy complete freedom of speech. The rules of Parliament (self-prescribed) guarantee the rights of opposition parties to criticize without fear of retribution by the governing party.

The formation and operation of Parliament is dependent upon political parties; elections are fought and successful candidates find their seats in the legislature on a party basis, and it is

through parties that the House and its committees conduct business. The capacity of CABINET to exert leverage on party supporters guarantees that the government's business will be piloted through the reefs of opposition. Indeed, it is the Cabinet's power, through its control of the party, that is criticized for undermining the traditional capacity of Parliament to hold government responsible through the threat of a no-confidence vote. Party discipline enables the Cabinet to counter with the threat of dissolution to force members to toe the line or place their seats at risk in an ensuing election. This shift in the balance of power puts in doubt Parliament's capacity to fulfil its traditional task of holding the executive to account. While parliamentary prerogatives are considerable, as an institution it is usually perceived as functionally inferior to the Cabinet and senior public service.

J.E. HODGETTS

**Parliament, Library of**, initially formed in 1841 by the amalgamation of the legislative libraries of Upper and Lower Canada. In 1849 the Parliament Buildings in Montréal were burned by a mob protesting the REBELLION LOSSES BILL and only 200 of the 12 000 books were saved. Re-established in Ottawa after completion of the original PARLIAMENT BUILDING, the present building was the only structure left after the disastrous fire of 1916. The marvellous neo-Gothic structure was preserved in the new Parliament Buildings. The library's large collection of books and documents is carefully chosen to meet the demands of its parliamentary clientele. A research section provides substantial assistance to House members and parliamentary committees. The library's collections are available to other libraries through interlibrary loan. Under the Library of Parliament Act, the library is considered a department for administrative purposes and the parliamentary librarian holds the rank of deputy minister.

**Parliament, Opening of**, may refer either to the beginning of the first session of PARLIAMENT after a general election or to the beginning of a subsequent session. All the proceedings take place in the Senate chamber and involve all 3

elements of Parliament — the CROWN, the SENATE and the HOUSE OF COMMONS. If there has been an election, on the first day of the session the Commons are summoned to the Senate, only to be told that the SPEECH FROM THE THRONE will not be read until they have selected one of their members as their spokesperson. The Commons then return to their own chamber and elect a Speaker. Later that day or on the next, the Commons, again pursuant to a summons delivered by the Gentleman Usher of the Black Rod, but now headed by their Speaker and the Sergeant at Arms bearing the mace, go up again to the Senate chamber. There the Speaker, standing at the bar of the Senate, presents himself or herself to the Queen's representative and requests that the traditional rights of the Commons be confirmed. When this has been done the Queen's representative (almost always the GOVERNOR GENERAL), reads the Speech from the Throne to the 2 Houses. The Senators are seated in their places; the Commons stand crowded behind their Speaker beyond the bar at the south end of the chamber. The prime minister is seated to the right of the throne. When the speech has been concluded the Commons are dismissed, and the Speaker leads them back to their own chamber. Once the governor general has departed the 2 Houses normally adjourn. On the next day both Houses begin working on the business of the session. If the session is not the first of a new Parliament, the Speech from the Throne can be delivered at once because a Speaker already has been chosen.

JOHN B. STEWART

Reading: John B. Stewart, *The Canadian House of Commons* (1977).

**Parliament Buildings**, Ottawa, present one of Canada's most visually striking and historically remarkable building complexes. As first conceived, they were intended to serve a union of Upper and Lower Canada, but after CONFEDERATION had been negotiated they were available for the 4 constituent provinces. They provide space for the HOUSE OF COMMONS, SENATE, many members' offices, and committee rooms. Four main elements make up the complex: Centre Block with tower, flanking East and West Blocks, and a Parliamentary Library at the rear. The complex occupies a picturesque site above the OTTAWA R.

Architecturally the Parliament Buildings represent Canada's best example of the developed picturesque Gothic revival style. Prominent are such elements from medieval architecture as pointed arches, lancet windows with tracery, pinnacles with crockets, prominent exposed buttresses, and contrasting variegated stonework set off by brick trim. The East and West Blocks (1859-65, Stent & Laver) and the Library (begun by Fuller & Jones, 1859, redesigned with wrought-iron dome in 1870, completed in 1877) represent the original mid-19th-century Gothic revival style. The Centre Block was first designed in 1859 by Thomas FULLER and Chilion Jones, reworked in 1863 by Fuller and Charles BAILLAIRGÉ, and completed 1866; it was rebuilt (after a spectacular fire in 1916) by Pearson & Marchand in academic Gothic revival, more archaeologically correct but less colourful and eye-catching. Its grand central tower was originally called Victoria Tower, then, as rebuilt in 1917, Victoria Tower, and in 1933, the Peace Tower.

ALAN GOWANS

Reading: National Film Board, *Stones of History: Canada's Houses of Parliament* (1967).

**Parliamentary Press Gallery** is a loosely knit association of more than 300 journalists assigned by media organizations to cover Parliament and government. Traditionally seen as a small club of elite newspaper writers, it has expanded and become less cohesive since the admission of broadcasters in 1959 and the admission of camera and sound people in 1982.

The Parliamentary Library was the only structure left standing after the fire of 1916, and it was preserved in the new Parliament Buildings (photo by Richard Vroom).

The original Parliament Buildings (top), designed by Thomas Fuller, were a masterpiece of mid-19th-century Gothic revival style. This view is from the western approach. The current Parliament Buildings (bottom) were built after fire destroyed the original in 1916. The grand central tower was rebuilt in 1917 and named the Peace Tower in 1933 (top courtesy Public Archives of Canada/PA-8338; bottom courtesy National Film Board/Photothèque).

Many of its early records were destroyed in the Parliament Buildings fire in 1916, but the gallery is known to have existed at least since Confederation, and its organization has become more structured over the years. In the 19th century its members were usually attached to a political party, and even into the 20th century Conservative and Liberal reporters sat at opposite ends of the gallery, though this pattern disappeared as newspapers detached themselves from political affiliation.

As a group, members have often been described as an important instrument of political communication, but as an association the gallery has only minor influence. The executive of the association facilitates news coverage and arranges news conferences or access to information. Occasionally, it is drawn into more

difficult problems, such as controversial applications for admission, the gallery's right to discipline members or its right to take a stand on public issues. A number of cases have established that although the gallery as an association has the right to deny membership, the Commons Speaker, as representative of the House, has the final authority to determine who will have access to facilities for coverage of Parliament.

CARMAN CUMMING

**Parliamentary Procedure** There are 5 basic principles of parliamentary procedure: first, the HOUSE OF COMMONS is master of its own proceedings; second, all discussion must be relevant to a motion and directed at a decision by the House; third, if possible, the House should not be taken by surprise (the usual required notice for debates is 48 hours); fourth, a majority of those voting, not a majority of the membership, is required to carry a motion; and fifth, the entire session and not just one sitting is used as the basic time unit for procedural purposes.

The House of Commons has adopted a large number of *standing orders* to govern its work but it is guided also by law, by the SPEAKER's rulings,

and practice. If there is no applicable Canadian rule, the House looks to the British House of Commons. All orders of the House are recorded in its minutes — the daily Votes and Proceedings and the sessional Journals — and from time to time consolidations of the standing orders are prepared for the convenience of members. The last major changes in the standing orders were made on 20 Dec 1968, 24 July 1969 and 12 Dec 1975. When points of order are being discussed members refer frequently to *Rules and Forms of the House of Commons of Canada*, by Arthur Beauchesne, and to Erskine May's *Parliamentary Practice*, a British work (1844), kept up to date by the clerks at Westminster.

The House expresses its opinions in *resolutions* and its will by *orders*. Most orders relate to its own conduct, eg, the decision that a bill be read a second (or third) time is in effect an order to the clerk to have the bill read. Most orders are particular, eg, "That Bill C-27 be now read a third time." Standing orders are those that remain in effect until altered by the House.

The House communicates by messages, addresses and bills. Messages are often sent to and received from the SENATE. The most famous address was that sent jointly with the Senate to Her Majesty in 1981 requesting the patriation of the CONSTITUTION. A *bill* is a request to the Queen that she assent to the text of the bill, making it a statute. No bill may go forward for royal assent unless it has passed the Senate and the House of Commons.

Decisions by the House are initiated by *motions*, most of which must be preceded by a printed notice which is sent to all members in the daily Notice Paper. The decision of the majority of the members voting on a question is taken as the decision of the House. Many votes are unanimous. Recorded divisions are very formal — each member rises in his place and his vote is recorded in the minutes. The expression "on division" is often used to show there is opposition but that those opposed see no point in using time for a recorded division. Since the Speaker and 19 other members constitute a quorum, a bill may pass the House even if the vote at every stage is only 10 Yeas and 9 Nays.

The many different kinds of business are dealt with in an exact program, the basic distinction being between items taking little time — often called routine proceedings — and the rest. Oral questions and routine proceedings take up a little more than an hour at the beginning of each sitting. Under routine proceedings, public bills are introduced and given first reading, standing COMMITTEES and special committees report to the House, written questions are answered and motions are made for concurrence mostly in committee reports. At the end of routine proceedings the House turns to the orders of the day. The second distinction is between private members' business and government business. Under the standing orders most of the House's time after routine proceedings is at the government's disposal (16 hours weekly), at best the private members have 4 hours a week.

Private members' business comprises *motions* (for proposed orders or resolutions), *private members' bills* (to change the general law), and *private bills*, and *motions for the production of papers*. Each new item is added at the bottom of the appropriate list. The lists are dealt with from the top and after an item has had a turn — in effect, an hour — it drops, unless completed, to the bottom of the list and is said to have been talked out. In contrast, all government orders go on one mixed list, Government Orders. The government House Leader may have items of government business dealt with in any priority, and may have the House return to the same item day after day. Government items are never talked out, although they may be delayed by FILIBUSTER. The 5 lists, together with written questions, are

printed in the *Order Paper*, which grows thicker as a session progresses. Private members' bills, which rarely become law nowadays (in 1964 the name of Trans-Canada Airlines was changed to Air Canada by a private member's bill and in 1982 Dominion Day was changed to Canada Day). Private bills are now used mainly to incorporate certain kinds of federal companies. Private members' motions are almost always talked out. Motions for the ministers to bring forth letters, documents and reports are relatively unimportant unless the government is in a minority; if the government has no objection they carry without debate, and debated motions will be defeated if the government has a majority.

The expression *orders of the day* originated with the House at Westminster which planned its work by ordering that particular items come up on specified days, even at specified hours. After a first reading the Speaker at Ottawa still asks, "When shall the said bill be read a second time?" and after the report stage, "When shall the said bill be read a third time?" Each item is really an order, and at the end of routine proceedings the Speaker announces, "Orders of the day." An item of business taken after routine proceedings is in the form of an order, and the order may be that the motion is to be moved that a particular bill be read a second (or third) time. Orders, motions and bills are often confused in the news. Government motions are intended not to change the law, but to produce an order or resolution of the House; they parallel private members' motions. The regular government motions for the Christmas, Easter and summer adjournments are debatable, unlike a simple motion to adjourn (for the day), which may initiate a division but not a debate. Government legislative business is composed of nonfinancial bills, ways and means business which results in taxation bills, and supply business which results in appropriation bills (see BUDGETARY PROCESS).

The first 2 motions of the ordinary legislative process — that permission be given to introduce the bill and that the bill be read a first time — are treated as routine proceedings without debate, but perhaps with a division. The motion that the bill be read a second time is debatable, so it is moved pursuant to an order of the day. If that motion carries, one of the Table Officers "reads" the bill. Nowadays the reading is symbolic; he simply says, "Second reading of this bill." Next the bill is sent to a committee, where it is studied closely, clause by clause, with or without amendments. It is then reported back to the House. If the bill has been to a committee other than a committee of the whole House, any member may move amendments to it after written notice. But if the bill has been to a committee of the whole House the report stage is only a formality. The last stage concerns the motion that the bill "be now read a third time and do pass." If this motion carries, the bill is sent to the Senate for passage there, or, if it has already passed there, it returns there to await royal assent. Bills introduced in the House of Commons are numbered C-1, C-2, etc. and Senate bills are numbered S-1, S-2, etc. Royal assents, like SPEECHES FROM THE THRONE, are given in the Senate chamber.

Appropriation bills — allotting money for particular purposes — follow a similar process but normally take only a few minutes because the members have had time to examine the Crown's request (estimates) for supply in the standing committees. The standing orders set aside 25 days a year in the House as Opposition Days, to allow the Opposition to criticize the government before the House is asked to appropriate money.

Taxation bills, too, are advanced through a variation of the ordinary legislative process. The minister of finance usually announces major

tax changes in a budget speech, moves a standard motion, "that this House approves in general the budgetary policy of the government," and the budget debate, limited to 6 days, then begins. Often the Official Opposition will move an amendment and a third party a subamendment. On 8 May 1974, the TRUDEAU government was defeated on a New Democratic Party subamendment to the budget motion, and on 13 Dec 1979, the CLARK government was defeated in the same way. During his speech the minister tables notices of ways-and-means motions outlining his proposed tax changes in some detail; these are intended to elicit comments on the practicality of the proposed changes from tax lawyers, accountants and others. Later, perhaps months later, he brings in his taxation bills, one for each ways-and-means motion. Taxation bills, which are considered in committees of the whole House, generally move slowly through the second-reading, committee and third-reading stages. The debate initiated by the Speech from the Throne is now limited to 8 days and attracts little attention unless the government is in a minority.

Debating takes place in the House, an unsuitable mode for some matters which are better considered in committees. In committees of the whole House the proceedings are far more flexible than they are in the House. Since Dec 1968, almost all nonfinancial bills are considered in the standing committees.

The defeat of the government in a division does not necessarily bring its resignation or an election — it may be prepared to carry on without the lost bill, as was the PEARSON government in Feb 1968, and the House itself may not regard the defeat as demonstrating a lack of confidence. The rules provide regular opportunities for explicit non-confidence motions by the Opposition; they can be moved as amendments to the Address-in-Reply motion, as amendments to the budget motion and as motions on 6 of the 25 Opposition Days. Even an explicit non-confidence vote does not impose a legal obligation to resign or bring on an election, but a government that ignored such a vote would be mad. The House can force a government out of office by refusing to appropriate money.

The rules permit members to address oral questions to the CABINET daily. In Canada no written notices of the questions are required as they are in Britain, consequently the Canadian question period is more timely, turbulent and, some observers claim, trivial. The daily period for oral questions is the source of much of the news from Ottawa. A minister is not required to answer any or every question candidly; indeed the House would often regard completely truthful answers as contrary to the national interest.

Sometimes the House agrees to debate a matter not included among the orders of the day. Once the notice time has elapsed any government order of the day can be activated, even if it is the

last one on the list, so normally the government has no need for emergency debates. Standing Order 26 enables private members to request an emergency debate. A motion to adjourn under S.O. 26 is debatable but may not be moved without special permission. The member must apply to the Speaker following routine proceedings; if the application is found valid it needs the support of only 19 others. These debates generally begin after dinner, even on Wednesday and Friday evenings, when the House does not ordinarily sit. The Speaker can terminate them when they become repetitious but in practice they continue until all members who wish to speak have done so.

JOHN B. STEWART  
Reading: John B. Stewart, *The Canadian House of Commons: Procedure and Reform* (1977).

**Parlow, Kathleen**, violinist, teacher (b at Calgary 20 Sept 1890; d at Oakville, Ont 19 Aug 1963). Trained entirely outside Canada, Parlow completed her studies with Leopold Auer at St Petersburg [Leningrad] Conservatory and made her professional debut in Berlin in 1907. A brilliant soloist and recitalist, renowned for tone, technique and breadth of repertoire, she toured Europe, Russia, the US, Canada and Asia. After 1927 her career was centered on teaching and chamber-music performance. Returning permanently to Canada in 1941, she taught at the Toronto Conservatory and founded the Parlow String Quartet, which, as the best-known quartet of its day (1943-58), influenced the musical taste of audiences across the country, introducing much unfamiliar music, including works by Canadian composers. BARCLAY MCMILLAN

**Parr**, graphic artist, hunter (b on southern Baffin I 1893; d at Cape Dorset, NWT 3 Nov 1969). Parr led a traditional nomadic existence for most of his life. A serious hunting accident obliged him to settle permanently in CAPE DORSET in 1961, where he began drawing at age 68. In his short artistic career he produced over 2000 drawings and contributed 34 prints to the annual Cape Dorset print collections. Filled with animals and hunters and drawn in a distinctive, primitive style, with little regard for naturalism or perspective, Parr's naive images are powerful expressions of an old man's love for a disappearing way of life. Often considered crude and childish, his works were largely unappreciated during his lifetime. Only after his death were there major exhibitions of his work, and a posthumously published print, *Hunters of Old*, was selected for a 1977 Canadian postage stamp. See INUIT ART. INGO HESSEL

**Parr, John**, soldier, colonial administrator (b at Dublin, Ire 20 Dec 1725; d at Halifax 25 Nov 1791). After a lengthy career in the army, he became governor of NS in 1782. Taking up his post just before some 30 000 LOYALISTS entered the maritime colonies, he was forced to deal with their resettlement and shortly found himself caught between the pretensions of the newcomers and the claims of older settlers, a situation that endured until the end of his administration. On the whole he acquitted himself well, though he won little popularity or admiration for his efforts. J. M. BUMSTED

**Parry, Sir William Edward**, naval officer, arctic explorer (b at Bath, Eng 19 Dec 1790; d at Ems, Ger 8 July 1855). On 3 naval expeditions to the Canadian Arctic, Parry contributed to the eventual discovery of the NORTHWEST PASSAGE. He became an officer in the British Navy just as the Admiralty was turning to arctic exploration. After accompanying Sir John Ross to Baffin Bay and Lancaster Sd in 1818, he led his own expedition in 1819 up the sound as far as Melville I, where his 2 ships wintered. Only one other naval expedition would get this far W in the 19th century. In 1821 he led his second expedi-

Parr's print, *Hunters of Old*, was selected for a 1977 Canadian postage stamp (courtesy West Baffin Eskimo Co-operative, Cape Dorset, NWT).

tion in search of a navigable exit to the W out of Hudson Bay. After 2 winters in the ice, he admitted that no such channel existed. Parry returned to the Canadian Arctic for the last time in 1824, wintering in Prince Regent Inlet and losing one of his ships before returning to England. Before leaving arctic exploration altogether, he attempted to reach the N Pole from Spitzbergen in 1827 and, though he failed, he reached farther N than anyone else would do for close to 50 years.

DANIEL FRANCIS

**Parry Channel** is a sea passage running E-W through the arctic islands. Named for explorer W.E. PARRY, it begins at LANCASTER SOUND, passes through Barrow Str, leads into Viscount Melville Sound, finally reaching the BEAUFORT SEA through M'Clure Str. The permanent pack ice in M'Clure Str is an impassable obstacle to further navigation through the Parry Channel, forcing ships making the NORTHWEST PASSAGE to detour far to the S. The straight, parallel coastlines and great depths found in Parry Channel suggest it is a deep, submerged trough caused by past intense movements of the Earth. It marks the geological divide between Precambrian rocks of the Canadian SHIELD to the S and sedimentary rocks forming the arctic islands to the N. DOUG FINLAYSON

**Parry Islands**, a group of High Arctic islands comprising MELVILLE, BATHURST and CORNWALLIS islands, as well as a number of smaller ones. Melville is the largest of the 3 main islands and is also the highest, exceeding 1000 m in places. The islands are topographically similar since all are part of the same geosynclinal structure; each takes the form of a level plateau 600 m in elevation that ends abruptly in 300 m high cliffs along many parts of the coast. The most striking feature of the surface of Melville and Cornwallis islands is the almost complete absence of vegetation, exposing a great number and variety of patterned ground features. DOUG FINLAYSON

**Parry Sound**, Ont. Town, pop 6124 (1981c), inc 1888, located on the eastern side of GEORGIAN BAY, 225 km N of Toronto. The name honours British explorer Sir William Edward PARRY. The site was purchased in the middle of the 19th century by W.H. Beatty, a land surveyor looking for fresh timber limits. The settlement was laid out after 1867. Beatty family interests were managed by a son, William, Jr, who treated the town as a personal fiefdom and was known as "the governor". He enforced prohibition and at one point circulated his own money — Beatty script. For many years logging was the major industry. The town also boasted a deep-water harbour. As logging declined, tourism increased and now the town is the centre of the ruggedly beautiful Thirty Thousand Islands vacation area. It is famous as the home of hockey legend Bobby ORR.

DANIEL FRANCIS

**Parsnip** (*Pastinaca sativa*), perennial plant grown as an annual VEGETABLE crop and belonging to the Umbelliferae family. Of Eurasian origin, parsnips were brought to N America by European colonists. They have white, fleshy, sweet, slightly acid roots. Stems, with ovate leaflets, are 40-75 cm high. Improved varieties (eg, Hollow Crown) have short tops and smooth roots, 25-30 cm long and 6-8 cm thick at the shoulders. Canada's temperate climate is well suited to parsnips. Seed germination and root development are slow, requiring 100-125 growing days. Seeds are sown early, 1.5 cm deep, in fertile, well-drained and slightly acid sandy loam or

muck soils. Depending on soil and variety, plants are spaced 5-10 cm apart. Chemical weed control or early cultivation is essential. A few radish seeds planted with parsnips mark the rows to permit earlier weed control; they also break crusted soil. INSECT PESTS include leafhoppers and carrot rust flies; diseases, leaf-spot canker. Parsnips are rich in potassium. In 1983 Canada's production was 192 ha, 2706 t, worth nearly \$1.2 million. Ontario produced one-half of this crop. V.W. NUTTALL

**Parsons, Robert John**, journalist, politician (b at Harbour Grace, Nfld, c1802; d at St John's 20 June 1883). With William Carson and other Newfoundland Liberals, he founded the weekly *Newfoundland Patriot*, in 1833 and became its sole owner and editor (1840). Eloquent and occasionally outrageous in his defence of the Liberal cause, he wrote a satirical putdown of Chief Justice Henry BOUTON in 1835 who sentenced him to jail for contempt of court. This episode won Parsons esteem in Liberal circles. He was elected to the Assembly in 1843 and sat almost continually until 1878. Although a Liberal, Parsons was prepared to break with the party line on occasion and consequently never held high office. Yet he was a powerful influence, a forceful advocate of RESPONSIBLE GOVERNMENT in the 1850s, and in 1869 one of the leaders of the anti-Confederate campaign. GEOFF BUDDEN

**Parti bleu**, political group formed in Québec about 1850 around the moderate reform beliefs of Louis-Hippolyte LAFONTAINE; the name derived from an attempt to establish an identity distinct from that of the extremist, anticlerical PARTI ROUGE. With the encouragement of the church, the "bleus" attracted much popular support. Members such as Augustin-Norbert MORIN and George-Etienne CARTIER provided the French Canadian leaders in the PROVINCE OF CANADA's government. The party was associated with English-speaking Tories and, through co-operation with Canada West's moderate reformers, provided the basis for the CONSERVATIVE PARTY.

**Parti canadien**, founded during the early 19th century, was a political party of middle-class French Canadian professionals and merchants, although it attracted some English speakers. Its newspaper, *Le Canadien*, was first published in Québec City 22 Nov 1806. Around 1810, under the leadership of Pierre Bédard, the party was involved in agitation for ministerial responsibility and for greater power and control of political patronage by French Canadians. In Mar 1810, at the insistence of GOV CRAIG, Bédard and some *Le Canadien* staff were arrested, and thereafter Bédard's control of the party declined. After about 1815 Louis-Joseph PAPINEAU emerged as leader, and the party went on to fight against the 1822 proposal for union of the Canadas. In 1826, to reflect a growing sense of FRENCH CANADIAN NATIONALISM, the Parti canadien became the Parti PATRIOTE. See also LOWER CANADA.

**Parti national**, political party fd in 1871 by Québec Liberals including Honoré MERCIER and Louis Jetté. It unsuccessfully attempted to acquire the clerical support for liberalism that the PARTI ROUGE lacked. Mercier revived it in 1885 during the uproar over Louis RIEL's execution. The Parti national, a coalition of Liberals and disenchanted Québec Conservatives using a platform based on French Canadian nationalism, won the 1886 provincial election. It governed Québec until 1891, when the Mercier ministry was dismissed by the lieutenant-governor for involvement in the BAIE DES CHALEURS SCANDAL. It was soundly defeated in the 1892 provincial election.

**Parti pris**, political and cultural magazine fd 1963 by Montréal writers André MAJOR, Paul CHAMBERLAND, Pierre Maheu, Jean-Marc PIOTTE

and André Brochu, all in their twenties and convinced that Québec needed a revolution to produce an independent, socialist and secular state. Young activist intellectuals in QUIET REVOLUTION Québec soon began to gravitate to the magazine. During its 5 years, *Parti pris* was simultaneously a high-quality magazine (53 issues appeared, in 39 installments); an avant-garde revolutionary centre which was active in demonstrations, the training of militants, the Club Parti pris and later the Mouvement de Libération Populaire; and a publishing house which put out some 20 works, most of them literary and some outstanding. The publishing house, Éditions Parti pris, continued to exist after the magazine had disappeared, primarily because of the efforts of poet GÉRALD GOGIN.

The magazine allied itself with the major ideological currents of its time: Marxist-Leninism, Sartrean existentialism and Third World decolonization. It drew heavily on these ideologies to develop a virulent analysis of Québec as a colonized society whose inhabitants were economically, culturally and politically deeply alienated, dispossessed of their being along with their homeland. *Parti pris* consistently rejected "French Canada" and called "Québec" into existence. On the literary level, it was known mainly for the JOURNAL writing it published. The group put out powerful, shocking works, such as *Le Cassé* (1964; tr *Flat Broke and Beat*, 1964) by Jacques Renaud, *L'Afficheur hurle* (1965; tr *The Shouting Signpainters*, 1972) by Paul Chamberland, and an extraordinary essay, *Nègres blancs d'Amérique* (1968; tr *White Niggers of America*, 1971) by Pierre Vallières. *Parti pris* was a brilliant literary generation. In the words of a contemporary, it was the Québec "Intellectual" Liberation Front.

ROBERT MAJOR

**Parti Québécois**, a nationalist party in Québec created in 1968 by a fusion of 2 independentist movements. Its objective is the establishment of SOVEREIGNTY-ASSOCIATION, ie, associate state status for Québec on an equal basis with the Government of Canada. Led by former Liberal minister of natural resources in the Lesage government and television personality René LÉVESQUE, it suffered 2 electoral defeats (in 1970 with 23.2% of the popular vote, it elected 7 members to the National Assembly; in 1973 it elected 6 candidates but garnered 30.8% of the vote), but achieved power in 1976 with 41% of the popular vote and 71 seats. A REFERENDUM was held in May 1980 in which the government asked for a mandate to negotiate with federal authorities on sovereignty-association. Despite the loss of that referendum (60-40%) the party was re-elected in 1981 winning 82 seats. The party is supported across the socioeconomic spectrum, including both the working class and the new bureaucratic class that emerged from the QUIET REVOLUTION of the early 1960s. The PQ has managed to win the participation of both labour and business in tripartite *sommets de concertations* (summit conferences) in many fields of economic activity, eg, fisheries and the textile industry, but in 1983 lost some of its traditional support from labour through its response to labour unrest. Its controversial LANGUAGE POLICY (see BILL 101) has been opposed by the English-speaking minority in the province and attacked by some French-speaking Québécois who feel it does not adequately protect the French language. It has delayed the pursuit of sovereignty-association largely because, according to most opinion polls, a majority of people in Québec still prefer to be part of Canada. This delay, ironically, may also have cost the PQ support from some of its traditional bases. Late in 1984, after the announcement of a neo-federalist credo by René LÉVESQUE, the PQ government was shaken by the resignation from Cabinet of a group of *independentistes*, including Jacques Parizeau. CLINTON ARCHIBALD

**Parti rouge**, also known as *Parti démocratique*, established about 1848 by a group of radical young francophone intellectuals who had helped found the *INSTITUT CANADIEN* and who were inspired by the republican ideas of Louis-Joseph PAPINEAU. Members included the DORION brothers, Louis-Victor SICOTTE, Joseph Papin and Joseph DOUTRE. In the legislature and through *L'Avenir* and *Le Pays* the rouges advocated repeal of the ACT OF UNION, annexation of Canada to the US, extension of the elective principle of government to all offices, abolition of the SEIGNEURIAL SYSTEM and universal suffrage. Although their extremism moderated over time, they remained staunchly anticlerical and opposed to the ULTRA-MONTANE doctrines of Mgr BOURGET, thereby ensuring the continued animosity of the church and limited popular support. After Confederation the Parti rouge merged with the CLEAR GRITS of Canada West to form the basis of the LIBERAL PARTY.

**Partridge, Edward Alexander**, farmer, farm leader, author (b at Whites' Corners [Dalston] near Barrie, Canada W 5 Nov 1862; d at Victoria 3 Aug 1931). Partridge grew up in an area where farm militancy was well established in the 1870s. He went west with brother Henry in Dec 1883 and taught school while homesteading E of Sinaluta. During the NORTH-WEST REBELLION he served in the Yorkton Company of Infantry. In the mid-1890s Partridge became active in the Patrons of Industry in the Sinaluta area. A bustling community dominated by Ontario settlers, Sinaluta became a centre for strong regional and political movements. In 1902 Sinaluta farmers charged the CPR with improperly allocating grain cars under the Manitoba Grain Act. Henry Partridge, the magistrate who judged the case, found the company guilty. This largely symbolic victory over the railway made the Partridge brothers important figures among the Saskatchewan grain growers. Early in 1905 a few neighbours sponsored a trip by Ed Partridge to investigate the operations of the Winnipeg Grain Exchange. Shocked by the speculation he found, he quickly developed a plan for a co-operative marketing program, and the Grain Growers Grain Co was organized in 1906. After a bitter struggle to join the Winnipeg Exchange in 1907, the company prospered. Partridge was its first president and he was also instrumental in starting in 1908 *GRAIN GROWERS' GUIDE*, the voice of Prairie farmers.

Partridge was a visionary who believed that the keys to western development were government control of the grain-marketing system to ensure reliable, inexpensive delivery of grain, and the development of the HUDSON BAY RAILWAY. He inevitably found himself in fierce struggles with politicians and other farm leaders and in 1912 he resigned from the Grain Growers Grain Company. He realized that he was a weak administrator and was primarily responsible for selecting his successor. Shortly afterward he started the Square Deal Grain Co, but when it declined in 1913 he returned to Sinaluta.

Despite a number of personal tragedies and failing health, he re-entered the farm movement as elder spokesman for a new generation of agrarian radicals at the end of the war. He was revered by many within the Farmers' Union of Canada, a radical farm movement formed in 1921. He became once again a popular spokesman for farmers and in 1926 he published *A War on Poverty*. A strange mixture of Ruskinian socialism, Old Ontario torism, western utopianism and religious fervour, the book called for an independent western state, Coal-samoa. It was a highly individualistic vision that attracted much interest but few converts. Plagued by despondency at times throughout his life, Partridge died, probably by suicide, in 1931.

IAN MACPHERSON

**Party Financing** Canadian political parties need money for election expenses (traditionally the only reason), to maintain organizational activities (accomplished more or less successfully) and to conduct research for policy purposes (a poor third). The financing of Canadian parties reflects the country's institutions. The Cabinet and parliamentary systems tend to centralize power and funds in the hands of the leadership, but the influences of FEDERALISM result in a dispersal of both among competing national and provincial governments and party structures. From Confederation until about 1897 party funds were an essential tool in overcoming the fissiparous tendencies of weak partisanship — the "loose fish" phenomenon and dominant ministerialism. Party chiefs such as John A. MACDONALD were intimately involved in fund raising and in distributing election funds to ensure the election loyalty of their followers. Inevitably they were also involved in questionable dealings with financial interests in search of concessions, contracts and favours, as exemplified by the PACIFIC SCANDAL of the 1870s and other railway scandals (see PATRONAGE). As partisanship crystallized, party leaders tried to disengage themselves from the raising of campaign war chests, but W.L. Mackenzie KING's entanglement in the Beauharnois Scandal of 1931 (King, who had accepted money from a promoter of a hydroelectric plant, called it his "vale of humiliation") proved that it continued to haunt them. Fund-raising specialists gradually assumed this role, freeing party leaders from immediate involvement in this necessary but messy aspect of party politics (see CORRUPTION; CONFLICT OF INTEREST).

Until recently, the large industrial and financial interests of Toronto and Montréal (hundreds rather than thousands of givers) provided nearly all the funds required by the Liberal and Progressive Conservative parties. Although recent reforms at the federal and provincial levels have modified this pattern, campaigns at all levels, including the municipal, depended largely on the same sources as the central party funds. Currently, multinational firms and their Canadian branches play a large role in the financing of the Canadian PARTY SYSTEM. Fund raising was traditionally the responsibility of committees in Toronto and Montréal and of various satellite groups in Hamilton, London, Winnipeg, Calgary and Vancouver, though western fund raisers have lately become more prominent because of shifts in the Canadian economy. The main fund raisers were not responsible to the formal, elected party organs and rarely held elective office. Appointed by the party leader, they were usually co-opted from the legal or financial communities, or else they inherited their positions from older family members. Their usual reward when a party achieved office was appointment to the Senate or the bench. The traditional model was altered by the rise of third parties and the resurgence of provincial economic and political power after WWII. The CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), the SOCIAL CREDIT movement in Alberta and Québec, and the PARTI QUÉBÉCOIS tapped new financial resources and became largely self-financing. The NEW DEMOCRATIC PARTY has relied heavily on its membership but receives substantial support from trade unions, some of them headquartered in the US. The emergence of provincial power has not lessened party dependence on business but has altered the entry point for party monies and reduced the former dependence of provincial organizations on federal ones.

As a result of the demise of the notorious UNION NATIONALE machine of Maurice DUPLESSIS and because of scandals in Ottawa and the provinces, such as the RIVARD (which involved a drug peddler) and Fidnam (an Ontario real-estate scandal) affairs, and because of the effect

of the American Watergate scandal, there was a movement for the control of election expenses during the 1960s and 1970s. A Federal Advisory Committee on Election Expenses led to the ELECTION EXPENSES ACT (1974) while the Ontario Commission on the Legislature led to the establishment of the Commission on Election Contributions and Expenses. Reforms have now been adopted by 7 provinces, as well as by some municipal bodies. The role of party funds, formerly ignored, has been recognized. Control bodies have been instituted and ceilings imposed on party and candidate spending and contributions. Disclosure of the amounts and sources of income and expenses is mandatory. Incentives for individual donors have been provided in the form of graduated tax credits favouring smaller gifts. No other jurisdiction has yet followed Québec's lead in banning corporate and other organizational contributions. Subsidies in the form of reimbursements for a portion of the total permitted expenses for candidate and party spending at election time are now provided at the federal level and in a majority of provinces. The maximum permitted expenditures for parties and candidates at the federal level will be adjusted according to the rise in the CONSUMER PRICE INDEX. In the 1979 federal general election 1427 candidates raised over \$15.6 million from 88 431 contributors and spent almost \$16 million, over 50% of which was reimbursed from the federal treasury; the 1980 general-election figures were about the same. Total central registered party spending for the 1979 campaign amounted to over \$10 million, of which more than \$2 million (representing 50% of the broadcasting time purchased by the parties) was reimbursed by the federal treasury. Parties are permitted a combined total of 6.5 hours broadcast time; the allocation to each party is roughly determined by the number of seats held and the size of the popular vote won by each party in and for the outgoing Parliament. Total spending by the parties in the 1980 campaign rose to almost \$11.5 million, but the reimbursement was sharply higher, rising 25% to nearly \$2.5 million because of the increase in broadcasting expenditures. The reimbursement of 50% of broadcasting time costs has now been transformed into a reimbursement of 22.5% of the total permitted costs of qualifying political parties.

Much of the mystery surrounding political funds has been eliminated, with consequent equity among political competitors, and escalation of costs has been checked. Grass-roots donations have been encouraged and the number of individual personal gifts has multiplied. Nevertheless, the 2 major parties (particularly the Liberals) still rely heavily on the corporate sector, as does Social Credit in BC. The New Democrats are still a grass-roots party but trade-union contributions and affiliation dues are important resources. Only in Québec are personal contributions a significant source of funds. Despite reforms, the financial dependence of the Canadian party system on corporations, on the trade-union elite and on the state persists.

KHAYYAM Z. PALTIEL

*Reading:* Khayyam Z. Paltiel, *Political Party Financing in Canada* (1970); Howard R. Penniman, ed, *Canada at the Polls, 1979 and 1980: A Study of the General Elections* (1981); *Report of the Advisory Committee on Election Expenses* (1966).

**Party System** Although Canada is often thought of as a 2-party system, it is more accurate to say that (federally) it is a multiparty system in which one party usually dominates. Nationally, since 1921, there have been representatives of at least 3 and sometimes 4 or 5 political parties in Parliament. The LIBERAL PARTY, the CONSERVATIVE PARTY and the CO-OPERATIVE COMMONWEALTH FEDERATION (and its successor the NEW DEMOCRATIC PARTY) have been represented in

every Parliament since 1935. Other parties sometimes represented have included the PROGRESSIVE PARTY, the UNITED FARMERS OF ALBERTA, SOCIAL CREDIT, the BLOC POPULAIRE and the Labor Progressive Party. Indeed, more than 100 other political parties have run at least one candidate in an election. In 1984, 4 political parties were registered, ie, eligible to run candidates with the party name designated on the ballot, to receive donations and issue income-tax receipts, and to be reimbursed for certain expenses by the federal government. To be registered for a federal election, a political party must have had at least 12 members in the previous Parliament, or must nominate at least 50 candidates.

Provincially the situation is more complex. Not only have each of the Liberals, Conservatives, CCF-NDP and Social Credit parties formed the governments of at least 2 provinces, but in provinces such as BC the NDP and the Social Credit are the only political parties to have formed governments in the last 30 years. Between 1936 and 1960, Québec politics was dominated by the UNION NATIONALE which was not represented in federal elections. Alberta has been dominated by one party, as has Ontario.

**Origins of Party System** Despite the plethora of parties that have been formed to run candidates at the national level, only the Liberal and Conservative parties have ever had a realistic possibility of taking office. Both parties took shape in the mid-19th century. The Conservatives were formed from a Liberal-Conservative coalition, Tories and French-speaking *bleus* in the Province of Canada allied with more liberal elements. The Liberals were created from a coalition of the CLEAR GRITS of Upper Canada, the anticlerical *rouges*, and the reform element in the Maritimes. The 2 parties at their inception reflected religious, geographic and other differences. The Conservative Party was grounded in Toryism, ie, a belief in the importance of hierarchy or privilege in political and social life, in collectivism and in the nation as the fundamental basis of political life, but the party also absorbed tenets of "business liberalism," an important variant of liberalism. As a broad set of beliefs, liberalism is represented not only in the laissez-faire individualism of Western CONSERVATISM, but in the mild reformism of the moderates within the New Democratic Party. Liberalism asserts the paramountcy of the individual over the collectivity, and rejects the belief that individuals are fixed to predestined spots in a social hierarchy. Business liberalism identifies the state as a primary threat to individuals, and their freedom, particularly the right of individuals to behave as they please in the marketplace, but business liberals also attach great importance to the rule of law, the independence of the judiciary and the accountability of the executive to the legislature. In the 20th century, welfare liberalism, a rival variant, arose. Welfare liberals regard the concentrated power of large corporations as the chief menace to individual liberty and argue that the state has an important role to play in the redistribution of wealth.

In other competitive party systems, trade unions and co-operative movements are major sources of party funds, but historically (and currently) both the Liberals and Conservatives rely on the economic elite in Montréal and Toronto for PARTY FINANCING. In strategy, both parties discount the significance of class differences in Canada (see CLASS AND POLITICS), and have consequently found themselves in the difficult position of proclaiming a commitment to social reform while trying not to arouse the ire of their financial supporters. However, with the reforms in election financing in the 1970s this dependency has lessened, and both Liberals and Conservatives limit the size of any single contribution to avoid even the appearance that campaign contributions buy political favours.

In the 20th century, the party system in Canada was expanded by the growth of what have been described in C. Winn and J. McMenemy's *Political Parties in Canada* (1975) as movement or fragment parties, or a combination of both, the development of which was facilitated by the British parliamentary system employed in Canada. Because the focus of this system is the constituency, the election of only a few members of Parliament by a minor party still allows that party to criticize the government and initiate procedural motions in House of Commons debates. Fragment parties, ie, those established by a disenchanted ex-member of a parliamentary party have included the Nationalists, (founded by Henri BOURASSA), the Reconstruction Party (founded by H.H. STEVENS), the New Democracy Party (founded by W.D. Herridge) and Action Canada (founded by Paul HELLYER). These parties tended to be defined by the founder's personality. Parties such as Social Credit and the Co-operative Commonwealth Federation originate in SOCIAL MOVEMENTS. These class and region-based parties are usually crippled electorally by bicultural division. The populist party, Social Credit founded in Alberta by William ABERHART, has been successful as a regional or provincial party but had limited success nationally. In Alberta, it was an alternative to the Conservative and Liberal parties and the government of the United Farmers of Alberta, which had allied itself with the CCF. In Québec, where Social Credit erupted in 1962 under the leadership of Réal CAOUETTE, it exploited the concerns of rural and small-town dwellers with the economic and political establishment of the country (see CREDITISTES).

The social democratic CCF, a federation of many groups and movements, rejected in its structure the model of the parliamentary parties to secure regular involvement of grass-roots members; this structure was modified in the CCF's transformation into the NDP.

The Progressives were a mixed fragment movement party founded in Manitoba by T.A. CRERAR but supported by the popular United Farmers of Alberta. They represented a radical interpretation of liberalism combined with some collectivist concerns; although they were short-lived as a national party, in the early 1930s some Progressive and UFA MPs helped found the CCF, and the Progressive premier of Manitoba, John Bracken, went on to become leader of the renamed Progressive Conservative Party.

**Structure of the Party System** Virtually all Canadian political parties aim to promote objectives compatible with liberal-democratic values and hope to obtain their ends by achieving power through constitutional means within a parliamentary system of government. Canada's electoral system is based upon single-member constituencies, and a political party tries to win a majority of seats in a general election to form a government. The Conservative, Liberal and New Democratic parties maintain provincial associations under which are riding (constituency level) organizations that contest national and provincial elections. At annual or biannual meetings, the associations elect officers, adopt resolutions and organize party followers. The extra-parliamentary organizations are not tightly structured, and no party has a large dues-paying membership, and active involvement by ordinary party members is minimal except at election time, though NDP supporters are on balance more active.

The constitutions of all 3 federal parties protect bicultural and regional interests (eg, that of the Liberals provides for equal francophone and anglophone representation; the NDP selects an associate president and an associate secretary from a cultural group not represented by the president and secretary). Party constitutions au-

thorize as well the appointment of paid officials. Despite some differences (eg, membership criteria) all 3 constitutions reinforce the authority of the national leader and seek to moderate internal dissension.

Each general election involves simultaneous elections in all of Canada's 282 (1985) ridings, and in each constituency there may be candidates from registered political parties, as well as representatives of other parties without registered status, whose names appear on the ballot as "Independents." The first task of the constituency party is to choose its candidate and although the procedures for doing so are normally loosely established by the national political party, there is considerable autonomy accorded the local parties, and their practices vary widely. Usually the candidate is selected by a secret vote of all members resident in the constituency over the age of 14. Although membership in a constituency party of a major national party might normally run in the 200-500 range, this figure sometimes swells to 4000-5000 for nomination meetings. Because the rules for contested nominations are not clearly established and because these events normally involve the infusion into the party of large numbers of new members only weakly committed to the party as an institution, the system often produces conflict and tension.

Once the party's candidate is chosen, the local party tries to secure his or her election. The party will choose a campaign manager, rent a campaign office and begin the process of publicizing the party and the candidate by signs and advertisements in the media. Close to the election, it will organize door-to-door canvasses and the distribution of literature. After election day the party will quickly lapse into a loosely organized social club, guarding a desultory existence and waiting to be resurrected for the next election.

It is not easy to define the exact relationship between the various provincial parties and the national units with which they share a common name. For example, in Ontario membership between the federal and provincial parties is common, but in Québec there is no provincial Conservative Party, and membership in the federal and provincial Liberal parties is separate. BC's provincial Social Credit Party has weak ties with its federal counterpart, while in practice it has close informal ties with the federal BC Conservatives who in turn largely neglect their politically insignificant provincial counterpart. Even where party membership overlaps between federal and provincial parties, it is not uncommon for either activists or ordinary members to have strong preferences for one level or the other. In most provinces, many voters consistently choose one party at the provincial level and another in federal elections. NDP supporters tend to be more consistent in their voting patterns, but even here there is considerable movement in voting preferences between one election and the next.

The primary task of both the provincial and federal parties is to choose the party leader (in effect the party's candidate for premier or prime minister) and then secure the election of a sufficient number of party supporters. Election of party leaders normally takes place after the resignation or death of the incumbent, although most parties have provisions for forcing a LEADERSHIP CONVENTION on an unwilling leader. The parties also elect a president and other executive members whose job it is to manage the party's administrative apparatus. As well as leadership conventions, most parties also hold policy conventions, the NDP regularly, the other parties more occasionally. There is often controversy between the MPs and participants in policy conventions as to how far the elected members are bound by the content of resolutions.

In a general election, it is the task of the na-

tional party to manage the overall national campaign. It plans the leader's tour, raises and spends money on advertising and campaign literature and distributes money and other resources. At other times, the parties operate offices with a small but paid staff whose responsibility it is to conduct party business and to co-ordinate the various constituency, provincial and national organizations. There is sometimes a conflict between the extra-parliamentary party and the senators and elected MPs. The latter see themselves as the top of the power pyramid and consider the volunteer and paid party workers as their agents, whereas the volunteers especially often consider themselves important political forces within the constituency, provincial or national party, and view the elected MPs as their representatives. The parliamentary caucuses of the major parties have always tended to be unrepresentative of the nation as a whole, and even of their own voters. From the late 1960s until recently the Conservatives were very weak in Québec, while the Liberals suffered in western Canada. The New Democratic Party, which was very weak in Québec, was somewhat divided between its Ontario wing, which provided much of its popular vote, and the western wing which contributed the majority of elected members.

However, all 3 of the major national parties attempt to field candidates for each of the country's constituencies, and each party ensures that its national leader will be prominently displayed in every area of the country. In general, the Liberal Party has historically been supported by Catholics, urban dwellers, French Canadians, recent immigrants, the moderately well-to-do and professionals. The Conservative Party usually attracts greater support from Canadians of British origin, small town and rural dwellers, Protestants and small businessmen. The NDP usually draws strongly from Protestants, union members, urban dwellers in Ontario, rural dwellers in the West and the better educated. Although the NDP is strongly identified by the public with the trade-union movement, the party wins most of its seats in areas that are not heavily unionized and does not receive a majority of the votes cast by union households. It is too early to determine if the 1984 federal election, which saw a major Conservative victory and significant gains in Québec, will represent the beginning of a long-term change in traditional voting patterns.

The party system in Canada has major failings. First, too few Canadians are directly involved in political activities. Second, Canadian parties generate few important policies. Governments rely heavily on the civil service and other experts for ideas. Party policies are rarely pressed by governments until the policies have been approved by the bureaucratic elite. Finally the party system has been only partly successful in enhancing national unity. Although the parties have struggled to maintain their status as national institutions, the Liberal Party has generally been identified with the interests of central Canada, and the Conservative Party with those of western Canada. Conflict, instead of being contained and resolved within political parties, has often been exacerbated because partisan controversy and distrust have complicated already difficult economic and social questions.

**Party Whip**, member of a party caucus who ensures that the number of MPs in the legislature, or at committee meetings, is adequate to win a vote if one is called. The division bells in

the HOUSE OF COMMONS ring until whips are satisfied that sufficient members of their own party are present. They can offer a few minor rewards, eg, trips and committee membership, but have few effective punishments and rely more on persuasion than coercion. They also arrange the order of speakers in the legislature, facilitating the Speaker's job.

ROBERT J. JACKSON

**Passamaquoddy Bay** is a small inlet near the mouth of the Bay of FUNDY. Its mouth is restricted by a chain of islands, including DEER and CAMPOBELLO, and strong tides (range 8.3 m) prevail in the region. Rich fisheries for herring and lobster occur here and the St Andrews Marine Biological Station on its shores is an important research centre. Because of the tides and topography, several schemes for TIDAL ENERGY development have been proposed in the past. Recent international controversy relates to the passage of supertankers through Canadian waters in the region to reach a proposed refinery at Eastport, Maine.

P.C. SMITH AND R.J. CONOVER

**Passchendaele** (Passendale, Belgium) In 1917 the Germans began unrestricted submarine warfare, Russia crumbled under the impact of revolution and withdrew from WORLD WAR I, and part of the French army mutinied following the failure of Gen Nivelle's spring offensive. To relieve the resulting German pressure on the Allied forces, British Commander in Chief Gen Sir Douglas Haig launched an attack from the British front. After the British and Australian/New Zealand troops had fought weeks of grinding battle resulting in many casualties, on Oct 26 Lt-Gen Sir Arthur CURRIE's Canadian Corps attacked over terrain that resembled a quagmire. By Nov 7, having endured appalling conditions and having suffered over 7000 casualties, the Canadians seized Passchendaele and with it 5 km<sup>2</sup> of mud. Haig has been severely criticized for prolonging his attack, but the Canadians gained great merit for their accomplishment in battle.

R.H. ROY

**Passenger Pigeon** (*Ectopistes migratorius*) is extinct. Also known as wild PIGEON, this largish, long-tailed species (family Columbidae) was once abundant, nesting in vast, densely populated colonies and migrating in flocks that, at times, darkened the sky for hours or even days. The habit of concentrating in great numbers proved disastrous because it facilitated mass slaughter by man. The species was gunned, netted and clubbed into oblivion. Its decline from the uncountable numbers that were one of the natural wonders of the continent became precipitous 1871-80. Because only one egg per clutch was being laid, the passenger pigeon's reproductive potential was inadequate to maintain the sadly decreased and scattered populations that remained late in the 19th century. The last known specimen taken in the wild was at Sargento, Ohio, on 24 Mar 1900. The last survivor died on 1 Sept 1914 in a zoo in Cincinnati, Ohio. In Canada, the passenger pigeon was a summer resident, nesting from the Maritimes through southern Québec, Ontario, Manitoba, central-eastern Saskatchewan and probably parts of Alberta. It was last recorded in Canada on 18 May 1902 at Penetanguishene, Ont. Specimens were last taken in 1898 at Lk Winnipegosis, Man, and in 1899 at Scotch Lk, NB.

W. EARL GODFREY

**Patent** A patent may be granted in Canada to the first true inventor who submits an application to the Canadian Patent Office setting out the details of the invention and the reasons why the inventor believes it to be a major step forward in that particular field. The exclusive rights guaranteed by a patent are intended to encourage the process of invention and exchange of information. An invention must meet the tests set out in the Patent Act (which is under review in 1984).

The Act prescribes that the invention must not have been known or used previously in Canada and must not have been on sale or disclosed in a printed publication for more than 2 years prior to the application.

At the Patent Office, the application is examined by technically qualified staff who determine whether the application discloses the claims completely and fully and whether or not the application passes the tests of novelty and utility. If the application is successful, the inventor is granted the exclusive rights to the manufacture, use and sale of the article or process for 17 years. Special provisions are contained in the Act to ensure that the monopoly is not used to the detriment of the public, especially in the case of food, drugs and atomic energy patents. In addition, the commissioner of patents may take steps to ensure the Canadian market is being properly supplied with the products or processes in question.

International patent protection is available through the Union for the Protection of Industrial Property which allows for registration of a patent in other countries of the union. Further, an inventor has one year within which to file in other union countries and thus preserve his original filing day in Canada. PETER J.M. LOWN

**Patents, Copyright and Industrial Designs, Royal Commission on**, sat between 1954 and 1960. Its brief was "to enquire as to whether federal legislation relating in any way to patents of invention, industrial designs, copyright and trademarks affords reasonable incentive to invention and research, to the development of literary and artistic talents, to creativeness, and to making available to the Canadian public scientific, technical, literary and artistic creations and other adaptations, applications and uses, in a manner and on terms adequately safeguarding the paramount public interest." The commission later requested that TRADEMARKS be removed from its brief. Three reports were published: *Copyright*, Aug 1957; *Industrial Designs*, June 1958; and *Patents of Invention*, Dec 1959. Chaired by J.L. ILSLEY, the commission heard from various public and private organizations and from individuals. In June 1966 the ECONOMIC COUNCIL OF CANADA examined the issues dealt with by the Ilsley Commission and, over the next 5 years, published a series of reports, including Special Study No 8, *Science, Technology and Innovation*, by A.H. Wilson, in 1968. The report emphasized the importance of innovation to industry.

ADRIANA A. DAVIES

**Patrick, Thomas Alfred**, physician, legislator (b at Ilderton, Ont 23 Dec 1864; d at North Battleford, Sask 6 Sept 1943). After graduating from Western in 1888, Patrick practised medicine and surgery in Saltcoats, Sask, until 1894 and in Yorkton, Sask, until 1939. Elected from Yorkton to the North-West Territories Assembly in 1897, he used his slogan "No Annexation of Manitoba" on campaign buttons in 1898, and won decisive reelection on a "2-province" platform in 1902. He was the first to propose the present boundaries of Saskatchewan and Alberta.

C. STUART HOUSTON

**Patrick, William**, clergyman, educator (b at Glasgow, Scot 8 Sept 1852; d at Kirkintilloch, Scot 28 Sept 1911). After studying theology at the Free Church Coll in Glasgow, he was ordained in 1878. He combined an active involvement in education with his pastoral duties and in 1900 was appointed principal of Winnipeg's Manitoba Coll, where he taught philosophy and New Testament courses until his untimely death. During his career in Canada, he was a member of the Social Reform Council of Canada, acted on the royal commission to establish an agricultural college for Manitoba, and was a strong and respected Presbyterian leader in the church union movement.
